5 说明 (续)

TLIN1039-Q1 集成了一个用于 LIN 响应器节点应用、ESD 保护和故障保护的电阻器，可减少应用中的外部组件数量。一旦发生接地漂移或电源电压断开，该器件可防止反馈电流经 LIN 流向电源输入。器件还包含欠压保护、过热关断保护和接地失效保护功能。

6 Pin Configuration and Functions

图 6-1. DDF Package, 8-Pin (SOT), Top View

表 6-1. Pin Functions

PIN		Type	DESCRIPTION
Name	No.		
RXD	1	DO	RXD output (open-drain) interface reporting state of LIN bus voltage
EN	2	DI	Enable input - High puts the device in normal operation mode and low puts the device in sleep mode; integrated pull-down
NC	3	–	Not connected
TXD	4	DI	TXD input interface to control state of LIN output; integrated pull-down
GND	5	GND	Ground
LIN	6	HV I/O	LIN bus single-wire transmitter and receiver
V _{SUP}	7	HV Supply	Device supply voltage (connected to battery in series with external reverse blocking diode)
NC	8	–	Not connected

7 Specifications

7.1 Absolute Maximum Ratings

(1) (2)

		MIN	MAX	UNIT
V _{SUP}	Supply voltage range (ISO 17987)	- 0.3	45	V
V _{LIN}	LIN Bus input voltage (ISO 17987)	- 45	45	V
V _{LOGIC_INPUT}	Logic input voltage (TXD, EN)	- 0.3	6	V
V _{LOGIC_OUTPUT}	Logic output voltage (RXD)	- 0.3	6	V
I _O	Digital pin output current		8	mA
T _J	Junction Temp	- 55	165	°C
T _{stg}	Storage temperature	-65	150	°C

- (1) Operation outside the Absolute Maximum Ratings may cause permanent device damage. Absolute Maximum Ratings do not imply functional operation of the device at these or any other conditions beyond those listed under Recommended Operating Conditions. If used outside the Recommended Operating Conditions but within the Absolute Maximum Ratings, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.
- (2) All voltage values are with respect to ground terminal.

7.2 ESD Ratings

				VALUE	UNIT
V _{ESD}	Electrostatic discharge	Human body model (HBM) classification level 3B: V _{SUP} with respect to ground		±8000	V
		Human body model (HBM) classification level 3B: LIN with respect to ground		±10000	V
		Human body model (HBM) classification level 3A: all other pins, per AEC Q100-002 ⁽¹⁾		±4000	V
V _{ESD}	Electrostatic discharge	Charged device model (CDM) classification level C5, per AEC Q100-011	All pins	±750	V

- (1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

7.3 ESD Ratings - IEC Specification

				VALUE	UNIT
V _{ESD}	Electrostatic discharge	LIN, V _{SUP} terminal to GND ⁽¹⁾	IEC 62228-2 per ISO 10605 Contact discharge R = 330 Ω, C = 150 pF (IEC 61000-4-2)	±8000	V
		LIN terminal to GND ⁽¹⁾	IEC 62228-2 per ISO 10605 Indirect contact discharge R = 330 Ω, C = 150 pF (IEC 61000-4-2)	±8000	
V _{TRAN}	Non-synchronous transient injection	LIN, V _{SUP} terminal to GND ⁽¹⁾	IEC 62228-2 per IEC 62215-3 12 V electrical systems Pulse 1	-100	V
			IEC 62228-2 per IEC 62215-3 12 V electrical systems Pulse 2	75	
			IEC 62228-2 per IEC 62215-3 12 V electrical systems Pulse 3a	-150	
			IEC 62228-2 per IEC 62215-3 12 V electrical systems Pulse 3b	150	
	Direct capacitor coupling	LIN terminal to GND ⁽²⁾	SAE J2962-1 per ISO 7637-3 DCC - Slow transient pulse	±30	

- (1) Results given here are specific to the IEC 62228-2 Integrated circuits – EMC evaluation of transceivers – Part 2: LIN transceivers. Testing performed by OEM approved independent 3rd party, EMC report available upon request.
- (2) Results given here are specific to the SAE J2962-1 Communication Transceivers Qualification Requirements - LIN. Testing performed by OEM approved independent 3rd party, EMC report available upon request.

7.4 Thermal Information

THERMAL METRIC ⁽¹⁾		TLIN1039-Q1	UNIT
		DDF(SOT)	
		8 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	125.3	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	64.3	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	45.8	°C/W
Ψ_{JT}	Junction-to-top characterization parameter	2.8	°C/W
Ψ_{JB}	Junction-to-board characterization parameter	45.5	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	–	°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

7.5 Recommended Operating Conditions

parameters valid across $-40^{\circ}\text{C} \leq T_J \leq 150^{\circ}\text{C}$ (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V_{SUP}	Supply Voltage	4.5		36	V
V_{LIN}	LIN Bus input voltage	0		36	V
V_{LOGIC}	Logic Pin Voltage	0		5.25	V
T_J	Operating virtual junction temperature range	-40		150	°C
T_{SDR}	Thermal shutdown rising	160			°C
T_{SDF}	Thermal shutdown falling			150	°C
$T_{SD(HYS)}$	Thermal shutdown hysteresis		10		°C

7.6 Power Supply Characteristics

parameters valid across $-40^{\circ}\text{C} \leq T_J \leq 150^{\circ}\text{C}$ (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
Supply Voltage and Current						
V_{SUP}	Operational supply voltage ISO 17987 Param 10	Device is operational beyond the LIN defined nominal supply voltage range See Fig 8-1 and Fig 8-2	4.5		36	V
	Nominal supply voltage ISO 17987 Param 10	Normal and standby modes ⁽¹⁾ See Fig 8-1 and Fig 8-2	4.5		36	V
		Sleep mode	4.5		36	V
I_{SUP}	Supply current Bus dominant	Normal mode EN = High, $R_{LIN} \geq 500 \Omega$, $C_{LIN} \leq 10 \text{ nF}$		1.2	6.5	mA
		Standby mode EN = 0 V, $R_{LIN} \geq 500 \Omega$, $C_{LIN} \leq 10 \text{ nF}$		1	1.7	mA
	Supply current Bus recessive	Normal mode EN = High		300	700	μA
		Standby mode EN = 0 V		20	30	μA
	Supply current Sleep mode	$4.5 \text{ V} < V_{SUP} \leq 14 \text{ V}$, EN = 0 V, TXD and RXD floating		9	14	μA
		$14 \text{ V} < V_{SUP} \leq 36 \text{ V}$, EN = 0 V, TXD and RXD floating			22	μA
$UV_{SUP(R)}$	Under voltage V_{SUP} threshold	Ramp up		4.15	4.45	V
$UV_{SUP(F)}$	Under voltage V_{SUP} threshold	Ramp down	3.5	4		V
UV_{HYS}	Delta hysteresis voltage for V_{SUP} under voltage threshold			0.13		V

(1) Ramp V_{SUP} while LIN signal is a 10 kHz square wave with 50% duty cycle and 36 V swing.

7.7 Electrical Characteristics

parameters valid across $-40^{\circ}\text{C} \leq T_J \leq 150^{\circ}\text{C}$ (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
RXD Output Terminal						
V_{OL}	Low-level voltage	Based upon external pull-up to V_{CC} ⁽⁴⁾			0.6	V
I_{OL}	Low-level output current, open drain	LIN = 0 V, RXD = 0.4 V	1.5			mA
I_{LKG}	Leakage current, high-level	LIN = V_{SUP} , RXD = V_{CC}	- 5		5	μA
TXD Input Terminal						
V_{IL}	Low-level input voltage				0.8	V
V_{IH}	High-level input voltage		2			V
I_{LKG}	Low-level input leakage current	TXD = 0 V	- 5		5	μA
R_{TXD}	Internal pull-down resistor value		125	350	800	$\text{k}\Omega$
EN Input Terminal						
V_{IL}	Low-level input voltage		- 0.3		0.8	V
V_{IH}	High-level input voltage		2		5.25	V
V_{HYS}	Hysteresis voltage	By design and characterization	30		500	mV
I_{IL}	Low-level input current	EN = 0 V	- 5		5	μA
R_{EN}	Internal pull-down resistor		125	350	800	$\text{k}\Omega$
LIN Terminal						
V_{OH}	LIN recessive high-level output voltage ⁽³⁾	TXD = V_{CC} , $I_O = 0$ mA $7\text{ V} \leq V_{SUP} \leq 36\text{ V}$	0.85			V_{SUP}
V_{OH}	LIN recessive high-level output voltage ⁽³⁾	TXD = V_{CC} , $I_O = 0$ mA $4.5\text{ V} \leq V_{SUP} < 7\text{ V}$	3			V
V_{OH}	LIN recessive high-level output voltage ^{(1) (2)}	TXD = V_{CC} , $I_O = 0$ mA $7\text{ V} \leq V_{SUP} \leq 18\text{ V}$	0.8			V_{SUP}
V_{OL}	LIN dominant low-level output voltage ⁽³⁾	TXD = 0 V $7\text{ V} \leq V_{SUP} \leq 36\text{ V}$			0.2	V_{SUP}
V_{OL}	LIN dominant low-level output voltage ⁽³⁾	TXD = 0 V $4.5\text{ V} \leq V_{SUP} < 7\text{ V}$			1.2	V
V_{OL}	LIN dominant low-level output voltage ^{(1) (2)}	TXD = 0 V $7\text{ V} \leq V_{SUP} \leq 18\text{ V}$			0.2	V_{SUP}
V_{BUSdom}	Low-level input voltage ISO 17987 Param 17	LIN dominant (including LIN dominant for wake up) See Fig 8-3 and Fig 8-4			0.4	V_{SUP}
V_{BUSrec}	High-level input voltage ISO 17987 Param 18	LIN recessive See Fig 8-3 and Fig 8-4	0.6			V_{SUP}
V_{IH}	LIN recessive high-level input voltage threshold ^{(1) (2)}	$7\text{ V} \leq V_{SUP} \leq 18\text{ V}$	0.47		0.6	V_{SUP}
V_{IL}	LIN dominant low-level input voltage threshold ^{(1) (2)}	$7\text{ V} \leq V_{SUP} \leq 18\text{ V}$	0.4		0.53	V_{SUP}
$V_{SUP_NON_OP}$	V_{SUP} where impact of recessive LIN bus < 5% ⁽³⁾	TXD & RXD open $4.5\text{ V} \leq \text{LIN} \leq 45\text{ V}$	- 0.3		42	V
V_{BUS_CNT}	Receiver center threshold	$V_{BUS_CNT} = (V_{BUSrec} + V_{BUSdom})/2$ See Fig 8-3 and Fig 8-4	0.475	0.5	0.525	V_{SUP}
V_{HYS}	Hysteresis voltage (ISO 17987)	$V_{HYS} = V_{BUSrec} - V_{BUSdom}$ See Fig 8-3 and Fig 8-4			0.175	V_{SUP}
V_{HYS}	Hysteresis voltage (SAE J2602)	$V_{HYS} = V_{IH} - V_{IL}$ See Fig 8-3 and Fig 8-4	0.07		0.175	V_{SUP}
V_{SERIAL_DIODE}	Serial diode LIN termination pull-up path	$I_{SERIAL_DIODE} = 10\text{ }\mu\text{A}$	0.4	0.7	1.0	V
$I_{BUS(LIM)}$	Limiting current ISO 17987 Param 12	TXD = 0 V, $V_{LIN} = 18\text{ V}$ $V_{SUP} = 18\text{ V}$	40	90	200	mA
$I_{BUS_PAS_dom}$	Receiver leakage current, dominant	Driver off/recessive, LIN = 0 V $V_{SUP} = 12\text{ V}$ See Fig 8-6	- 1			mA
$I_{BUS_PAS_rec1}$	Receiver leakage current, recessive	Driver off/recessive, LIN $\geq V_{SUP}$ $4.5\text{ V} \leq V_{SUP} \leq 36\text{ V}$ See Fig 8-7			20	μA

7.7 Electrical Characteristics (continued)

parameters valid across $-40^{\circ}\text{C} \leq T_J \leq 150^{\circ}\text{C}$ (unless otherwise noted)

	PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
I _{BUS_PAS_rec2}	Receiver leakage current, recessive	Driver off/recessive, LIN = V _{SUP} See 图 8-7	- 5		5	μA
I _{BUS_NO_GND}	Leakage current, loss of ground	GND _{Device} = V _{SUP} = 18 V R _{Meas} = 1 kΩ 0 V < V _{LIN} < 18 V	- 1		1	mA
I _{leak_gnd(dom)}	Leakage current, loss of ground ⁽⁵⁾	V _{SUP} = 8 V, GND = open, V _{SUP} = 18 V, GND = open R _{COMMANDER} = 1 kΩ, C _L = 1 nF R _{RESPONDER} = 20 kΩ, C _L = 1 nF LIN = dominant	- 1		1	mA
I _{leak_gnd(rec)}	Leakage current, loss of ground ⁽⁵⁾	V _{SUP} = 8 V, GND = open, V _{SUP} = 18 V, GND = open R _{COMMANDER} = 1 kΩ, C _L = 1 nF R _{RESPONDER} = 20 kΩ, C _L = 1 nF LIN = recessive	- 100		100	μA
I _{BUS_NO_BAT}	Leakage current, loss of supply	V _{SUP} = GND 0 V ≤ V _{LIN} ≤ 18 V			5	μA
I _{RSLEEP}	Pull-up current source to V _{SUP} sleep mode	V _{SUP} = 14 V, LIN = GND	- 20		- 1.5	μA
R _{PU}	Pull-up resistor to V _{SUP}	Normal and standby modes	20	45	60	kΩ
C _{LIN}	Capacitance of the LIN pin	V _{SUP} = 14 V			25	pF

Duty Cycle Characteristics

D1	Duty Cycle 1 ⁽³⁾ ISO 17987 Param 27	TH _{REC(MAX)} = 0.744 x V _{SUP} TH _{DOM(MAX)} = 0.581 x V _{SUP} V _{SUP} = 7 V to 18 V, t _{BIT} = 50 μs D1 = t _{BUS_rec(min)} / (2 x t _{BIT}) See 图 8-10 and 图 8-11	0.396			
D1	Duty Cycle 1 ^{(3) (6)}	TH _{REC(MAX)} = 0.665 x V _{SUP} , TH _{DOM(MAX)} = 0.499 x V _{SUP} V _{SUP} = 4.5 V to 7 V, t _{BIT} = 50 μs D1 = t _{BUS_rec(min)} / (2 x t _{BIT}) See 图 8-10 and 图 8-11	0.396			
D1	Duty cycle 1 ^{(1) (2) (6)}	TH _{REC(MAX)} = 0.744 x V _{SUP} , TH _{DOM(MAX)} = 0.581 x V _{SUP} , V _{SUP} = 7 V to 18 V, t _{BIT} = 52 μs D1 = t _{BUS_rec(min)} / (2 x t _{BIT}) See 图 8-10 and 图 8-11	0.396			
D2	Duty Cycle 2 ⁽³⁾ ISO 17987 Param 28	TH _{REC(MIN)} = 0.422 x V _{SUP} TH _{DOM(MIN)} = 0.284 x V _{SUP} V _{SUP} = 7 V to 18 V, t _{BIT} = 50 μs D2 = t _{BUS_rec(MAX)} / (2 x t _{BIT}) See 图 8-10 and 图 8-11			0.581	
D2	Duty cycle 2 ^{(3) (6)}	TH _{REC(MIN)} = 0.496 x V _{SUP} , TH _{DOM(MIN)} = 0.361 x V _{SUP} , V _{SUP} = 4.5 V to 7 V, t _{BIT} = 50 μs D2 = t _{BUS_rec(MAX)} / (2 x t _{BIT}) See 图 8-10 and 图 8-11			0.581	
D2	Duty cycle 2 ^{(1) (2) (6)}	TH _{REC(MIN)} = 0.422 x V _{SUP} , TH _{DOM(MIN)} = 0.284 x V _{SUP} , V _{SUP} = 7 V to 18 V, t _{BIT} = 52 μs D2 = t _{BUS_rec(MAX)} / (2 x t _{BIT}) See 图 8-10 and 图 8-11			0.581	
D3	Duty Cycle 3 ⁽³⁾ ISO 17987 Param 29	TH _{REC(MAX)} = 0.778 x V _{SUP} TH _{DOM(MAX)} = 0.616 x V _{SUP} V _{SUP} = 7 V to 18 V, t _{BIT} = 96 μs D3 = t _{BUS_rec(min)} / (2 x t _{BIT}) See 图 8-10 and 图 8-11	0.417			
D3	Duty Cycle 3 ^{(3) (6)}	TH _{REC(MAX)} = 0.665 x V _{SUP} TH _{DOM(MAX)} = 0.499 x V _{SUP} V _{SUP} = 4.5 V to 7 V, t _{BIT} = 96 μs D3 = t _{BUS_rec(min)} / (2 x t _{BIT}) See 图 8-10 and 图 8-11	0.417			

7.7 Electrical Characteristics (continued)

parameters valid across $-40^{\circ}\text{C} \leq T_J \leq 150^{\circ}\text{C}$ (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
D3	Duty cycle 3 ⁽¹⁾ (2) (6)	$TH_{REC(MAX)} = 0.778 \times V_{SUP}$ $TH_{DOM(MAX)} = 0.616 \times V_{SUP}$ $V_{SUP} = 7\text{ V to }18\text{ V}, t_{BIT} = 96\text{ }\mu\text{s}$ $D3 = t_{BUS_rec(min)}/(2 \times t_{BIT})$ See 图 8-10 and 图 8-11	0.417

T _{r-d max_D3}	Transmitter propagation delay timings for the duty cycle ⁽¹⁾ (2) (6) Recessive to dominant	$TH_{REC(MAX)} = 0.778 \times V_{SUP}$ $TH_{DOM(MAX)} = 0.616 \times V_{SUP}$ $7\text{ V} \leq V_{SUP} \leq 18\text{ V}, t_{BIT} = 96\text{ }\mu\text{s}$ $t_{REC(MAX)}_{D3} - t_{DOM(MIN)}_{D3}$			15.9	μs
T _{d-r max_D4}	Transmitter propagation delay timings for the duty cycle ⁽¹⁾ (2) (6) Dominant to recessive	$TH_{REC(MIN)} = 0.389 \times V_{SUP}$ $TH_{DOM(MIN)} = 0.251 \times V_{SUP}$ $7\text{ V} \leq V_{SUP} \leq 18\text{ V}, t_{BIT} = 96\text{ }\mu\text{s}$ $t_{DOM(MAX)}_{D4} - t_{REC(MIN)}_{D4}$			17.28	μs
T _{r-d max_low}	Low battery transmitter propagation delay timings for the duty cycle ⁽¹⁾ (2) (6) Recessive to dominant	$TH_{REC(MAX)} = 0.665 \times V_{SUP}$ $TH_{DOM(MAX)} = 0.499 \times V_{SUP}$ $5.5\text{ V} \leq V_{SUP} \leq 7\text{ V}, t_{BIT} = 52\text{ }\mu\text{s}$ $t_{REC(MAX)}_{low} - t_{DOM(MIN)}_{low}$			10.8	μs
T _{d-r max_low}	Low battery transmitter propagation delay timings for the duty cycle ⁽¹⁾ (2) (6) Dominant to recessive	$TH_{REC(MAX)} = 0.496 \times V_{SUP}$ $TH_{DOM(MAX)} = 0.361 \times V_{SUP}$ $6.1\text{ V} \leq V_{SUP} \leq 7\text{ V}, t_{BIT} = 52\text{ }\mu\text{s}$ $t_{DOM(MAX)}_{low} - t_{REC(MIN)}_{low}$			8.4	μs

- (1) SAE 2602 commander node load conditions: 5.5 nF/4 k Ω and 899 pF/20 k Ω
- (2) SAE 2602 responder node load conditions: 5.5 nF/875 Ω and 899 pF/900 Ω
- (3) ISO 17987 bus load conditions (C_{LINBUS}, R_{LINBUS}) include 1 nF/1 k Ω ; 6.8 nF/660 Ω ; 10 nF/500 Ω .
- (4) RXD uses open drain output structure therefore V_{OL} level is based upon microcontroller supply voltage.
- (5) $I_{leak\ gnd} = (V_{BAT} - V_{LIN})/R_{Load}$
- (6) Specified by design

7.8 AC Switching Characteristics

parameters valid across $-40^{\circ}\text{C} \leq T_J \leq 150^{\circ}\text{C}$ (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
Device Switching Characteristics						
t_{rx_pdr}	Receiver rising propagation delay time ISO 17987 Param 31	$5.5\text{ V} \leq V_{SUP}$, $R_{RXD} = 2.4\text{ k}\Omega$, $C_{RXD} = 20\text{ pF}$ See 图 8-12 and 图 8-13			5	μs
t_{rx_pdf}	Receiver falling propagation delay time ISO 17987 Param 31				5	μs

9 Detailed Description

9.1 Overview

The TLIN1039-Q1 is a Local Interconnect Network (LIN) physical layer transceiver, compliant with LIN 2.0, LIN 2.1, LIN 2.2, LIN 2.2A and ISO/DIS 17987 – 4 standards, with integrated wake-up and protection features. The LIN bus is a single-wire bidirectional bus typically used for low speed in-vehicle networks. The device transmitter supports data rates from 2.4 kbps to 20 kbps and the receiver works up to 100 kbps supporting in-line programming. The LIN protocol data stream on the TXD input is converted by the TLIN1039-Q1 into a LIN bus signal using a current-limited wave-shaping driver as outlined by the LIN physical layer specification. The receiver converts the data stream to logic-level signals that are sent to the microprocessor through the open-drain RXD pin. The LIN bus has two states: dominant state (voltage near ground) and recessive state (voltage near battery). In the recessive state, the LIN bus is pulled high by the internal pull-up resistor (45 k Ω) and a series diode. No external pull-up components are required for responder node applications. Commander node applications require an external pull-up resistor (1 k Ω) plus a series diode per the LIN specification.

The device is designed to support 12-V applications with a wide input voltage operating range and also supports low-power sleep mode. The device also provides two methods to wake up: EN pin and from the LIN bus.

The TLIN1039-Q1 integrates ESD protection and fault protection which allow for a reduction in the required external components in the applications. In the event of a ground shift or supply voltage disconnection, the device prevents back-feed current through LIN to the supply input. The device also includes undervoltage detection, temperature shutdown protection, and loss-of-ground protection.

9.3 Feature Description

9.3.1 LIN (Local Interconnect Network) Bus

This high voltage input/output pin is a single-wire LIN bus transmitter and receiver. The LIN pin can survive transient voltages up to 45 V. Reverse currents from the LIN to supply (V_{SUP}) are minimized with blocking diodes, even in the event of a ground shift or loss of supply (V_{SUP}).

9.3.1.1 LIN Transmitter Characteristics

The transmitter has thresholds and AC parameters according to the LIN specification. The transmitter is a low-side transistor with internal current limitation and thermal shutdown. During a thermal shutdown condition, the transmitter is disabled to protect the device. There is an internal pull-up resistor with a serial diode structure to V_{SUP} , so no external pull-up components are required for the LIN responder node applications. An external pull-up resistor and series diode to V_{SUP} must be added when the device is used for a commander node application per the LIN specification.

9.3.1.2 LIN Receiver Characteristics

The receiver characteristic thresholds are proportional to the device supply pin in accordance to the LIN specification.

The receiver is capable of receiving higher data rates (> 100 kbps) than supported by LIN or SAE J2602 specifications. This allows the TLIN1039-Q1 to be used for high speed downloads at the end-of-line production or other applications. The actual data rate achievable depends on system time constants (bus capacitance and pull-up resistance) and driver characteristics used in the system.

9.3.1.2.1 Termination

There is an internal pull-up resistor with a serial diode structure to V_{SUP} , so no external pull-up components are required for the LIN responder node applications. An external pull-up resistor ($1\text{ k}\Omega$) and a series diode to V_{SUP} must be added when the device is used for commander node applications as per the LIN specification.

图 9-1 shows a commander node configuration, and how the voltage levels are defined.

图 9-1. Commander Node Configuration with Voltage Levels

9.3.2 TXD (Transmit Input and Output)

TXD is the interface to the MCU LIN protocol controller or SCI and UART that is used to control the state of the LIN output. When TXD is low, the LIN output is dominant (near ground). When TXD is high, the LIN output is recessive (near $V_{Battery}$). See 图 9-1. The TXD input structure is compatible with microcontrollers with 3.3 V and 5 V I/O and integrates a weak pull-down resistor.

9.3.3 RXD (Receive Output)

RXD is the interface to the MCU's LIN protocol controller or SCI and UART, which reports the state of the LIN bus voltage. LIN recessive (near V_{Battery}) is represented by a high level on the RXD and LIN dominant (near ground) is represented by a low level on the RXD pin. The RXD output structure is an open-drain output stage. This allows the device to be used with 3.3 V and 5 V I/O microcontrollers. If the microcontroller's RXD pin does not have an integrated pull-up, an external pull-up resistor to the microcontroller I/O supply voltage is required. In standby mode the RXD pin is driven low to indicate a wake-up request from the LIN bus.

9.3.4 V_{SUP} (Supply Voltage)

V_{SUP} is the power supply pin. V_{SUP} is connected to the battery through an external reverse-blocking diode (Figure 9-1). If there is a loss of power at the ECU level, the device has extremely low leakage from the LIN pin, which does not load the bus down. This is optimal for LIN systems in which some of the nodes are unpowered (ignition supplied) while the rest of the network remains powered (battery supplied).

9.3.5 GND (Ground)

GND is the device ground connection. The device can operate with a ground shift as long as the ground shift does not reduce the V_{SUP} below the minimum operating voltage, as well as ensuring the input and output voltages are within their appropriate thresholds. If there is a loss of ground at the ECU level, the device has extremely low leakage from the LIN pin, which does not load the bus down. This is optimal for LIN systems in which some of the nodes are unpowered (ignition supplied) while the rest of the network remains powered (battery supplied).

9.3.6 EN (Enable Input)

EN controls the operational modes of the device. When EN is high, the device is in normal operating mode allowing a transmission path from TXD to LIN and from LIN to RXD. When EN is low, the device is put into sleep mode and there are no transmission paths available. After LIN bus wake-up is received, the device can enter normal mode only by making EN = high. EN has an internal pull-down resistor to make sure the device remains in low-power mode even if EN floats.

9.3.7 Protection Features

The TLIN1039-Q1 has several protection features such as:

9.3.8 TXD Dominant Timeout (DTO)

While the LIN driver is active, TXD DTO circuit prevents the local node from blocking network communication in event of a hardware or software failure where TXD is held dominant longer than the timeout period $t_{\text{TXD_DTO}}$. The TXD DTO circuit is triggered by a falling edge on TXD. If no rising edge is seen before the timeout constant of the circuit, $t_{\text{TXD_DTO}}$, expires the LIN driver is disabled releasing the bus line to the recessive level. This keeps the bus free for communication between other nodes on the network. The LIN driver is re-activated on the next dominant to recessive transition on the TXD terminal, thus clearing the dominant timeout. During this fault, the transceiver remains in normal mode, the integrated LIN bus pull-up termination remains on, and the LIN receiver and RXD terminal remain active reflecting the LIN bus data.

The TXD pin has an internal pull-down to make sure the transceiver fails to a known state if TXD is disconnected. If EN pin is high at power-up the TLIN1039-Q1 enters normal mode. With the internal TXD connected low, the DTO timer starts. To avoid a $t_{\text{TXD_DTO}}$ fault, a recessive signal should be put onto the TXD pin before the $t_{\text{TXD_DTO}}$ timer expires, or the transceiver should be into sleep mode by connecting EN pin low.

9.3.9 Bus Stuck Dominant System Fault: False Wake-Up Lockout

The TLIN1039-Q1 contains logic to detect bus stuck dominant system faults and prevents the device from waking up falsely during the system fault. Upon entering sleep mode, the device detects the state of the LIN bus. If the bus is dominant, the wake-up logic is locked out until a valid recessive on the bus “clears” the bus stuck dominant, preventing excessive current consumption. Figure 9-2 and Figure 9-3 show the behavior of this protection.

Copyright © 2020, Texas Instruments Incorporated

图 9-2. No Bus Fault: Entering Sleep Mode with Bus Recessive Condition and Wake-up

Copyright © 2020, Texas Instruments Incorporated

图 9-3. Bus Fault: Entering Sleep Mode with Bus Stuck Dominant Fault, Clearing, and Wake-up

9.3.10 Thermal Shutdown

The LIN transmitter is protected by current limiting circuitry. If the junction temperature of the device exceeds the thermal shutdown threshold, the device puts the LIN transmitter into the recessive state. Once the over-temperature fault condition has been removed and the junction temperature has cooled beyond the hysteresis temperature, the transmitter is re-enabled, assuming the device remains in the normal operation mode. During this fault, the transceiver remains in normal mode (assuming no change of state request on EN), the transmitter is in recessive state, the RXD pin reflects the LIN bus and LIN bus pull-up termination remains on.

9.3.11 Under Voltage on V_{SUP}

The TLIN1039-Q1 contains a power-on reset circuit to avoid false bus messages during under voltage conditions when V_{SUP} is less than UV_{SUP} .

9.3.12 Unpowered Transceiver

In automotive applications, some LIN nodes in a system can be unpowered, ignition supplied, while others in the network remains powered by the battery. The TLIN1039-Q1 has extremely low unpowered leakage current from the bus so an unpowered node does not affect the network or load it down.

9.4 Functional Modes

The TLIN1039-Q1 has three functional modes of operation: normal, sleep, and standby. The next sections will describe these modes as well as how the device moves between the different modes. 图 9-4 graphically shows the relationship while 表 9-1 shows the state of pins

表 9-1. Operating Modes

MODE	EN	RXD	LIN BUS TERMINATION	TRANSMITTER	COMMENT
Sleep	Low	Floating	Weak current pull-up	Off	
Standby	Low	Low	45 kΩ	Off	Wake-up event detected, waiting on MCU to set EN
Normal	High	LIN bus data	45 kΩ	On	LIN transmission up to 20 kbps

图 9-4. Operating State Diagram

9.4.1 Normal Mode

If the EN pin is high at power-up, the device will power-up in normal mode. If the EN pin is low, it will power-up in standby mode. The EN pin controls the mode of the device. In normal operational mode the receiver and transmitter are active and the LIN transmission up to the LIN specified maximum of 20 kbps is supported. The receiver detects the data stream on the LIN bus and outputs it on RXD for the LIN controller. A recessive signal on the LIN bus is a logic high and a dominant signal on the LIN bus is a logic low. The driver transmits input data from TXD to the LIN bus. Normal mode is entered as EN transitions high while the TLIN1039-Q1 is in sleep or standby mode for $> t_{NOMINT}$.

9.4.2 Sleep Mode

Sleep mode is the power saving mode for the TLIN1039-Q1. Sleep mode is only entered when the EN pin is low and from normal mode. Even with extremely low current consumption in this mode, the TLIN1039-Q1 can still wake-up from LIN bus through a wake-up signal or if EN is set high for $\geq t_{\text{MODE_CHANGE}}$. The LIN bus is filtered to prevent false wake-up events. The wake-up events must be active for the respective time periods (t_{LINBUS}).

The sleep mode is entered by setting EN low for longer than $t_{\text{MODE_CHANGE}}$.

While the device is in sleep mode:

- The LIN bus driver is disabled and the internal LIN bus termination is switched off (to minimize power loss if LIN is short circuited to ground). However, the weak current pull-up is active to prevent false wake-up events in case an external connection to the LIN bus is lost.
- The normal receiver is disabled.
- EN input and LIN wake-up receiver are active.

9.4.3 Standby Mode

This mode is entered whenever a wake-up event occurs through LIN bus while the device is in sleep mode. The LIN bus responder mode termination circuit is turned on when standby mode is entered. Standby mode is signaled through a low level on RXD. See [Standby Mode Application Note](#) for more application information.

When EN is set high for longer than $t_{\text{MODE_CHANGE}}$ while the device is in standby mode, the device returns to normal mode. The normal transmission paths from TXD to LIN bus and LIN bus to RXD are enabled.

9.4.4 Wake-Up Events

There are two ways to wake up from sleep mode:

- Remote wake up initiated by the falling edge of a recessive (high) to dominant (low) state transition on LIN bus where the dominant state is held for t_{LINBUS} filter time. After the t_{LINBUS} filter time has been met, a rising edge on the LIN bus going from dominant state to recessive state initiates a remote wake-up event, eliminating false wake-ups from disturbances on the LIN bus or if the bus is shorted to ground.
- Local wake-up through EN being set high for longer than $t_{\text{MODE_CHANGE}}$.

9.4.4.1 Wake-Up Request (RXD)

When the TLIN1039-Q1 encounters a wake-up event from the LIN bus, RXD goes low and the device transitions to standby mode until EN is reasserted high and the device enters normal mode. Once the device enters normal mode, the RXD pin releases the wake-up request signal and the RXD pin then reflects the receiver output from the LIN bus.

9.4.4.2 Mode Transitions

When the TLIN1039-Q1 is transitioning from normal to sleep or standby modes the device needs the time $t_{\text{MODE_CHANGE}}$ to allow the change to fully propagate from the EN pin through the device into the new state. When transitioning from sleep or standby to normal mode the device needs t_{NOMINT} .

10 Application and Implementation

Note

以下应用部分中的信息不属于 TI 器件规格的范围，TI 不担保其准确性和完整性。TI 的客户应负责确定器件是否适用于其应用。客户应验证并测试其设计，以确保系统功能。

10.1 Application Information

The TLIN1039-Q1 can be used as both a responder node device and a commander node device in a LIN network. The device comes with the ability to support both remote wake up request and local wake up request.

10.2 Typical Application

The device integrates a 45 k Ω pull-up resistor and series diode for responder node applications. For commander applications an external 1 k Ω pull-up resistor with series blocking diode can be used. 图 10-1 shows the device being used in both commander node and responder node applications.

图 10-1. Typical LIN Bus

10.2.1 Design Requirements

The RXD output structure is an open-drain output stage. This allows the TLIN1039-Q1 to be used with 3.3 V and 5 V I/O processor. If the RXD pin of the processor does not have an integrated pull-up, an external pull-up resistor to the processor I/O supply voltage is required. The external pull-up resistor value should be between 1 k Ω to 10 k Ω , depending on supply used (See I_{OL} in electrical characteristics). The V_{SUP} pin of the device should

be decoupled with a 100 nF capacitor by placing it close to the V_{SUP} supply pin. The system should include additional decoupling on the V_{SUP} line as needed per the application requirements.

10.2.2 Detailed Design Procedures

10.2.2.1 Normal Mode Application Note

When using the TLIN1039-Q1 in systems which are monitoring the RXD pin for a wake-up request, special care should be taken during the mode transitions. The output of the RXD pin is indeterminate for the transition period between states as the receivers are switched. The application software should not look for an edge on the RXD pin, for indication of wake-up request, until t_{MODE_CHANGE} has been met. This is shown in 图 8-14

10.2.2.2 Standby Mode Application Note

If the TLIN1039-Q1 detects an under voltage on V_{SUP} , the RXD pin transitions low and signals to the software that the TLIN1039-Q1 is in standby mode. The transceiver should be returned to sleep mode for the lowest power state.

10.2.3 Application Curves

图 10-2 and 图 10-3 show the propagation delay from the TXD pin to the LIN pin for the dominant to recessive and recessive to dominant edges. The device was configured as a commander node with an external pull-up resistor (1 k Ω) and 680 pF bus capacitance.

图 10-2. Dominant to Recessive Propagation Delay

图 10-3. Recessive to Dominant Propagation Delay

11 Power Supply Recommendations

The was designed to operate directly from a car battery, or any other DC supply ranging from 4.5 V to 36 V. The V_{SUP} pin of the transceiver should be decoupled with a 100-nF capacitor by placing it close to the V_{SUP} supply pin. The system should include additional decoupling on the V_{SUP} line as needed per the application requirements.

12 Layout

For the PCB design to be successful, start with design of the protection and filtering circuitry. Because ESD transients have a wide frequency bandwidth from approximately 3 MHz to 3 GHz, high frequency layout techniques must be applied during PCB design. Placement at the connector also prevents these noisy events from propagating further into the PCB and system.

12.1 Layout Guidelines

- **Pin 1 (RXD):** The pin is an open-drain output and requires an external pull-up resistor in the range of 1 k Ω to 10 k Ω to function properly. Note that the minimum value depends on the logic supply used. See I_{OL} in electrical specifications. If the microprocessor paired with the transceiver does not have an integrated pull-up, an external resistor should be placed between RXD and the regulated voltage supply for the microprocessor.
- **Pin 2 (EN):** EN is an input pin that is used to place the device in a low-power sleep mode. If this feature is not used the pin should be pulled high to the regulated voltage supply of the microprocessor through a series resistor between 1 k Ω and 10 k Ω . Additionally, a series resistor may be placed on the pin to limit current on the digital lines in the case of an over voltage fault.
- **Pin 3 (NC):** Not Connected.
- **Pin 4 (TXD):** The TXD pin is used to transmit the input signal from the microcontroller. To prevent an over-voltage on this pin, a series resistor can be placed to limit the input current to the device. A capacitor to ground can be placed close to the input pin of the device to filter noise.
- **Pin 5 (GND):** This is the ground connection for the device. This pin should be tied to the ground plane through a short trace with the use of two vias to limit total return inductance.
- **Pin 6 (LIN):** This pin connects to the LIN bus. For responder mode applications a 220 pF capacitor to ground is implemented. For commander mode applications, an additional series resistor and blocking diode should be placed between the LIN pin and the V_{SUP} pin. See [Typical LIN Bus](#).
- **Pin 7 (V_{SUP}):** This is the supply pin for the device. A 100 nF decoupling capacitor should be placed as close to the device as possible.
- **Pin 8 (NC):** Not Connected.

Note

All ground and power connections should be made as short as possible, and use at least two vias to minimize the total loop inductance.

Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated transceiver. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TLIN1039DDFRQ1	ACTIVE	SOT-23-THIN	DDF	8	3000	RoHS & Green	NIPDAU	Level-1-260C-UNLIM	-40 to 125	2JIF	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

4222047/C 10/2022

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 mm per side.

EXAMPLE BOARD LAYOUT

DDF0008A

SOT-23 - 1.1 mm max height

PLASTIC SMALL OUTLINE

LAND PATTERN EXAMPLE
SCALE:15X

NON SOLDER MASK
DEFINED

SOLDER MASK
DEFINED

SOLDER MASK DETAILS

4222047/C 10/2022

NOTES: (continued)

4. Publication IPC-7351 may have alternate designs.
5. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

EXAMPLE STENCIL DESIGN

DDF0008A

SOT-23 - 1.1 mm max height

PLASTIC SMALL OUTLINE

SOLDER PASTE EXAMPLE
BASED ON 0.125 mm THICK STENCIL
SCALE:15X

4222047/C 10/2022

NOTES: (continued)

6. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
7. Board assembly site may have different recommendations for stencil design.

重要声明和免责声明

TI“按原样”提供技术和可靠性数据（包括数据表）、设计资源（包括参考设计）、应用或其他设计建议、网络工具、安全信息和其他资源，不保证没有瑕疵且不做任何明示或暗示的担保，包括但不限于对适销性、某特定用途方面的适用性或不侵犯任何第三方知识产权的暗示担保。

这些资源可供使用 TI 产品进行设计的熟练开发人员使用。您将自行承担以下全部责任：(1) 针对您的应用选择合适的 TI 产品，(2) 设计、验证并测试您的应用，(3) 确保您的应用满足相应标准以及任何其他功能安全、信息安全、监管或其他要求。

这些资源如有变更，恕不另行通知。TI 授权您仅可将这些资源用于研发本资源所述的 TI 产品的应用。严禁对这些资源进行其他复制或展示。您无权使用任何其他 TI 知识产权或任何第三方知识产权。您应全额赔偿因在这些资源的使用中对 TI 及其代表造成的任何索赔、损害、成本、损失和债务，TI 对此概不负责。
