

## TPS6274x 针对低功耗应用的 360nA I<sub>Q</sub> 降压转换器

### 1 特性

- 输入电压 (V<sub>IN</sub>) 范围: 2.2V 至 5.5V
- 典型值360nA 静态电流
- 10μA 输出电流时的效率高达 90%
- 高达 300mA/400mA 的输出电流 (TPS62740/TPS62742)
- 射频 (RF) 友好型 DCS-Control™
- 高达 2MHz 的开关频率
- 低输出纹波电压
- 1.8V 至 3.3V 之间 16 个可选输出电压 (步长 100mV)
- 自动转换至无纹波 100% 模式
- 转换率受控的负载开关
- V<sub>OUT</sub> / LOAD 上的放电功能
- 电源正常输出
- 针对与微型 2.2μH 电感器和 10μF C<sub>OUT</sub> 的共同运行进行了优化
- 总体解决方案尺寸 < 31mm<sup>2</sup>
- 小型 2mm x 3mm<sup>2</sup> 晶圆级小外形无引线 (WSON) 封装

### 2 应用范围

- Bluetooth® 低功耗 (Low Energy), 消费类电子产品用射频 (RF4CE), 短距离低功耗通信技术 (Zigbee)
- 工业用仪表计量
- 能量采集

### 4 典型应用

### 3 说明

TPS6274x 是业界第一款降压转换器, 此转换器特有典型值为 360nA 的静态电流, 并且搭配微型 2.2μH 电感和 10μF 输出电容一起工作。这款基于 DCS-Control™ 的全新器件将轻负载效率范围扩展至 10μA 负载电流以下。TPS62740 支持高达 300mA 的输出电流, TPS62742 支持高达 400mA 的输出电流。此器件由可再充电锂离子电池, 锂化学电池 (例如锂亚硫酰氟 (Li-SOCl<sub>2</sub>), 锂锰电池 (Li-MnO<sub>2</sub>) 和两节或三节碱性电池) 供电运行。输入电压范围高达 5.5V, 也实现由 1 个 USB 端口和薄膜太阳能模块供电运行。用户可使用 4 个 VSEL 引脚在 1.8V 至 3.3V 范围内选择输出电压 (步长 100mV)。TPS6274x 搭配使用小型输出电容, 特有低输出纹波电压和低噪声。一旦电池电压接近输出电压 (接近 100% 占空比), 此器件进入无纹波 100% 模式运行, 以防止输出纹波电压的增加。然后, 此器件停止开关, 并且输出被连接至输入电压。集成转换率受控负载开关特有典型值为 0.6Ω 的导通电阻, 并且将选择的输出电压分配至临时使用的子系统。TPS6274 采用小型 12 引脚 2mm x 3mm<sup>2</sup> WSON 封装, 并且支持 31mm<sup>2</sup> 的总体解决方案尺寸。

## 7 Pin Configuration and Functions

### Pin Functions

PIN		I/O	DESCRIPTION
NAME	NO		
VIN	1	PWR	V <sub>IN</sub> power supply pin. Connect this pin close to the VIN terminal of the input capacitor. A ceramic capacitor of 4.7μF is required.
SW	2	OUT	This is the switch pin and is connected to the internal MOSFET switches. Connect the inductor to this terminal.
GND	3	PWR	GND supply pin. Connect this pin close to the GND terminal of the input and output capacitor.
CTRL	4	IN	This pin controls the output LOAD pin. With CTRL = low, the output LOAD is disabled. This pin must be terminated.
VOUT	5	IN	Feedback pin for the internal feedback divider network and regulation loop. An internal load switch is connected between this pin and the LOAD pin. Connect this pin directly to the output capacitor with a short trace.
LOAD	6	OUT	This output is controlled by the CTRL Pin. With CTRL high, an internal load switch connects the LOAD pin to the VOUT pin. The LOAD pin allows to connect / disconnect other system components to the output of the DC/DC converter. This pin is pulled to GND with CTRL pin = low. The LOAD pin features a soft switching. If not used, leave the pin open.
PG	7	OUT	Power good open drain output. This pin is high impedance to indicate "Power Good". Connect a external pull up resistor to generate a "high" level. If not used, this pin can be left open.
VSEL4	8	IN	Output voltage selection pins. See <a href="#">Table 1</a> for V <sub>OUT</sub> selection. These pins must be terminated and can be changed during operation.
VSEL3	9	IN	
VSEL2	10	IN	
VSEL1	11	IN	
EN	12	IN	High level enables the devices, low level turns the device into shutdown mode. This pin must be terminated.
EXPOSED THERMAL PAD		NC	Not electrically connected to the IC, but must be soldered. Connect this pad to GND and use it as a central GND plane.

**Table 1. Output Voltage Setting**

## 8 Specifications

### 8.1 Absolute Maximum Ratings<sup>(1)</sup>

Over operating free-air temperature range (unless otherwise noted)

		MIN	MAX	UNIT
Pin voltage <sup>(2)</sup>	V <sub>IN</sub>	-0.3	6	V
	SW <sup>(3)</sup>	-0.3	V <sub>IN</sub> +0.3V	V
	EN, CTRL, VSEL1-4	-0.3	V <sub>IN</sub> +0.3V	V
	PG	-0.3	V <sub>IN</sub> +0.3V	V
	VOUT, LOAD	-0.3	3.7	V
PG pin	I <sub>PG</sub>		10	mA
Maximum operating junction temperature, T <sub>J</sub>		-40	150	°C

(1) Stresses beyond those listed under *absolute maximum ratings* may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under *recommended operating conditions* is not implied. Exposure to absolute–maximum–rated conditions for extended periods may affect device reliability.

(2) All voltage values are with respect to network ground terminal GND.

(3) The MAX value V<sub>IN</sub> +0.3V applies for applicative operation (device switching), DC voltage applied to this pin may not exceed 4V

### 8.2 Handling Ratings

		MIN	MAX	UNIT
T <sub>stg</sub>	Storage temperature range	-65	150	°C
V <sub>(ESD)</sub>	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins <sup>(1)</sup>	2000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins <sup>(2)</sup>	1000	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process. The human body model is a 100-pF capacitor discharged through a 1.5-kΩ resistor into each pin.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 8.3 Recommended Operating Conditions

		MIN	NOM	MAX	UNIT
$V_{IN}$	Supply voltage $V_{IN}^{(1)}$	2.2		5.5	V
$I_{OUT} + I_{LOAD}$	Device output current (sum of $I_{OUT}$ and $I_{LOAD}$ )	$V_{OUTnom} + 0.7V \leq V_{IN} \leq 5.5V$	TPS62740	300	mA
		$3V \leq V_{IN}, V_{OUTnom} + 0.7V \leq V_{IN} \leq 5.5V$	TPS62742	400	
		$V_{OUTnom} \leq V_{IN} \leq V_{OUTnom} + 0.7V$		100	
$I_{LOAD}$	Load current (current from LOAD pin)			100	
L	Inductance	1.5	2.2	3.3	$\mu$ H
$C_{OUT}$	Output capacitance connected to VOUT pin (not including LOAD pin)			22	$\mu$ F
$C_{LOAD}$	Capacitance connected to LOAD pin			10	
$T_J$	Operating junction temperature range	-40		125	$^{\circ}$ C
$T_A$	Ambient temperature range	-40		85	

(1) The minimum required supply voltage for startup is 2.15V (undervoltage lockout threshold  $V_{TH\_UVLO+}$ ). The device is functional down to 2V supply voltage (falling undervoltage lockout threshold  $V_{TH\_UVLO-}$ ).

### 8.4 Thermal Information

THERMAL METRIC		DSS / 12 PINS	UNIT
$R_{\theta JA}$	Junction-to-ambient thermal resistance	61.8	$^{\circ}$ C/W
$R_{\theta Jctop}$	Junction-to-case (top) thermal resistance	70.9	
$R_{\theta JB}$	Junction-to-board thermal resistance	25.7	
$\psi_{JT}$	Junction-to-top characterization parameter	1.9	
$\psi_{JB}$	Junction-to-board characterization parameter	25.7	
$R_{\theta Jcbot}$	Junction-to-case (bottom) thermal resistance	7.2	

### 8.5 Electrical Characteristics

$V_{IN} = 3.6V$ ,  $T_A = -40^{\circ}C$  to  $85^{\circ}C$  typical values are at  $T_A = 25^{\circ}C$  (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
<b>SUPPLY</b>						
$V_{IN}$	Input voltage range		2.2		5.5	V
$I_Q$	Operating quiescent current	$EN = V_{IN}, CTRL = GND, I_{OUT} = 0\mu A, V_{OUT} = 1.8V$ , device not switching,		360	1800	nA
		$EN = V_{IN}, I_{OUT} = 0mA, CTRL = GND, V_{OUT} = 1.8V$ , device switching		460		
		$EN = V_{IN}, I_{OUT} = 0mA, CTRL = V_{IN}, V_{OUT} = 1.8V$ , device not switching		12.5		$\mu$ A
$I_{SD}$	Shutdown current	$EN = GND$ , shutdown current into $V_{IN}$		70	1000	nA
		$EN = GND$ , shutdown current into $V_{IN}, T_A = 60^{\circ}C$		150	450	
$V_{TH\_UVLO+}$	Undervoltage lockout threshold	Rising $V_{IN}$		2.075	2.15	V
$V_{TH\_UVLO-}$		Falling $V_{IN}$		1.925	2	
<b>INPUTS EN, CTRL, VSEL 1-4</b>						
$V_{IH\ TH}$	High level input threshold	$2.2V \leq V_{IN} \leq 5.5V$			1.1	V
$V_{IL\ TH}$	Low level input threshold	$2.2V \leq V_{IN} \leq 5.5V$		0.4		V
$I_{IN}$	Input bias Current	$T_A = 25^{\circ}C$			10	nA
		$T_A = -40^{\circ}C$ to $85^{\circ}C$			25	
<b>POWER SWITCHES</b>						
$R_{DS(ON)}$	High side MOSFET on-resistance	$V_{IN} = 3.6V, I_{OUT} = 50mA$		0.6	0.85	$\Omega$
	Low Side MOSFET on-resistance			0.36	0.5	

**Electrical Characteristics (continued)**
 $V_{IN} = 3.6V$ ,  $T_A = -40^{\circ}C$  to  $85^{\circ}C$  typical values are at  $T_A = 25^{\circ}C$  (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT	
$I_{LIMF}$	High side MOSFET switch current limit	$2.2V \leq V_{IN} \leq 5.5V$ , TPS62740	480	600	720	mA

			$T_A = -40^{\circ}C$ to $85^{\circ}C$		1010		
<b>LOAD OUTPUT (LOAD)</b>							
$R_{LOAD}$	High side MOSFET on-resistance	$I_{LOAD} = 50mA$ , CTRL = $V_{IN}$ , VOUT = 2.0V, $2.2V \leq V_{IN} \leq 5.5V$		0.6	1.25	$\Omega$	
$R_{DSCH\_LOAD}$	Low side MOSFET on-resistance	CTRL = GND, $2.2V \leq V_{IN} \leq 5.5V$ , $I_{LOAD} = -10mA$		30	65		
$t_{Rise\_LOAD}$	$V_{LOAD}$ rise time	Starting with CTRL low to high transition, time to ramp $V_{LOAD}$ from 0V to 95% VOUT = 1.8V, $2.2V \leq V_{IN} \leq 5.5V$ , $I_{LOAD} = 1mA$		315	800	$\mu s$	
<b>AUTO 100% MODE TRANSITION</b>							
$V_{TH\_100+}$	Auto 100% Mode leave detection threshold <sup>(1)</sup>	Rising $V_{IN}$ , 100% Mode is left with $V_{IN} = V_{OUT} + V_{TH\_100+}$ , max value at $T_J = 85^{\circ}C$	170	250	340	mV	
$V_{TH\_100-}$	Auto 100% Mode enter detection threshold <sup>(1)</sup>	Falling $V_{IN}$ , 100% Mode is entered with $V_{IN} = V_{OUT} + V_{TH\_100-}$ , max value at $T_J = 85^{\circ}C$	110	200	280		
<b>POWER GOOD OUTPUT (PG, OPEN DRAIN)</b>							
$V_{TH\_PG+}$	Power good threshold voltage	Rising output voltage on VOUT pin, referred to $V_{VOUT}$		97.5%			
$V_{PG\_Hys}$		Hysteresis			-3%		
$V_{OL}$	Low level output voltage	$2.2V \leq V_{IN} \leq 5.5V$ , EN = GND, current into PG pin $I_{PG} = 4mA$			0.3	V	
$I_{IN\_PG}$	Bias current into PG pin	PG pin is high impedance, VOUT = 2V, EN = $V_{IN}$ , CTRL = GND, $I_{OUT} = 0mA$	$T_A = 25^{\circ}C$	0	10	nA	
			$T_A = -40^{\circ}C$ to $85^{\circ}C$		25		
<b>OUTPUT</b>							
$t_{ONmin}$	Minimum ON time	$V_{IN} = 3.6V$ , $V_{OUT} = 2.0V$ , $I_{OUT} = 0mA$		225		ns	
$t_{OFFmin}$	Minimum OFF time	$V_{IN} = 2.3V$		50		ns	
$t_{Startup\_delay}$	Regulator start up delay time	$V_{IN} = 3.6V$ , from transition EN = low to high until device starts switching		10	25	ms	
$t_{Softstart}$	Softstart time with reduced switch current limit	$2.2V \leq V_{IN} \leq 5.5V$ , EN = $V_{IN}$		700	1200	$\mu s$	
$I_{LIM\_softstart}$	High side MOSFET switch current limit	Reduced switch current limit during softstart	TPS62740	80	150	200	mA
			TPS62742		150		
	Low side MOSFET switch current limit			150			
$V_{VOUT}$	Output voltage range	Output voltages are selected with pins VSEL 1 - 4		1.8	3.3	V	
	Output voltage accuracy	$V_{IN} = 3.6V$ , $I_{OUT} = 10mA$ , $V_{OUT} = 1.8V$	-2.5	0%	2.5		
		$V_{IN} = 3.6V$ , $I_{OUT} = 100mA$ , $V_{OUT} = 1.8V$	-2	0%	2		
	DC output voltage load regulation	$V_{OUT} = 1.8V$ , $V_{IN} = 3.6V$ , CTRL = $V_{IN}$		0.001		%/mA	
DC output voltage line regulation	$V_{OUT} = 1.8V$ , CTRL = $V_{IN}$ , $I_{OUT} = 10mA$ , $2.5V \leq V_{IN} \leq 5.5V$		0		%/V		

(1)  $V_{IN}$  is compared to the programmed output voltage ( $V_{OUT}$ ). When  $V_{IN} - V_{OUT}$  falls below  $V_{TH\_100-}$ , the device enters 100% Mode by turning the high side MOSFET on. The 100% Mode is exited when  $V_{IN} - V_{OUT}$  exceeds  $V_{TH\_100+}$  and the device starts switching. The hysteresis for the 100% Mode detection threshold  $V_{TH\_100+} - V_{TH\_100-}$  will always be positive and will be approximately 50 mV(typ.)

## 9 Detailed Description

### 9.1 Overview

The TPS6274x is the first step down converter with an ultra low quiescent current consumption (360nA typ.) and featuring TI's DCS-Control™ topology while maintaining a regulated output voltage. The device extends high efficiency operation to output currents down to a few micro amperes.

### 9.2 Functional Block Diagram

### 9.3 Feature Description

#### 9.3.1 DCS-Control™

TI's DCS-Control™ (Direct Control with Seamless Transition into Power Save Mode) is an advanced regulation topology, which combines the advantages of hysteretic and voltage mode control. Characteristics of DCS-Control™ are excellent AC load regulation and transient response, low output ripple voltage and a seamless transition between PFM and PWM mode operation. DCS-Control™ includes an AC loop which senses the output voltage (VOUT pin) and directly feeds the information to a fast comparator stage. This comparator sets the switching frequency, which is constant for steady state operating conditions, and provides immediate response to dynamic load changes. In order to achieve accurate DC load regulation, a voltage feedback loop is used. The internally compensated regulation network achieves fast and stable operation with small external components and low ESR capacitors.

## Feature Description (continued)

The DCS-Control™ topology supports PWM (Pulse Width Modulation) mode for medium and high load conditions and a Power Save Mode at light loads. During PWM mode, it operates in continuous conduction. The switching frequency is up to 2MHz with a controlled frequency variation depending on the input voltage. If the load current decreases, the converter seamlessly enters Power Save Mode to maintain high efficiency down to very light loads. In Power Save Mode the switching frequency varies nearly linearly with the load current. Since DCS-Control™ supports both operation modes within one single building block, the transition from PWM to Power Save Mode is seamless without effects on the output voltage. The TPS6274x offers both excellent DC voltage and superior load transient regulation, combined with very low output voltage ripple, minimizing interference with RF circuits. At high load currents, the converter operates in quasi fixed frequency PWM mode operation and at light loads, in PFM (Pulse Frequency Modulation) mode to maintain highest efficiency over the full load current range. In PFM Mode, the device generates a single switching pulse to ramp up the inductor current and recharge the output capacitor, followed by a sleep period where most of the internal circuits are shutdown to achieve a lowest quiescent current. During this time, the load current is supported by the output capacitor. The duration of the sleep period depends on the load current and the inductor peak current.

During the sleep periods, the current consumption of TPS6274x is reduced to 360nA. This low quiescent current consumption is achieved by an ultra low power voltage reference, an integrated high impedance (typ. 50MΩ) feedback divider network and an optimized DCS-Control™ block.

### 9.3.2 CTRL / Output Load

With the CTRL pin set to high, the LOAD pin is connected to the VOUT pin via an load switch and can power up an additional, temporarily used sub-system. The load switch is slew rate controlled to support soft switching and not to impact the regulated output VOUT. If CTRL pin is pulled to GND, the LOAD pin is disconnected from the VOUT pin and internally connected to GND by an internal discharge switch. When CTRL pin is set to high, the Quiescent current of the DCS control block is increased to typ. 12.5μA. This ensures excellent transient response on both outputs VOUT and LOAD in case of a sudden load step at the LOAD output. The CTRL pin can be controlled by a micro controller.

### 9.3.3 Enable / Shutdown

The DC/DC converter is activated when the EN pin is set to high. For proper operation, the pin must be terminated and must not be left floating. With the EN pin set to low, the device enters shutdown mode with less than typ. 70nA current consumption.

### 9.3.4 Power Good Output (PG)

The Power Good comparator features an open drain output. The PG comparator is active with EN pin set to high and  $V_{IN}$  is above the threshold  $V_{TH\_UVLO+}$ . It is driven to high impedance once  $V_{OUT}$  trips the threshold  $V_{TH\_PG+}$  for rising  $V_{OUT}$ . The output is pulled to low level once  $V_{OUT}$  falls below the PG hysteresis,  $V_{PG\_hys}$ . The output is also pulled to low level in case the input voltage  $V_{IN}$  falls below the undervoltage lockout threshold  $V_{TH\_UVLO-}$  or the device is disabled with EN = low. The power good output (PG) can be used as an indicator for the system to signal that the converter has started up and the output voltage is in regulation.

### 9.3.5 Output Voltage Selection (VSEL1 – 4)

The TPS6274x doesn't require an external resistor divider network to program the output voltage. The device integrates a high impedance (typ. 50MΩ) feedback resistor divider network which is programmed by the pins VSEL 1-4. TPS6274x supports an output voltage range of 1.8V to 3.3V in 100mV steps. The output voltage can be changed during operation and supports a simple dynamic output voltage scaling, shown in [Figure 47](#). The output voltage is programmed according to [table Table 1](#).

### 9.3.6 Softstart

When the device is enabled, the internal reference is powered up and after the startup delay time  $t_{Startup\_delay}$  has expired, the device enters softstart, starts switching and ramps up the output voltage. During softstart the device operates with a reduced current limit,  $I_{LIM\_softstart}$ , of typ. 1/4 of the nominal current limit. This reduced current limit is active during the softstart time  $t_{Softstart}$ . The current limit is increased to its nominal value,  $I_{LIMF}$ , once the softstart time has expired.

## Feature Description (continued)

### 9.3.7 Undervoltage Lockout UVLO

The device includes an under-voltage lockout (UVLO) comparator which prevents the device from misoperation at too low input voltages. The UVLO comparator becomes active once the device is enabled with EN set to high. Once the input voltage trips the UVLO threshold  $V_{TH\_UVLO+}$  (typically 2.075V) for rising  $V_{IN}$ , the UVLO comparator releases the device for start up and operation. With a falling input voltage, the device operates down to the UVLO threshold level  $V_{TH\_UVLO-}$  (typically 1.925V). Once this threshold is tripped, the device stops switching, the load switch at pin LOAD is disabled and both rails, VOUT and LOAD are discharged. The converter starts operation again once the input voltage trips the rising UVLO threshold level  $V_{TH\_UVLO+}$ .

## 9.4 Device Functional Modes

### 9.4.1 VOUT And LOAD Output Discharge

Both the VOUT pin and the LOAD pin feature a discharge circuit to connect each rail to GND, once they are disabled. This feature prevents residual charge voltages on capacitors connected to these pins, which may impact proper power up of the main- and sub-system. With CTRL pin pulled to low, the discharge circuit at the LOAD pin becomes active. With the EN pin pulled to low, the discharge circuits at both pins VOUT and Load are active. The discharge circuits of both rails VOUT and LOAD are associated with the UVLO comparator as well. Both discharge circuits become active once the UVLO comparator triggers and the input voltage  $V_{IN}$  has dropped below the UVLO comparator threshold  $V_{TH\_UVLO-}$  (typ. 1.925V).

### 9.4.2 Automatic Transition Into 100% Mode

Once the input voltage comes close to the output voltage, the DC/DC converter stops switching and enters 100% duty cycle operation. It connects the output VOUT via the inductor and the internal high side MOSFET switch to the input VIN, once the input voltage  $V_{IN}$  falls below the 100% mode enter threshold,  $V_{TH\_100-}$ . The DC/DC regulator is turned off, not switching and therefore it generates no output ripple voltage. Because the output is connected to the input, the output voltage tracks the input voltage minus the voltage drop across the internal high side switch and the inductor caused by the output current. Once the input voltage increases and trips the 100% mode leave threshold,  $V_{TH\_100+}$ , the DC/DC regulator turns on and starts switching again. See [Figure 6](#), [Figure 49](#), [Figure 50](#), [Figure 51](#).

**Figure 6. Automatic 100% Mode Transition**

## **Device Functional Modes (continued)**

### **9.4.3 Internal Current Limit**

The TPS6274x integrates a current limit on the high side, as well the low side MOSFETs to protect the device against overload or short circuit conditions. The peak current in the switches is monitored cycle by cycle. If the high side MOSFET current limit is reached, the high side MOSFET is turned off and the low side MOSFET is turned on until the current decreases below the low side MOSFET current limit.

### **9.4.4 Dynamic Voltage Scaling with VSEL Interface**

During operation, the output voltage of the device can be changed, see [Figure 47](#). The device will not actively ramp down the output voltage from a higher to a lower level.

## 10 Application and Implementation

### 10.1 Application Information

The TPS6274x devices are a step down converter family featuring typ. 360nA quiescent current and operating with a tiny 2.2μH inductor and 10μF output capacitor. This new DCS-Control™ based devices extend the light load efficiency range below 10μA load currents. TPS62740 supports output currents up to 300mA, TPS62742 up to 400mA. The devices operate from rechargeable Li-Ion batteries, Li-primary battery chemistries such as Li-SOCl<sub>2</sub>, Li-MnO<sub>2</sub> and two or three cell alkaline batteries.

### 10.2 Typical Application

**Figure 7. TPS62740 Typical Application Circuit**

**Figure 8. TPS62742 Typical Application Circuit**

#### 10.2.1 Design Requirements

The TPS6274x is a highly integrated DC/DC converter. The output voltage is set via a VSEL pin interface without any additional external components. For proper operation only a input- and output capacitor and an inductor is required. The integrated load switch doesn't require a capacitor on its LOAD pin. Table 2 shows the components used for the application characteristic curves.

**Table 2. Components for Application Characteristic Curves**

Reference	Description	Value	Manufacturer
TPS62740/42	360nA Iq step down converter		Texas Instruments
CIN, COUT, CLOAD	Ceramic capacitor GRM188R60J106M	10μF	Murata
L	Inductor LPS3314	2.2μH	Coilcraft

### 10.2.2 Detailed Design Procedure

Table 3 shows the recommended output filter components. The TPS6274x is optimized for operation with a 2.2μH inductor and with 10μF output capacitor.

**Table 3. Recommended LC Output Filter Combinations**

Inductor Value [μH] <sup>(1)</sup>	Output Capacitor Value [μF] <sup>(2)</sup>		
	4.7μF	10μF	22μF
2.2	√	√ <sup>(3)</sup>	√

- (1) Inductor tolerance and current de-rating is anticipated. The effective inductance can vary by 20% and -30%.
- (2) Capacitance tolerance and bias voltage de-rating is anticipated. The effective capacitance can vary by 20% and -50%.
- (3) This LC combination is the standard value and recommended for most applications.

#### 10.2.2.1 Inductor Selection

The inductor value affects its peak-to-peak ripple current, the PWM-to-PFM transition point, the output voltage ripple and the efficiency. The selected inductor has to be rated for its DC resistance and saturation current. The inductor ripple current ( $\Delta I_L$ ) decreases with higher inductance and increases with higher  $V_{IN}$  or  $V_{OUT}$  and can be estimated according to Equation 1.

Equation 2 calculates the maximum inductor current under static load conditions. The saturation current of the inductor should be rated higher than the maximum inductor current, as calculated with Equation 2. This is recommended because during a heavy load transient the inductor current rises above the calculated value. A more conservative way is to select the inductor saturation current above the high-side MOSFET switch current limit,  $I_{LIMF}$ .

$$\Delta I_L = V_{out} \times \frac{1 - \frac{V_{out}}{V_{in}}}{L \times f} \quad (1)$$

$$I_{Lmax} = I_{outmax} + \frac{\Delta I_L}{2} \quad (2)$$

With:

f = Switching Frequency

L = Inductor Value

$\Delta I_L$  = Peak to Peak inductor ripple current

$I_{Lmax}$  = Maximum Inductor current

In DC/DC converter applications, the efficiency is essentially affected by the inductor AC resistance (i.e. quality factor) and by the inductor DCR value. Increasing the inductor value produces lower RMS currents, but degrades transient response. For a given physical inductor size, increased inductance usually results in an inductor with lower saturation current.

The total losses of the coil consist of both the losses in the DC resistance ( $R_{DC}$ ) and the following frequency-dependent components:

- The losses in the core material (magnetic hysteresis loss, especially at high switching frequencies)
- Additional losses in the conductor from the skin effect (current displacement at high frequencies)
- Magnetic field losses of the neighboring windings (proximity effect)
- Radiation losses

The following inductor series from different suppliers have been used:

**Table 4. List Of Inductors<sup>(1)</sup>**

INDUCTANCE [ $\mu$ H]	DIMENSIONS [ $\text{mm}^3$ ]	INDUCTOR TYPE	SUPPLIER
2.2	3.3 x 3.3 x 1.4	LPS3314	Coilcraft
2.2	2.5 x 3.0 x 1.5	VLF302515MT	TDK
2.2	2.0 x 1.2 x 1.0	MIPSZ2012 2R2	FDK
2.2	2.5 x 2.0 x 1.2	MIPSA2520 2R2	FDK
2.2	2.0 x 1.2 x 1.0	MDT2012CH2R2	TOKO

### 10.2.2.2 DC/DC Output Capacitor Selection

The DCS-Control™ scheme of the TPS6274x allows the use of tiny ceramic capacitors. Ceramic capacitors with low ESR values have the lowest output voltage ripple and are recommended. The output capacitor requires either an X7R or X5R dielectric. Y5V and Z5U dielectric capacitors, aside from their wide variation in capacitance over temperature, become resistive at high frequencies. At light load currents, the converter operates in Power Save Mode and the output voltage ripple is dependent on the output capacitor value and the PFM peak inductor current. A larger output capacitors can be used, but it should be considered that larger output capacitors lead to an increased leakage current in the capacitor and may reduce overall conversion efficiency. Furthermore, larger output capacitors impact the start up behavior of the DC/DC converter.

### 10.2.2.3 Input Capacitor Selection

Because the buck converter has a pulsating input current, a low ESR input capacitor is required for best input voltage filtering to ensure proper function of the device and to minimize input voltage spikes. For most applications a 10 $\mu$ F is sufficient. The input capacitor can be increased without any limit for better input voltage filtering.

Table 5 shows a list of tested input/output capacitors.

**Table 5. List Of Capacitors<sup>(1)</sup>**

CAPACITANCE [ $\mu$ F]	SIZE	CAPACITOR TYPE	SUPPLIER
10	0603	GRM188R60J106ME84	Murata

### 10.3 System Example

**Figure 52. Example Of Implementation In A Master MCU Based System**

## 11 Power Supply Recommendations

The power supply to the TPS6274x needs to have a current rating according to the supply voltage, output voltage and output current of the TPS6274x.

## 12 Layout

### 12.1 Layout Guidelines

As for all switching power supplies, the layout is an important step in the design. Care must be taken in board layout to get the specified performance. If the layout is not carefully done, the regulator could show poor line and/or load regulation, stability issues as well as EMI problems and interference with RF circuits. It is critical to provide a low inductance, impedance ground path. Therefore, use wide and short traces for the main current paths. The input capacitor should be placed as close as possible to the IC pins VIN and GND. The output capacitor should be placed close between VOUT and GND pins. The VOUT line should be connected to the output capacitor and routed away from noisy components and traces (e.g. SW line) or other noise sources. The exposed thermal pad of the package and the GND pin should be connected. See [Figure 53](#) for the recommended PCB layout.

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSELETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

Refer to the product data sheet for package details.

# DSS0012A

## PACKAGE OUTLINE

### WSON - 0.8 mm max height

PLASTIC SMALL OUTLINE - NO LEAD

4222684/A 02/2016

#### NOTES:

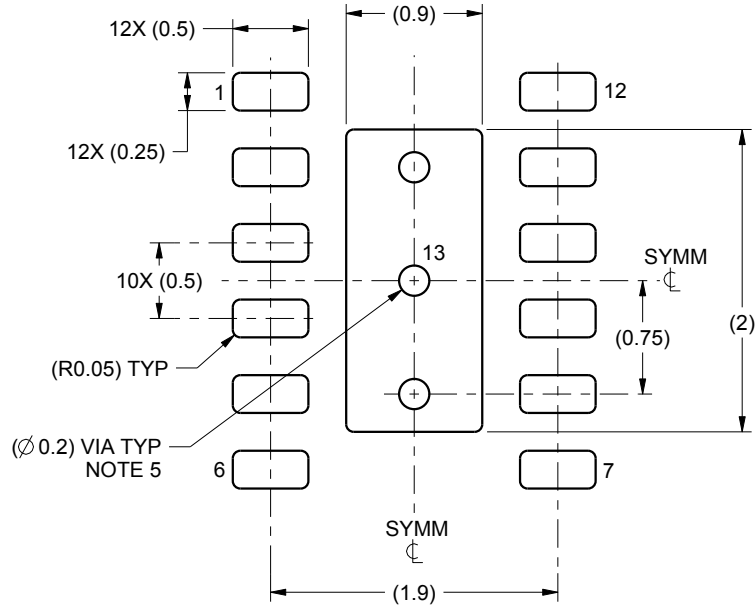

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.

# EXAMPLE BOARD LAYOUT

DSS0012A

WSON - 0.8 mm max height

PLASTIC SMALL OUTLINE - NO LEAD

LAND PATTERN EXAMPLE  
SCALE:20X

SOLDER MASK DETAILS

4222684/A 02/2016

NOTES: (continued)

4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 ([www.ti.com/lit/sluea271](http://www.ti.com/lit/sluea271)).
5. Vias are optional depending on application, refer to device data sheet. If some or all are implemented, recommended via locations are shown. It is recommended that vias located under solder paste be filled, plugged or tented.

# EXAMPLE STENCIL DESIGN

DSS0012A

WSON - 0.8 mm max height

PLASTIC SMALL OUTLINE - NO LEAD

SOLDER PASTE EXAMPLE  
BASED ON 0.125 mm THICK STENCIL

EXPOSED PAD 13:  
90% PRINTED SOLDER COVERAGE BY AREA UNDER PACKAGE  
SCALE:20X

4222684/A 02/2016

NOTES: (continued)

6. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.

## 重要声明和免责声明

TI“按原样”提供技术和可靠性数据（包括数据表）、设计资源（包括参考设计）、应用或其他设计建议、网络工具、安全信息和其他资源，不保证没有瑕疵且不做任何明示或暗示的担保，包括但不限于对适销性、某特定用途方面的适用性或不侵犯任何第三方知识产权的暗示担保。

这些资源可供使用 TI 产品进行设计的熟练开发人员使用。您将自行承担以下全部责任：(1) 针对您的应用选择合适的 TI 产品，(2) 设计、验证并测试您的应用，(3) 确保您的应用满足相应标准以及任何其他功能安全、信息安全、监管或其他要求。
