UCD7100 具有电流检测的数字控制兼容型低侧 ±4A MOSFET 单驱动器

1 特性

- 可调节电流限制保护
- 3.3V、10mA 内部稳压器
- 兼容 DSP/µC 的输入
- 单路 ±4A TrueDrive™ 高电流驱动器
- 2.2nF 负载时的上升时间和下降时间典型值为 10ns
- 25ns 输入至输出传播延迟
- 25ns 电流检测到输出延迟
- 可编程的电流限制阈值
- 数字输出电流限制标志
- 4.5V 至 15V 电源电压范围
- 额定温度为 –40°C 至 105°C
- 无铅封装

2 应用

- 数字控制型电源
- 直流/直流转换器
- 电机控制器
- 线路驱动器

3 说明

UCD7100 器件是数字控制兼容型 UCD7K 系列驱动器，适用于使用数字控制技术、需要快速提供本地峰值电流限制保护的应用。

UCD7100 是一款 ±4A 低侧高电流 MOSFET 栅极驱动器，支持 UCD9110 或 UCD9501 等数字电源控制器连接单端拓扑的功率级。它可提供逐周期电流限制功能，具有可编程阈值以及可由主机控制器监测的数字输出电流限制标志。借助 25ns 快速逐周期电流限制保护功能，万一出现数字系统无法及时应对故障的情况，驱动器就可以关闭功率级。

5 说明（续）

为了实现快速开关速度，UCD7100 输出级使用 TrueDrive™ 输出架构，可在开关切换的米勒平坦区向 MOSFET 的栅极提供 ±4A 的额定电流。它还包含 3.3V、10mA 的线性稳压器，可为数字控制器供电。

UCD7000 驱动器系列与 DSP、微控制器或 ASIC 的标准 3.3V I/O 端口兼容。UCD7100 采用 PowerPAD™ HTSSOP-14 封装。

8 Specifications

8.1 Absolute Maximum Ratings

			MIN	MAX[(1)]	UNIT[(2)]
V_{DD}	Supply Voltage			16	
I_{DD}	Supply Current	Quiescent		20	mA
		Switching, T_A = 25°C, T_J = 125°C, V_{DD} = 12 V		200	
V_{OUT}	Output Gate Drive Voltage	OUT	– 1 V	VDD	V
$I_{OUT(sink)}$	Output Gate Drive Current	OUT		4.0	A
$I_{OUT(source)}$				– 4.0	
	Analog Input	ISET, CS	– 0.3	3.6	V
		ILIM	– 0.3	3.6	
	Digital I/O’s	IN, CLF	– 0.3	3.6	
	Power Dissipation	T_A = 25°C, T_J = 125°C, (PWP-14)		2.67	W
T_J	Junction Operating Temperature		- – 55	150	°C
T_{SOL}	Lead Temperature (Soldering, 10 s)			+300	°C

(1) Operation outside the Absolute Maximum Ratings may cause permanent device damage. Absolute Maximum Ratings do not imply functional operation of the device at these or any other conditions beyond those listed under Recommended Operating Conditions. If outside the Recommended Operating Conditions but within the Absolute Maximum Ratings, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.
(2) All voltages are with respect to GND. Currents are positive into, negative out of the specified terminal.

8.2 Handling Ratings

			MIN	MAX	UNIT
T_{stg}	Storage temperature range		– 65	150	°C
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins[(1)]		2000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins[(2)]		500	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

8.3 Recommended Operating Conditions

	MIN	TYP	MAX	UNIT

9 Detailed Description

9.1 Overview

The UCD7100 is a member of the UCD7K family of digital control compatible drivers for applications utilizing digital control techniques, or applications requiring fast local peak current limit protection.

The UCD7100 is a low-side ±4-A high-current MOSFET gate driver. The UCD7100 allows digital power controllers such as the UCD9110 or UCD9501 to interface to the power stage in single-ended topologies. It provides a cycle-by-cycle current limit function with programmable threshold and a digital output current limit flag, which can be monitored by the host controller. With a fast 25-ns cycle-by-cycle current limit protection, the driver can turn off the power stage in the unlikely event that the digital system cannot respond to a failure situation in time.

9.3 Feature Description

9.3.1 Input

The IN pin is a high impedance digital input capable of accepting 3.3-V logic level signals up to 2 MHz. There is an internal Schmitt Trigger comparator which isolates the internal circuitry from any external noise.

If limiting the rise or fall times to the power device is desired, then an external resistance can be added between the output of the driver and the load device, which is generally a power MOSFET gate. The external resistor may also help remove power dissipation from the package.

9.3.2 Current Sensing and Protection

A very fast current limit comparator connected to the CS pin is used to protect the power stage by implementing cycle-by-cycle current limiting.

The current limit threshold is equal to the lesser of the positive inputs at the current limit comparator. The current limit threshold can be set to any value between 0.25 V and 1.0 V by applying the desired threshold voltage to the current limit (ILIM) pin. When the CS level is greater than the ILIM voltage minus 25 mV, the output of the driver is forced low and the current limit flag (CLF) is set high. The CLF signal is latched high until the UCD7K device receives the next rising edge on the IN pin.

Copyright © 2022 Texas Instruments Incorporated

When the CS voltage is below ILIM, the driver output will follow the PWM input. The CLF digital output flag can be monitored by the host controller to determine when a current limit event occurs and to then apply the appropriate algorithm to obtain the desired current limit profile.

One of the main benefits of this local protection feature is that the UCD7K devices can protect the power stage if the software code in the digital controller becomes corrupted and hangs up. If the controller's PWM output stays high, the local current sense circuit will turn off the driver output when an over-current condition occurs. The system would likely go into a retry mode because; most DSP and microcontrollers have on-board watchdog, brown-out, and other supervisory peripherals to restart the device in the event that it is not operating properly. But these peripherals typically do not react fast enough to save the power stage. The UCD7K's local current limit comparator provides the required fast protection for the power stage.

The CS threshold is 25 mV below the ILIM voltage. This way, if the user attempts to command zero current (I_{LIM} < 25 mV) while the CS pin is at ground, for example at start-up, the CLF flag latches high until the IN pin receives a pulse. At start-up it is necessary to ensure that the ILIM pin always greater than the CS pin for the handshaking to work as described below. If for any reason the CS pin comes to within 25 mV of the ILIM pin during start-up, then the CLF flag is latched high and the digital controller must poll the UCD7K device, by sending it a narrow IN pulse. If the fault condition is not present the IN pulse resets the CLF signal to low indicating that the UCD7K device is ready to process power pulses.

9.3.3 Handshaking

The UCD7K family of devices have a built-in handshaking feature to facilitate efficient start-up of the digitally controlled power supply. At start-up the CLF flag is held high until all the internal and external supply voltages of the UCD7K device are within their operating range. Once the supply voltages are within acceptable limits, the CLF goes low and the device will process input drive signals. The micro-controller should monitor the CLF flag at start-up and wait for the CLF flag to go LOW before sending power pulses to the UCD7K device.

9.3.4 Driver Output

The high-current output stage of the UCD7K device family is capable of supplying ±4-A peak current pulses and swings to both VDD and GND. The driver outputs follows the state of the IN pin provided that the VDD and 3V3 voltages are above their respective under-voltage lockout threshold.

The drive output utilizes Texas Instruments' TrueDrive™ architecture, which delivers rated current into the gate of a MOSFET when it is most needed during the Miller plateau region of the switching transition providing efficiency gains.

TrueDrive™ consists of pullup/ pulldown circuits using bipolar and MOSFET transistors in parallel. The peak output current rating is the combined current from the bipolar and MOSFET transistors. The output resistance is the $R_{DS(on)}$ of the MOSFET transistor when the voltage on the driver output is less than the saturation voltage of the bipolar transistor. This hybrid output stage also allows efficient current sourcing at low supply voltages.

Each output stage also provides a very low impedance to overshoot and undershoot due to the body diode of the external MOSFET. This means that in many cases, external-schottky-clamp diodes are not required.

9.3.5 Source/Sink Capabilities During Miller Plateau

Large power MOSFETs present a large load to the control circuitry. Proper drive is required for efficient, reliable operation. The UCD7K drivers have been optimized to provide maximum drive to a power MOSFET during the Miller plateau region of the switching transition. This interval occurs while the drain voltage is swinging between the voltage levels dictated by the power topology, requiring the charging/discharging of the drain-gate capacitance with current supplied or removed by the driver device. See Reference [1]

9.3.6 Drive Current and Power Requirements

The UCD7K family of drivers can deliver high current into a MOSFET gate for a period of several hundred nanoseconds. High peak current is required to turn the device ON quickly. Then, to turn the device OFF, the driver is required to sink a similar amount of current to ground. This repeats at the operating frequency of the power device. A MOSFET is used in this discussion because it is the most common type of switching device used in high frequency power conversion equipment.

Copyright © 2022 Texas Instruments Incorporated

Reference [1] discusses the current required to drive a power MOSFET and other capacitive-input switching devices.

When a driver device is tested with a discrete, capacitive load it is a fairly simple matter to calculate the power that is required from the bias supply. The energy that must be transferred from the bias supply to charge the capacitor is given by:

$$E = \frac{1}{2} \times CV^2 \quad (1)$$

where C is the load capacitor and V is the bias voltage feeding the driver.

There is an equal amount of energy transferred to ground when the capacitor is discharged. This leads to a power loss given by the following:

$$P = \frac{1}{2} \times CV^2 \times f \quad (2)$$

where f is the switching frequency.

This power is dissipated in the resistive elements of the circuit. Thus, with no external resistor between the driver and gate, this power is dissipated inside the driver. Half of the total power is dissipated when the capacitor is charged, and the other half is dissipated when the capacitor is discharged. An actual example using the conditions of the previous gate drive waveform should help clarify this.

With V_{DD} = 12 V, C_{LOAD} = 10 nF, and f = 300 kHz, the power loss can be calculated as:

$$P = 10\ \text{nF} \times 12^2 \times 300\ \text{kHz} = 0.432\ \text{W} \quad (3)$$

With a 12-V supply, this would equate to a current of:

$$I = \frac{P}{V} = \frac{0.432\ \text{W}}{12\ \text{V}} = 0.036\ \text{A} \quad (4)$$

The actual current measured from the supply was 0.037 A, and is very close to the predicted value. But, the I_{DD} current that is due to the device internal consumption should be considered. With no load the device current drawn is 0.0027 A. Under this condition the output rise and fall times are faster than with a load. This could lead to an almost insignificant, yet measurable current due to cross-conduction in the output stages of the driver. However, these small current differences are buried in the high frequency switching spikes, and are beyond the measurement capabilities of a basic lab setup. The measured current with 10-nF load is close to the value expected.

The switching load presented by a power MOSFET can be converted to an equivalent capacitance by examining the gate charge required to switch the device. This gate charge includes the effects of the input capacitance plus the added charge needed to swing the drain of the device between the ON and OFF states. Most manufacturers provide specifications that provide the typical and maximum gate charge, in nC, to switch the device under specified conditions. Using the gate charge Q_G, one can determine the power that must be dissipated when charging a capacitor. This is done by using the equivalence $Q_G = C_{EFF} \times V$ to provide the following equation for power:

$$P = C \times V^2 \times f = Q_G \times V \times f \quad (5)$$

This equation allows a power designer to calculate the bias power required to drive a specific MOSFET gate at a specific bias voltage.

Note

The 10% and 90% thresholds depict the dynamics of the bipolar output devices that dominate the power MOSFET transition through the Miller regions of operation.

9.4 Device Functional Modes

9.4.1 Operation with V_{DD} < 4.25 V (minimum V_{DD})

The devices operate with V_{DD} voltages above 4.75 V. The maximum UVLO voltage is 4.75 V, and operates at V_{DD} voltages above 4.75 V. The typical UVLO voltage is 4.5 V. The minimum UVLO voltage is 4.25 V. At V_{DD} below the actual UVLO voltage, the devices do not operate, and OUT remains low.

9.4.2 Operation with IN Pin Open

If the IN pin is disconnected (open), a 100 kΩ internal resistor connects IN to GND to prevent unpredictable operation due to a floating IN pin, and OUT remains low.

9.4.3 Operation with ILIM Pin Open

If the ILIM pin is disconnected (open), the current limit threshold is set at 0.5 V.

9.4.4 Operation with ILIM Pin High

If the signal on ILIM pin is higher than 1 V, the current limit threshold is clamped at 1 V.

10 Application and Implementation

Note

以下应用部分中的信息不属于 TI 器件规格的范围，TI 不担保其准确性和完整性。TI 的客 户应负责确定器件是否适用于其应用。客户应验证并测试其设计，以确保系统功能。

10.1 Application Information

The UCD7100 is part of a family of digital compatible drivers targeting applications utilizing digital control techniques or applications that require local fast peak current limit protection.

10.2 Typical Application

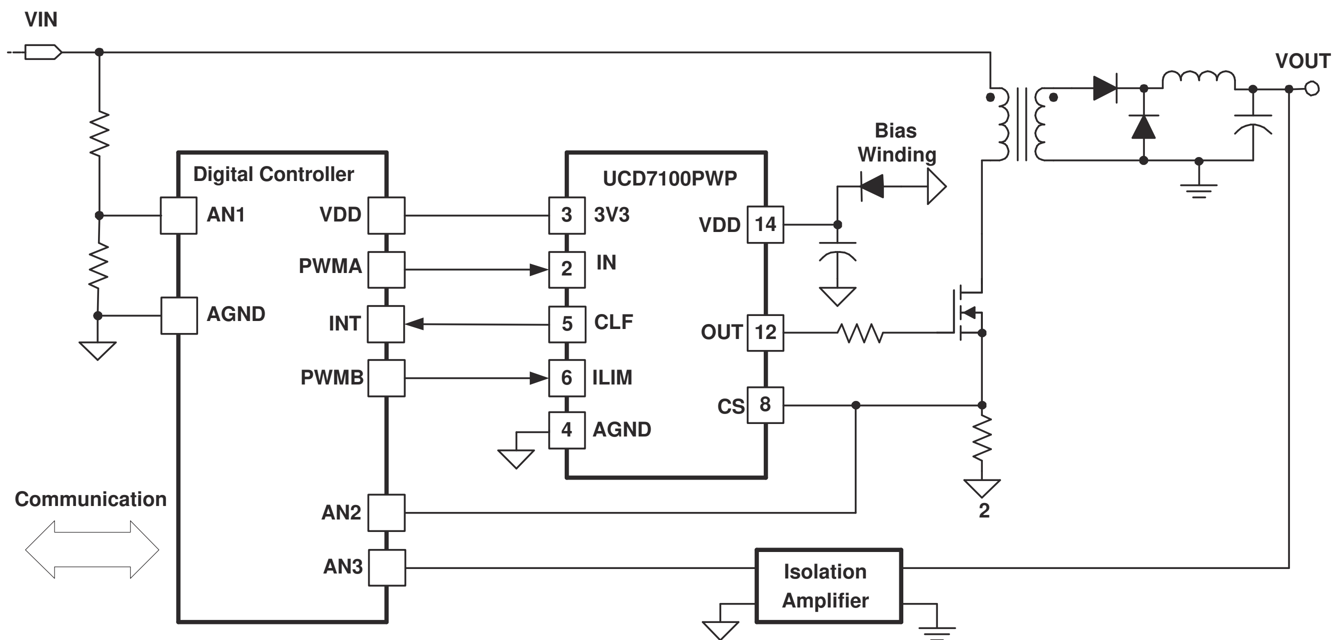

图 10-1. Typical Application

10.2.1 Design Requirements

In this design example, the UCD7100 is used to drive a forward converter which is controlled by a digital controller. The switching frequency is 100 KHz, and the input current cycle-by-cycle protection threshold is set at 5 A.

10.2.2 Detailed Design Procedure

The cycle-by-cycle current protection is implemented by connecting the current sense signal to the CS pin. When the CS level is greater than the ILIM voltage minus 25 mV, the output of the driver is forced low and the current limit flag (CLF) is set high. The CLF signal is latched high until the UCD7K device receives the next rising edge on the IN pin.

$$I_{peak} * R_{sense} = V_{ILIM} - 0.025 \tag{6}$$

$$R_{sense} = \frac{V_{ILIM} - 0.025}{I_{peak}} \tag{7}$$

The current limit threshold can be set to any value between 0.25 V and 1.0 V, so R_{sense} must be between 0.045 Ω and 0.195 Ω. For example, if R_{sense} is 0.15 Ω, then V_{ILIM} must be 0.775 V to protect input current at 5 A. If the digital controller has an internal digital-to-analog converter, then it can generate 0.775 V and connect to ILIM directly. For a digital controller without an internal digital-to-analog converter, it can generate a PWM signal, send the PWM signal through a low pass filter, then connect to the ILIM pin. Assuming the magnitude of the PWM pulse is 3.3 V, then the duty cycle is:

$$D = \frac{0.775}{3.3} \tag{8}$$

10.2.3 Application Curve

11 Power Supply Recommendations

11.1 Supply

The UCD7K devices accept an input range of 4.5 V to 15 V. The device has an internal precision linear regulator that produces the 3V3 output from this VDD input. A separate pin, PVDD, not connected internally to the VDD supply rail provides power for the output drivers. In all applications the same bus voltage supplies the two pins. It is recommended that a low value of resistance be placed between the two pins so that the local capacitance on each pin forms low pass filters to attenuate any switching noise that may be on the bus.

Although quiescent VDD current is low, total supply current will be higher, depending on the gate drive output current required by the switching frequency. Total V_{DD} current is the sum of quiescent V_{DD} current and the average OUT current. Knowing the operating frequency and the MOSFET gate charge (Q_G), average OUT current can be calculated from:

$I_{OUT} = Q_G \times f$, where f is frequency.

For high-speed circuit performance, a V_{DD} bypass capacitor is recommended to prevent noise problems. A 4.7-μF ceramic capacitor should be located close to the V_{DD} to ground connection. A larger capacitor with relatively low ESR should be connected to the PVDD pin, to help deliver the high current peaks to the load. The capacitors should present a low impedance characteristic for the expected current levels in the driver application. The use of surface mount components for all bypass capacitors is highly recommended.

11.2 Reference and External Bias Supply

All devices in the UCD7K family are capable of supplying a regulated 3.3-V rail to power various types of external loads such as a microcontroller or an ASIC. The onboard linear voltage regulator is capable of sourcing up to 10 mA of current. For normal operation, place a minimum of 0.22 μF of ceramic capacitance from the reference pin to ground.

12 Layout

12.1 Layout Guidelines

In a power driver operating at high frequency, it is a significant challenge to get clean waveforms without much overshoot/undershoot and ringing. The low output impedance of these drivers produces waveforms with high di/dt. This tends to induce ringing in the parasitic inductances. Utmost care must be used in the circuit layout. It is advantageous to connect the driver IC as close as possible to the leads. The driver device layout has the analog ground on the opposite side of the output, so the ground should be connected to the bypass capacitors and the load with copper trace as wide as possible. These connections should also be made with a small enclosed loop area to minimize the inductance.

图 12-2. PFC Boost Front-End Power Supply

12.3 Thermal Considerations

The useful range of a driver is greatly affected by the drive power requirements of the load and the thermal characteristics of the device package. In order for a power driver to be useful over a particular temperature range the package must allow for the efficient removal of the heat produced while keeping the junction temperature within rated limits. The UCD7K family of drivers is available in PowerPAD™ TSSOP package to cover a range of application requirements. Both have the exposed pads to relieve thermal dissipation from the semiconductor junction.

As illustrated in Reference [2], the PowerPAD™ packages offer a leadframe die pad that is exposed at the base of the package. This pad is soldered to the copper on the PC board (PCB) directly underneath the device package, reducing the Θ_{JC} down to 4.7°C/W. The PC board must be designed with thermal lands and thermal vias to complete the heat removal subsystem, as summarized in Reference [3].

Note that the PowerPAD™ is not directly connected to any leads of the package. However, it is electrically and thermally connected to the substrate which is the ground of the device.

13 Device and Documentation Support

13.1 Device Support

13.1.1 Development Support

PRODUCT	DESCRIPTION	FEATURES
UCD7201	Dual Low Side ±4-A Drivers with Common CS	3V3, CS(1) (2)
UCD7230	±4A Synchronous Buck Driver with CS	3V3, CS(1) (2)

(1) 3V3 = 3.3V linear regulator.
(2) CS = current sense and current limit function.

13.2 第三方产品免责声明

TI 发布的与第三方产品或服务有关的信息，不能构成与此类产品或服务或保修的适用性有关的认可，不能构成此类产品或服务单独或与任何 TI 产品或服务一起的表示或认可。

13.3 Documentation Support

13.3.1 Related Documentation

1. Texas Instruments, *Power Supply Seminar SEM−1400 Topic 2: Design And Application Guide For High Speed MOSFET Gate Drive Circuits, by Laszlo Balogh*
2. Texas Instruments, *Technical Brief, PowerPad Thermally Enhanced Package*
3. Texas Instruments, *Application Brief, PowerPAD Made Easy*

13.4 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. Click on *Subscribe to updates* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

13.5 支持资源

TI E2E™ 支持论坛是工程师的重要参考资料，可直接从专家获得快速、经过验证的解答和设计帮助。搜索现有解答或提出自己的问题可获得所需的快速设计帮助。

链接的内容由各个贡献者“按原样”提供。这些内容并不构成 TI 技术规范，并且不一定反映 TI 的观点；请参阅 TI 的《使用条款》。

13.6 Trademarks

TrueDrive™ and PowerPAD™ are trademarks of Texas Instruments.
TI E2E™ is a trademark of Texas Instruments.
所有商标均为其各自所有者的财产。

13.7 术语表

TI 术语表　本术语表列出并解释了术语、首字母缩略词和定义。

13.8 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

14 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
UCD7100APWP	ACTIVE	HTSSOP	PWP	14	90	RoHS & Green	NIPDAU	Level-2-260C-1 YEAR	-40 to 105	UCD7100	Samples

[(1)] The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

[(2)] **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

[(3)] MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

[(4)] There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

[(5)] Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

[(6)] Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

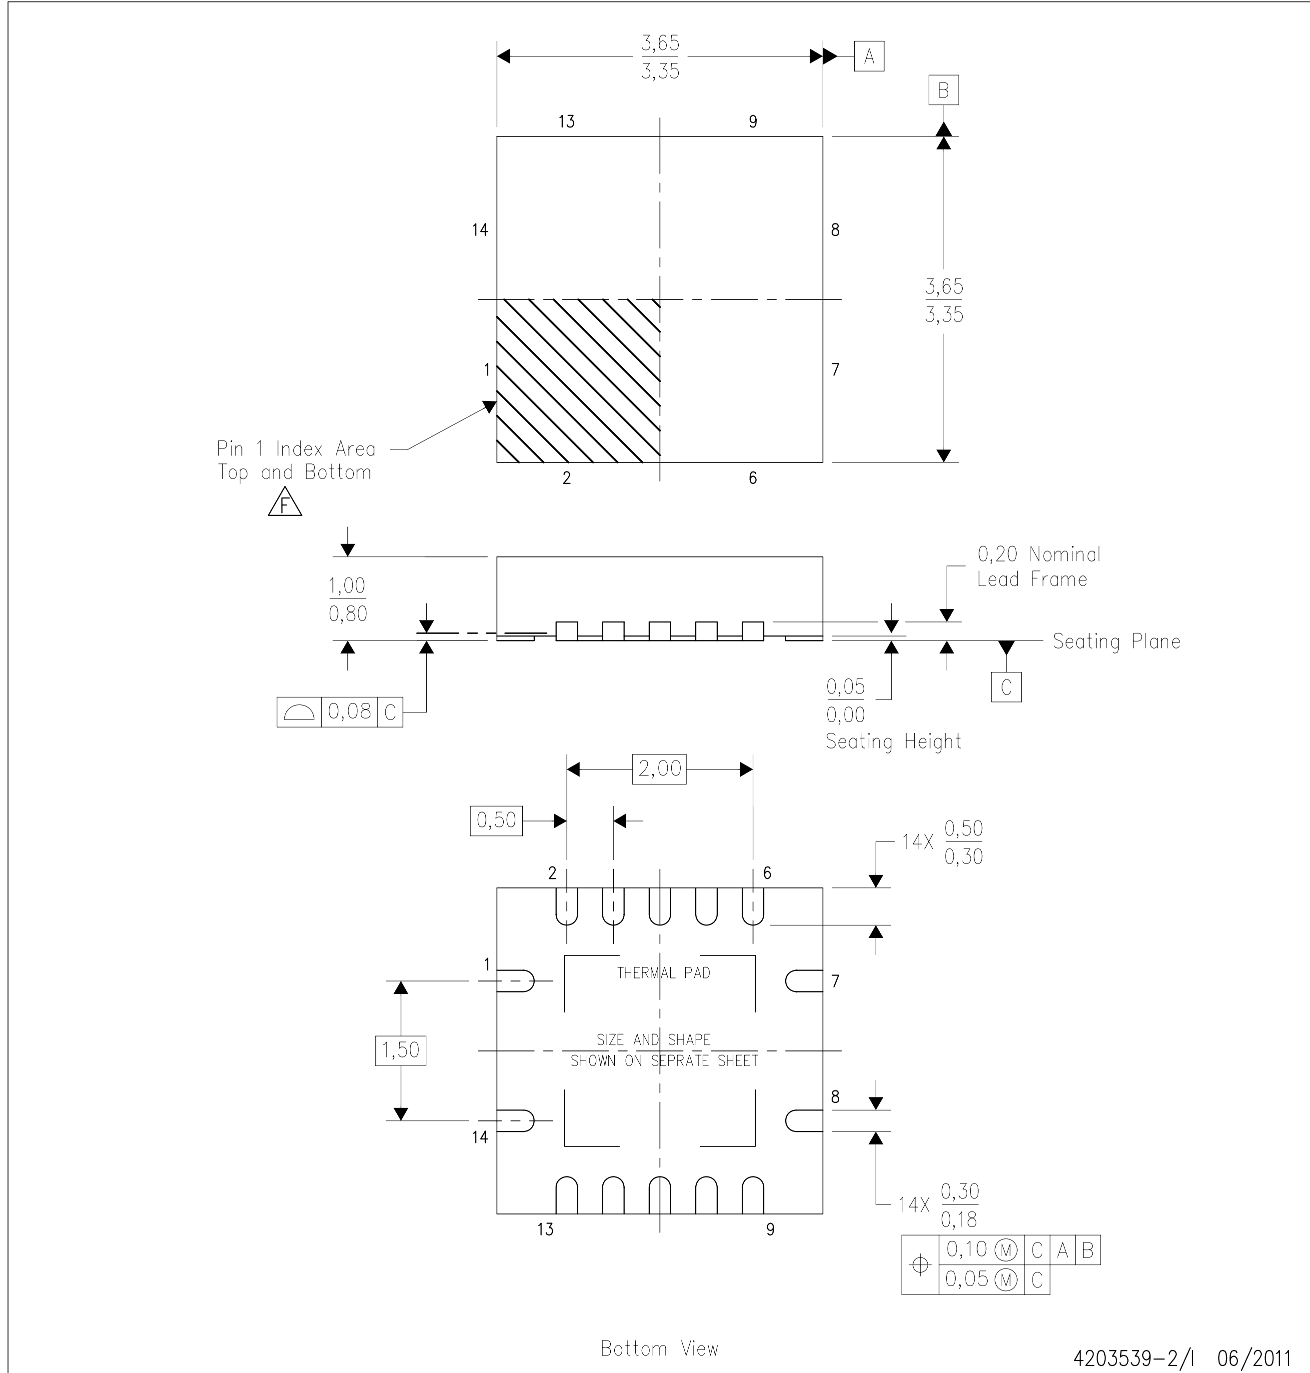
RGY (S-PVQFN-N14) PLASTIC QUAD FLATPACK NO-LEAD



NOTES:

A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
B. This drawing is subject to change without notice.
C. QFN (Quad Flatpack No-Lead) package configuration.
D. The package thermal pad must be soldered to the board for thermal and mechanical performance.
E. See the additional figure in the Product Data Sheet for details regarding the exposed thermal pad features and dimensions.
F. Pin 1 identifiers are located on both top and bottom of the package and within the zone indicated. The Pin 1 identifiers are either a molded, marked, or metal feature.
G. Package complies to JEDEC MO-241 variation BA.

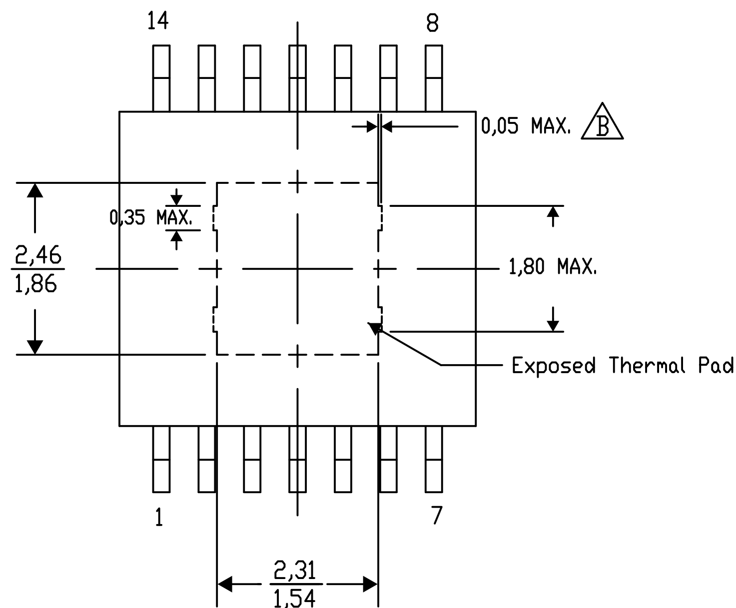
PWP (R-PDSO-G14) PowerPAD™ SMALL PLASTIC OUTLINE

THERMAL INFORMATION

This PowerPAD™ package incorporates an exposed thermal pad that is designed to be attached to a printed circuit board (PCB). The thermal pad must be soldered directly to the PCB. After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For additional information on the PowerPAD package and how to take advantage of its heat dissipating abilities, refer to Technical Brief, PowerPAD Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 and Application Brief, PowerPAD Made Easy, Texas Instruments Literature No. SLMA004. Both documents are available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.



Exposed Thermal Pad Dimensions

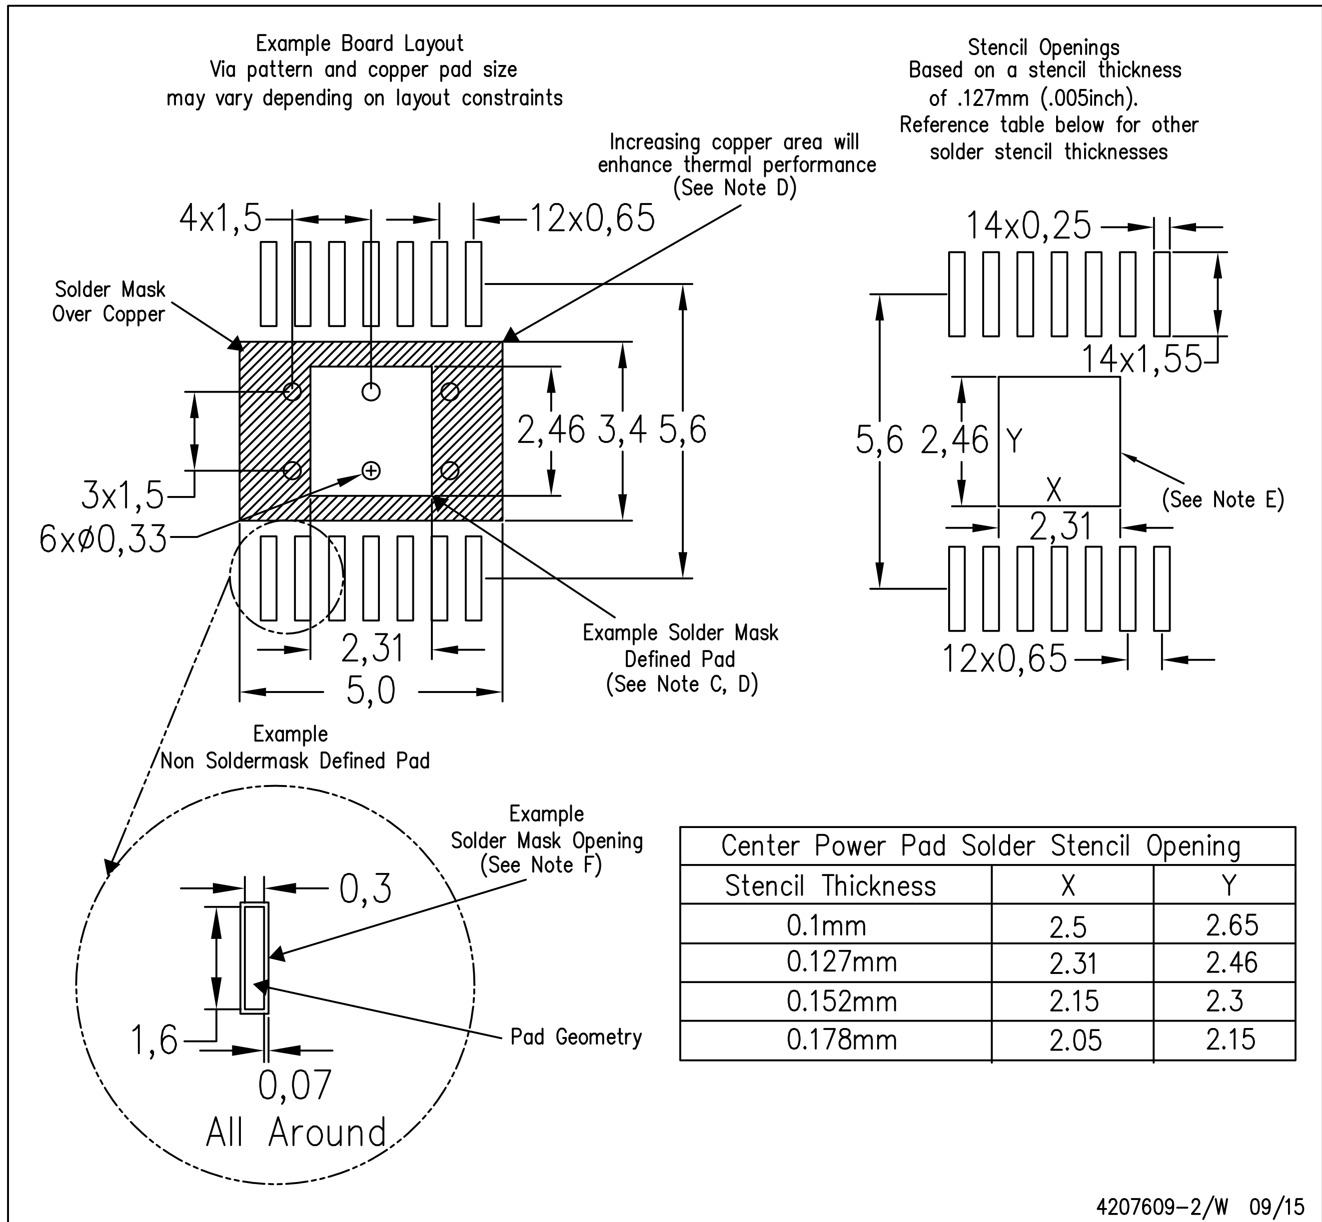
4206332-44/AO 01/16

NOTE: A. All linear dimensions are in millimeters

B. Exposed tie strap features may not be present.

PowerPAD is a trademark of Texas Instruments

PWP (R-PDSO-G14) PowerPAD™ PLASTIC SMALL OUTLINE



Center Power Pad Solder Stencil Opening		
Stencil Thickness	X	Y
0.1mm	2.5	2.65
0.127mm	2.31	2.46
0.152mm	2.15	2.3
0.178mm	2.05	2.15

NOTES:

A. All linear dimensions are in millimeters.

B. This drawing is subject to change without notice.

C. Customers should place a note on the circuit board fabrication drawing not to alter the center solder mask defined pad.

D. This package is designed to be soldered to a thermal pad on the board. Refer to Technical Brief, PowerPad Thermally Enhanced Package, Texas Instruments Literature No. SLMA002, SLMA004, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at www.ti.com <http://www.ti.com>. Publication IPC-7351 is recommended for alternate designs.

E. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Example stencil design based on a 50% volumetric metal load solder paste. Refer to IPC-7525 for other stencil recommendations.

F. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

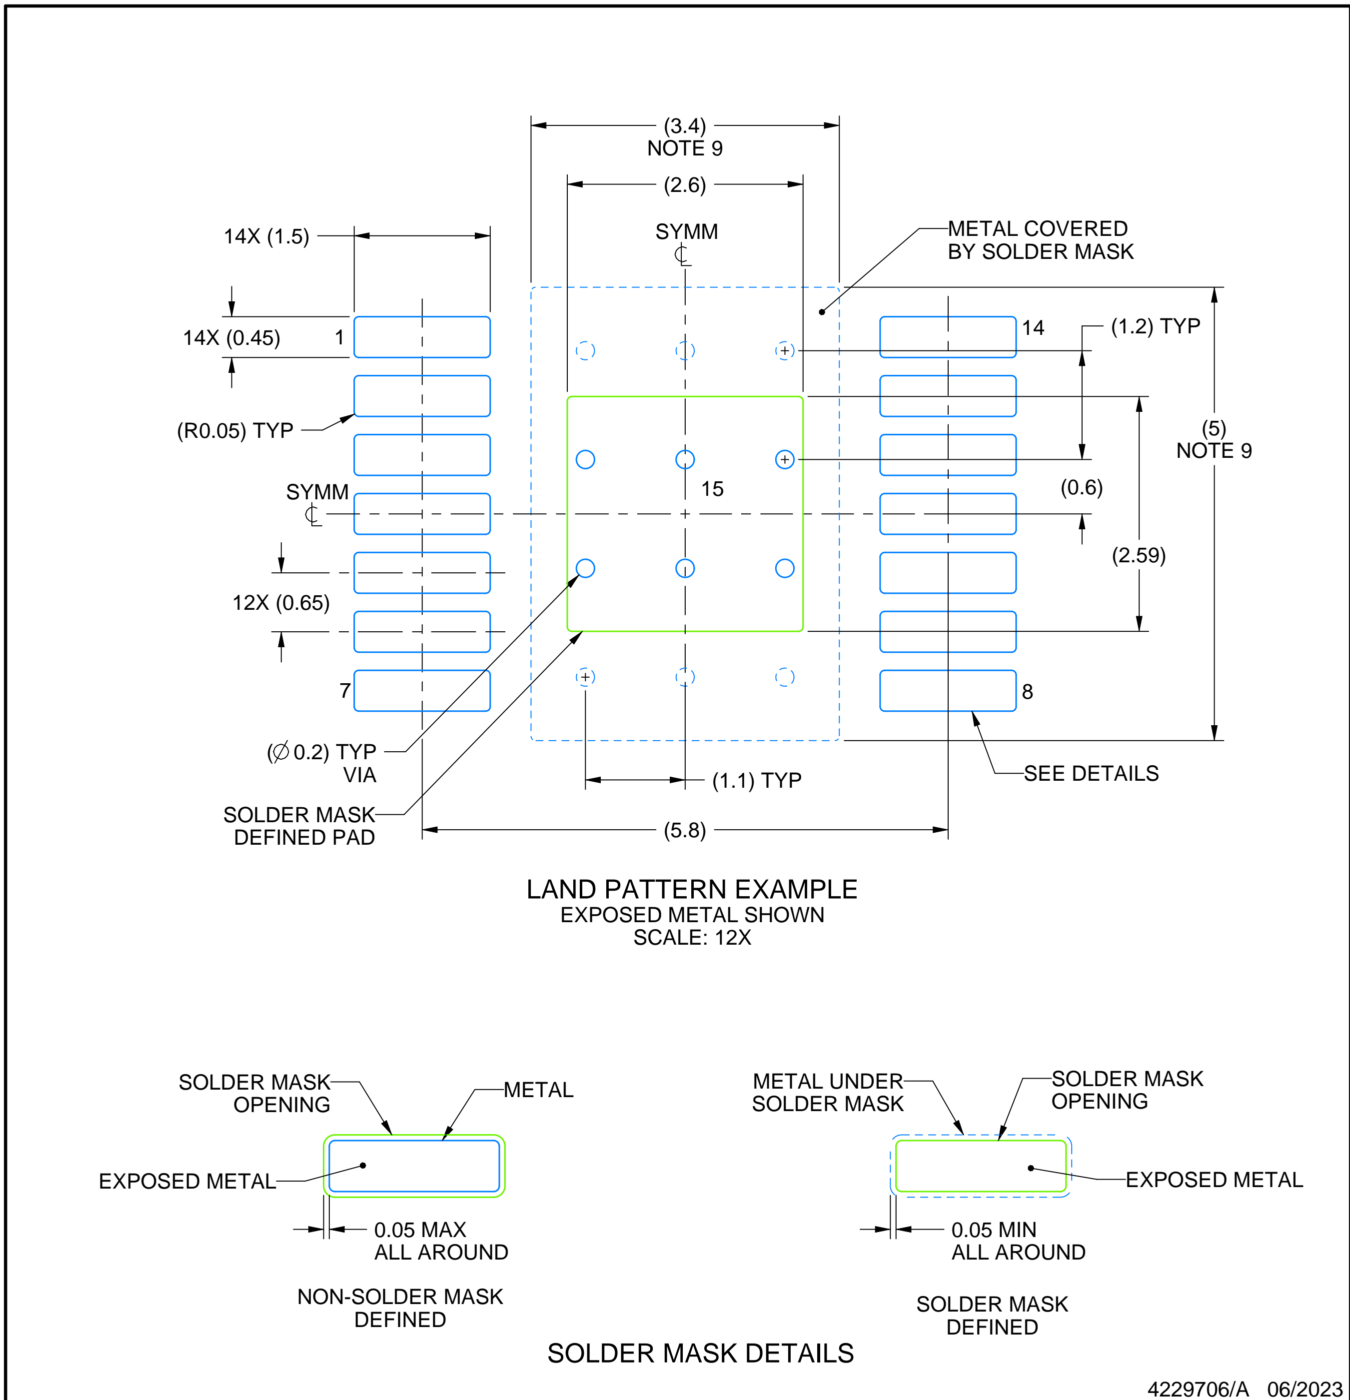
DETAIL A
TYPICAL

4229706/A 06/2023

PowerPAD is a trademark of Texas Instruments.

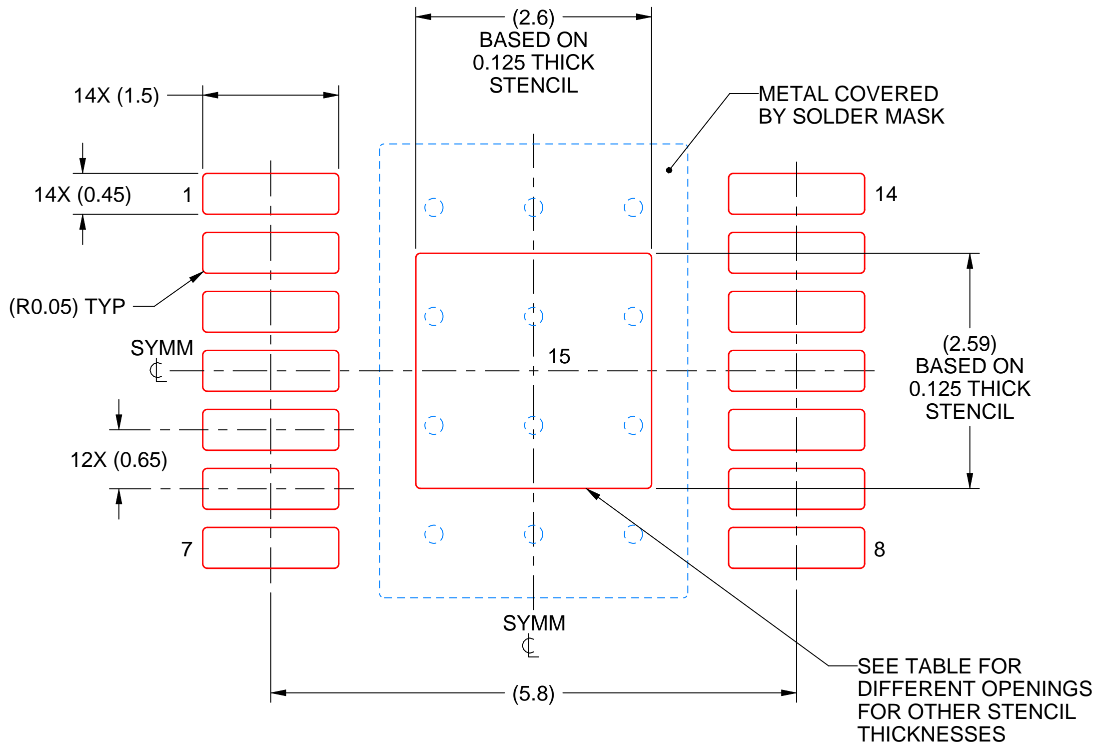
NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 mm per side.
4. Reference JEDEC registration MO-153.
5. Features may differ or may not be present.



NOTES: (continued)

6. Publication IPC-7351 may have alternate designs.
7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.
8. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature numbers SLMA002 (www.ti.com/lit/slma002) and SLMA004 (www.ti.com/lit/slma004).
9. Size of metal pad may vary due to creepage requirement.
10. Vias are optional depending on application, refer to device data sheet. It is recommended that vias under paste be filled, plugged or tented.



SOLDER PASTE EXAMPLE
