

TMP275 具有 I²C 和 SMBus 接口的 ±0.5°C 温度传感器（采用行业标准 LM75 尺寸和引脚）

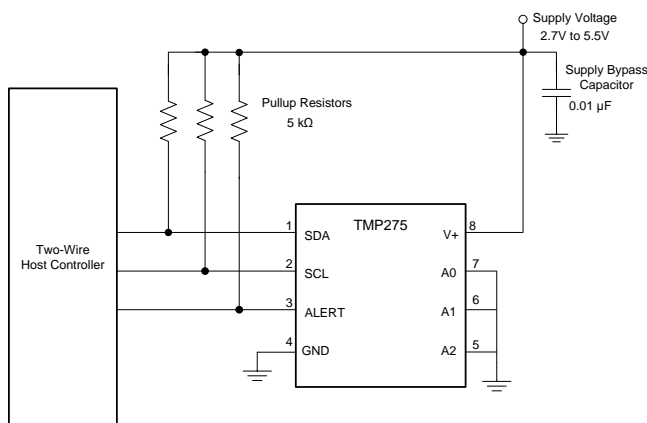

1 特性

- 高精度：
 - 20°C 至 100°C 范围内为 ±0.5°C（最大值）
 - 40°C 至 125°C 范围内为 ±1°C（最大值）
- 低静态电流：
 - 50µA（典型值）
 - 0.1µA（待机状态）
- 分辨率：9 至 12 位，用户可选
- 数字输出：SMBus™、两线制和 I²C 接口兼容性
- 8 个 I²C/系统管理总线 (SMBus) 地址
- 宽电源电压范围：2.7V 至 5.5V
- 小型 VSSOP-8 和 SOIC-8 封装
- 无需指定上电序列，可在 V+ 之前使能双线制总线上拉

2 应用

- 电源温度监控
- 计算机外设过热保护
- 电池管理
- 办公机器
- 服务器
- 恒温器控制
- 环境监测和供热通风与空气调节 (HVAC)
- 机电器件温度
- 数据记录器

简化电路原理图

3 说明

TMP275 是一款具有 12 位模数转换器 (ADC) 的 ±0.5°C 精密集成数字温度传感器，可在低至 2.7V 的电源电压下运行，并且可与德州仪器 (TI) 的 LM75、TMP75、TMP75B 和 TMP175 器件实现引脚和寄存器兼容。此器件采用 SOIC-8 和 VSSOP-8 两种封装，不需要外部组件便可测温。TMP275 能够以最高 0.0625°C（12 位），最低 0.5°C（9 位）的分辨率读取温度，从而允许用户编程更高的分辨率或更短的时间来最大限度地提升效率。器件的额定工作温度范围为 -40°C 至 125°C。

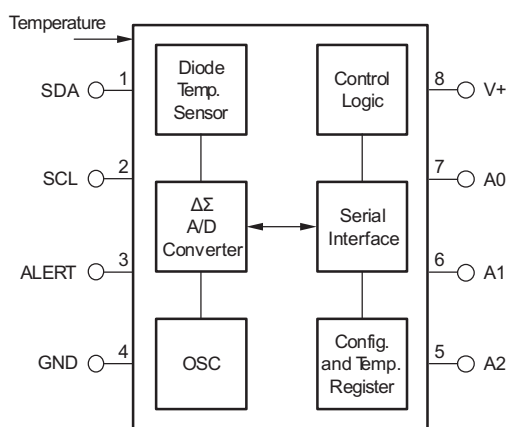

TMP275 器件特有系统管理总线 (SMBus) 和两线制接口兼容性，并且可在同一总线上，借助 SMBus 过热报警功能支持多达 8 个器件。厂家校准的温度精度和抗扰数字接口使得 TMP275 成为其他传感器和电子元件温度补偿的首选解决方案，而且无需针对分布式温度感测进行额外的系统级校准或复杂的电路板布局布线。

器件信息⁽¹⁾

器件型号	封装	封装尺寸（标称值）
TMP275	SOIC (8)	4.90mm × 3.91mm
	VSSOP (8)	3.00mm × 3.00mm

7 Detailed Description

7.1 Overview

The TMP275 is a digital temperature sensor that is optimal for thermal management and thermal protection applications. The TMP275 is Two-Wire, SMBus, and I²C interface-compatible, and is specified over a temperature range of –40°C to 125°C. The temperature sensor in the TMP275 is the chip itself. Thermal paths run through the package leads as well as the plastic package. The package leads provide the primary thermal path because of the lower thermal resistance of the metal. See [Functional Block Diagram](#) for the internal block diagram of TMP275 device.

7.2 Functional Block Diagram

7.3 Feature Description

7.3.1 Digital Temperature Output

The temperature register of the TMP275 is a 12-bit, read-only register that stores the output of the most recent conversion. Two bytes must be read to obtain data, and are described in [Figure 13](#) and [Figure 14](#). Note that byte 1 is the most significant byte, followed by byte 2, the least significant byte. The first 12 bits are used to indicate temperature, with all remaining bits equal to zero. The least significant byte does not have to be read if that information is not needed. Data format for temperature is summarized in [Table 1](#). Following power up or reset, the Temperature Register reads 0°C until the first conversion is complete. The user can obtain 9, 10, 11, or 12 bits of resolution by addressing the Configuration Register and setting the resolution bits accordingly. For 9-, 10-, or 11-bit resolution, the most significant bits in the Temperature Register are used with the unused LSBs set to zero

Table 1. Temperature Data Format

TEMPERATURE (°C)	DIGITAL OUTPUT (BINARY)	HEX
128	0111 1111 1111	7FF
127.9375	0111 1111 1111	7FF
100	0110 0100 0000	640
80	0101 0000 0000	500
75	0100 1011 0000	4B0
50	0011 0010 0000	320
25	0001 1001 0000	190
0.25	0000 0000 0100	004
0	0000 0000 0000	000
–0.25	1111 1111 1100	FFC
–25	1110 0111 0000	E70
–55	1100 1001 0000	C90

7.3.2 Serial Interface

The TMP275 operates only as slave devices on the SMBus, Two-Wire, and I²C interface-compatible bus. Connections to the bus are made through the open-drain I/O lines SDA and SCL. The SDA and SCL pins feature integrated spike suppression filters and Schmitt triggers to minimize the effects of input spikes and bus noise. The TMP275 supports the transmission protocol for fast (up to 400 kHz) and high-speed (up to 2.38 MHz) modes. All data bytes are transmitted MSB first.

7.3.3 Bus Overview

The device that initiates the transfer is called a *master*, and the devices controlled by the master are *slaves*. The bus must be controlled by a master device that generates the serial clock (SCL), controls the bus access, and generates the START and STOP conditions.

To address a specific device, a START condition is initiated, indicated by pulling the data-line (SDA) from a HIGH to LOW logic level while SCL is HIGH. All slaves on the bus shift in the slave address byte, with the last bit indicating whether a read or write operation is intended. During the ninth clock pulse, the slave being addressed responds to the master by generating an Acknowledge and pulling SDA LOW.

Data transfer is then initiated and sent over eight clock pulses followed by an Acknowledge Bit. During data transfer SDA must remain stable while SCL is HIGH, as any change in SDA while SCL is HIGH will be interpreted as a control signal.

Once all data has been transferred, the master generates a STOP condition indicated by pulling SDA from LOW to HIGH, while SCL is HIGH.

7.3.4 Serial Bus Address

To communicate with the TMP275, the master must first address slave devices through a slave address byte. The slave address byte consists of 7 address bits, and a direction bit indicating the intent of executing a read or write operation.

The TMP275 features three address pins, allowing up to eight devices to be connected per bus. Pin logic levels are described in [Table 2](#). The address pins of the TMP275 are read after reset, at start of communication, or in response to a Two-Wire address acquire request. Following reading the state of the pins the address is latched to minimize power dissipation associated with detection.

Table 2. Address Pins and Slave Addresses for the TMP275

A2	A1	A0	SLAVE ADDRESS
0	0	0	1001000
0	0	1	1001001
0	1	0	1001010
0	1	1	1001011
1	0	0	1001100
1	0	1	1001101
1	1	0	1001110
1	1	1	1001111

7.3.4.1 Writing and Reading to the TMP275

Accessing a particular register on the TMP275 is accomplished by writing the appropriate value to the Pointer Register. The value for the Pointer Register is the first byte transferred after the slave address byte with the R/W bit LOW. Every write operation to the TMP275 requires a value for the Pointer Register (see [Figure 8](#)).

When reading from the TMP275, the last value stored in the Pointer Register by a write operation is used to determine which register is read by a read operation. To change the register pointer for a read operation, a new value must be written to the Pointer Register. This is accomplished by issuing a slave address byte with the R/W bit LOW, followed by the Pointer Register Byte. No additional data is required. The master can then generate a START condition and send the slave address byte with the R/W bit HIGH to initiate the read command. See [Figure 9](#) for details of this sequence. If repeated reads from the same register are desired, it is not necessary to continually send the Pointer Register bytes, as the TMP275 remembers the Pointer Register value until it is changed by the next write operation.

Note that register bytes are sent most-significant byte first, followed by the least significant byte.

7.3.4.2 Slave Mode Operations

The TMP275 can operate as a slave receiver or slave transmitter.

7.3.4.2.1 Slave Receiver Mode

The first byte transmitted by the master is the slave address, with the R/\overline{W} bit LOW. The TMP275 then acknowledges reception of a valid address. The next byte transmitted by the master is the Pointer Register. The TMP275 then acknowledges reception of the Pointer Register byte. The next byte or bytes are written to the register addressed by the Pointer Register. The TMP275 acknowledges reception of each data byte. The master may terminate data transfer by generating a START or STOP condition.

7.3.4.2.2 Slave Transmitter Mode

The first byte is transmitted by the master and is the slave address, with the R/\overline{W} bit HIGH. The slave acknowledges reception of a valid slave address. The next byte is transmitted by the slave and is the most significant byte of the register indicated by the Pointer Register. The master acknowledges reception of the data byte. The next byte transmitted by the slave is the least significant byte. The master acknowledges reception of the data byte. The master may terminate data transfer by generating a Not-Acknowledge on reception of any data byte, or generating a START or STOP condition.

7.3.4.3 SMBus Alert Function

The TMP275 supports the SMBus Alert function. When the TMP275 is operating in Interrupt Mode ($TM = 1$), the ALERT pin of the TMP275 may be connected as an SMBus Alert signal. When a master senses that an ALERT condition is present on the ALERT line, the master sends an SMBus Alert command (00011001) on the bus. If the ALERT pin of the TMP275 is active, the device acknowledges the SMBus Alert command and responds by returning its slave address on the SDA line. The eighth bit (LSB) of the slave address byte indicates if the temperature exceeding T_{HIGH} or falling below T_{LOW} caused the ALERT condition. This bit will be HIGH if the temperature is greater than or equal to T_{HIGH} . This bit will be LOW if the temperature is less than T_{LOW} . Refer to [Figure 10](#) for details of this sequence.

If multiple devices on the bus respond to the SMBus Alert command, arbitration during the slave address portion of the SMBus Alert command determines which device clears its ALERT status. If the TMP275 wins the arbitration, its ALERT pin becomes inactive at the completion of the SMBus Alert command. If the TMP275 loses the arbitration, its ALERT pin remains active.

7.3.4.4 General Call

The TMP275 responds to a Two-Wire General Call address (0000000) if the eighth bit is 0. The device acknowledges the General Call address and responds to commands in the second byte. If the second byte is 00000100, the TMP275 latches the status of their address pins, but will not reset. If the second byte is 00000110, the TMP275 latches the status of their address pins and reset their internal registers to their power-up values.

7.3.4.5 High-Speed Mode

For the Two-Wire bus to operate at frequencies above 400 kHz, the master device must issue an Hs-mode master code (00001XXX) as the first byte after a START condition to switch the bus to high-speed operation. The TMP275 device will not acknowledge this byte, but will switch their input filters on SDA and SCL and their output filters on SDA to operate in Hs-mode, allowing transfers at up to 2.38 MHz. After the Hs-mode master code has been issued, the master will transmit a Two-Wire slave address to initiate a data transfer operation. The bus will continue to operate in Hs-mode until a STOP condition occurs on the bus. Upon receiving the STOP condition, the TMP275 switches the input and output filter back to fast-mode operation.

7.3.4.6 Time-Out Function

The TMP275 resets the serial interface if either SCL or SDA is held LOW for 54 ms (typical) between a START and STOP condition. The TMP275 releases the bus if it is pulled LOW and waits for a START condition. To avoid activating the time-out function, it is necessary to maintain a communication speed of at least 1 kHz for SCL operating frequency.

7.3.5 Timing Diagrams

The TMP275 is Two-Wire, SMBUs, and I²C interface-compatible. Figure 7 to Figure 10 describe the various operations on the TMP275. Bus definitions are given below. Parameters for Figure 7 are defined in [Timing Requirements](#).

Bus Idle: Both SDA and SCL lines remain HIGH.

Start Data Transfer: A change in the state of the SDA line, from HIGH to LOW, while the SCL line is HIGH, defines a START condition. Each data transfer is initiated with a START condition.

Stop Data Transfer: A change in the state of the SDA line from LOW to HIGH while the SCL line is HIGH defines a STOP condition. Each data transfer is terminated with a repeated START or STOP condition.

Data Transfer: The number of data bytes transferred between a START and a STOP condition is not limited and is determined by the master device. The receiver acknowledges the transfer of data.

Acknowledge: Each receiving device, when addressed, is obliged to generate an Acknowledge bit. A device that acknowledges must pull down the SDA line during the Acknowledge clock pulse in such a way that the SDA line is stable LOW during the HIGH period of the Acknowledge clock pulse. Setup and hold times must be taken into account. On a master receive, the termination of the data transfer can be signaled by the master generating a Not-Acknowledge on the last byte that has been transmitted by the slave.

7.4 Device Functional Modes

7.4.1 Shutdown Mode (SD)

The Shutdown Mode of the TMP275 allows the user to save maximum power by shutting down all device circuitry other than the serial interface, which reduces current consumption to typically less than 0.1 μ A. Shutdown Mode is enabled when the SD bit is 1; the device will shut down once the current conversion is completed. When SD is equal to 0, the device maintains a continuous conversion state.

7.4.2 Thermostat Mode (TM)

The Thermostat Mode bit of the TMP275 indicates to the device whether to operate in Comparator Mode (TM = 0) or Interrupt Mode (TM = 1). For more information on comparator and interrupt modes, see the [High and Low Limit Registers](#) section.

7.4.2.1 Comparator Mode (TM = 0)

In Comparator mode (TM = 0), the ALERT pin is activated when the temperature equals or exceeds the value in the T(HIGH) register and it remains active until the temperature falls below the value in the T(LOW) register. For more information on the comparator mode, see the [High and Low Limit Registers](#) section.

7.4.2.2 Interrupt Mode (TM = 1)

In Interrupt mode (TM = 1), the ALERT pin is activated when the temperature exceeds T(HIGH) or goes below T(LOW) registers. The ALERT pin is cleared when the host controller reads the temperature register. For more information on the interrupt mode, see the [High and Low Limit Registers](#) section.

7.4.3 One-Shot (OS)

The TMP275 features a One-Shot Temperature Measurement Mode. When the device is in Shutdown Mode, writing a '1' to the OS bit starts a single temperature conversion. The device returns to the shutdown state at the completion of the single conversion. This mode is useful for reducing power consumption in the TMP275 when continuous temperature monitoring is not required. When the configuration register is read, the OS always reads zero.

7.5 Programming

7.5.1 Pointer Register

Figure 11 shows the internal register structure of the TMP275. The 8-bit Pointer Register of the devices is used to address a given data register. The Pointer Register uses the two LSBs to identify which of the data registers should respond to a read or write command. Figure 12 identifies the bits of the Pointer Register byte. Table 3 describes the pointer address of the registers available in the TMP275. Power-up reset value of P1/P0 is 00.

Figure 11. Internal Register Structure of the TMP275

7.5.1.1 Pointer Register Byte (offset = N/A) [reset = 00h]

Figure 12. Pointer Register Byte

P7	P6	P5	P4	P3	P2	P1	P0

7.5.1.2 Pointer Addresses of the TMP275

Table 3. Pointer Addresses of the TMP275 Field Description

P1	P0	TYPE	REGISTER
0	0	R only, default	Temperature Register
0	1	R/W	Configuration Register
1	0	R/W	T _{LOW} Register
1	1	R/W	T _{HIGH} Register

7.5.2 Temperature Register

The Temperature Register of the TMP275 is a 12-bit, read-only register that stores the output of the most recent conversion. Two bytes must be read to obtain data, and are described in Figure 13 and Figure 14. Note that byte 1 is the most significant byte, followed by byte 2, the least significant byte. The first 12 bits are used to indicate temperature, with all remaining bits equal to zero. The least significant byte does not have to be read if that information is not needed. Data format for temperature is summarized in Table 1. Following power up or reset, the Temperature Register reads 0°C until the first conversion is complete.

Figure 14. Byte 2 of Temperature Register

D7	D6	D5	D4	D3	D2	D1	D0
T3	T2	T1	T0	0	0	0	0

7.5.3 Configuration Register

The Configuration Register is an 8-bit read/write register used to store bits that control the operational modes of the temperature sensor. Read/write operations are performed MSB first. The format of the Configuration Register for the TMP275 is shown in [Table 4](#), followed by a breakdown of the register bits. The power-up/reset value of the Configuration Register is all bits equal to 0.

Table 4. Configuration Register Format

BYTE	D7	D6	D5	D4	D3	D2	D1	D0
1	OS	R1	R0	F1	F0	POL	TM	SD

7.5.4 Shutdown Mode (SD)

The Shutdown Mode of the TMP275 allows the user to save maximum power by shutting down all device circuitry other than the serial interface, which reduces current consumption to typically less than 0.1 μ A. Shutdown Mode is enabled when the SD bit is 1; the device shuts down once the current conversion is completed. When SD is equal to 0, the device maintains a continuous conversion state.

7.5.5 Thermostat Mode (TM)

The Thermostat Mode bit of the TMP275 indicates to the device whether to operate in Comparator Mode (TM = 0) or Interrupt Mode (TM = 1). For more information on Comparator and Interrupt modes, see the [High and Low Limit Registers](#) section.

7.5.6 Polarity (POL)

The Polarity Bit of the TMP275 allows the user to adjust the polarity of the ALERT pin output. If POL = 0, the ALERT pin is active LOW, as shown in [Figure 15](#). For POL = 1, the ALERT pin is active HIGH, and the state of the ALERT pin is inverted.

Figure 15. Output Transfer Function Diagrams

7.5.7 Fault Queue (F1/F0)

A fault condition is defined as when the measured temperature exceeds the user-defined limits set in the T_{HIGH} and T_{LOW} Registers. Additionally, the number of fault conditions required to generate an alert may be programmed using the fault queue. The fault queue is provided to prevent a false alert as a result of environmental noise. The fault queue requires consecutive fault measurements to trigger the alert function. Table 5 defines the number of measured faults that may be programmed to trigger an alert condition in the device. For T_{HIGH} and T_{LOW} register format and byte order, see the section *High and Low Limit Registers*.

Table 5. Fault Settings

F1	F0	CONSECUTIVE FAULTS
0	0	1
0	1	2
1	0	4
1	1	6

7.5.8 Converter Resolution (R1/R0)

The converter resolution bits control the resolution of the internal analog-to-digital (A/D) converter. This control allows the user to maximize efficiency by programming for higher resolution or faster conversion time. Table 6 identifies the Resolution Bits and the relationship between resolution and conversion time.

Table 6. Resolution of the TMP275

R1	R0	RESOLUTION	CONVERSION TIME (typical)
0	0	9 Bits (0.5°C)	27.5ms
0	1	10 Bits (0.25°C)	55ms
1	0	11 Bits (0.125°C)	110ms
1	1	12 Bits (0.0625°C)	220ms

7.5.9 One-Shot (OS)

The TMP275 features a One-Shot Temperature Measurement Mode. When the device is in Shutdown Mode, writing a '1' to the OS bit starts a single temperature conversion. The device returns to the shutdown state at the completion of the single conversion. This mode is useful for reducing power consumption in the TMP275 when continuous temperature monitoring is not required. When the configuration register is read, the OS always reads zero.

7.5.10 High and Low Limit Registers

In Comparator Mode (TM = 0), the ALERT pin of the TMP275 becomes active when the temperature equals or exceeds the value in T_{HIGH} and generates a consecutive number of faults according to fault bits F1 and F0. The ALERT pin remains active until the temperature falls below the indicated T_{LOW} value for the same number of faults.

In Interrupt Mode (TM = 1), the ALERT pin becomes active when the temperature equals or exceeds T_{HIGH} for a consecutive number of fault conditions. The ALERT pin remains active until a read operation of any register occurs, or the device successfully responds to the SMBus Alert Response Address. The ALERT pin is also cleared if the device is placed in Shutdown Mode. Once the ALERT pin is cleared, it only becomes active again by the temperature falling below T_{LOW} . When the temperature falls below T_{LOW} , the ALERT pin becomes active and remain active until cleared by a read operation of any register or a successful response to the SMBus Alert Response Address. Once the ALERT pin is cleared, the above cycle repeats, with the ALERT pin becoming active when the temperature equals or exceeds T_{HIGH} . The ALERT pin can also be cleared by resetting the device with the General Call Reset command. This command also clears the state of the internal registers in the device, returning the device to Comparator Mode (TM = 0).

Both operational modes are represented in [Figure 15](#). [Table 7](#), [Table 8](#), [Table 9](#), and [Table 10](#) describe the format for the T_{HIGH} and T_{LOW} registers. Note that the most significant byte is sent first, followed by the least significant byte. Power-up reset values for T_{HIGH} and T_{LOW} are:

$$T_{HIGH} = 80^{\circ}\text{C} \text{ and } T_{LOW} = 75^{\circ}\text{C}$$

The format of the data for T_{HIGH} and T_{LOW} is the same as for the Temperature Register.

Table 7. Byte 1 T_{HIGH} Register

BYTE	D7	D6	D5	D4	D3	D2	D1	D0
1	H11	H10	H9	H8	H7	H6	H5	H4

Table 8. Byte 2 of T_{HIGH} Register

BYTE	D7	D6	D5	D4	D3	D2	D1	D0
2	H3	H2	H1	H0	0	0	0	0

Table 9. Byte 1 T_{LOW} Register

BYTE	D7	D6	D5	D4	D3	D2	D1	D0
1	L11	L10	L9	L8	L7	L6	L5	L4

Table 10. Byte 2 of T_{LOW} Register

BYTE	D7	D6	D5	D4	D3	D2	D1	D0
2	L3	L2	L1	L0	0	0	0	0

All 12 bits for the Temperature, T_{HIGH} , and T_{LOW} registers are used in the comparisons for the ALERT function for all converter resolutions. The three LSBs in T_{HIGH} and T_{LOW} can affect the ALERT output even if the converter is configured for 9-bit resolution.

8 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

The TMP275 is digital output temperature sensor with SMBus, Two-Wire, and I²C compatible interfaces. This device features three address pins (A0, A1, A2) allowing up to eight devices to be connected per bus. The TMP275 require no external components for operation except for pullup resistors on SCL, SDA, and ALERT, although TI recommends a 0.1- μ F bypass capacitor. The TMP275 measures the PCB temperature of the location it is mounted. The sensing device of the device is the chip itself. Thermal paths run through the package leads as well as the plastic package. The lower thermal resistance of metal causes the leads to provide the primary thermal path.

8.2 Typical Applications

8.2.1 Typical Connections of the TMP275

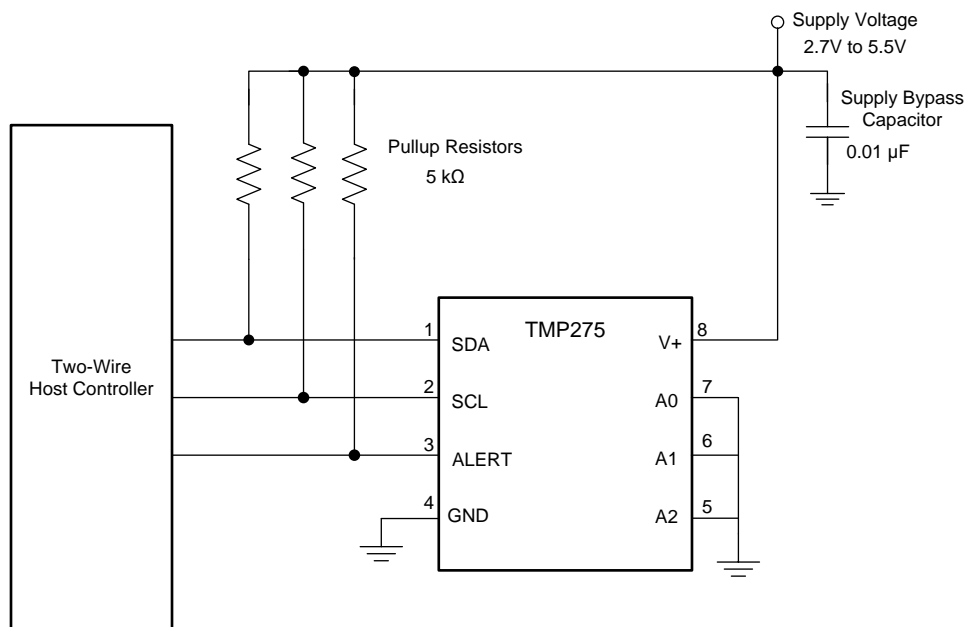

Figure 16. Typical Connections of the TMP275 Schematic

8.2.1.1 Design Requirements

Figure 16 shows TMP275 typical connections. The TMP275 device requires pullup resistors on the SCL, SDA, and ALERT pins. The recommended value for the pullup resistor is 5 k Ω . In some applications the pullup resistor can be lower or higher than 5 k Ω but must not exceed 3 mA of current on SCL and SDA pins, must not exceed 4 mA on ALERT pin. If the resistors are missing, the SCL and SDA lines will always be low (nearly 0 V) and the I²C bus will not work. TI recommends a 0.1- μ F bypass capacitor, as shown in Figure 16. The SCL, SDA, and ALERT lines can be pulled up to a supply that is equal to or higher than V+ through the pullup resistors.

The ALERT pin can be configured to respond to one of the two alert functions available, *Comparator Mode* and *Interrupt Mode*. To configure one of eight different addresses on the bus, connect A0, A1, and A2 to either a GND pin or V+ pin. In the circuit shown in Figure 16 the comparator mode is selected and the address pins (A0, A1, A2) are connected to ground.

Typical Applications (continued)

8.2.1.2 Detailed Design Procedure

The TMP275 device should be placed in close proximity to the heat source that must be monitored, with a proper layout for good thermal coupling. This placement ensures that temperature changes are captured within the shortest possible time interval. To maintain accuracy in applications that require air or surface temperature measurement, take care to isolate the package and leads from ambient air temperature. A thermally conductive adhesive is helpful in achieving accurate surface temperature measurement.

8.2.1.3 Application Curve

Figure 17 shows the step response of the TMP275 device to a submersion in an oil bath of 100°C from room temperature (27°C). The time-constant, or the time for the output to reach 63% of the input step, is 1.5 s. The time-constant result depends on the printed-circuit board (PCB) that the TMP275 devices are mounted. For this test, the TMP275 device was soldered to a two-layer PCB that measured 0.375 inches x 0.437 inches.

Figure 17. Temperature Step Response

8.2.2 Connecting Multiple Devices on a Single Bus

The TMP275 features three address pins allowing up to eight devices to be connected per bus. When the TMP275 is operating in Interrupt mode ($TM = 1$), the ALERT pin of the TMP275 may be connected as an SMBus Alert signal. Figure 18 shows eight TMP275 devices connected to a MCU (master) using one single bus. Each device that exists as a slave on the SMBus has one unique seven bit address, see Table 2 for TMP275 address options. When a master senses that an ALERT condition is present on the ALERT line, the master sends an SMBus Alert command (00011001) on the bus. If the ALERT pin of the TMP275 is active, the device acknowledges the SMBus Alert command and responds by returning its slave address on the SDA line. The eighth bit (LSB) of the slave address byte indicates if the temperature exceeding T_{HIGH} or falling below T_{LOW} caused the ALERT condition. This bit will be HIGH if the temperature is greater than or equal to T_{HIGH} . This bit will be LOW if the temperature is less than T_{LOW} .

This application have eight devices connected to the bus. If multiple devices on the bus respond to the SMBus Alert command, arbitration during the slave address portion of the SMBus Alert command determines which device clears its ALERT status. If the TMP275 wins the arbitration, its ALERT pin becomes inactive at the completion of the SMBus Alert command. If the TMP275 loses the arbitration, its ALERT pin remains active.

NOTE

Make sure you configure the device to operate in Interrupt Mode to enable the SMBus feature.

Typical Applications (continued)

Figure 18. Connecting Multiple Devices on a Single Bus

Typical Applications (continued)

8.2.3 Temperature Data Logger for Cold Chain Management Applications

Cold chain management includes all of the means used to ensure a constant temperature for a product that is not heat stable from the time it is manufactured or farmed until the time it is used. This includes industries such as food, retail, medical, and pharmaceutical. [Figure 19](#) implements a cold chain monitoring system that measures temperature, then logs the sensor data to nonvolatile (FRAM) memory in the MCU. [Figure 19](#) uses a Near Field Communication (NFC) interface for wireless communication and is powered from a CR2032 coin cell battery with a focus on low power to maximize the battery lifetime.

The microcontroller communicates with all of the sensor devices through an I²C-compatible interface. The MCU also communicates with the NFC transponder through this interface. An NFC enabled smartphone can be used to send configuration to the application board. For a detailed design procedure and requirements of this application, see [Ultralow Power Multi-Sensor Data Logger with NFC Interface Reference Design](#) (TIDU821).

Figure 19. Temperature Data Logger

9 Power Supply Recommendations

The TMP275 device operates with power supply in the range of 2.7 V to 5.5 V. A power-supply bypass capacitor is required for stability. Place this capacitor as close as possible to the supply and ground pins of the device. A typical value for this supply bypass capacitor is 0.01 μ F. Applications with noisy or high impedance power supplies may require additional decoupling capacitors to reject power-supply noise.

10 Layout

10.1 Layout Guidelines

Mount the TMP275 to a PCB as shown in [Figure 20](#). For this example the A0, A1, and A2 address pins are connected directly to ground. Connecting these pins to ground configures the device for slave address 1001000b.

- Bypass the V_S pin to ground with a low-ESR ceramic bypass-capacitor. The typical recommended bypass capacitance is a 0.1- μ F ceramic capacitor with a X5R or X7R dielectric. The optimum placement is closest to the V_S and GND pins of the device. Take care in minimizing the loop area formed by the bypass-capacitor connection, the V_S pin, and the GND pin of the IC. Additional bypass capacitance can be added to compensate for noisy or high-impedance power supplies.
- Pull up the open-drain output pins SDA, SCL and ALERT through 5-k Ω pullup resistors.

10.2 Layout Example

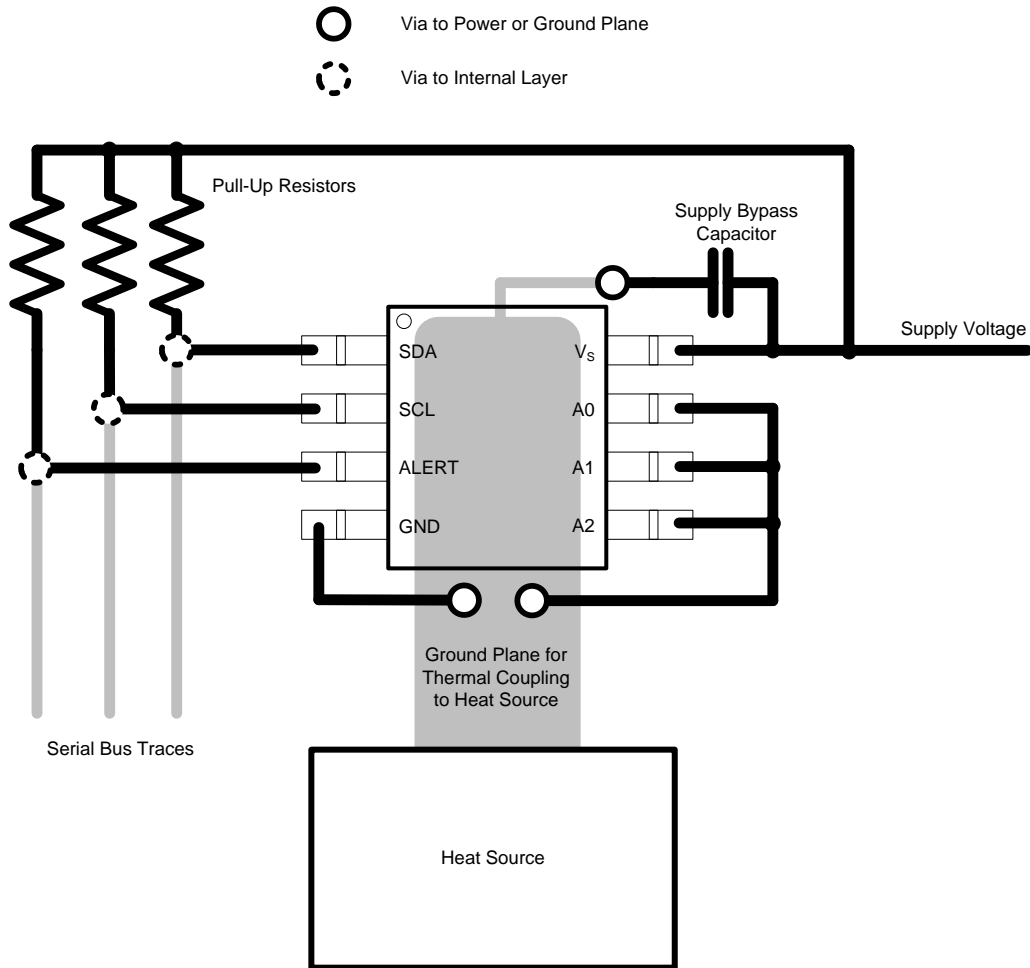

Figure 20. TMP275 Layout Example

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TMP275AIDGKR	ACTIVE	VSSOP	DGK	8	2500	RoHS & Green	NIPDAU NIPDAUAG	Level-2-260C-1 YEAR	-40 to 125	T275	Samples
TMP275AIDR	ACTIVE	SOIC	D	8	2500	RoHS & Green	NIPDAU	Level-1-260C-UNLIM	-40 to 125	TMP275	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
