

《THS413x 高速、低噪声、全差分 I/O 放大器》

1 特性

- 高性能
 - 带宽：170MHz ($V_{CC} = \pm 15V$, $G = 1V/V$)
 - 压摆率：51 V/ μ s
 - 增益带宽积：215 MHz
 - 失真：-102dBc THD (2V_{PP}、250kHz 时)
- 电压噪声
 - 1/f 电压噪声拐角频率：350 Hz
 - 输入基准噪声 1.25nV/ \sqrt Hz
- 单电源工作电压范围：5 V 至 30 V
- 静态电流 (关断)：860 μ A (THS4130)
- 温度范围：-40°C 至 +85°C
- 封装：PowerPAD™ HVSSOP-8、SOIC-8、VSSOP-8

2 应用

- 单端至差分转换
- 差分 ADC 驱动器
- 差分抗混叠
- 差分发送器和接收器
- 输出电平转换器
- 医疗超声波

适用于超声波的
时间增益控制 DAC 参考设计

3 说明

THS4130 和 THS4131 器件 (THS413x) 是使用德州仪器 (TI) 先进的高压互补双极工艺制造的全差分输入/输出放大器系列。

THS413x 使用从输入到输出的真正全差分信号路径，提供高达 $\pm 15V$ 的高电源电压。这种设计带来了出色的共模噪声抑制能力 (800kHz 时为 95dB) 和总谐波失真 (2V_{PP}、250kHz 时为 -102dBc)。高电压差分信号链可通过宽电源电压范围提高裕量和动态范围，而无需为差分信号的每个极性添加单独的放大器。

THS413x 具有 -40°C 至 +85°C 的宽额定运行温度范围。

4 Revision History

注：以前版本的页码可能与当前版本的页码不同

Changes from Revision K (August 2022) to Revision L (August 2023)	Page
• Changed MSOP and MSOP-PowerPad to VSSOP and HVSSOP in Thermal Information table.....	4
• Changed thermal specifications for DGN package in <i>Thermal Information</i> table.....	4
• Changed the Electrical Characteristics section to combine both Electrical Characteristics tables into one table with improved small-signal bandwidth, slew rate, settling time, total harmonic distortion (THD), spurious-free dynamic range (SFDR), voltage noise, offset voltage drift, output swing, and quiescent current parameters for the DGN package.....	5
• Changed input current noise typical from 1.3 pA/√Hz to 1.7 pA/√Hz for DGN package.....	5
• Changed common-mode input offset voltage maximum from 3.5 mV to 5.5 mV for DGN package.....	5
• Changed maximum input bias current from 6 μA to 15.4 μA for DGN package.....	5
• Changed single input resistance parameter into separate common-mode and differential input resistance parameters for DGN package.....	5
• Changed <i>Typical Characteristics: THS413xD, THS413xDGK</i> title to <i>Typical Characteristics</i> and deleted obsolete <i>Typical Characteristics: THS413xDGN</i> section; all plots now in one section.....	7

Changes from Revision J (March 2022) to Revision K (August 2022)	Page
• Updated thermal specifications for DGK package in <i>Thermal Information</i> table.....	4
• Changed title of <i>Electrical Characteristics: THS413xD</i> to <i>Electrical Characteristics: THS413xD, THS413xDGK</i>	5
• Changed title of <i>Typical Characteristics: THS413xD</i> to <i>Typical Characteristics: THS413xD, THS413xDGK</i>	7

6 Pin Configuration and Functions

图 6-1. D Package, 8-Pin SOIC, DGK Package, 8-pin VSSOP, DGN Package, 8-Pin HVSSOP THS4130 (Top View)

图 6-2. D Package, 8-Pin SOIC, DGK Package, 8-pin VSSOP, DGN Package, 8-Pin HVSSOP THS4131 (Top View)

表 6-1. Pin Functions

NAME	PIN NO.		TYPE ⁽¹⁾	DESCRIPTION
	THS4130	THS4131		
NC	—	7	—	No connect
PD	7	—	I	Active low power-down pin
V _{CC+}	3	3	I/O	Positive supply voltage pin
V _{CC-}	6	6	I/O	Negative supply voltage pin
V _{IN-}	1	1	I	Negative input pin
V _{OCM}	2	2	I	Common mode input pin
V _{OUT+}	4	4	O	Positive output pin
V _{OUT-}	5	5	O	Negative output pin
V _{IN+}	8	8	I	Positive input pin
Thermal Pad	Thermal Pad	Thermal Pad	—	Thermal pad. DGN (HVSSOP) package only. For the best thermal performance, connect the thermal pad to a large copper plane. This pad is electrically isolated from the die so the pad can be connected to any pin on the package.

(1) I = input, O = output.

7 Specifications

7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT	
V _I	Input voltage	-V _{CC}	+V _{CC}	V	
V _{CC-} to V _{CC+}	Supply voltage		33	V	
	Supply turn on and turn off dV/dT ⁽²⁾		1.7	V/μs	
I _O	Output current ⁽³⁾		150	mA	
V _{ID}	Differential input voltage	-1.5	1.5	V	
I _{IN}	Continuous input current		10	mA	
T _J	Junction temperature		150	°C	
	Junction temperature, continuous operation, long-term reliability ⁽⁴⁾		125	°C	
T _A	Ambient temperature	C-suffix	0	70	°C
		I-suffix	-40	85	°C
T _{stg}	Storage temperature	-65	150	°C	

- Operation outside the Absolute Maximum Ratings may cause permanent device damage. Absolute maximum ratings do not imply functional operation of the device at these or any other conditions beyond those listed under Recommended Operating Conditions. If briefly operating outside the Recommended Operating Conditions but within the Absolute Maximum Ratings, the device may not sustain damage, but it may not be fully functional. Operating the device in this manner may affect device reliability, functionality, performance, and shorten the device lifetime.
- Stay below this specification to make sure that the edge-triggered ESD absorption devices across the supply pins remain off.
- Some of the THS413x packages incorporate a thermal pad on the underside of the chip. This thermal pad acts as a heat sink and must be connected to a thermally dissipative plane for proper power dissipation. Failure to do so can result in exceeding the maximum junction temperature which can permanently damage the device. See TI technical briefs [SLMA002](#) and [SLMA004](#) for more information about using the PowerPAD integrated circuit package.
- The maximum junction temperature for continuous operation is limited by package constraints. Operation greater than this temperature can result in reduced reliability, reduced lifetime of the device, or both.

7.2 ESD Ratings

		VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±2500
		Charged-device model (CDM), per ANSI/ESDA/JEDEC JS-002 ⁽²⁾	±1500

- JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V _{CC}	Supply voltage	Dual supply	±2.5	±15	V
		Single supply	5	30	
T _A	Operating free-air temperature	C-suffix device	0	70	°C
		I-suffix device	-40	85	

7.4 Thermal Information

8 Detailed Description

8.1 Overview

The THS413x devices are fully differential amplifiers (FDAs). Differential signal processing offers a number of performance advantages in high-speed analog signal processing systems, including immunity to external common-mode noise, suppression of even-order nonlinearities, and increased dynamic range. FDAs not only serve as the primary means of providing gain to a differential signal chain, but also provide a monolithic solution for converting single-ended signals into differential signals allowing for easy, high-performance processing. For more information on the basic theory of operation for FDAs, see the [Fully Differential Amplifiers application note](#).

8.2 Functional Block Diagram

8.3 Feature Description

图 8-1 和 图 8-2 depict the differences between the operation of the THS413x in two different modes. FDAs can work with either differential or single-ended inputs.

图 8-1. Amplifying Differential Input Signals

图 8-2. Amplifying Single-ended Input Signals

8.4 Device Functional Modes

8.4.1 Power-Down Mode

Power-down mode is used when power saving is required. The THS4130 power-down (\overline{PD}) pin is an active low input. If left unconnected, an internal 250-k Ω resistor to V_{CC+} keeps the device turned on. The threshold voltage for the power-down function is approximately 1.4 V greater than V_{CC-} . Therefore, if the \overline{PD} pin is 1.4 V greater than V_{CC-} , then the device is active. If the \overline{PD} pin is less than 1.4 V greater than V_{CC-} , then the device is off. Pull the pin to V_{CC-} to turn the device off. 图 8-3 shows the simplified version of the power-down circuit. While in power-down mode, the amplifier goes into a high-impedance state. The amplifier output impedance is typically greater than 1 M Ω in power-down mode.

图 8-3. Simplified Power-Down Circuit

Similar to an op amp in an inverting configuration, the output impedance of an FDA is determined by the feedback network configuration. In addition, the THS4130 has an internal 10-k Ω resistor at each output that is tied to the V_{CM} error amplifier (see 节 8.2). The differential output impedance is equal to $[(2 \times R_F + 2 \times R_G) \parallel 20 \text{ k}\Omega]$. 图 8-4 shows the closed-loop output impedance of the THS4130 when in power-down.

$$V_{CC} = \pm 5 \text{ V, gain} = 1 \text{ V/V, } R_F = 1 \text{ k}\Omega, \overline{PD} = V_{CC-}$$

图 8-4. Output Impedance (in Power-Down) vs Frequency

9 Application and Implementation

备注

以下应用部分中的信息不属于 TI 器件规格的范围，TI 不担保其准确性和完整性。TI 的客户应负责确定器件是否适用于其应用。客户应验证并测试其设计，以确保系统功能。

9.1 Application Information

9.1.1 Output Common-Mode Voltage

The output common-mode voltage pin sets the dc output voltage of the THS413x. A voltage applied to the VOVM pin from a low-impedance source can be used to directly set the output common-mode voltage. If left floating, then the VOVM pin defaults to the mid-rail voltage, defined as:

$$\frac{(V_{CC+}) + (V_{CC-})}{2} \quad (1)$$

To minimize common-mode noise, connect a 0.1- μ F bypass capacitor to the VOVM pin. Output common-mode voltage causes additional current to flow in the feedback resistor network. This current is supplied by the output stage of the amplifier; therefore, additional power dissipation is created. For commonly-used feedback resistance values, this current is easily supplied by the amplifier. The additional internal power dissipation created by this current can be significant in some applications and can dictate the use of the HVSSOP package to effectively control self-heating.

9.1.1.1 Resistor Matching

Resistor matching is important in FDAs to maintain good output balance. An ideal differential output signal implies the two outputs of the FDA should be exactly equal in amplitude and shifted 180° in phase. Any imbalance in amplitude or phase between the two output signals results in an undesirable common-mode signal at the output. The output balance error is a measure of how well the outputs are balanced and is defined as the ratio of the output common-mode voltage to the output differential signal.

$$\text{Output Balance Error} = \frac{\left(\frac{V_{OUT+} - V_{OUT-}}{2}\right)}{V_{OUT+} - V_{OUT-}} \quad (2)$$

At low frequencies, resistor mismatch is the primary contributor to output balance errors. Additionally CMRR, PSRR, and HD2 performance diminish if resistor mismatch occurs. Therefore, to optimize performance, use 1% tolerance resistors or better. [表 9-1](#) provides the recommended resistor values to use for a particular gain.

表 9-1. Recommended Resistor Values

GAIN (V/V)	R _G (Ω)	R _F (Ω)
1	390	390
2	374	750
5	402	2010
10	402	4020

9.1.2 Driving a Capacitive Load

Driving capacitive loads with high-performance amplifiers is not a problem as long as certain precautions are taken. The THS413x have been internally compensated to maximize bandwidth and slew rate performance. When the amplifier is compensated in this manner, capacitive loading directly on the output decreases the device phase margin leading to high-frequency ringing or oscillations. Therefore, for capacitive loads of greater than 10 pF, place a resistor in series with the output of the amplifier, as shown in [图 9-1](#). A minimum value of 20 Ω works well for most applications. For example, in 50-Ω transmission systems, setting the series resistor value to 50 Ω both isolates any capacitance loading and provides the proper line impedance matching at the source end.

图 9-1. Driving a Capacitive Load

9.1.3 Data Converters

Driving data converters are one of the most popular applications for fully-differential amplifiers. [图 9-2](#) shows a typical configuration of an FDA attached to a differential analog-to-digital converter (ADC).

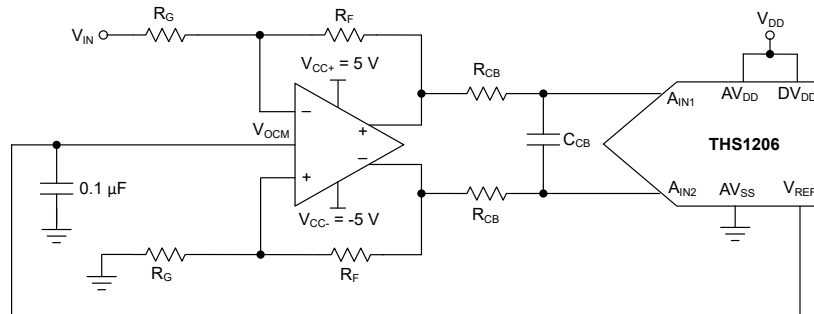

图 9-2. Fully-Differential Amplifier Attached to a Differential ADC

FDAs can operate with a single supply. V_{OCM} defaults to the mid-rail voltage, $V_{CC}/2$. The differential output can be fed into a data converter. This method eliminates the use of a transformer in the circuit. If the ADC has a reference voltage output (V_{ref}), then connect V_{ref} directly to the V_{OCM} of the amplifier using a bypass capacitor to reduce broadband common-mode noise.

图 9-3. Fully-Differential Amplifier Using a Single Supply

9.1.4 Single-Supply Applications

For proper operation, the input common-mode voltage to the input terminal of the amplifier must not exceed the common-mode input voltage range. However, some single-supply applications can require the input voltage to exceed the common-mode input voltage range. In such cases, to bring the common-mode input voltage within the specifications of the amplifier, the circuit configuration of 图 9-4 is suggested.

图 9-4. Circuit With Improved Common-Mode Input Voltage

方程式 3 是用于计算 R_{PU} :

$$R_{PU} = \frac{V_P - V_{CC}}{(V_{IN} - V_P) \frac{1}{R_G} + (V_{OUT} - V_P) \frac{1}{R_F}} \quad (3)$$

9.2 Typical Application

图 9-5. Antialias Filtering

For signal conditioning in ADC applications, make sure to limit the input frequency to the ADC. Low-pass filters can prevent the aliasing of the high-frequency noise with the frequency of operation. This design example shows a method by which the noise can be filtered in the THS413x. 图 9-5 shows the design example for the THS413x in active low-pass filter topology driving an ADC.

9.2.1 Design Requirements

表 9-2 shows example design parameters and values for the typical application design example in 图 9-5.

表 9-2. Design Parameters

DESIGN PARAMETERS	VALUE
Supply voltage	±2.5 V to ±15 V
Amplifier topology	Voltage feedback
Output control	DC-coupled with output common-mode control capability
Filter requirement	500-kHz, multiple-feedback low-pass filter

9.2.2 Detailed Design Procedure

图 9-5 shows a multiple-feedback (MFB) low-pass filter. The transfer function for this filter circuit is:

$$H_d(f) = \left[\frac{K}{-\left[\frac{f}{FSF \times f_c}\right]^2 + \frac{1}{Q} \frac{jf}{FSF \times f_c} + 1} \right] \times \left[\frac{\frac{Rt}{2R4 + Rt}}{1 + \frac{j2\pi f R4 Rt C3}{2R4 + Rt}} \right]$$

$$\text{where } K = \frac{R2}{R1}, FSF \times f_c = \frac{1}{2\pi\sqrt{2} \times R2 R3 C1 C2}, \text{ and } Q = \frac{\sqrt{2} \times R2 R3 C1 C2}{R3 C1 + R2 C1 + K R3 C1} \quad (4)$$

K sets the pass-band gain, f_c is the cutoff frequency for the filter, FSF is a frequency scaling factor, and Q is the quality factor.

$$FSF = \sqrt{Re^2 + |Im|^2} \text{ and } Q = \frac{\sqrt{Re^2 + |Im|^2}}{2Re} \quad (5)$$

where Re is the real part and Im is the imaginary part of the complex pole pair. Setting $R_2 = R$, $R_3 = mR$, $C_1 = C$, and $C_2 = nC$ results in:

$$FSF \times fc = \frac{1}{2\pi Rc\sqrt{2 \times mn}} \text{ and } Q = \frac{\sqrt{2 \times mn}}{1 + m(1 + K)} \quad (6)$$

Start by determining the ratios, m and n, required for the gain and Q of the filter type being designed, then select C and calculate R for the desired fc.

9.2.3 Application Curve

图 9-6. Large-Signal Frequency Response

9.3 Power Supply Recommendations

The THS413x devices are designed to operate on power supplies ranging from ± 2.5 V to ± 15 V (single-ended supplies of 5 V to 30 V). Use a power-supply accuracy of 5% or better. When operated on a board with high-speed digital signals, make sure to provide isolation between digital signal noise and the analog input pins. The THS413x are connected to power supplies through pin 3 (V_{CC+}) and pin 6 (V_{CC-}). Decouple each supply pin to GND as close to the device as possible with a low-inductance, surface-mount ceramic capacitor of approximately 10 nF. When vias are used to connect the bypass capacitors to a ground plane, configure the vias for minimal parasitic inductance. One method of reducing via inductance is to use multiple vias. For broadband systems, two capacitors per supply pin are advised.

To avoid undesirable signal transients, do not power on the THS413x with large inputs signals present. Careful planning of system power on sequencing is especially important to avoid damage to ADC inputs when an ADC is used in the application.

9.4 Layout

9.4.1 Layout Guidelines

To achieve the levels of high-frequency performance of the THS413x devices, follow proper printed-circuit board (PCB) high-frequency design techniques. Following is a general set of guidelines. In addition, a [THS413x evaluation board](#) is available to use as a guide for layout or for evaluating device performance.

- Ground planes—Use a ground plane on the board to provide all components with a low inductive ground connection. However, in the areas of the amplifier inputs and output, the ground plane can be removed to minimize the stray capacitance.
- Proper power-supply decoupling—use a 6.8- μ F tantalum capacitor in parallel with a 0.1- μ F ceramic capacitor on each supply pin. Sharing the tantalum among several amplifiers is possible depending on the application; however, always use a 0.1- μ F ceramic capacitor on the supply pin of every amplifier. In addition, place the 0.1- μ F capacitor as close as possible to the supply pin. As this distance increases, the inductance in the connecting trace makes the capacitor less effective. Strive for distances of less than 0.1 inches between the device power pin and the ceramic capacitors.
- Short trace runs or compact part placements—to optimize high-frequency performance, minimize stray series inductance. The best method is to make the circuit layout as compact as possible, thereby minimizing the length of all trace runs. Pay particular attention to the inputs of the amplifier; keep the length as short as possible. This short length helps minimize stray capacitance at the input of the amplifier.

9.4.1.1 PowerPAD™ Integrated Circuit Package Design Considerations

The THS413x is available in a thermally-enhanced DGN package, which is a member of the PowerPAD™ integrated circuit package family. This package is constructed using a downset leadframe upon which the die is mounted (see [图 9-7 a](#) and [图 9-7 b](#)). This arrangement results in the lead frame being exposed as a thermal pad on the underside of the package (see [图 9-7 c](#)). Because this thermal pad has direct thermal contact with the die, excellent thermal performance can be achieved by providing a good thermal path away from the thermal pad.

The PowerPAD package allows for both assembly and thermal management in one manufacturing operation. During the surface-mount solder operation (when the leads are being soldered), the thermal pad can also be soldered to a copper area underneath the package. Through the use of thermal paths within this copper area, heat can be conducted away from the package into either a ground plane or other heat dissipating device.

The PowerPAD package represents a breakthrough in combining the small area and ease of assembly of the surface mount with the previously awkward mechanical methods of using a heat sink.

More complete details of the PowerPAD installation process and thermal management techniques can be found in [PowerPAD Thermally-Enhanced Package application report](#). This document can be found on the TI website at [www.ti.com](#) by searching for the keyword PowerPAD. The document can also be ordered through your local TI sales office; refer to SLMA002 when ordering.

Note: The thermal pad (PowerPAD) is electrically isolated from all other pins and can be connected to any potential from V_{CC-} to V_{CC+} . Typically, the thermal pad is connected to the ground plane because this plane tends to physically be the largest and is able to dissipate the most amount of heat.

10.5 静电放电警告

静电放电 (ESD) 会损坏这个集成电路。德州仪器 (TI) 建议通过适当的预防措施处理所有集成电路。如果不遵守正确的处理和安装程序，可能会损坏集成电路。

ESD 的损坏小至导致微小的性能降级，大至整个器件故障。精密的集成电路可能更容易受到损坏，这是因为非常细微的参数更改都可能会导致器件与其发布的规格不相符。

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of ≤ 1000 ppm threshold. Antimony trioxide based flame retardants must also meet the ≤ 1000 ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided.  - B. This drawing is subject to change without notice.
 - C. Publication IPC-7351 is recommended for alternate designs.
 - D. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC-7525 for other stencil recommendations.
 - E. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

重要声明和免责声明

TI“按原样”提供技术和可靠性数据（包括数据表）、设计资源（包括参考设计）、应用或其他设计建议、网络工具、安全信息和其他资源，不保证没有瑕疵且不做任何明示或暗示的担保，包括但不限于对适销性、某特定用途方面的适用性或不侵犯任何第三方知识产权的暗示担保。

这些资源可供使用 TI 产品进行设计的熟练开发人员使用。您将自行承担以下全部责任：(1) 针对您的应用选择合适的 TI 产品，(2) 设计、验证并测试您的应用，(3) 确保您的应用满足相应标准以及任何其他功能安全、信息安全、监管或其他要求。

这些资源如有变更，恕不另行通知。TI 授权您仅可将这些资源用于研发本资源所述的 TI 产品的应用。严禁对这些资源进行其他复制或展示。您无权使用任何其他 TI 知识产权或任何第三方知识产权。您应全额赔偿因在这些资源的使用中对 TI 及其代表造成的任何索赔、损害、成本、损失和债务，TI 对此概不负责。

TI 提供的产品受 [TI 的销售条款](#) 或 [ti.com](#) 上其他适用条款/TI 产品随附的其他适用条款的约束。TI 提供这些资源并不会扩展或以其他方式更改 TI 针对 TI 产品发布的适用的担保或担保免责声明。

TI 反对并拒绝您可能提出的任何其他或不同的条款。
