

## TUSB73x0 USB 3.0 xHCI 主机控制器

### 1 特性

- 符合 USB 3.0 标准的 xHCI 主机控制器
  - PCIe x1 Gen2 接口
  - 4 个下行端口
- 2 个或 4 个下行端口
- 每个下行端口
  - 可能需要单独启用或禁用
  - 可针对传输摆幅、去加重功能和均衡设置进行调节
  - 可能会标记为可拆卸或不可拆卸
  - 具有独立电源控制与过流检测
- 默认配置无需外部闪存
  - 针对自定义配置的可选串行 EEPROM
- 内部展频生成
  - 低成本晶体或振荡器支持
- 卓越的自适应接收器均衡器设计

### 2 应用

- 机架式服务器、微服务器和塔式服务器
- 高性能计算
- 存储区域网络 (SAN) 和主机总线适配器 (HBA) 卡
- 台式计算机或主板

### 3 说明

TUSB7320 最多支持两个下行端口。TUSB7340 是一款兼容 USB 3.0 的 xHCI 主机控制器，最多支持四个下行端口。这两种部件均采用 100 引脚 RKM 封装且引脚兼容。下文中使用 TUSB73x0 统一指代 TUSB7320 和 TUSB7340。

TUSB73x0 通过一个 PCIe x1 Gen 2 接口连接到主机系统，可在下行 USB 端口提供超速、高速、全速或低速连接。

器件信息

| 器件型号 <sup>(1)</sup> | USB 端口计数 | 封装             |
|---------------------|----------|----------------|
| TUSB7320            | 2 端口     | (WQFN-MR, 100) |
| TUSB7340            | 4 端口     |                |

(1) 如需了解所有可用封装，请参阅数据表末尾的可订购产品附录。

典型应用

图 4-2. RKM Package, 100-Pin WQFN-MR Exposed Thermal Pad TUSB7340 (Top View)

The following tables give a description of the terminals. These terminals are grouped in tables by functionality. Each table includes the terminal name, terminal number, I/O type, and terminal description.

| TYPE   | DESCRIPTION               |
|--------|---------------------------|
| I      | Input                     |
| O      | Output                    |
| I/O    | Input/Output              |
| PD, PU | Internal pull-down/pullup |
| S      | Strapping pin             |
| P      | Power supply              |
| G      | Ground                    |

| PIN                     |          |          | TYPE | DESCRIPTION                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------------|----------|----------|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NAME                    | TUSB7320 | TUSB7340 |      |                                                                                                                                                                                                                                                                                                                                                                                          |
| CLOCK AND RESET SIGNALS |          |          |      |                                                                                                                                                                                                                                                                                                                                                                                          |
| GRST#                   | A15      | A15      | I PU | Global power reset. This reset brings all of the TUSB73x0 internal registers to their default states. When GRST# is asserted, the device is completely nonfunctional. GRST# should be asserted until all power rails are valid at the device. If a 24 MHz or 48 MHz reference clock is used instead of a crystal, GRST# must remain asserted until the 24 MHz or 48 MHz clock is stable. |
| XI                      | A23      | A23      | I    | Crystal input. This terminal is the crystal input for the internal oscillator. The input may alternately be driven by the output of an external oscillator. When using a crystal a 2-M $\Omega$ feedback resistor is required between XI and XO.                                                                                                                                         |
| XO                      | A22      | A22      | O    | Crystal output. This terminal is crystal output for the internal oscillator. If XI is driven by an external oscillator this pin may be left unconnected. When using a crystal a 2-M $\Omega$ feedback resistor is required between XI and XO.                                                                                                                                            |
| FREQSEL                 | B14      | B14      | I    | Frequency select. This terminal indicates the oscillator input frequency and is used to configure the correct PLL multiplier. This pin should be set low for normal operation.                                                                                                                                                                                                           |
| PCIE_REFCLKP            | A45      | A45      | I    | PCI Express Reference Clock. PCIE_REFCLKP and PCIE_REFCLKN comprise the differential input pair for the 100-MHz system reference clock.                                                                                                                                                                                                                                                  |
| PCIE_REFCLKN            | B41      | B41      | I    |                                                                                                                                                                                                                                                                                                                                                                                          |
| PERST#                  | A40      | A40      | I    | PCI Express Reset Input. The PERST# signal is used to signal when the system power is stable. The PERST# signal is also used to generate an internal power on reset                                                                                                                                                                                                                      |
| PCI EXPRESS SIGNALS     |          |          |      |                                                                                                                                                                                                                                                                                                                                                                                          |
| PCIE_TXP                | B38      | B38      | O    | PCI Express transmitter differential pair (positive).                                                                                                                                                                                                                                                                                                                                    |
| PCIE_TXN                | A41      | A41      | O    | PCI Express transmitter differential pair (negative).                                                                                                                                                                                                                                                                                                                                    |
| PCIE_RXP                | B39      | B39      | I    | PCI Express receiver differential pair (positive).                                                                                                                                                                                                                                                                                                                                       |

| V <sub>O</sub> Output voltage        | PCI Express (TX)                  | 0.8   | 1.2         | V    |
|                                      | Miscellaneous 3.3 V IO            | – 0.5 | VDD33 + 0.5 | V    |
| T <sub>stg</sub> Storage temperature |                                   | – 65  | 150         | °C   |

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

### 5.2 ESD Ratings

|                                            |                                                                                | VALUE | UNIT |
|--------------------------------------------|--------------------------------------------------------------------------------|-------|------|
| V <sub>(ESD)</sub> Electrostatic discharge | Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>              | ±1500 | V    |
|                                            | Charged-device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup> | ±500  |      |

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.  
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 5.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

|                                                     |                          | MIN   | NOM | MAX  | UNIT |
|-----------------------------------------------------|--------------------------|-------|-----|------|------|
| Supply voltage range                                | VDD33                    | 3     | 3.3 | 3.6  | V    |
|                                                     | VDDA_3P3                 | 3     | 3.3 | 3.6  |      |
|                                                     | VDD11 <sup>(1) (2)</sup> | 1.045 | 1.1 | 1.21 | V    |
| T <sub>A</sub> Operating free-air temperature range |                          | 0     |     | 70   | °C   |
|                                                     | Industrial version       | – 40  |     | 85   |      |
| T <sub>J</sub> Operating junction temperature range |                          | 0     |     | 105  | °C   |
|                                                     | Industrial version       | – 40  |     | 105  |      |

- (1) A 1.05-V supply may be used as long as the minimum supply conditions are met.  
(2) 1.1 V –5% / +10% supply is recommended.

## 5.4 Thermal Information

| THERMAL METRIC <sup>(1)</sup> |                                              | TUSB7320, TUSB7340 | UNIT |
|-------------------------------|----------------------------------------------|--------------------|------|
|                               |                                              | RKM (WQFN-MR)      |      |
|                               |                                              | 100 PINS           |      |
| $R_{\theta JA}$               | Junction-to-ambient thermal resistance       | 25.6               | °C/W |
| $R_{\theta JC(top)}$          | Junction-to-case (top) thermal resistance    | 9.5                | °C/W |
| $R_{\theta JB}$               | Junction-to-board thermal resistance         | 15.2               | °C/W |
| $\psi_{JT}$                   | Junction-to-top characterization parameter   | 0.1                | °C/W |
| $\psi_{JB}$                   | Junction-to-board characterization parameter | 7.5                | °C/W |
| $R_{\theta JC(bot)}$          | Junction-to-case (bottom) thermal resistance | 0.4                | °C/W |

## 5.5 3.3-V I/O Electrical Characteristics

over operating free-air temperature range (unless otherwise noted)

| PARAMETER | OPERATION                                                                                | TEST CONDITIONS             | MIN        | MAX   | UNIT |
|-----------|------------------------------------------------------------------------------------------|-----------------------------|------------|-------|------|
| $V_{IH}$  | High-level input voltage <sup>(1)</sup>                                                  | VDD33                       | 2          | VDD33 | V    |
| $V_{IL}$  | Low-level input voltage <sup>(1)</sup>                                                   | VDD33                       | 0          | 0.8   | V    |
|           |                                                                                          | JTAG pins only              | 0          | 0.55  | V    |
| $V_I$     | Input voltage                                                                            |                             | 0          | VDD33 | V    |
| $V_O$     | Output voltage <sup>(2)</sup>                                                            |                             | 0          | VDD33 | V    |
| $t_t$     | Input transition time ( $t_{rise}$ and $t_{fall}$ )                                      |                             | 0          | 25    | ns   |
| $V_{hys}$ | Input hysteresis <sup>(3)</sup>                                                          |                             | 0.13 VDD33 |       | V    |
| $V_{OH}$  | High-level output voltage                                                                | VDD33<br>$I_{OH} = -4$ mA   | 2.4        |       | V    |
| $V_{OL}$  | Low-level output voltage                                                                 | VDD33<br>$I_{OL} = 4$ mA    |            | 0.4   | V    |
| $I_{OZ}$  | High-impedance, output current <sup>(2)</sup>                                            | VDD33<br>$V_I = 0$ to VDD33 |            | ±20   | µA   |
| $I_{OZP}$ | High-impedance, output current with internal pullup or pull-down resistor <sup>(4)</sup> | VDD33<br>$V_I = 0$ to VDD33 |            | ±225  | µA   |
| $I_I$     | Input current <sup>(5)</sup>                                                             | VDD33<br>$V_I = 0$ to VDD33 |            | ±15   | µA   |

- (1) Applies to external inputs and bidirectional buffers.  
 (2) Applies to external outputs and bidirectional buffers.  
 (3) Applies to PERST, GRST, and PME.  
 (4) Applies to GRST (pullup) and most GPIO (pullup).  
 (5) Applies to external input buffers.

## 5.6 Input Clock Specification

See [External Clock](#).

| PARAMETER                                                     | TEST CONDITIONS         | MIN | TYP | MAX  | UNIT |
|---------------------------------------------------------------|-------------------------|-----|-----|------|------|
| Frequency Tolerance                                           | Operational Temperature |     |     | ±50  | ppm  |
| Frequency Stability                                           | 1 year aging            |     |     | ±100 | ppm  |
| Rise / Fall Time                                              | 20% - 80%               |     |     | 6    | ns   |
| Reference Clock $R_J$ with JTF (1 sigma) <sup>(1) (2)</sup>   |                         |     | 0.8 |      | ps   |
| Reference Clock $T_J$ with JTF (total p-p) <sup>(2) (3)</sup> |                         |     | 25  |      | ps   |
| Reference Clock Jitter (absolute p-p) <sup>(4)</sup>          |                         |     | 50  |      | ps   |

- (1) Sigma value assuming Gaussian distribution.  
 (2) After application of JTF.  
 (3) Calculated as  $14.1 \times R_J + D_J$

(4) Absolute phase jitter (p-p)

## 5.7 Input Clock 1.8-V DC Characteristics

See [External Clock](#).

| PARAMETER | TEST CONDITION                                                                            | MIN            | TYP | MAX            | UNIT |

| System hibernate                           | 63              | 66.15  | 4              | 13.20  | 79.35   |

- (1) *Device active* indicates that connected devices are actively transferring data.  
 (2) No downstream devices are connected.

## 6 Detailed Description

### 6.1 Overview

The TUSB73x0 interfaces to the host system through a PCIe x1 Gen 2 interface and provides SuperSpeed, high-speed, full-speed, or low-speed connections on the downstream USB ports.

### 6.2 Functional Block Diagram

## 6.3 Feature Description

### 6.3.1 PHY Control

#### 6.3.1.1 Output Voltage Swing Control

The output swing of each transmitter can be independently set to one of a number of settings through the SWING bits in the [De-Emphasis and Swing Control Register](#) section.

Reducing the output amplitude decreases the current drawn in direct proportion to the reduction in swing, thereby saving power.

**表 6-1. Differential Output Swing**

| SWING VALUE | AC-COUPLED AMPLITUDE |
|-------------|----------------------|
| 0000        | 2.7                  |
| 0001        | 147                  |
| 0010        | 222                  |
| 0011        | 298                  |
| 0100        | 373                  |
| 0101        | 449                  |
| 0110        | 525                  |
| 0111        | 600                  |
| 1000        | 702                  |
| 1001        | 777                  |
| 1010        | 853                  |
| 1011        | 928                  |
| 1100        | 1050                 |
| 1101        | 1082                 |
| 1110        | 1164                 |
| 1111        | 1253                 |

### 6.3.1.1.1 De-Emphasis Control

De-emphasis provides a means to compensate for high-frequency attenuation in the attached media. De-emphasis causes the output amplitude to be smaller for bits which are not preceded by a transition than for bits which are. Fifteen different de-emphasis settings are provided through the PORTx\_DE bits in [De-Emphasis and Swing Control Register](#).

表 6-2. Differential Output De-Emphasis

| VALUE | AMPLITUDE REDUCTION |        |
|-------|---------------------|--------|
|       | %                   | dB     |
| 0000  | 0                   | 0      |
| 0001  | 5.33                | -0.48  |
| 0010  | 9.52                | -0.87  |
| 0011  | 13.8                | -1.29  |
| 0100  | 18.1                | -1.73  |
| 0101  | 22.5                | -2.21  |
| 0110  | 27.0                | -2.73  |
| 0111  | 31.4                | -3.28  |
| 1000  | 36.2                | -3.9   |
| 1001  | 40.8                | -4.55  |
| 1010  | 45.4                | -5.26  |
| 1011  | 50.2                | -6.05  |
| 1100  | 55.0                | -6.93  |
| 1101  | 59.7                | -7.90  |
| 1110  | 64.5                | -8.99  |
| 1111  | 69.3                | -10.27 |

### 6.3.1.2 Adaptive Equalizer

All receive channels in this macro family incorporate an adaptive equalizer, which can compensate for channel insertion loss by attenuating the low frequency components with respect to the high frequency components of the signal, thereby reducing inter-symbol interference.

The equalizer can be configured through the Portx\_EQ bits of the [Equalizer Control Register](#). 表 6-3 summarizes the options, which are:

- **No adaptive equalization.** The equalizer provides a flat response at the maximum gain. This setting may be appropriate if jitter at the receiver occurs predominantly as a result of crosstalk rather than frequency dependent loss.
- **Fully adaptive equalization.** Both the low frequency gain and zero position of the equalizer are determined algorithmically by analyzing the data patterns and transition positions in the received data. FTC refers to the algorithm that controls the zero position. In the FTC normal mode, the zero is decreased in frequency when more equalization is needed; in the FTC reversed mode, the zero is increased in frequency when more equalization is needed. The fully adaptive with FTC reversed setting should be used for most applications.
- **Hold.** The equalizer state is held at its current gain level and zero point.
- **Initialize.** The equalizer is initialized to a mid-point gain level, with the zero set to a frequency appropriate for the receiver data rate.
- **Partially adaptive equalization.** The low frequency gain of the equalizer is determined algorithmically by analyzing the data patterns and transition positions in the received data. The zero position is fixed in one of eight zero positions. For any given application, the optimal setting is a function of the loss characteristics of the channel and the spectral density of the signal as well as the data rate, which means it is not possible to

identify the best setting by data rate alone, although generally speaking, the lower the line rate, the lower the zero frequency that will be required.

When enabled, the receiver equalization logic analyzes data patterns and transition times to determine whether the low frequency gain of the equalizer should be increased or decreased. For the fully adaptive setting (**EQ** = 0001), if the low frequency gain reaches the minimum value, the zero frequency is then reduced. Likewise, if it reaches the maximum value, the zero frequency is then increased.

The decision logic is implemented as a voting algorithm with a relatively long analysis interval. The slow time constant that results reduces the probability of incorrect decisions but allows the equalizer to compensate for the relatively stable response of the channel.

**表 6-3. Receiver Equalizer Configuration**

| EQ VALUE | AMPLITUDE REDUCTION          |                |
|----------|------------------------------|----------------|
|          | LOW-FREQUENCY GAIN           | ZERO FREQUENCY |
| 0000     | Maximum                      | -              |
| 0001     | Fully Adaptive, FTC Normal   |                |
| 0010     | Fully Adaptive, FTC Reversed |                |
| 0011     | Hold                         |                |
| 0100     | Initialize                   |                |
| 0101     |                              |                |
| 0110     |                              |                |
| 0111     |                              |                |
| 1000     | Partially Adaptive           | 365 MHz        |
| 1001     |                              | 275 MHz        |
| 1010     |                              | 195 MHz        |
| 1011     |                              | 140 MHz        |
| 1100     |                              | 105 MHz        |
| 1101     |                              | 75 MHz         |
| 1110     |                              | 55 MHz         |
| 1111     |                              | 50 MHz         |

### 6.3.2 Input Clock

#### 6.3.2.1 Clock Source Requirements

The TUSB73x0 supports an external oscillator source or a crystal unit. The frequency of the clock source may be 24 MHz or 48 MHz. If a clock is provided to XI instead of a crystal, XO is left open and VSSOSC should be connected to the PCB ground plane. Otherwise, if a crystal is used, the connection needs to follow the guidelines below.

Because XI and XO are coupled to other leads and supplies on the PCB, it is important to keep them as short as possible and away from any switching leads. It is also recommended to minimize the capacitance between XI and XO. This can be accomplished by connecting the VSSOSC lead to the two external capacitors CL1 and CL2 and shielding them with the clean ground lines. The VSSOSC should not be connected to PCB ground when using a crystal.

Load capacitance ( $C_{load}$ ) of the crystal varying with the crystal vendors is the total capacitance value of the entire oscillation circuit system as seen from the crystal. It includes two external capacitors CL1 and CL2.

图 6-1. Oscillation Circuit

### 6.3.2.2 External Clock

When using an external clock source, the reference clock should have a  $\pm 100$  PPM or better frequency stability and have less than 50-ps absolute peak to peak jitter or less than 25-ps peak to peak jitter after applying the USB 3.0 jitter transfer function. XI should be tied to the clock source and XO should be left floating. The input clock must be 1.8-V LVCMOS; this input is not 3.3-V tolerant.

### 6.3.2.3 External Crystal

An external 2-M $\Omega$  feedback resistor is required between XI and XO when using a crystal. See [Crystal Specification](#) for additional crystal specifications.

## 6.4 Programming

### 6.4.1 Two-Wire Serial-Bus Interface

The host controller provides a two-wire serial-bus interface to load subsystem identification information and specific register defaults from an external EEPROM. The serial-bus interface signals include SDA and SCL. The use of an external EEPROM is optional. The TUSB73x0 will function with the default settings. For motherboard down applications, BIOS can be used to set all of the options available on the TUSB73x0.

On a PCIe Add-in Card, an EEPROM is only needed if any of the following is true:

- Mark one or more USB ports as non-removable.
- Disable one or more USB ports.
- Set a PCIe Subsystem ID and Subsystem Vendor ID.
- Change the default de-emphasis/swing/equalizer settings of the SuperSpeed USB ports.
- Change the default L0s and L1 latency values for PCIe.
- Change the default PWRON polarity to active high instead of active low.

#### 6.4.1.1 Serial-Bus Interface Implementation

To enable the serial-bus interface, a pullup resistor must be implemented on the SCL signal. At the rising edge of PERST# or GRST#, whichever occurs later in time, the SCL terminal is checked for a pullup resistor. If one is detected, then bit 3 (SBDETECT) in [Serial Bus Control and Status Register](#) is set. Software may disable the serial-bus interface at any time by writing a 0b to the SBDETECT bit. If no external EEPROM is required, then the serial-bus interface is permanently disabled by attaching a pull-down resistor to the SCL signal.

The host controller implements a two-terminal serial interface with one clock signal (SCL) and one data signal (SDA). The SCL signal is an unidirectional output from the host controller and the SDA signal is bidirectional. Both are open-drain signals and require pullup resistors. The host controller is a bus controller device and drives SCL at approximately 60 kHz during data transfers and places SCL in a high-impedance state (0 frequency) during bus idle states. The serial EEPROM is a bus target device and must acknowledge a target address equal to A0h. 图 6-2 illustrates an example application implementing the two-wire serial bus.

图 6-2. Serial EEPROM Application

#### 6.4.1.2 Serial-Bus Interface Protocol

All data transfers are initiated by the serial-bus controller. The beginning of a data transfer is indicated by a start condition, which is signaled when the SDA line transitions to the low state while SCL is in the high state, as illustrated in 图 6-3. The end of a requested data transfer is indicated by a stop condition, which is signaled by a low-to-high transition of SDA while SCL is in the high state, as shown in 图 6-3. Data on SDA must remain stable during the high state of the SCL signal, as changes on the SDA signal during the high state of SCL are interpreted as control signals, that is, a start or stop condition.

图 6-3. Serial-Bus Start and Stop Conditions and Bit Transfers

Data is transferred serially in 8-bit bytes. During a data transfer operation, the exact number of bytes that are transmitted is unlimited. However, each byte must be followed by an acknowledge bit to continue the data transfer operation. An acknowledge (ACK) is indicated by the data byte receiver pulling the SDA signal low, so that it remains low during the high state of the SCL signal. 图 6-4 illustrates the acknowledge protocol.

**图 6-4. Serial-Bus Protocol Acknowledge**

The host controller performs three basic serial-bus operations: single byte reads, single byte writes, and multibyte reads. The single byte operations occur under software control. The multibyte read operations are performed by the serial EEPROM initialization circuitry immediately after a PCI Express reset. See [TUSB7340 Power Consumption](#), [Serial-Bus EEPROM Application](#), for details on how the host controller automatically loads the subsystem identification and other register defaults from the serial-bus EEPROM.

图 6-5 illustrates a single byte write. The host controller issues a start condition and sends the 7-bit target device address and the R/W command bit is equal to 0b. A 0b in the R/W command bit indicates that the data transfer is a write. The target device acknowledges if it recognizes the target address. If no acknowledgment is received by the host controller, then bit 1 (SB\_ERR) is set in the serial-bus control and status register (PCI offset BCh, see [Serial Bus Control and Status Register](#)). Next, the EEPROM word address is sent by the host controller, and another target acknowledgment is expected. Then the host controller delivers the data byte MSB first and expects a final acknowledgment before issuing the stop condition.

**图 6-5. Serial-Bus Protocol – Byte Write**

图 6-6 illustrates a single byte read. The host controller issues a start condition and sends the 7-bit target device address and the R/W command bit is equal to 0b (write). The target device acknowledges if it recognizes the target address. Next, the EEPROM word address is sent by the host controller, and another target acknowledgment is expected. Then, the host controller issues a restart condition followed by the 7-bit target address and the R/W command bit is equal to 1b (read). Once again, the target device responds with an acknowledge. Next, the target device sends the 8-bit data byte, MSB first. Because this is a 1-byte read, the host controller responds with no acknowledge (logic high) indicating the last data byte. Finally, the host controller issues a stop condition.

**图 6-6. Serial-Bus Protocol – Byte Read**

图 6-7 illustrates the serial interface protocol during a multibyte serial EEPROM download. The serial-bus protocol starts exactly the same as a 1-byte read. The only difference is that multiple data bytes are transferred. The number of transferred data bytes is controlled by the host controller. After each data byte, the host controller issues acknowledge (logic low) if more data bytes are requested. The transfer ends after a host controller no acknowledge (logic high) followed by a stop condition.

图 6-7. Serial-Bus Protocol – Multibyte Read

Bit 7 (PROT\_SEL) in the serial-bus control and status register changes the serial-bus protocol. Each of the three previous serial-bus protocol figures illustrates the PROT\_SEL bit default (logic low). When this control bit is asserted, the word address and corresponding acknowledge are removed from the serial-bus protocol. This feature allows the system designer a second serial-bus protocol option when selecting external EEPROM devices.

#### 6.4.1.3 Serial-Bus EEPROM Application

A serial EEPROM interface is implemented to pre-load several registers. The registers and corresponding bits that are loaded through the EEPROM are provided in 表 6-4.

表 6-4. EEPROM Register Loading Map

| SERIAL EEPROM WORD ADDRESS | BYTE DESCRIPTION                               |
|----------------------------|------------------------------------------------|
| 00h                        | TUSB73X0 Function Indicator (00h)              |
| 01h                        | Number of Bytes (19h)                          |
| 02h                        | PCI D0h, Subsystem Vendor ID, Byte 0           |
| 03h                        | PCI D1h, Subsystem Vendor ID, Byte 1           |
| 04h                        | PCI D2h, Subsystem ID, Byte 0                  |
| 05h                        | PCI D3h, Subsystem ID, Byte 1                  |
| 06h                        | PCI D4h, General Control 0, Byte 0             |
| 07h                        | PCI D5h, General Control 0, Byte 1             |
| 08h                        | PCI D8h, General Control 1, Byte 0             |
| 09h                        | PCI DCh, General Control 2, Byte 0             |
| 0Ah                        | PCI E0h, USB Control, Byte 0                   |
| 0Bh                        | PCI E1h, USB Control, Byte 1                   |
| 0Ch                        | PCI E2h, USB Control, Byte 2                   |
| 0Dh                        | PCI E3h, USB Control, Byte 3                   |
| 0Eh                        | PCI E4h, De-emphasis and Swing Control, Byte 0 |
| 0Fh                        | PCI E5h, De-emphasis and Swing Control, Byte 1 |
| 10h                        | PCI E6h, De-emphasis and Swing Control, Byte 2 |
| 11h                        | PCI E7h, De-emphasis and Swing Control, Byte 3 |
| 12h                        | PCI E8h, Equalizer Control, Byte 0             |
| 13h                        | PCI E9h, Equalizer Control, Byte 1             |
| 14h                        | PCI EAh, Equalizer Control, Byte 2             |
| 15h                        | PCI EBh, Equalizer Control, Byte 3             |

**表 6-4. EEPROM Register Loading Map (续)**

| SERIAL EEPROM WORD ADDRESS | BYTE DESCRIPTION                                     |
|----------------------------|------------------------------------------------------|
| 16h                        | PCI ECh, Custom PHY Transmit/Receive Control, Byte 0 |
| 17h                        | PCI EDh, Custom PHY Transmit/Receive Control, Byte 1 |
| 18h                        | PCI EEh, Custom PHY Transmit/Receive Control, Byte 2 |
| 19h                        | PCI EFh, Custom PHY Transmit/Receive Control, Byte 3 |
| 1Ah                        | PCI 61h, Frame Length Adjustment Register            |
| 1Bh                        | End of List Indicator (80h)                          |

This format must be explicitly followed for the host controller to correctly load initialization values from a serial EEPROM. All byte locations must be considered when programming the EEPROM.

The serial EEPROM is addressed by the host controller at target address 1010 000b. This target address is internally hardwired and cannot be changed by the system designer. Therefore, all three hardware address bits for the EEPROM are tied to VSS to achieve this address. The serial EEPROM in the sample application circuit (图 6-2) assumes the 1010b high-address nibble. The lower three address bits are terminal inputs to the chip, and the sample application shows these terminal inputs tied to VSS.

During an EEPROM download operation, bit 4 (ROMBUSY) in the serial-bus control and status register is asserted. After the download is finished, bit 0 (ROM\_ERR) in the serial-bus control and status register may be monitored to verify a successful download.

#### 6.4.2 System Management Interrupt

The TUSB73X0 includes a System Management Interrupt (SMI) pin to allow for USB support in the BIOS of a system that implements the TUSB73X0. The SMI pin is controlled by the bits in the USB Legacy Support Control/Status Register. See [USB Legacy Support Control/Status Register](#) for more information. If there are no SMI events pending or if all sources for SMI are disabled, the TUSB73X0 drives the SMI pin low. When an SMI event occurs and the corresponding event is enabled, the TUSB73X0 drives the SMI pin high until the event is cleared or disabled.

## 7 Application and Implementation

### 备注

以下应用部分中的信息不属于 TI 器件规格的范围，TI 不担保其准确性和完整性。TI 的客户应负责确定器件是否适用于其应用。客户应验证并测试其设计，以确保系统功能。

### 7.1 Application Information

The TUSB7340EVM board is a free-standing reference design for a four-port PCIe – based SuperSpeed USB (USB 3.0) Extensible Host Controller (xHCI). It is used to evaluate system compatibility. A Microsoft® WHQL certified xHCI compliant driver stack is provided as well. The TUSB7340 is fully backwards compatible to USB 2.0 supporting USB peripherals and hubs that support all data transfer speeds: USB 2.0 Low – speed (1.5 Mbps), USB 2.0 Full – speed (12 Mbps), USB 2.0 High – speed (480 Mbps), as well as SuperSpeed USB (5 Gbps). A SuperSpeed peripheral is required to evaluate SuperSpeed data transfer.

#### 7.1.1 特性

- 兼容 HCI 的驱动程序堆栈
- 支持所有 USB 数据传输速率
  - 支持全速和低速
  - 支持高速
  - 支持超高速
- 强大的设备类支持
- 面向大容量存储设备的 UASP 支持
- 适用于 Windows XP™、Windows Vista™ 和 Windows® 7
  - 同时支持 32 位和 64 位
- 可从开源社区获取 Linux® 支持

## 7.2 Typical Application

图 7-1. TUSB7320 DEMO EVM REV B

图 7-2. TUSB7340 DEMO EVM REV B

### 7.2.1 Design Requirements

表 7-1. Design Parameters

| PARAMETERS            | VALUES         |
|-----------------------|----------------|
| Input voltage range   | 1.1 V to 3.3 V |
| Output voltage        | 5 V            |
| Output current rating | 484 MHz        |

## 7.2.2 Detailed Design Procedure

### 7.2.2.1 Upstream Implementation

The upstream port of the TUSB7320 is connected to a PCIe x1 Gen 2 interface. As we are using a 48-Mhz external crystal, an external 2-M $\Omega$  feedback resistor is required between XI and XO.

图 7-3. Reference Design 1

### 7.2.2.2 Downstream Ports Implementation

The downstream ports of the TUSB7320 is connected to a USB3 Type A connector.

图 7-4. Reference Design 2

### 7.2.2.3 PCI Express Connector

The PERp and PERn signals must be attached to the coupling capacitor (0.1  $\mu$ F).

图 7-5. Reference Design 3

### 7.2.2.4 1.1-V Regulator

To use only one power source, a 1.1-V regulator must be used.

#### 1.1V REGULATOR

图 7-6. Reference Design 4

### 7.2.2.5 5-V VBUS Options

There are two options that can be implemented to generate the 5-V source; the first one is using a 5-V regulator, and the second one is using the IDE power connector.

## 5V VBUS OPTIONS

### OPTION 1: 5V REGULATOR

### OPTION 2: 5V FROM IDE CONNECTOR

## 7.3 Power Supply Recommendations

### 7.3.1 Power-Up and Power-Down Sequencing

The host controller contains both 1.1-V and 3.3-V power terminals. The following power-up and power-down sequences describe how power is applied to these terminals.

In addition, the host controller has three resets: PERST#, GRST#, and an internal power-on-reset. These resets are fully described in the next section. The following power-up and power-down sequences describe how PERST# is applied to the host controller.

The application of the PCI Express reference clock (PCIE\_REFCLK) is important to the power-up/-down sequence and is included in the following power-up and power-down descriptions.

#### 7.3.1.1 Power-Up Sequence

1. Assert PERST# to the device.
2. Apply 3.3-V followed by 1.1-V voltages. The recommended 1.1-V and 3.3-V power supply ramp time is greater than or equal to 1 ms (measured from 0% to 100%).
3. GRST# must remain asserted until both the 1.1-V and 3.3-V voltages have reached the minimum recommended operating voltage, see [Recommended Operating Conditions](#). If a 24 MHz or 48 MHz reference clock is used instead of a crystal, GRST# must remain asserted until the 24 MHz or 48 MHz clock is stable.
4. Apply a stable PCI Express reference clock.
5. To meet PCI Express specification requirements, PERST cannot be deasserted until the following two delay requirements are satisfied:

Wait a minimum of 100  $\mu$ s after applying a stable PCI Express reference clock. The 100- $\mu$ s limit satisfies the requirement for stable device clocks by the de-assertion of PERST.

Wait a minimum of 100 ms after applying power. The 100-ms limit satisfies the requirement for stable power by the de-assertion of PERST.

See the power-up sequencing diagram in [图 7-16](#).

图 7-16. Power-Up Sequence

### 7.3.1.2 Power-Down Sequence

1. Assert PERST# to the device.
2. Remove the reference clock.
3. Remove the 3.3-V and 1.1-V voltages

See the power power-down sequencing diagram in 图 7-17. If the VDD33\_AUX terminal is to remain powered after a system shutdown, then the host controller power-down sequence is exactly the same as shown in 图 7-17.

图 7-17. Power-Down Sequence

### 7.3.2 PCI Express Power Management

The TUSB73X0 includes the MSI-X Table and PBA in memory mapped register space (see 表 8-195). These registers are accessible through the address programmed into the Base Address Register 2/3.

## 7.4 Layout

### 7.4.1 Layout Guidelines

#### 7.4.1.1 High-Speed Differential Routing

The high-speed differential pair (USB\_DM and USB\_DP) is connected to a type A USB connector. The differential pair traces should be routed with  $90\ \Omega \pm 15\%$  differential impedance. The high-speed signal pair should be trace length matched. Maximum trace length mismatch between high speed USB signal pairs should be no greater than 150 mils. Keep total trace length to a minimum, if routing longer than six inches contact TI to address signal integrity concerns. Route differential traces first.

Route the differential pairs on the top or bottom layers with the minimum amount of vias possible. No termination or coupling caps are required. If a common mode choke is required then place the choke as close as possible to the USB connector signal pins. Likewise ESD clamps should also be placed as close as possible to the USB connector signal pins (closer than the choke).

For more detailed information, you may also see the [USB 2.0 Board Design and Layout Guidelines](#) which describes general PCB design and layout guidelines for the USB 2.0 differential pair (DP/DM).

#### 7.4.1.2 SuperSpeed Differential Routing

SuperSpeed consists of two differential routing pairs, a transmit pair (USB\_SSTXM and USB\_SSTXP) and a receive pair (USB\_SSRXM and USB\_SSRXP). Each differential pair traces should be routed with  $90\ \Omega \pm 15\%$  differential impedance. The high-speed signal pair should be trace length matched. Maximum trace length mismatch between SuperSpeed USB signal pairs should be no greater than 5 mils. The total length for each differential pair can be no longer than six inches, this is based on the SS USB compliance channel specification, and should be avoided if at all possible. TI recommends that the SuperSpeed differential pairs be as short as possible.

The transmit differential pair does not have to be the same length as the receive differential pair. Keep total trace length to a minimum. Route differential traces first. Route the differential pairs on the top or bottom layers with

the minimum amount of vias possible. The transmitter differential pair requires 0.1- $\mu$ F coupling capacitors for proper operation. The package/case size of these capacitors should be no bigger than 0402. C-packs are not allowed. The capacitors should be placed symmetrically as close as possible to the USB connector signal pins.

If a common mode choke is required, then place the choke as close as possible to the USB connector signal pins (closer than the transmitter capacitors). Likewise, ESD clamps should also be placed as close as possible to the USB connector signal pins (closer than the choke and transmitter capacitors).

It is permissible to swap the plus and minus on either or both of the SuperSpeed differential pairs. This may be necessary to prevent the differential traces from crossing over one another. However, it is not permissible to swap the transmitter differential pair with the receive differential pair.

TI recommends to use a 2010 pad for the inside pins provided no pad is used for adjacent pins. Instead use a pad on one of the inside pins then for the next pad route the trace between the outer pins to a via.

To minimize cross-talk on the SS USB differential signal pair, it is recommended that the spacing between the TX and RX signal pairs for each interface be five times the width of the trace (5-W rule). For instance, if the SS USB TX differential pair trace width is 5 mils, then there should be 25 mils of space between the TX and RX differential pairs. If this 5-W rule cannot be implemented, then the space between the TX and RX differential pairs should be maximized as much as possible and ground-fill should be placed between the two. In this case, it is better to route each differential pair on opposite sides of the board with a ground plane between them.

## 8 Register Maps

### 8.1 Classic PCI Configuration Space

#### 8.1.1 The PCI Configuration Map

The programming model of the TUSB73X0 USB 3.0 Host Controller is compliant to the standard PCI device programming model. The PCI configuration map uses the type 0 PCI header.

Sticky bits, which are reset by a global reset (GRST) or the internally-generated power-on-reset, and bits that are reset by a PCI Express reset (PERST), a GRST, or the internally generated power-on-reset are indicated as such.

**表 8-1. PCI Configuration Register Map**

| REGISTER NAME                     |                           |                      |                           | OFFSET    |

### 8.1.2 Vendor ID Register

This 16-bit read only register contains the value 104Ch, which is the vendor ID assigned to Texas Instruments.

PCI register offset: 00h

Register type: Read-only

Default value: 104Ch

**表 8-2. PCI Register 00h**

| Bit No.     | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Reset State | 0  | 0  | 0  | 1  | 0  | 0  | 0 | 0 | 0 | 1 | 0 | 0 | 1 | 1 | 0 | 0 |

### 8.1.3 Device ID Register

This 16-bit read only register contains the value 8241h, which is the device ID assigned by TI to the TUSB73X0.

PCI register offset: 02h

Register type: Read-only

Default value: 8241h

**表 8-3. PCI Register 02h**

| Bit No.     | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Returns zeros when read.                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 10    | INT_DISABLE    | rw     | INTx# Disable. This bit enables device specific interrupts.                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 9     | FBB_ENB        | r      | Fast back-to-back enable. The host controller does not generate fast back-to-back transactions; therefore, this bit returns 0 when read.                                                                                                                                                                                                                                                                                                                                                  |
| 8     | SERR_ENB       | rw     | SERR enable bit. When this bit is set, the host controller can signal fatal and nonfatal errors on the PCI Express interface on behalf of SERR assertions detected on the PCI bus.<br>0 = Disable the reporting of nonfatal errors and fatal errors (default)<br>1 = Enable the reporting of nonfatal errors and fatal errors                                                                                                                                                             |
| 7     | STEP_ENB       | r      | Address/data stepping control. The host controller does not support address/data stepping, and this bit is hardwired to 0b.                                                                                                                                                                                                                                                                                                                                                               |
| 6     | PERR_ENB       | rw     | Controls the setting of bit 8 (DATAPAR) in the status register (offset 06h, see <a href="#">Status Register</a> ) in response to a received poisoned TLP from PCI Express. A received poisoned TLP is forwarded with bad parity to conventional PCI regardless of the setting of this bit.<br>0 = Disables the setting of the controller data parity error bit (default)<br>1 = Enables the setting of the controller data parity error bit                                               |
| 5     | VGA_ENB        | r      | VGA palette snoop enable. The host controller does not support VGA palette snooping; therefore, this bit returns 0b when read.                                                                                                                                                                                                                                                                                                                                                            |
| 4     | MWI_ENB        | r      | Memory write and invalidate enable. The host controller does not support memory write and invalidate enable; therefore, this bit returns 0b when read.                                                                                                                                                                                                                                                                                                                                    |
| 3     | SPECIAL        | r      | Special cycle enable. This host controller does not respond to special cycle transactions; therefore, this bit returns 0 when read.                                                                                                                                                                                                                                                                                                                                                       |
| 2     | CONTROLLER_ENB | rw     | Bus controller enable. When this bit is set, the host controller is enabled to initiate transactions on the PCI Express interface.<br>0 = PCI Express interface cannot initiate transactions. The host controller must disable the response to memory and I/O transactions on the PCI interface (default).<br>1 = PCI Express interface can initiate transactions. The host controller can forward memory and I/O transactions from PCI secondary interface to the PCI Express interface. |
| 1     | MEMORY_ENB     | rw     | Memory space enable. Setting this bit enables the host controller to respond to memory transactions on the PCI Express interface.<br>0 = PCI Express receiver cannot process downstream memory transactions and must respond with an unsupported request (default)<br>1 = PCI Express receiver can process downstream memory transactions. The host controller can forward memory transactions to the PCI interface.                                                                      |

| BIT | FIELD NAME | ACCESS | DESCRIPTION                                                                                                                                                                                                                                                                                                                                                                                           |
|-----|------------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0   | IO_ENB     | r      | I/O space enable. Setting this bit enables the host controller to respond to I/O transactions on the PCI Express interface.<br>0 = PCI Express receiver cannot process downstream I/O transactions and must respond with an unsupported request (default)<br>1 = PCI Express receiver can process downstream I/O transactions. The host controller can forward I/O transactions to the PCI interface. |

### 8.1.5 Status Register

The status register provides information about the PCI Express interface to the system.

PCI register offset: 06h

Register type: Read-only, Read/Clear

Default value: 0010h

**表 8-6. PCI Register 06h**

| Bit No.     | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Reset State | 0  | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**表 8-7. Status Register Description**

| BIT  | FIELD NAME    | ACCESS | DESCRIPTION                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------|---------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 15   | PAR_ERR       | rcu    | Detected parity error. This bit is set when the PCI Express interface receives a poisoned TLP. This bit is set regardless of the state of bit 6 (PERR_ENB) in the command register (offset 04h, see <a href="#">Command Register</a> ).<br>0 = No parity error detected<br>1 = Parity error detected                                                                                                                                                                   |
| 14   | SYS_ERR       | rcu    | Signaled system error. This bit is set when the host controller sends an ERR_FATAL or ERR_NONFATAL message and bit 8 (SERR_ENB) in the command register (offset 04h, see <a href="#">Command Register</a> ) is set.<br>0 = No error signaled<br>1 = ERR_FATAL or ERR_NONFATAL signaled                                                                                                                                                                                 |
| 13   | MABORT        | rcu    | Received controller abort. This bit is set when the PCI Express interface of the host controller receives a completion-with-unsupported-request status.<br>0 = Unsupported request not received on the PCI Express interface<br>1 = Unsupported request received on the PCI Express interface                                                                                                                                                                          |
| 12   | TABORT_REC    | rcu    | Received target abort. This bit is set when the PCI Express interface of the host controller receives a completion-with-completer-abort status.<br>0 = Completer abort not received on the PCI Express interface<br>1 = Completer abort received on the PCI Express interface                                                                                                                                                                                          |
| 11   | TABORT_SIG    | rcu    | Signaled target abort. This bit is set when the PCI Express interface completes a request with completer abort status.<br>0 = Completer abort not signaled on the PCI Express interface<br>1 = Completer abort signaled on the PCI Express interface                                                                                                                                                                                                                   |
| 10:9 | DEVSEL_TIMING | r      | DEVSEL Timing. These bits are read only zero, because they do not apply to PCI Express.                                                                                                                                                                                                                                                                                                                                                                                |
| 8    | DATAPAR       | rcu    | controller data parity error. This bit is set if bit 6 (PERR_ENB) in the command register (offset 04h, see <a href="#">Command Register</a> ) is set and the host controller receives a completion with data marked as poisoned on the PCI Express interface or poisons a write request received on the PCI Express interface.<br>0 = No uncorrectable data error detected on the primary interface<br>1 = Uncorrectable data error detected on the primary interface. |
| 7    | FBB_CAP       | r      | Fast back-to-back capable. This bit does not have a meaningful context for a PCI Express device and is hardwired to 0b.                                                                                                                                                                                                                                                                                                                                                |
| 6    | RSVD          | r      | Reserved. Returns zeros when read.                                                                                                                                                                                                                                                                                                                                                                                                                                     |

表 8-7. Status Register Description (续)

| BIT | FIELD NAME | ACCESS | DESCRIPTION                                                                                                                 |
|-----|------------|--------|-----------------------------------------------------------------------------------------------------------------------------|
| 5   | 66MHZ      | r      | 66 MHz capable. This bit does not have a meaningful context for a PCI Express device and is hardwired to 0b.                |
| 4   | CAPLIST    | r      | Capabilities list. This bit returns 1b when read, indicating that the host controller supports additional PCI capabilities. |
| 3   | INT_STATUS | ru     | Interrupt Status. This bit reflects the interrupt status of the function.                                                   |
| 2:0 | RSVD       | r      | Reserved. Returns zeros when read.                                                                                          |

### 8.1.6 Class Code and Revision ID Register

This read only register categorizes the Base Class, Sub Class, and Programming Interface of the TUSB73X0. The Base Class is 0Ch, identifying the device as a Serial Bus Controller. The Sub Class is 03h, identifying the function as a Universal Serial Bus Host Controller, and the Programming Interface is 30h, identifying the function as a USB 3.0 xHCI Host Controller. Furthermore, the TI chip revision is indicated in the lower byte (02h).

PCI register offset: 08h

Register type: Read-only

Default value: 0C03 3002h

表 8-8. PCI Register 06h

| Bit No.     | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Reset State | 0  | 0  | 0  | 0  | 1  | 1  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 1  | 1  |

| Bit No.     | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Reset State | 0  | 0  | 1  | 1  | 0  | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 |

表 8-9. Class Code and Revision ID Register Description

| BIT   | FIELD NAME | ACCESS | DESCRIPTION                                                                                                                        |
|-------|------------|--------|------------------------------------------------------------------------------------------------------------------------------------|
| 31:24 | BASECLASS  | r      | Base Class. This field returns 0Ch when read, which classifies the function as a Serial Bus Controller.                            |
| 23:16 | SUBCLASS   | r      | Sub Class. This field returns 03h when read, which specifically classifies the function as a Universal Serial Bus Host Controller. |
| 15:8  | PGMIF      | r      | Programming Interface. This field returns 30h when read, which identifies the function as a USB 3.0 xHCI Host Controller.          |
| 7:0   | CHIPREV    | r      | Silicon Revision. This field returns the silicon revision of the function. This field is 02h.                                      |

### 8.1.7 Cache Line Size Register

This 8-bit register is read/write for legacy compatibility purposes and is not applicable to the functionality of the TUSB73X0.

PCI register offset: 0Ch

Register type: Read/Write

Default value: 00h

表 8-10. PCI Register 0Ch

| Bit No.     | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------|---|---|---|---|---|---|---|---|---|
| Reset State | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

### 8.1.8 Latency Timer Register

This read-only register has no meaningful context for a PCI Express device and returns zeros when read.

PCI register offset: 0Dh

Register type: Read-only

Default value: 00h

**表 8-11. PCI Register 0Dh**

| Bit No.     | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------|---|---|---|---|---|---|---|---|---|
| Reset State | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

### 8.1.9 Header Type Register

This read only register indicates that this function has a type 0 PCI header. Bit seven of this register is zero indicating that the TUSB73X0 is not a Multifunction device.

PCI register offset: 0Eh

Register type: Read-only

Default value: 00h

**表 8-12. PCI Register 0Eh**

| Bit No.     | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------|---|---|---|---|---|---|---|---|---|
| Reset State | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

### 8.1.10 BIST Register

Because the TUSB73X0 does not support a built-in self test (BIST), this read only register returns the value of 00h when read.

PCI register offset: 0Fh

Register type: Read-only

Default value: 00h

**表 8-13. PCI Register 0Fh**

| Bit No.     | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------|---|---|---|---|---|---|---|---|---|
| Reset State | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

### 8.1.11 Base Address Register 0

This register is used to program the memory address used to access the device control registers.

PCI register offset: 10h

Register type: Read/Write, Read-only

Default value: 0000 0004h

**表 8-14. PCI Register 10h**

| Bit No.     | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Reset State | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

| Bit No.     | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Reset State | 0  | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 |

**表 8-15. Base Address Register 0 Description**

| BITS  | FIELD NAME | ACCESS | DESCRIPTION                                                                                                                                                                    |
|-------|------------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31:16 | ADDRESS    | rw     | Memory Address. The lower 32 bits of the 64-bit memory address field for the TUSB73X0. The TUSB73X0 uses 16 read/write bits indicating that 64 kB of memory space is required. |
| 15:4  | RSVD       | r      | Reserved. These bits are read-only and return zeros when read.                                                                                                                 |
| 3     | PRE_FETCH  | r      | Prefetchable. This bit is read only 0 indicating that this memory window is not prefetchable.                                                                                  |
| 2:1   | MEM_TYPE   | r      | Memory Type. This field is read only 10b indicating that this window can be located anywhere in the 64-bit address space.                                                      |
| 0     | MEM_IND    | r      | Memory Space Indicator. This field returns 0 indicating that memory space is used.                                                                                             |

### 8.1.12 Base Address Register 1

This register is used to program the memory address used to access the device control registers.

PCI register offset: 14h

Register type: Read/Write

Default value: 0000 0000h

**表 8-16. PCI Register 14h**

| Bit No.     | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Reset State | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

| Bit No.     | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Reset State | 0  | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**表 8-17. Base Address Register 1 Description**

| BITS | FIELD NAME | ACCESS | DESCRIPTION                                                                                           |
|------|------------|--------|-------------------------------------------------------------------------------------------------------|
| 31:0 | ADDRESS    | rw     | Memory Address. This field indicates the upper 32 bits of the 64-bit memory address for the TUSB73X0. |

### 8.1.13 Base Address Register 2

This register is used to program the memory address used to access the MSI-X Table and PBA.

PCI register offset: 18h

Register type: Read/Write, Read-only

Default value: 0000 0004h

**表 8-18. PCI Register 18h**

| Bit No.     | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Reset State | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

| Bit No.     | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Reset State | 0  | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 |

**表 8-19. Base Address Register 2 Description**

| BIT   | FIELD NAME | ACCESS | DESCRIPTION                                                                                                                                                     |
|-------|------------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31:20 | ADDRESS    | rw     | Memory Address. The lower 32 bits of the 64-bit memory address field for the TUSB73X0 uses 19 read/write bits indicating that 8 MB of memory space is required. |
| 19:4  | RSVD       | r      | Reserved. These bits are read-only and returns zeros when read.                                                                                                 |
| 3     | PRE_FETCH  | r      | Prefetchable. This bit is read only 0 indicating that this memory window is not prefetchable.                                                                   |
| 2:1   | MEM_TYPE   | r      | Memory Type. This field is read only 10b indicating that this window can be located anywhere in the 64-bit address space.                                       |
| 0     | MEM_IND    | r      | Memory Space Indicator. This field returns 0 indicating that memory space is used.                                                                              |

### 8.1.14 Base Address Register 3

This register is used to program the memory address used to access the MSI-X Table and PBA.

PCI register offset: 1Ch

Register type: Read/Write

Default value: 0000 0000h

**表 8-20. PCI Register 1Ch**

| Bit No.     | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Reset State | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

| Bit No.     | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Reset State | 0  | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**表 8-21. Table 9-3 Base Address Register 3 Description**

| BIT  | FIELD NAME | ACCESS | DESCRIPTION                                                                                           |
|------|------------|--------|-------------------------------------------------------------------------------------------------------|
| 31:0 | ADDRESS    | rw     | Memory Address. This field indicates the upper 32 bits of the 64-bit memory address for the TUSB73X0. |

### 8.1.15 Subsystem Vendor ID Register

This register, which is used for system and option card identification purposes, may be required for certain operating systems. This read-only register is a direct reflection of the Subsystem Access register, which is read/write and is initialized through the EEPROM (if present) or can be written through the Subsystem Alias Register at PCI Offset D0h.

PCI register offset: 2Ch

Register type: Read-only

Default value: 0000h

**表 8-22. PCI Register 2Ch**

| Bit No.     | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Reset State | 0  | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

### 8.1.16 Subsystem ID Register

This register, which is used for system and option card identification purposes, may be required for certain operating systems. This read-only register is a direct reflection of the Subsystem Access register, which is read/write and is initialized through the EEPROM (if present) or can be written through the Subsystem Alias Register at PCI Offset D0h.

PCI register offset: 2Eh

Register type: Read-only

Default value: 0000h

**表 8-23. PCI Register 2Eh**

| Bit No.     | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Reset State | 0  | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

### 8.1.17 Capabilities Pointer Register

This read-only register provides a pointer into the PCI configuration header where the PCI power management block resides. Because the PCI power management registers begin at 40h, this register is hardwired to 40h.

PCI register offset: 34h

Register type: Read-only

Default value: 40h

**表 8-24. PCI Register 34h**

| Bit No.     | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------|---|---|---|---|---|---|---|---|
| Reset State | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 |

### 8.1.18 Interrupt Line Register

This read/write register is programmed by the system and indicates to the software which interrupt line the TUSB73X0 has been assigned. The default value of this register is FFh, indicating that an interrupt line has not yet been assigned to the function

PCI register offset: 3Ch

Register type: Read-only

Default value: FFh

**表 8-25. PCI Register 3Ch**

| Bit No.     | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------|---|---|---|---|---|---|---|---|
| Reset State | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

### 8.1.19 Interrupt Pin Register

The Interrupt Pin register is read-only 01h indicating that the TUSB73X0 uses INTA.

PCI register offset: 3Dh

Register type: Read-only

Default value: 01h

**表 8-26. PCI Register 3Dh**

| Bit No.     | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------|---|---|---|---|---|---|---|---|
| Reset State | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |

### 8.1.20 Min Grant Register

This read-only register has no meaningful context for a PCI Express device and returns zeros when read.

PCI register offset: 3Eh

Register type: Read-only

Default value: 00h

**表 8-27. PCI Register 3Eh**

| Bit No.     | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------|---|---|---|---|---|---|---|---|
| Reset State | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

### 8.1.21 Max Latency Register

This read-only register has no meaningful context for a PCI Express device and returns zeros when read.

PCI register offset: 3Fh

Register type: Read-only

Default value: 00h

**表 8-28. PCI Register 3Fh**

| Bit No.     | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------|---|---|---|---|---|---|---|---|
| Reset State | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

### 8.1.22 Capability ID Register

This read-only register identifies the linked list item as the register for PCI Power management. The register returns 01h when read.

PCI register offset: 40h

Register type: Read-only

Default value: 01h

**表 8-29. PCI Register 40h**

| Bit No.     | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------|---|---|---|---|---|---|---|---|
| Reset State | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |

### 8.1.23 Next Item Pointer Register

The contents of this read-only register indicate the next item in the linked list of capabilities for the TUSB73X0. This register reads 48h pointing to the MSI Capability registers.

PCI register offset: 41h

Register type: Read-only

Default value: 48h

**表 8-30. PCI Register 41h**

| Bit No.     | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------|---|---|---|---|---|---|---|---|
| Reset State | 0 | 1 | 0 | 0 | 1 | 0 | 0 | 0 |

### 8.1.24 Power Management Capabilities Register

The read-only register indicates the capabilities of the TUSB73X0 related to PCI power management.

PCI register offset: 42h

Register type: Read-only

Default value: xxx3h

**表 8-31. PCI Register 42h**

| Bit No.     | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Reset State | x  | 1  | 1  | 1  | 1  | 1  | 1 | x | x | x | 0 | 0 | 0 | 0 | 1 | 1 |

**表 8-32. Power Management Capabilities Register Description**

| BIT   | FIELD NAME  | ACCESS | DESCRIPTION                                                                                                                                                                                                                      |
|-------|-------------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 15:11 | PME_SUPPORT | r      | PME# support. This five-bit field indicates the power states from which the TUSB73X0 may assert PME#. If the AUX_DET pin is 1, this field is 11111. If the AUX_DET pin is 0, this field is 01111.                                |
| 10    | D2_SUPPORT  | r      | This bit returns a 1 when read, indicating that the function supports the D2 device power state.                                                                                                                                 |
| 9     | D1_SUPPORT  | r      | This bit returns a 1 when read, indicating that the function supports the D1 device power state.                                                                                                                                 |
| 8:6   | AUX_CURRENT | r      | 3.3 Vaux auxiliary current requirements. If the AUX_DET pin is 1, this field is 010. If the AUX_DET pin is 0, this field is 000.                                                                                                 |
| 5     | DSI         | r      | Device Specific Initialization. This bit returns 0 when read, indicating that the TUSB73X0 does not require special initialization beyond the standard PCI configuration header before a generic class driver is able to use it. |
| 4     | RSVD        | r      | Reserved. Returns zero when read.                                                                                                                                                                                                |
| 3     | PME_CLK     | r      | PME# Clock.                                                                                                                                                                                                                      |
| 2:0   | PM_VERSION  | r      | Power Mgmt Version. This field returns 3' b011 indicating Rev 1.2 compatibility.                                                                                                                                                 |

### 8.1.25 Power Management Control/Status Register

This register determines and changes the current power state of the TUSB73X0.

PCI register offset: 44h

Register type: Read/Write, Read-only

Default value: 0008h

**表 8-33. PCI Register 44h**

| Bit No.     | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Reset State | 0  | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 |

**表 8-34. Power Management Control/Status Register Description**

| BIT   | FIELD NAME | ACCESS | DESCRIPTION                                                                                               |
|-------|------------|--------|-----------------------------------------------------------------------------------------------------------|
| 15    | PME_STAT   | rc     | PME# Status. This bit is sticky and is only reset by a Global Reset.                                      |
| 14:13 | DATA_SCALE | r      | Data Scale. This 2-bit field returns 0' s when read because the TUSB73X0 does not use the Data Register.  |
| 12:9  | DATA_SEL   | r      | Data Select. This 4-bit field returns 0' s when read because the TUSB73X0 does not use the Data Register. |
| 8     | PME_EN     | nw     | PME# Enable. This bit is sticky and is only reset by a Global Reset.                                      |

表 8-34. Power Management Control/Status Register Description (续)

| BITS | FIELD NAME    | ACCESS | DESCRIPTION                                                                                                                                                                                                        |
|------|---------------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 7:4  | RSVD          | r      | Reserved. Returns zero when read.                                                                                                                                                                                  |
| 3    | NO_SOFT_RESET | r      | No Soft Reset. This bit returns 1 indicating that no internal reset is generated and the device retains its configuration context when transitioning from the D3hot state to the D0 state.                         |
| 2    | RSVD          | r      | Reserved. Returns zero when read.                                                                                                                                                                                  |
| 1:0  | PWR_STATE     | rw     | Power State. This 2-bit field is used both to determine the current power state of the function and to set the function into a new power state. This field is encoded as follows: 00 = D001 = D110 = D211 = D3hot. |

**8.1.26 Power Management Bridge Support Extension Register**

This read-only register is not applicable to the TUSB73X0 and returns 00h when read.

PCI register offset: 46h

Register type: Read-only

Default value: 00h

表 8-35. PCI Register 46h

| Bit No.     | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------|---|---|---|---|---|---|---|---|
| Reset State | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**8.1.27 Power Management Data Register**

This read-only register is not applicable to the TUSB73X0 and returns 00h when read.

PCI register offset: 47h

Register type: Read-only

Default value: 00h

表 8-36. PCI Register 47h

| Bit No.     | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------|---|---|---|---|---|---|---|---|
| Reset State | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**8.1.28 MSI Capability ID Register**

This read-only register identifies the linked list item as the register for Message Signaled Interrupts Capabilities. The register returns 05h when read.

PCI register offset: 48h

Register type: Read-only

Default value: 05h

表 8-37. PCI Register 48h

| Bit No.     | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------|---|---|---|---|---|---|---|---|
| Reset State | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 1 |

### 8.1.29 Next Item Pointer Register

The contents of this read-only register indicate the next item in the linked list of capabilities for the TUSB73X0. This register reads 70h pointing to the PCI Express Capability registers.

PCI register offset: 49h

Register type: Read-only

Default value: 70h

**表 8-38. PCI Register 49h**

| Bit No.     | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------|---|---|---|---|---|---|---|---|
| Reset State | 0 | 1 | 1 | 1 | 0 | 0 | 0 | 0 |

### 8.1.30 MSI Message Control Register

The register is used to control the sending of MSI messages.

PCI register offset: 4Ah

Register type: Read/Write, Read-only

Default value: 0086h

**表 8-39. PCI Register 4Ah**

| Bit No.     | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Reset State | 0  | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 1 | 1 | 0 |

**表 8-40. MSI Message Control Register Description**

| BIT  | FIELD NAME | ACCESS | DESCRIPTION                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------|------------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 15:8 | RSVD       | r      | Reserved. Returns zeros when read.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 8    | PVM_CAP    | r      | Per-vector Masking Capable. This bit is read only 0 indicating that the TUSB73X0 does not support per-vector masking.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 7    | 64CAP      | r      | 64 Bit Message Capability. This bit is read only 1 indicating that the TUSB73X0 supports 64 bit MSI message addressing.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 6:4  | MM_EN      | rw     | Multiple Message Enable. This bit indicates the number of distinct messages that the TUSB73X0 is allowed to generate.<br>000 – 1 Message (All interrupters mapped to the same message)<br>001 – 2 Messages (Interrupters 0, 2, 4, and 6 mapped to message 0 and Interrupters 1, 3, 5, and 7 mapped to message 1)<br>010 – 4 Messages (Interrupters 0 and 4 mapped to message 0, Interrupters 1 and 5 mapped to message 1, Interrupters 2 and 6 mapped to message 2, Interrupters 3 and 7 mapped to message 3)<br>011 – 8 Messages (Interrupter # mapped to corresponding message #)<br>100 – 16 Messages (Interrupter # mapped to corresponding message #)<br>101 – 32 Messages (Interrupter # mapped to corresponding message #)<br>110 – Reserved<br>111 – Reserved |
| 3:1  | MM_CAP     | r      | Multiple Message Capabilities. This field indicates the number of distinct messages that TUSB73X0 is capable of generating. This field is read only 011 indicating that the TUSB73X0 can signal 8 distinct messages.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 0    | MSI_EN     | rw     | MSI Enable. This bit is used to enable MSI interrupt signaling. MSI signaling must be enabled by software for the TUSB73X0 to signal an MSI<br>0 – MSI signaling is prohibited<br>1 – MSI signaling is enabled                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

### 8.1.31 MSI Lower Message Address Register

This register contains the lower 32 bits of the address that a MSI message is written to when an interrupt is to be signaled.

PCI register offset: 4Ch

Register type: Read/Write

Default value: 0000 0000h

**表 8-41. PCI Register 4Ch**

| Bit No.     | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

| 1:0  | RSVD       | r      | Reserved. Return zeros when read. |

### 8.1.32 MSI Upper Message Address Register

This register contains the upper 32 bits of the address that a MSI message is written to when an interrupt is to be signaled. If this register is 0000 0000h, 32-bit addressing is used; otherwise, 64-bit addressing is used.

PCI register offset: 50h

Register type: Read/Write

Default value: 0000 0000h

**表 8-43. PCI Register 4Ch**

| Bit No.     | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

### 8.1.33 MSI Message Data Register

This 16-bit register contains the data that software programmed the device to send when it sends a MSI message.

PCI register offset: 54h

Register type: Read/Write

Default value: 0000h

**表 8-44. PCI Register 54h**

| Bit No.     | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Reset State | 0  | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**表 8-45. MSI Message Data Register Description**

| BIT  | FIELD NAME | ACCESS | DESCRIPTION                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------|------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 15:4 | MSG        | rw     | System Specific Message. This field contains the portion of the message that the TUSB73X0 can never modify.                                                                                                                                                                                                                                                                                                                                                                                                         |
| 3:0  | MSG_NUM    | rw     | Message Number. This portion of the message field may be modified to contain the message number if multiple messages are enabled. The number of bits that are modifiable depends on the number of messages enabled in the Message Control Register.<br>1 Message – No message data bits can be modified<br>2 messages – Bit 0 can be modified<br>4 messages – Bits 0:1 can be modified<br>8 messages – Bits 0:2 can be modified<br>16 messages – Bits 0:3 can be modified<br>32 messages – Bits 0:4 can be modified |

### 8.1.34 Serial Bus Release Number Register (SBRN)

This read only register is set to 30h to indicate that the TUSB73X0 is compliant to release 3.0 of the Universal Serial Bus Specification.

PCI register offset: 60h

Register type: Read-only

Default value: 00h

**表 8-46. PCI Register 60h**

| Bit No.     | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------|---|---|---|---|---|---|---|---|
| Reset State | 0 | 0 | 1 | 1 | 0 | 0 | 0 | 0 |

### 8.1.35 Frame Length Adjustment Register (FLADJ)

This register is used to adjust any offset from the clock source that generates the clock that drives the SOF counter. When a new value is written to this register, the length of the frame is adjusted for all USB buses implemented by the TUSB73X0. This register is only reset by a Global Reset.

PCI register offset: 61h

Register type: Read/Write

Default value: 20h

**表 8-47. PCI Register 61h**

| Bit No.     | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------|---|---|---|---|---|---|---|---|
| Reset State | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 |

**表 8-48. Frame Length Adjustment Register Description**

| BIT | FIELD NAME                  | ACCESS | DESCRIPTION                                                                                                                                                                                                                                                    |
|-----|-----------------------------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 7:6 | RSVD                        | r      | Reserved. Return zeros when read.                                                                                                                                                                                                                              |
| 5:0 | FRAME_LENGTH <sup>(1)</sup> | rw     | Frame Length Timing Value. Each decimal value change to this register corresponds to 16 high-speed bit times. The SOF cycle time is equal to 59488 plus the value in this field. The default value is decimal 32 (20h), which gives a SOF cycle time of 60000. |

(1) This bit is a sticky bit and is reset by a global reset (GRST) or the internally-generated power-on-reset.

### 8.1.36 PCI Express Capability ID Register

This read-only register identifies the linked list item as the register for PCI Express Capabilities. The register returns 10h when read.

PCI register offset: 70h

Register type: Read-only

Default value: 10h

**表 8-49. PCI Register 70h**

| Bit No.     | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------|---|---|---|---|---|---|---|---|
| Reset State | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 |

### 8.1.37 Next Item Pointer Register

The contents of this read-only register indicate the next item in the linked list of capabilities for the TUSB73X0. This register reads C0h pointing to the MSI-X Capability registers.

PCI register offset: 71h

Register type: Read-only

Default value: C0h

**表 8-50. PCI Register 71h**

| Bit No.     | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------|---|---|---|---|---|---|---|---|
| Reset State | 1 | 1 | 0 | 0 | 0 | 0 | 0 | 0 |

### 8.1.38 PCI Express Capabilities Register

This register indicates the capabilities of the TUSB73X0 related to PCI Express.

PCI register offset: 72h

Register type: Read-only

Default value: 0002h

**表 8-51. PCI Register 72h**

| Bit No.     | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Reset State | 0  | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 |

**表 8-52. PCI Express Capabilities Register Description**

| BIT   | FIELD NAME | ACCESS | DESCRIPTION                                                                                                |
|-------|------------|--------|------------------------------------------------------------------------------------------------------------|
| 15:14 | RSVD       | r      | Reserved. Returns zeros when read.                                                                         |
| 13:9  | INT_NUM    | r      | Interrupt Message Number. This field is used for MSI and MSI-X support.                                    |
| 8     | SLOT       | r      | Slot Implemented. This bit is not valid for the TUSB73X0 and is read only zero.                            |
| 7:4   | DEV_TYPE   | r      | Device/Port Type. This read only field returns 0000b indicating that the device is a PCI Express Endpoint. |
| 3:0   | VERSION    | r      | Capability Version. This field returns 0010b indicating revision two of the PCI Express capability.        |

### 8.1.39 Device Capabilities Register

The Device Capabilities Register indicates the device specific capabilities of the TUSB73X0.

PCI register offset: 74h

Register type: Read-only, Hardware Update

Default value: 0000 8FC3h

**表 8-53. PCI Register 74h**

| Bit No.     | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Reset State | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

| Bit No.     | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|

**表 8-54. Device Capabilities Register Description**

| BIT   | FIELD NAME | ACCESS | DESCRIPTION                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------|------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31:29 | RSVD       | r      | Reserved. Return zeros when read.                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 28    | FLR        | r      | Function Level Reset. This bit is set to 0 because the TUSB73X0 has only one function.                                                                                                                                                                                                                                                                                                                                                                                                |
| 27:26 | CSPLS      | ru     | Captured Slot Power Limit Scale. The value in this register is programmed by the host by issuing a Set_Slot_Power_Limit Message. When a Set_Slot_Power_Limit Message is received bits 9:8 are written to this field. The value in this register specifies the scale used for the Slot Power Limit.<br>00 – 1.0x<br>01 – 0.1x<br>10 – 0.01x<br>11 – 0.001x                                                                                                                             |
| 25:18 | CSPLV      | ru     | Captured Slot power Limit Value. The value in this register is programmed by the host by issuing a Set_Slot_Power_Limit Message. When a Set_Slot_Power_Limit Message is received bits 7:0 are written to this field. The value in this register in combination with the Slot power Limit Scale value, specifies the upper limit of power supplied to the slot. The power limit is calculated by multiplying the value in this field by the value in the Slot Power Limit Scale field. |
| 17:16 | RSVD       | r      | Reserved. Return zeros when read.                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 15    | RBER       | r      | Role Based Error Reporting. This bit is hardwired to 1 indicating that the TUSB73X0 supports Role Based Error Reporting                                                                                                                                                                                                                                                                                                                                                               |
| 14:12 | RSVD       | r      | Reserved. Return zeros when read.                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 11:9  | EP_L1_LAT  | r      | Endpoint L1 Acceptable Latency. This field indicates the acceptable latency for a transition from L1 to L0 State. This field can be programmed by writing to the L1_LATENCY field in the General Control Register 2. The default value for this register is the latency for the PHY to exit the L1 state. This field cannot be programmed to be less than the latency for the PHY to exit the L1 state.                                                                               |
| 8:6   | EP_L0S_LAT | r      | Endpoint L0s Acceptable Latency. This field indicates the acceptable latency for a transition from L0s to L0 State. This field can be programmed by writing to the L0s_LATENCY field in the General Control Register 2. The default value for this register is the latency for the PHY to exit the L0s state. This field cannot be programmed to be less than the latency for the PHY to exit the L0s state.                                                                          |
| 5     | ETFS       | r      | Extended Tag Field Supported. This field indicates the size of the tag field and is encoded as 0.                                                                                                                                                                                                                                                                                                                                                                                     |

**表 8-54. Device Capabilities Register Description (续)**

| BIT | FIELD NAME | ACCESS | DESCRIPTION                                                                                                                                                                                         |
|-----|------------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 4:3 | PFS        | r      | Phantom Functions Supported. This field is read only 00b indicating that function numbers are not used for phantom functions.                                                                       |
| 2:0 | MPSS       | r      | Max Payload Size Supported. This field indicates the maximum payload size that the device can support for TLPs. This field is encoded as 011b indicating the Max Payload size for a TLP is 1 Kbyte. |

#### 8.1.40 Device Control Register

The Device Control Register controls PCI Express device specific parameters.

PCI register offset: 78h

Register type: Read/Write

Default value: 2810h

**表 8-55. PCI Register 78h**

| Bit No.     | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Reset State | 0  | 0  | 1  | 0  | 1  | 0  | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 |

**表 8-56. Device Control Register Description**

| BIT   | FIELD NAME   | ACCESS | DESCRIPTION                                                                                                                                                                                                                                                                                               |
|-------|--------------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 15    | INITIATE_FLR | rw     | Initiate Function Level Reset. A write of 1b initiates Function Level Reset to the Function. The value read by software from this bit is always 0b.                                                                                                                                                       |
| 14:12 | MRRS         | rw     | Max Read Request Size. This field is programmed by host software to set the maximum size of a read request that the TUSB73X0 can generate. This field is encoded as:<br>000 – 128B<br>001 – 256B<br>010 – 512B (default)<br>011 – 1024B<br>100 – 2048B<br>101 – 4096B<br>110 – Reserved<br>111 – Reserved |
| 11    | ENS          | rw     | Enable No Snoop. Controls the setting of the <i>No Snoop</i> flag within the TLP header for upstream memory transactions mapped to any traffic class mapped to a virtual channel other than VC0 through the Upstream Decode Windows.<br>0 – No snoop field is 0<br>1 – No snoop field is 1 (default)      |
| 10    | APPE         | rw     | Auxiliary Power PM Enable. This bit is only reset by a Global Reset.                                                                                                                                                                                                                                      |
| 9     | PFE          | r      | Phantom Function Enable. Because the TUSB73X0 does not support phantom functions this bit is read only zero.                                                                                                                                                                                              |
| 8     | ETFE         | rw     | Extended Tag Field Enable.                                                                                                                                                                                                                                                                                |
| 7:5   | MPS          | rw     | Max Payload Size.                                                                                                                                                                                                                                                                                         |
| 4     | ERO          | rw     | Enable Relaxed Ordering.                                                                                                                                                                                                                                                                                  |
| 3     | URRE         | rw     | Unsupported Request Reporting Enable.                                                                                                                                                                                                                                                                     |
| 2     | FERE         | rw     | Fatal Error Reporting Enable.                                                                                                                                                                                                                                                                             |
| 1     | NFERE        | rw     | Non-Fatal Error Reporting Enable.                                                                                                                                                                                                                                                                         |
| 0     | CERE         | rw     | Correctable Error Reporting Enable.                                                                                                                                                                                                                                                                       |

### 8.1.41 Device Status Register

The Device Status Register controls PCI Express device specific parameters.

PCI register offset: 7Ah

Register type: Read Only, Clear by a Write of One, Hardware Update

Default value: 00x0h

表 8-57. PCI Register 7Ah

| Bit No.     | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Reset State | 0  | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 0 | 0 | x | 0 | 0 | 0 | 0 |

表 8-58. Device Status Register Description

表 8-60. Link Capabilities Register Description

| BIT   | FIELD NAME | ACCESS | DESCRIPTION                                                                                                                                                |
|-------|------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31:24 | PORT_NUM   | r      | Port Number. This field indicates port number for the PCI Express link. This field is read only 00h indicating that the Link is associated with port zero. |
| 23:19 | RSVD       | r      | Reserved. Returns zeros when read.                                                                                                                         |
| 18    | CLK_PM     | r      | Clock Power Management. This bit is hardwired to 1 to indicate that the TUSB73X0 supports Clock Power Management through the CLKREQ# protocol.             |

**表 8-60. Link Capabilities Register Description (续)**

| BIT   | FIELD NAME  | ACCESS | DESCRIPTION                                                                                                                                                                                                                                                               |
|-------|-------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 17:15 | L1_LATENCY  | r      | L1 Exit Latency. This field indicates the time that it takes to transition from the L1 state to the L0 state. The value reported by this field is determined by either the L1_EXIT_LAT_ASYNC field or the L1_EXIT_LAT_COMMON field in the General Control Register 0.     |
| 14:12 | L0S_LATENCY | r      | L0s Exit Latency. This field indicates the time that it takes to transition from the L0s state to the L0 state. The value reported by this field is determined by either the L0s_EXIT_LAT_ASYNC field or the L0s_EXIT_LAT_COMMON field in the General Control Register 0. |
| 11:10 | ASLPMS      | r      | Active State Link PM Support. This field indicates the level of active state power management that the TUSB73X0 supports. The value 11b indicates support for both L0s and L1 through active state power management.                                                      |
| 9:4   | MLW         | r      | Maximum Link Width. This field is encoded 000001b to indicate that the TUSB73X0 only supports a 1x PCI Express link.                                                                                                                                                      |
| 3:0   | MLS         | r      | Maximum Link Speed. This field is encoded 0010b to indicate that the TUSB73X0 supports link speeds of 5 Gb/s and 2.5 Gb/s.                                                                                                                                                |

### 8.1.43 Link Control Register

The Link Control Register indicates is used to control link specific behavior.

PCI register offset: 80h

Register type: Read-only, Read/Write

Default value: 0000h

**表 8-61. PCI Register 80h**

| Bit No.     | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|

#### 8.1.44 Link Status Register

The Link Status Register indicates current state of the PCI Express Link.

PCI register offset: 82h

Register type: Read-only

Default value: 101xh

表 8-63. PCI Register 82h

| Bit No.     | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Reset State | 0  | 0  | 0  | 1  | 0  | 0  | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | x | x |

表 8-64. Link Status Register Description

| BIT | FIELD NAME | ACCESS | DESCRIPTION                                                                                                                           |
|-----|------------|--------|---------------------------------------------------------------------------------------------------------------------------------------|
| 15  | LINK_ABS   | r      | Link Autonomous Bandwidth Status. This bit has no function and is read only zero.                                                     |
| 14  | LINK_BMS   | r      | Link Bandwidth Management Status. This bit has no function and is read only zero.                                                     |
| 13  | DLL_ACTIVE | r      | Data Link Layer Active. This bit has no function and is read only zero.                                                               |
| 12  | SCC        | r      | Slot Clock Configuration. This bit is 1, because the TUSB73X0 uses the 100-MHz differential reference clock provided by the platform. |
| 11  | LT         | r      | Link Training. This bit has no function and is read only zero.                                                                        |
| 10  | TE         | r      | Retrain Link. This bit has no function and is read only zero.                                                                         |
| 9:4 | NLW        | r      | Negotiated Link Width. This field is read only 000001b indicating the lane width is 1x.                                               |
| 3:0 | LS         | r      | Link Speed. This field indicates the negotiated link speed.                                                                           |

#### 8.1.45 Device Capabilities 2 Register

The Device Capabilities 2 Register indicates the device specific capabilities of the TUSB73X0.

PCI register offset: 94h

Register type: Read-only

Default value: 0000 0010h

表 8-65. PCI Register 94h

| Bit No.     | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Reset State | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

| Bit No. | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---------|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
|---------|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|

|             |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
|-------------|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Reset State | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 |
|-------------|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

表 8-66. Device Capabilities 2 Register Description

| BIT  | FIELD NAME      | ACCESS | DESCRIPTION                                                                                                                           |
|------|-----------------|--------|---------------------------------------------------------------------------------------------------------------------------------------|
| 31:5 | RSVD            | r      | Reserved. Returns zeros when read.                                                                                                    |
| 4    | CPLT_TO_DIS_SUP | r      | Completion Timeout Disable Supported. This bit is read only 1b indicating that the completion timeout disable mechanism is supported. |
| 3:0  | CPLT_TO_RANGES  | r      | Completion Timeout Ranges Supported. This field is read only 0000b indicating that completion timeout programming is not supported.   |

**8.1.46 Device Control 2 Register**

The Device Control 2 Register controls PCI Express device specific parameters.

PCI register offset: 98h

Register type: Read-only, Read/Write

Default value: 0800h

表 8-67. PCI Register 98h

| Bit No.     | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| Reset State | 0  | 0  | 0  | 0  | 1  | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

表 8-68. Device Control 2 Register Description

| BIT  | FIELD NAME    | ACCESS | DESCRIPTION                                                                                                              |
|------|---------------|--------|--------------------------------------------------------------------------------------------------------------------------|
| 15:5 | RSVD          | r      | Reserved. Returns zeros when read.                                                                                       |
| 4    | CPTL_TO_DIS   | rw     | Completion Timeout Disable.                                                                                              |
| 3:0  | CPTL_TO_VALUE | r      | Completion Timeout Value. This field is read only 0000b indicating that completion timeout programming is not supported. |

**8.1.47 Link Control 2 Register**

The Link Control 2 Register indicates is used to control link specific behavior.

PCI register offset: A0h

Register type: Read-only, Read/Write

Default value: 0000h

表 8-69. PCI Register A0h

| Bit No.     | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Reset State | 0  | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 |

表 8-70. Link Control 2 Register Description

| BIT   | FIELD NAME                        | ACCESS | DESCRIPTION                                                                        |
|-------|-----------------------------------|--------|------------------------------------------------------------------------------------|
| 15:13 | RSVD                              | r      | Reserved. Returns zeros when read.                                                 |
| 12    | COMPLIANCE_DEEMPH <sup>(1)</sup>  | rw     | Compliance De-Emphasis. This bit is sticky and is only reset by a Global Reset.    |
| 11    | COMPLIANCE_SOS <sup>(1)</sup>     | rw     | Compliance SOS. This bit is sticky and is only reset by a Global Reset.            |
| 10    | ENT_MOD_COMPLIANCE <sup>(1)</sup> | rw     | Enter Modified Compliance. This bit is sticky and is only reset by a Global Reset. |
| 9:7   | TRANSMIT_MARGIN <sup>(1)</sup>    | rw     | Transmit Margin. This bit is sticky and is only reset by a Global Reset.           |
| 6     | SEL_DEEMPH                        | r      | Selectable De-Emphasis. This bit has no function and is read only zero.            |

**表 8-70. Link Control 2 Register Description (续)**

| BIT | FIELD NAME                    | ACCESS | DESCRIPTION                                                                                           |
|-----|-------------------------------|--------|-------------------------------------------------------------------------------------------------------|
| 5   | HW_AUTO_SPEED_DIS             | r      | Hardware Autonomous Speed Disable. This bit is read only zero because this function is not supported. |
| 4   | ENTER_COMPL <sup>(1)</sup>    | rw     | Enter Compliance. This bit is sticky and is only reset by a Global Reset.                             |
| 3:0 | TGT_LINK_SPEED <sup>(1)</sup> | rw     | Target Link Speed. This bit is sticky and is only reset by a Global Reset.                            |

(1) This bit is a sticky bit and is reset by a global reset (GRST) or the internally-generated power-on-reset.

#### 8.1.48 Link Status 2 Register

The Link Status 2 Register indicates current state of the PCI Express Link.

PCI register offset: A2h

Register type: Read-only

Default value: 000xh

**表 8-71. PCI Register A2h**

| Bit No.     | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Reset State | 0  | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | x |

**表 8-72. Link Status 2 Register Description**

| BIT  | FIELD NAME   | ACCESS | DESCRIPTION                        |
|------|--------------|--------|------------------------------------|
| 15:1 | RSVD         | r      | Reserved. Returns zeros when read. |
| 0    | DEEMPH_LEVEL | r      | Current De-Emphasis Level.         |

#### 8.1.49 Serial Bus Data Register

The Serial Bus Data register is used to read and write data on the serial bus interface. When writing data to the serial bus, this register must be written before writing to the Serial Bus Address register to initiate the cycle. When reading data from the serial bus, this register will contain the data read after the REQBUSY (bit 5 Serial Bus Control Register) bit is cleared. This register is reset by a PCI Express reset (PERST#), a GRST#, or the internally-generated power-on-reset.

PCI register offset: B0h

Register type: Read/Write

Default value: 00h

**表 8-73. PCI Register B0h**

| Bit No.     | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------|---|---|---|---|---|---|---|---|
| Reset State | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

### 8.1.50 Serial Bus Index Register

The value written to the Serial Bus Index register represents the byte address of the byte being read or written from the serial bus device. The Serial Bus Index register must be written before the before initiating a serial bus cycle by writing to the Serial Bus target Address register. This register is reset by a PCI Express reset (PERST#), a GRST#, or the internally-generated power-on-reset.

PCI register offset: B1h

Register type: Read/Write

Default value: 00h

**表 8-74. PCI Register B1h**

| Bit No.     | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------|---|---|---|---|---|---|---|---|
| Reset State | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

### 8.1.51 Serial Bus Target Address Register

The Serial Bus target Address register is used to indicate the address of the device being targeted by the serial bus cycle. This register also indicates if the cycle will be a read or a write cycle. Writing to this register initiates the cycle on the serial interface. This register is reset by a PCI Express reset (PERST#), a GRST#, or the internally-generated power-on-reset.

PCI register offset: B2h

Register type: Read/Write

Default value: 00h

**表 8-75. PCI Register B2h**

| Bit No.     | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------|---|---|---|---|---|---|---|---|
| Reset State | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**表 8-76. Serial Bus Target Address Register Description**

| BIT | FIELD NAME                 | ACCESS | DESCRIPTION                                                                                                                                                                                 |
|-----|----------------------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 7:1 | TARGET_ADDR <sup>(1)</sup> | rw     | Serial Bus Target Address. This bit field represents the target address of a read or write transaction on the serial interface.                                                             |
| 0   | RW_CMD <sup>(1)</sup>      | rw     | Read/Write Command. This bit is used to determine if the serial bus cycle will be a read or a write cycle.<br>0 – A single byte write is requested.<br>1 – A single byte read is requested. |

(1) This bit is reset by a PCI Express reset (PERST), a GRST, or the internally generated power-on-reset.

## 8.1.52 Serial Bus Control and Status Register

The Serial Bus Control and Status register is used to control the behavior of the Serial bus interface. This register also provides status information about the state of the serial bus. This register is reset by a PCI Express reset (PERST#), a GRST#, or the internally-generated power-on-reset.

PCI register offset: B3h

Register type: Read/Write, Read-Only, Read/Clear

Default value: 00h

**表 8-77. PCI Register B3h**

| Bit No.     | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------|---|---|---|---|---|---|---|---|
| Reset State | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**表 8-78. Serial Bus Control and Status Register Description**

| BIT | FIELD NAME              | ACCESS | DESCRIPTION                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| BIT  | FIELD NAME               | ACCESS | DESCRIPTION                                                                                                  |
|------|--------------------------|--------|--------------------------------------------------------------------------------------------------------------|
| 15:4 | RSVD                     | r      | Reserved. Returns zero when read.                                                                            |
| 3    | GPIO3_DIR <sup>(1)</sup> | rw     | GPIO 3 Data Direction. This bit selects whether GPIO3 is in input or output mode.<br>0 – Input<br>1 – Output |
| 2    | GPIO2_DIR <sup>(1)</sup> | rw     | GPIO 2 Data Direction. This bit selects whether GPIO2 is in input or output mode.<br>0 – Input<br>1 – Output |
| 1    | GPIO1_DIR <sup>(1)</sup> | rw     | GPIO 1 Data Direction. This bit selects whether GPIO1 is in input or output mode.<br>0 – Input<br>1 – Output |
| 0    | GPIO0_DIR <sup>(1)</sup> | rw     | GPIO 0 Data Direction. This bit selects whether GPIO0 is in input or output mode.<br>0 – Input<br>1 – Output |

(1) This bit is reset by a PCI Express reset (PERST), a GRST, or the internally generated power-on-reset.

### 8.1.54 GPIO Data Register

This register is used to read the state of the GPIO pins and to change the state of GPIO pins that are in output mode. Writing to a bit that is in input mode will be ignored. The default value at power up depends on the state of the GPIO terminals as they default to general purpose inputs. This register is reset by a PCI Express reset (PERST#), a GRST#, or the internally-generated power-on-reset.

PCI register offset: B6h

Register type: Read/Write, Read-Only

Default value: 0000h

**表 8-81. PCI Register B6h**

| Bit No.     | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Reset State | 0  | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 0 | 0 | 0 | x | x | x | x |

**表 8-82. GPIO Data Register Description**

| BIT  | FIELD NAME                | ACCESS | DESCRIPTION                                                                                           |
|------|---------------------------|--------|-------------------------------------------------------------------------------------------------------|
| 15:4 | RSVD                      | r      | Reserved. Returns zero when read.                                                                     |
| 3    | GPIO3_DATA <sup>(1)</sup> | rw     | GPIO 3 Data. This bit is used to read the state of GPIO3 or change the state of GPIO3 in output mode. |
| 2    | GPIO2_DATA <sup>(1)</sup> | rw     | GPIO 2 Data. This bit is used to read the state of GPIO2 or change the state of GPIO2 in output mode. |
| 1    | GPIO1_DATA <sup>(1)</sup> | rw     | GPIO 1 Data. This bit is used to read the state of GPIO1 or change the state of GPIO1 in output mode. |
| 0    | GPIO0_DATA <sup>(1)</sup> | rw     | GPIO 0 Data. This bit is used to read the state of GPIO0 or change the state of GPIO0 in output mode. |

(1) This bit is reset by a PCI Express reset (PERST), a GRST, or the internally generated power-on-reset.

### 8.1.55 MSI-X Capability ID Register

This read-only register identifies the linked list item as the register for MSI-X Capabilities. The register returns 11h when read.

PCI register offset: C0h

Register type: Read-Only

Default value: 11h

**表 8-83. PCI Register C0h**

| Bit No.     | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------|---|---|---|---|---|---|---|---|
| Reset State | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 1 |

### 8.1.56 Next Item Pointer Register

The contents of this read-only register indicate the next item in the linked list of capabilities for the TUSB73X0. This register reads 00h indicating that no additional capabilities are supported.

PCI register offset: C1h

Register type: Read-Only

Default value: 11h

**表 8-84. PCI Register C1h**

| Bit No.     | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------|---|---|---|---|---|---|---|---|
| Reset State | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

### 8.1.57 MSI-X Message Control Register

This register is used to control the sending of MSI-X messages.

PCI register offset: C2h

Register type: Read-Only, Read/Write

Default value: 0007h

**表 8-85. PCI Register C2h**

| Bit No.     | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Reset State | 0  | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 |

**表 8-86. MSI-X Message Control Register Description**

| BIT   | FIELD NAME | ACCESS | DESCRIPTION                                                                       |
|-------|------------|--------|-----------------------------------------------------------------------------------|
| 15    | MSIX_EN    | rw     | MSI-X Enable.                                                                     |
| 14    | FUNC_MASK  | rw     | Function Mask.                                                                    |
| 13:11 | RSVD       | r      | Reserved. Returns zero when read.                                                 |
| 10:0  | TABLE_SIZE | r      | MSI-X Table Size. This field is set to 07h to indicate a table size of 8 entries. |

### 8.1.58 MSI-X Table Offset and BIR Register

This register indicates into which BAR and offset the MSI-X table is mapped.

PCI register offset: C4h

Register type: Read-Only

Default value: 0000 0002h

**表 8-87. PCI Register C4h**

| Bit No.     | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Reset State | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

| Bit No.     | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**表 8-88. MSI-X Table Offset and BIR Register Description**

| BIT  | FIELD NAME   | ACCESS | DESCRIPTION                                                                                                                                    |
|------|--------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------|
| 31:3 | TABLE_OFFSET | r      | Table Offset. This field is set to 000h to indicate that the MSI-X Table is at an offset of 0000h from the beginning of the BAR at offset 18h. |
| 2:0  | TABLE_BIR    | r      | Table BIR. This field is set to 010b to indicate that the MSI-X table is mapped into the BAR at offset 18h.                                    |

### 8.1.59 MSI-X PBA Offset and BIR Register

This register indicates into which BAR and offset the MSI-X PBA is mapped.

PCI register offset: C8h

Register type: Read-Only

Default value: 0000 1000h

**表 8-89. PCI Register C8h**

| Bit No.     | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Reset State | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

| Bit No.     | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Reset State | 0  | 0  | 0  | 1  | 0  | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**表 8-90. MSI-X PBA Offset and BIR Register Descriptions**

| BIT  | FIELD NAME | ACCESS | DESCRIPTION                                                                                                                                |
|------|------------|--------|--------------------------------------------------------------------------------------------------------------------------------------------|
| 31:3 | PBA_OFFSET | r      | PBA Offset. This field is set to 200h to indicate that the MSI-X PBA is at an offset of 1000h from the beginning of the BAR at offset 18h. |
| 2:0  | PBA_BIR    | r      | PBA BIR. This field is set to 010b to indicate that the MSI-X PBA is mapped into the BAR at offset 18h.                                    |

### 8.1.60 Subsystem Access Register

This register is a read/write register and the contents of this register are aliased to the Subsystem Vendor ID and Subsystem ID Registers at PCI Offsets 2Ch and 2Eh. This register is reset by a PCI Express reset (PERST#), a GRST#, or the internally-generated power-on-reset.

PCI register offset: D0h

Register type: Read/Write

Default value: 0000 0000h

表 8-91. PCI Register D0h

| Bit No.     | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Reset State | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

| Bit No.     | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

表 8-92. Subsystem Access Register Description

| BIT   | FIELD NAME                       | ACCESS | DESCRIPTION                                                                                                            |
|-------|----------------------------------|--------|------------------------------------------------------------------------------------------------------------------------|
| 31:16 | SubsystemID <sup>(1)</sup>       | rw     | Subsystem ID. The value written to this field is aliased to the Subsystem ID Register at PCI Offset 2Eh.               |
| 15:0  | SubsystemVendorID <sup>(1)</sup> | rw     | Subsystem Vendor ID. The value written to this field is aliased to the Subsystem Vendor ID Register at PCI Offset 2Ch. |

(1) This bit is reset by a PCI Express reset (PERST), a GRST, or the internally generated power-on-reset.

### 8.1.61 General Control 0 Register

This register is a read/write register is used to control various functions of the TUSB73X0. This register is reset by a PCI Express reset (PERST#), a GRST#, or the internally-generated power-on-reset.

PCI register offset: D4h

Register type: Read/Write

Default value: 0000 0D9Bh

表 8-93. PCI Register D4h

| Bit No.     | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**表 8-94. General Control 0 Register Description**

| BIT   | FIELD NAME                         | ACCESS | DESCRIPTION                                                                                                                                                                                                                         |
|-------|------------------------------------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31:12 | RSVD                               | r      | Reserved. Returns zeros when read.                                                                                                                                                                                                  |
| 11:9  | L1_EXIT_LAT_ASYNC <sup>(1)</sup>   | rw     | L1 Exit Latency for Asynchronous Clock. This value in this field is the value reported in the L1_LATENCY field in the Link Capabilities Register when the CCC bit in the Link Control Register is 0. This field defaults to 110b.   |
| 8:6   | L1_EXIT_LAT_COMMON <sup>(1)</sup>  | rw     | L1 Exit Latency for Common Clock. This value in this field is the value reported in the L1_LATENCY field in the Link Capabilities Register when the CCC bit in the Link Control Register is 1. This field defaults to 110b.         |
| 5:3   | L0s_EXIT_LAT_ASYNC <sup>(1)</sup>  | rw     | L0s Exit Latency for Asynchronous Clock. This value in this field is the value reported in the L0s_LATENCY field in the Link Capabilities Register when the CCC bit in the Link Control Register is 0. This field defaults to 011b. |
| 2:0   | L0s_EXIT_LAT_COMMON <sup>(1)</sup> | rw     | L0s Exit Latency for Common Clock. This value in this field is the value reported in the L0s_LATENCY field in the Link Capabilities Register when the CCC bit in the Link Control Register is 1. This field defaults to 011b.       |

(1) This bit is reset by a PCI Express reset (PERST), a GRST, or the internally generated power-on-reset.

### 8.1.62 General Control 1 Register

This register is a read/write register is used to control various functions of the TUSB73X0. This register is reset by a PCI Express reset (PERST#), a GRST#, or the internally-generated power-on-reset.

PCI register offset: D8h

Register type: Read-Only, Read/Write

Default value: 0000 001Bh

**表 8-95. PCI Register D8h**

| Bit No.     | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 31:6 | RSVD                              | r      | Reserved. Returns zeros when read.                                                                                                               |
| 5:3  | L1ASPM_ENTRY_TIMER <sup>(1)</sup> | rw     | L1ASPM Entry Timer. This field specifies the value of the L1ASPM Entry Timer. This field defaults to 011, corresponding to a value of 8 $\mu$ s. |
| 2:0  | L0s_ENTRY_TIMER <sup>(1)</sup>    | rw     | L0s Entry timer. This field specifies the value of the L0s Entry timer. This field defaults to 011, corresponding to a value of 4 $\mu$ s.       |

(1) This bit is reset by a PCI Express reset (PERST), a GRST, or the internally generated power-on-reset.

### 8.1.63 General Control 2 Register

This register is a read/write register is used to control various functions of the TUSB73X0. This register is reset by a PCI Express reset (PERST#), a GRST#, or the internally-generated power-on-reset.

Note: For Pass 1.0 of the TUSB73X0 design, this register is read only zeros and has no effect.

PCI register offset: DCh

Register type: Read-Only, Read/Write

Default value: 0000 001Bh

表 8-97. PCI Register DCh

(1) This bit is reset by a PCI Express reset (PERST), a GRST, or the internally generated power-on-reset.

## 8.1.64 USB Control Register

This register is a read/write register is used to control USB settings in the TUSB73X0. This register is reset by a PCI Express reset (PERST#), a GRST#, or the internally-generated power-on-reset.

PCI register offset: E0h

Register type: Read/Write

Default value: 0000 0000h

**表 8-99. PCI Register E0h**

**表 8-100. USB Control Register Description**

| BIT   | FIELD NAME                     | ACCESS | DESCRIPTION                                                                                                                                                                                                                                                                                                                                                                                 |
|-------|--------------------------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31    | USB_SPREAD_DIS <sup>(1)</sup>  | rw     | USB Spread Spectrum Disable. When this bit is set to 1, spread spectrum generation for the USB 3.0 clock is disabled.                                                                                                                                                                                                                                                                       |
| 30    | FREQ_SEL_EN <sup>(2)</sup>     | rw     | Frequency Select Enable. When this bit is set to 1, the oscillator is restarted. This bit can only be written to once after power up.                                                                                                                                                                                                                                                       |
| 29:24 | PLL_FREQ_SEL <sup>(2)</sup>    | r      | PLL Frequency Select. If the FREQSEL pin is 1, then the value in this field controls the Frequency Select inputs to the PLL. In addition, the frequency selector inputs to the Oscillator are set appropriately for the frequency selected. If the FREQSEL pin is 0, then this field has no effect. Once the FREQ_SEL_EN bit has been set, this field will be locked and cannot be changed. |
| 23    | HIDE_MSIX <sup>(1)</sup>       | rw     | Hide MSI-X. When this bit is set, the Next Item Pointer Register (offset 71h) for the PCI Express Capability is set to 00h, and BAR2 (offset 18h) and BAR3 (offset 1Ch) are only zeros.                                                                                                                                                                                                     |
| 22    | PWRON_POLARITY <sup>(2)</sup>  | rw     | PWRONx Polarity. When this bit is 0 (default), the PWRONx# pins are active low and their internal pull-down resistors are enabled. When this bit is 1, the PWRONx# pins are active high and their internal pull-down resistors are disabled.                                                                                                                                                |
| 21:17 | RSVD                           | r      | Reserved. Returns zero when read.                                                                                                                                                                                                                                                                                                                                                           |
| 16    | PPC_NOT_PRESENT <sup>(1)</sup> | rw     | Port Power Control Not Present. When this bit is 0, the TUSB73X0 forces the PPC bit to 1 in the Host Controller Capability Parameters, indicating that the system supports port power switches. When this bit is set to 1, the TUSB73X0 forces the PPC bit to 0 in the Host Controller Capability Parameters, indicating that the system does not support port power switches.              |
| 15:12 | RSVD <sup>(1)</sup>            | rw     | Reserved. Returns zeros when read.                                                                                                                                                                                                                                                                                                                                                          |
| 11    | PORT4_DIS <sup>(1)</sup>       | rw     | USB Port 4 Disable. When this bit is set to 1, port 4 of the TUSB73X0 is disabled. For the TUSB7320 Port 4 is not present and this bit has no effect.                                                                                                                                                                                                                                       |
| 10    | PORT3_DIS <sup>(1)</sup>       | rw     | USB Port 3 Disable. When this bit is set to 1, port 3 of the TUSB73X0 is disabled. For the TUSB7320 Port 3 is not present and this bit has no effect.                                                                                                                                                                                                                                       |
| 9     | PORT2_DIS <sup>(1)</sup>       | rw     | USB Port 2 Disable. When this bit is set to 1, port 2 of the TUSB73X0 is disabled.                                                                                                                                                                                                                                                                                                          |
| 8     | PORT1_DIS <sup>(1)</sup>       | rw     | USB Port 1 Disable. When this bit is set to 1, port 1 of the TUSB73X0 is disabled.                                                                                                                                                                                                                                                                                                          |

表 8-100. USB Control Register Description (续)

| BIT | FIELD NAME                        | ACCESS | DESCRIPTION                                                                                                                                                                                                                              |
|-----|-----------------------------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 7   | USB3_PORT4_NON_REM <sup>(1)</sup> | rw     | USB 3.0 Port 4 Non-removable. When this bit is set to 1, the TUSB73X0 forces the DR bit to 1 in the Port Status and Control Register corresponding to USB 3.0 Port 4. For the TUSB7320 Port 4 is not present and this bit has no effect. |
| 6   | USB3_PORT3_NON_REM <sup>(1)</sup> | rw     | USB 3.0 Port 3 Non-removable. When this bit is set to 1, the TUSB73X0 forces the DR bit to 1 in the Port Status and Control Register corresponding to USB 3.0 Port 3. For the TUSB7320 Port 3 is not present and this bit has no effect. |
| 5   | USB3_PORT2_NON_REM <sup>(1)</sup> | rw     | USB 3.0 Port 2 Non-removable. When this bit is set to 1, the TUSB73X0 forces the DR bit to 1 in the Port Status and Control Register corresponding to USB 3.0 Port 2.                                                                    |
| 4   | USB3_PORT1_NON_REM <sup>(1)</sup> | rw     | USB 3.0 Port 1 Non-removable. When this bit is set to 1, the TUSB73X0 forces the DR bit to 1 in the Port Status and Control Register corresponding to USB 3.0 Port 1.                                                                    |
| 3   | USB2_PORT4_NON_REM <sup>(1)</sup> | rw     | USB 2.0 Port 4 Non-removable. When this bit is set to 1, the TUSB73X0 forces the DR bit to 1 in the Port Status and Control Register corresponding to USB 2.0 Port 4. For the TUSB7320 Port 4 is not present and this bit has no effect. |
| 2   | USB2_PORT3_NON_REM <sup>(1)</sup> | rw     | USB 2.0 Port 3 Non-removable. When this bit is set to 1, the TUSB73X0 forces the DR bit to 1 in the Port Status and Control Register corresponding to USB 2.0 Port 3. For the TUSB7320 Port 3 is not present and this bit has no effect. |
| 1   | USB2_PORT2_NON_REM <sup>(1)</sup> | rw     | USB 2.0 Port 2 Non-removable. When this bit is set to 1, the TUSB73X0 forces the DR bit to 1 in the Port Status and Control Register corresponding to USB 2.0 Port 2.                                                                    |
| 0   | USB2_PORT1_NON_REM <sup>(1)</sup> | rw     | USB 2.0 Port 1 Non-removable. When this bit is set to 1, the TUSB73X0 forces the DR bit to 1 in the Port Status and Control Register corresponding to USB 2.0 Port 1.                                                                    |

(1) This bit is reset by a PCI Express reset (PERST), a GRST, or the internally generated power-on-reset.

(2) This bit is a sticky bit and is reset by a global reset (GRST) or the internally-generated power-on-reset.

### 8.1.65 De-Emphasis and Swing Control Register

This register is used to control the de-emphasis and transmit swing settings for each of the USB 3.0 ports when the default setting is overridden through the Custom PHY Transmit/Receive Control Register. This register is reset by a PCI Express reset (PERST#), a GRST#, or the internally-generated power-on-reset.

PCI register offset: E4h

Register type: Read/Write

Default value: 0000 0000h

|-------|----------------------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31:28 | PORT4_SWING <sup>(1)</sup> | rw     | Port 4 Swing. When the PORT4_SWING_OV bit is set to 1, these bits are used to set the output swing for port 4. For details on the behavior of the swing signals refer to 表 6-1. For the TUSB7320 Port 4 is not present and these bits have no effect.         |
| 27:24 | PORT4_DE <sup>(1)</sup>    | rw     | Port 4 De-emphasis. When the PORT4_DE_OV bit is set to 1, these bits are used to set the de-emphasis value for port 4. For details on the behavior of the swing signals refer to 表 6-2. For the TUSB7320 Port 4 is not present and these bits have no effect. |
| 23:20 | PORT3_SWING <sup>(1)</sup> | rw     | Port 3 Swing. When the PORT3_SWING_OV bit is set to 1 these bits are used to set the output swing for port 3. For details on the behavior of the swing signals refer to 表 6-1. For the TUSB7320 Port 3 is not present and these bits have no effect.          |
| 19:16 | PORT3_DE <sup>(1)</sup>    | rw     | Port 3 De-emphasis. When the PORT3_DE_OV bit is set to 1 these bits are used to set the de-emphasis value for port 3. For details on the behavior of the swing signals refer to 表 6-2. For the TUSB7320 Port 3 is not present and these bits have no effect.  |
| 15:12 | PORT2_SWING <sup>(1)</sup> | rw     | Port 2 Swing. When the PORT2_SWING_OV bit is set to 1, these bits are used to set the output swing for port 2. For details on the behavior of the swing signals refer to 表 6-1.                                                                               |
| 11:8  | PORT2_DE <sup>(1)</sup>    | rw     | Port 2 De-emphasis. When the PORT2_DE_OV bit is set to 1 these bits are used to set the de-emphasis value for port 2. For details on the behavior of the swing signals refer to 表 6-2.                                                                        |
| 7:4   | PORT1_SWING <sup>(1)</sup> | rw     | Port 1 Swing. When the PORT1_SWING_OV bit is set to 1, these bits are used to set the output swing for port 1. For details on the behavior of the swing signals refer to 表 6-1.                                                                               |
| 3:0   | PORT1_DE <sup>(1)</sup>    | rw     | Port 1 De-emphasis. When the PORT1_DE_OV bit is set to 1, these bits are used to set the de-emphasis value for port 1. For details on the behavior of the swing signals refer to 表 6-2.                                                                       |

(1) This bit is reset by a PCI Express reset (PERST), a GRST, or the internally generated power-on-reset.

### 8.1.66 Equalizer Control Register

This register is used to control the equalizer settings for each of the USB 3.0 ports when the default setting is overridden through the Custom PHY Transmit/Receive Control Register. This register is reset by a PCI Express reset (PERST#), a GRST#, or the internally-generated power-on-reset.

PCI register offset: E8h

Register type: Read/Write

Default value: 0000 0000h

| Serial Number Register (Upper DW)                |                                                      | 158h      |
| Reserved                                         |                                                      | 15C-FFFh  |

### 8.2.2 Advanced Error Reporting Capability Register

This read-only register identifies the linked list item as the register for PCI Express Advanced Error Reporting Capabilities. The register returns 0001h when read.

PCI Express Extended Register Offset: 100h

Register type: Read-Only

Default value: 0001h

表 8-108. PCI Express Extended Register 100h

| Bit No.     | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Reset State | 0  | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |

### 8.2.3 Next Capability Offset / Capability Version Register

This read-only register identifies the next location in the PCI Express Extended Capabilities link list. The upper 12 bits in this register shall be 150h, indicating that the Device Serial Number Capability starts at offset 150h. The least significant four bits identify the revision of the current capability block as 2h.

PCI Express Extended Register Offset: 100h

Register type: Read-Only

Default value: 1502h

**表 8-109. PCI Express Extended Register 102h**

| Bit No.     | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Reset State | 0  | 0  | 0  | 1  | 0  | 1  | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 |

### 8.2.4 Uncorrectable Error Status Register

The Uncorrectable Error Status Register reports the status of individual errors as they occur. Software may clear these bits only by writing a 1 to the desired location.

PCI Express Extended Register Offset: 104h

Register type: Read-Only, Read/Clear

Default value: 0000 0000h

**表 8-110. PCI Express Extended Register 104h**

| Bit No.     | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Reset State | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

|-------------|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Reset State | 0  | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**表 8-111. Custom PHY Transmit/Receive Control Register Description**

| BIT   | FIELD NAME                 | ACCESS | DESCRIPTION                                                                                                                                                             |
|-------|----------------------------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31:21 | RSVD                       | r      | Reserved. Returns zeros when read.                                                                                                                                      |
| 20    | UR_ERROR <sup>(1)</sup>    | rcu    | Unsupported Request Error. This bit is asserted when an Unsupported Request is received.                                                                                |
| 19    | ECRC_ERROR <sup>(1)</sup>  | rcu    | Extended CRC Error. This bit is asserted when an Extended CRC error is detected.                                                                                        |
| 18    | MAL_TLP <sup>(1)</sup>     | rcu    | Malformed TLP. This bit is asserted when a malformed TLP is detected.                                                                                                   |
| 17    | RX_OVERFLOW <sup>(1)</sup> | rcu    | Receiver Overflow. This bit is asserted when the flow control logic detects that the transmitting device has illegally exceeded the number of credits that were issued. |
| 16    | UNXP_CPL <sup>(1)</sup>    | rcu    | Unexpected Completion. This bit is asserted when a completion packet is received that does not correspond to an issued request.                                         |
| 15    | CPL_ABORT <sup>(1)</sup>   | rcu    | Completer Abort. This bit is asserted when the TUSB73X0 signals a Completer Abort.                                                                                      |
| 14    | CPL_TIMEOUT <sup>(1)</sup> | rcu    | Completion Timeout. This bit is asserted when no completion has been received for an issued request before the timeout period.                                          |
| 13    | FC_ERROR <sup>(1)</sup>    | rcu    | Flow Control Error. This bit is asserted when a flow control protocol error is detected either during initialization or during normal operation.                        |
| 12    | PSN_TLP <sup>(1)</sup>     | rcu    | Poisoned TLP. This bit is asserted when a poisoned TLP is received.                                                                                                     |

表 8-111. Custom PHY Transmit/Receive Control Register Description (续)

| BIT  | FIELD NAME               | ACCESS | DESCRIPTION                                                                                     |
|------|--------------------------|--------|-------------------------------------------------------------------------------------------------|
| 11:5 | RSVD                     | r      | Reserved. Returns zeros when read.                                                              |
| 4    | DLL_ERROR <sup>(1)</sup> | rcu    | Data Link Protocol Error. This bit is asserted if a data link layer protocol error is detected. |
| 3:0  | RSVD                     | r      | Reserved. Returns zeros when read.                                                              |

(1) This bit is reset by a PCI Express reset (PERST), a GRST, or the internally generated power-on-reset.

### 8.2.5 Uncorrectable Error Mask Register

The Uncorrectable Error Mask Register controls the reporting of individual errors as they occur. When a bit is set to one, the corresponding error condition will not be logged, and does not update any of the status bits within the Extended Error Reporting Capability block.

PCI Express Extended Register Offset: 108h

Register type: Read-Only, Read/Write

Default value: 0000 0000h

表 8-112. PCI Express Extended Register 108h

(1) This bit is reset by a PCI Express reset (PERST), a GRST, or the internally generated power-on-reset.

## 8.2.6 Uncorrectable Error Severity Register

The Uncorrectable Error Severity Register controls the reporting of individual errors as ERR\_FATAL or ERR\_NONFATAL. When a bit is set, the corresponding error condition will be identified as fatal. When a bit is clear, the corresponding error condition will be identified as non-fatal.

PCI Express Extended Register Offset: 10Ch

Register type: Read-Only, Read/Write

Default value: 0026 2030h

(1) This bit is reset by a PCI Express reset (PERST), a GRST, or the internally generated power-on-reset.

### 8.2.7 Correctable Error Severity Register

The Correctable Error Status Register reports the status of individual errors as they occur. Software may clear these bits only by writing a 1 to the desired location.

PCI Express Extended Register Offset: 110h

Register type: Read-Only, Read/Clear

Default value: 0000 0000h

表 8-116. PCI Express Extended Register 110h

|-------|-----------------------------|--------|----------------------------------------------------------------------------------------------------------------------------------------------|
| 31:14 | RSVD                        | r      | Reserved. Returns zeros when read.                                                                                                           |
| 13    | ANFES <sup>(1)</sup>        | rcu    | Advisory Non-Fatal Error Status. This bit is asserted when an Advisory Non-Fatal Error has been reported.                                    |
| 12    | REPLAY_TMOUT <sup>(1)</sup> | rcu    | Replay Timer Timeout. This bit is asserted when the replay timer expires for a pending request or completion that has not been acknowledged. |
| 11:9  | RSVD                        | r      | Reserved. Returns zeros when read.                                                                                                           |
| 8     | REPLAY_ROLL <sup>(1)</sup>  | rcu    | REPLAY_NUM Rollover. This bit is asserted when the replay counter rolls over when a pending request or completion has not been acknowledged. |
| 7     | BAD_DLLP <sup>(1)</sup>     | rcu    | Bad DLLP Error. This bit is asserted when an 8b/10b error was detected by the PHY during the reception of a DLLP.                            |

**表 8-117. Bit Descriptions – Correctable Error Severity Register (续)**

| BITS | FIELD NAME              | ACCESS | DESCRIPTION                                                                                                     |
|------|-------------------------|--------|-----------------------------------------------------------------------------------------------------------------|
| 6    | BAD_TLP <sup>(1)</sup>  | rcu    | Bad TLP Error. This bit is asserted when an 8b/10b error was detected by the PHY during the reception of a TLP. |
| 5:1  | RSVD                    | r      | Reserved. Returns zeros when read.                                                                              |
| 0    | RX_ERROR <sup>(1)</sup> | rcu    | Receiver Error. This bit is asserted when an 8b/10b error is detected by the PHY at any time.                   |

(1) This bit is reset by a PCI Express reset (PERST), a GRST, or the internally generated power-on-reset.

## 8.2.8 Correctable Error Mask Register

The Correctable Error Status Register reports the status of individual errors as they occur. Software may clear these bits only by writing a 1 to the desired location.

PCI Express Extended Register Offset: 114h

Register type: Read-Only, Read/Write

Default value: 0000 2000h

**表 8-118. PCI Express Extended Register 114h**

| Bit No.     | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Reset State | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

| 5:1   | RSVD                             | r      | Reserved. Returns zeros when read.                                                                 |
| 0     | RX_ERROR_MASK <sup>(1)</sup>     | rw     | Receiver Error Mask.<br>0 – Error Condition is Unmasked<br>1 – Error Condition is Masked           |

(1) This bit is reset by a PCI Express reset (PERST), a GRST, or the internally generated power-on-reset.

### 8.2.9 Advanced Error Capabilities and Control Register

The Advanced Error Capabilities and Control Register allows the system to monitor and control the advanced error reporting capabilities.

PCI Express Extended Register Offset: 118h

Register type: Read-Only, Read/Write

Default value: 0000 0050h

**表 8-120. PCI Express Extended Register 118h**

| Bit No.     | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Reset State | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

| Bit No.     | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|

**表 8-121. Bit Descriptions – Advanced Error Capabilities and Control Register**

| BIT  | FIELD NAME                 | ACCESS | DESCRIPTION                                                                                                                                                                                  |
|------|----------------------------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31:9 | RSVD                       | r      | Reserved. Returns zeros when read.                                                                                                                                                           |
| 8    | ECRC_CHK_EN <sup>(1)</sup> | rw     | Extended CRC Check Enable.<br>0 – Extended CRC checking is Disabled<br>1 – Extended CRC checking is Enabled                                                                                  |
| 7    | ECRC_CHK_CAPABLE           | r      | Extended CRC Check Capable. This read-only bit returns a value of 1 indicating that the TUSB73X0 is capable of checking extended CRC information.                                            |
| 6    | ECRC_GEN_EN <sup>(1)</sup> | rw     | Extended CRC Generation Enable.<br>0 – Extended CRC generation is Disabled<br>1 – Extended CRC generation is Enabled                                                                         |
| 5    | ECRC_GEN_CAPABLE           | r      | Extended CRC Generation Capable. This read-only bit returns a value of 1 indicating that the TUSB73X0 is capable of generating extended CRC information.                                     |
| 4:0  | FIRST_ERR <sup>(1)</sup>   | ru     | First Error Pointer. This five bit value reflects the bit position within the Uncorrectable Error Status Register corresponding to the class of the first error condition that was detected. |

(1) This bit is reset by a PCI Express reset (PERST), a GRST, or the internally generated power-on-reset.

### 8.2.10 Header Log Register

The Header Log Register stores the TLP header for the packet that lead to the most recently detected error condition. Offset 11Ch contains the first DWORD. Offset 128h contains the last DWORD (in the case of a 4DW TLP header). Each DWORD is stored with the least significant byte representing the earliest transmitted.

PCI Express Extended Register Offset: 11Ch, 120h, 124h, 128h

Register type: Read-Only

Default value: 0000 0000h

**表 8-122. PCI Express Extended Register 11Ch, 120, 124h, and 128h**

| Bit No.     | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Reset State | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

| Bit No.     | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Reset State | 0  | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

### 8.2.11 Device Serial Number Capability ID Register

This read-only register identifies the linked list item as the Device Serial Number Capability. This register returns 0003h when read.

PCI Express Extended Register Offset: 150h

Register type: Read-Only

Default value: 0003h

**表 8-123. Device Serial Number Capability ID Register**

| Bit No.     | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Reset State | 0  | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 |

### 8.2.12 Next Capability Offset/Capability Version Register

This read-only register identifies the next location in the PCI Express Extended Capabilities link list. The upper 12 bits in this register are 000h, indicating that the Device Serial Number Capability is the last capability in the list. The least significant four bits identify the revision of the current capability block as 1h.

PCI Express Extended Register Offset: 152h

Register type: Read-Only

Default value: 0001h

**表 8-124. Next Capability Offset/Capability Version Register**

| Bit No.     | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Reset State | 0  | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |

### 8.2.13 Device Serial Number Register

This read-only register identifies the Device Serial Number for the TUSB73x0. The Device Serial Number is in the format of an IEEE defined 64-bit extended unique identifier (EUI-64). The EUI-64 consists of TI' s 24-bit company ID (called an OUI-24) plus a 40 bit extension identifier. TI' s OUI-24 is 080028h and is hardwired into bits 63:40 of the Device Serial Number Register. The TUSB73x0 has been assigned the range of 00 0000 0000h to 00 0FFF FFFFh for the 40-bit extension identifier. As such, bits 39:32 of the Device Serial Number Register are hardwired to 00h, and bits 31:0 of the Device Serial Number Register are defined by a value unique for each device.

PCI Express Extended Register Offset: 154h

Register type: Read-Only

Default value: 0800 2800 XXXX XXXX h

**表 8-125. Device Serial Number Register**

| Bit No.     | 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 |
|-------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Reset State | 0  | 0  | 0  | 0  | 1  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

| Bit No.     | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |

| Reset State | 0  | 0  | 1  | 0  | 1  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

| Bit No.     | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Reset State | X  | X  | X  | X  | X  | X  | X  | X  | X  | X  | X  | X  | X  | X  | X  | X  |

| Bit No.     | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Reset State | X  | X  | X  | X  | X  | X  | X | X | X | X | X | X | X | X | X | X |

**表 8-126. Bit Descriptions - Device Serial Number Register**

| BIT   | FIELD NAME       | ACCESS | DESCRIPTION                                                                             |
|-------|------------------|--------|-----------------------------------------------------------------------------------------|
| 63:32 | SERIAL_NUM_UPPER | r      | Serial Number – Upper DW. The upper DW of the Serial Number is hardwired to 0800 2800h. |
| 31:0  | SERIAL_NUM_LOWER | r      | Serial Number – Lower DW. The lower DW of the Serial Number is unique for each device.  |

## 8.3 xHCI Memory Mapped Register Space

### 8.3.1 The xHCI Register Map

The TUSB73X0 includes xHCI registers in memory mapped register space. These registers are accessible through the address programmed into the Base Address Register 0/1.

**表 8-127. xHCI Register Map**

| REGISTER NAME                         | OFFSET    |
|---------------------------------------|-----------|
| Host Controller Capability Registers  | 000h-01Fh |
| Host Controller Operational Registers | 020h-49Fh |
| Runtime Registers                     | 4A0h-5BFh |
| Doorbell Registers                    | 5C0h-6C3h |
| Reserved                              | 6C4-9BFh  |

表 8-127. xHCI Register Map (续)

| REGISTER NAME                        | OFFSET     |
|--------------------------------------|------------|
| xHCI Extended Capabilities Registers | 9C0h-9EBh  |
| Reserved                             | 9ECh-FFFFh |

### 8.3.2 Host Controller Capability Registers

These registers specify the limits and capabilities of the TUSB7340. The offset in then table is from the address programmed into the Base Address Register 0.

表 8-128. Host Controller Capability Register Map

| REGISTER NAME                 | OFFSET  |
|-------------------------------|---------|
| HC Interface Version          | 00h     |
| Reserved                      | 04h     |
| Capability Length             | 08h     |
| HC Structural Parameters 1    | 0Ch     |
| HC Structural Parameters 2    | 10h     |
| HC Structural Parameters 3    | 14h     |
| HC Capability Parameters      | 18h     |
| Doorbell Offset               | 1Ch-1Fh |
| Runtime Register Space Offset |         |
| Reserved                      |         |

#### 8.3.2.1 Capability Registers Length

This read only register returns 20h when read to indicate that the beginning of the Operational Register Space is at an offset of 20h from the address programmed into the Base Address Register 0.

BAR0 register offset: 00h

Register type: Read-Only

Default value: 0020h

表 8-129. HC Capability Register 00h

| Bit No.     | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Reset State | 0  | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 |

#### 8.3.2.2 Host Controller Interface Version Number

This read only register indicates the xHCI specification revision number supported by the TUSB73X0.

BAR0 register offset: 02h

Register type: Read-Only

Default value: 0096h

表 8-130. HC Capability Register 02h

| Bit No.     | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Reset State | 0  | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 1 | 0 | 0 | 1 | 0 | 1 | 1 | 0 |

#### 8.3.2.3 Host Controller Structural Parameters 1

This read only register defines basic structural parameters supported by the TUSB73X0.

BAR0 register offset: 04h

Register type: Read-Only

Default value: 0800 0840h

**表 8-131. HC Capability Register 04h**

| Bit No.     | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Reset State | 0  | 0  | 0  | 0  | 1  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

| Bit No.     | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Reset State | 0  | 0  | 0  | 0  | 1  | 0  | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 |

**表 8-132. HC Structural Parameters 1 Description**

| BIT   | FIELD NAME | ACCESS | DESCRIPTION                                                                                                                                                                                                                                                                                     |
|-------|------------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31:24 | MAX_PORTS  | r      | Number of Ports. For the TUSB7340, this field is 08h to indicate that 8 ports are supported. For the TUSB7320, this field is 04h to indicate that 4 ports are supported. This field also indicates the number of sets of port registers that are addressable in the Operational Register Space. |
| 23:19 | RSVD       | r      | Reserved. Returns zeros when read.                                                                                                                                                                                                                                                              |
| 18:8  | MAX_INTRS  | r      | Number of Interrupters. This field specifies the number of Interrupters that are implemented. The TUSB73x0 implements 8 Interrupters. Each Interrupter is allocated to a vector of MSI-X.                                                                                                       |
| 7:0   | MAX_SLOTS  | r      | Number of Device Slots. This field specifies the maximum number of Device Context Structures and Doorbell Array entries that are supported. The TUSB73x0 supports 64 Device Slots.                                                                                                              |

### 8.3.2.4 Host Controller Structural Parameters 2

This read only register defines basic structural parameters supported by the TUSB73X0.

BAR0 register offset: 08h

Register type: Read-Only

Default value: 0C00 00F1h

表 8-133. HC Capability Register 08h

| Bit No.     | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Reset State | 0  | 0  | 0  | 0  | 1  | 1  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

| Bit No.     | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

表 8-134. HC Structural Parameters 2 Description

| BIT   | FIELD NAME      | ACCESS | DESCRIPTION                                                                                                                                                            |
|-------|-----------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31:27 | MAX_SCRATCH_BUF | r      | Max Scratchpad Buffers. This field indicates the number of Scratchpad Buffers system software reserves. The TUSB73X0 uses one Scratchpad Buffer.                       |
| 26    | SPR             | r      | Scratchpad Restore. This bit is 1b to indicate that the TUSB73X0 requires the integrity of the Scratchpad Buffer space to be maintained across power events.           |
| 25:13 | RSVD            | r      | Reserved. Returns zeros when read.                                                                                                                                     |
| 12:8  | IOC_INTERVAL    | r      | IOC Interval. This field is 0b.                                                                                                                                        |
| 7:4   | ERST_MAX        | r      | Event Ring Segment Table Max. This field is 1111b to indicate that the TUSB73X0 supports up to 32K Event Ring Segment Table entries.                                   |
| 3:0   | IST             | r      | Isochronous Scheduling Threshold. This field is 0001b to indicate that software can add a TRB no later than 1 Microframes before that TRB is scheduled to be executed. |

### 8.3.2.5 Host Controller Structural Parameters 3

This read only register defines basic structural parameters supported by the TUSB73X0.

BAR0 register offset: 0Ch

Register type: Read-Only

Default value: 07FF 00A0h

表 8-135. HC Capability Register 0Ch

| Bit No.     | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**表 8-136. HC Structural Parameters 3 Description**

| BIT   | FIELD NAME  | ACCESS | DESCRIPTION                                                                                                                                                              |
|-------|-------------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31:16 | U2_EXIT_LAT | r      | U2 Device Exit Latency. This field is 07FFh to indicate that the worst case latency for the TUSB73X0 to transition from U2 to U0 is 2047 $\mu$ s.                        |
| 15:8  | RSVD        | r      | Reserved. Returns zeros when read.                                                                                                                                       |
| 7:0   | U1_EXIT_LAT | r      | U1 Device Exit Latency. This field is 0Ah to indicate that the worst case latency for the TUSB73X0 to transition a root hub Port Link State from U1 to U0 is 10 $\mu$ s. |

### 8.3.2.6 Host Controller Capability Parameters

This read only register defines capability parameters supported by the TUSB73X0.

BAR0 register offset: 10h

Register type: Read-Only

Default value: 0270 102Xh

**表 8-137. HC Capability Register 10h**

| Bit No.     | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Reset State | 0  | 0  | 0  | 0  | 0  | 0  | 1  | 0  | 0  | 1  | 1  | 1  | 0  | 0  | 0  | 0  |

| Bit No.     | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Reset State | 1  | 1  | 1  | 1  | 0  | 0  | 0 | 0 | 0 | 1 | 1 | 0 | x | 1 | 0 | 1 |

**表 8-138. HC Capability Parameters Description**

| BIT   | FIELD NAME   | ACCESS | DESCRIPTION                                                                                                                                                                                                         |
|-------|--------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31:16 | XECP         | r      | xHCI Extended Capabilities Pointer. This field is 0270h to indicate that the beginning of the first xHCI Extended Capability is at an offset of 09C0h from the address programmed into the Base Address Register 0. |
| 15:12 | MAX_PSA_SIZE | r      | Maximum Primary Stream Array Size. This field is 1111 to indicate that the TUSB73X0 supports a Primary Stream Array size of 64K.                                                                                    |
| 11:10 | RSVD         | r      | Reserved. Returns zeros when read.                                                                                                                                                                                  |
| 9     | SBD          | r      | Secondary Bandwidth Domain Reporting. This bit is 0 to indicate that the TUSB73X0 does not support Secondary Bandwidth Domain reporting.                                                                            |
| 8     | FSE          | r      | Force Stopped Event. This bit is 0 to indicate that the TUSB73X0 does not support Force Stopped Events.                                                                                                             |
| 7     | NSS          | r      | No Secondary SID Support. This bit is 0 to indicate that the TUSB73X0 supports Secondary Stream ID decoding.                                                                                                        |
| 6     | LTC          | r      | Latency Tolerance Messaging Capability. This bit is 1 to indicate that the TUSB73X0 supports Latency Tolerance Messaging.                                                                                           |
| 5     | LHRC         | r      | Light HC Reset Capability. This bit is 1 to indicate that the TUSB73X0 supports Light Host Controller Resets.                                                                                                       |
| 4     | PIND         | r      | Port Indicators. This bit is 0 to indicate that the TUSB73X0 does not support port indicators.                                                                                                                      |
| 3     | PPC          | r      | Port Power Control. This value of this bit is determined by the PPC_NOT_PRESENT bit in the USB Control Register.                                                                                                    |
| 2     | CSZ          | r      | Context Size. This bit is 1 to indicate that the TUSB73X0 uses 64 byte Context data structures.                                                                                                                     |
| 1     | BNC          | r      | Bandwidth Negotiation Capability. This bit is 0 to indicate that the TUSB73X0 does not implement Bandwidth Negotiation.                                                                                             |

表 8-138. HC Capability Parameters Description (续)

| BIT | FIELD NAME | ACCESS | DESCRIPTION                                                                                                          |
|-----|------------|--------|----------------------------------------------------------------------------------------------------------------------|
| 0   | AC64       | r      | 64-bit Addressing Capability. This bit is 1 to indicate that the TUSB73X0 implements 64-bit address memory pointers. |

**8.3.2.7 Doorbell Offset**

This read only register returns 0000 05C0h when read to indicate that the beginning of the Doorbell Array is at an offset of 5C0h from the address programmed into the Base Address Register 0.

BAR0 register offset: 14h

Register type: Read-Only

Default value: 0000 05C0h

表 8-139. HC Capability Register 14h

| Bit No.     | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

### 8.3.3 Host Controller Operational Registers

These registers control the operation of the TUSB73X0. The offset in 表 8-141 is from the Operational Base, which is the address programmed into the Base Address Register 0 plus the value programmed into the Capability Registers Length (see [Capability Registers Length](#)).

**表 8-141. Host Controller Operational Register Map**

| REGISTER NAME                             | OFFSET    |
|-------------------------------------------|-----------|
| USB Command                               | 00h       |
| USB Status                                | 04h       |
| Page Size                                 | 08h       |
| Reserved                                  | 0Ch-13h   |
| Device Notification Control               | 14h       |
| Command Ring Control                      | 18h-1Fh   |
| Reserved                                  | 20h-2Fh   |
| Device Context Base Address Array Pointer | 30h-37h   |
| Configure                                 | 38h       |
| Reserved                                  | 3Ch-3FFh  |
| Port Register Set 1-8                     | 400h-47Fh |

#### 8.3.3.1 USB Command Register

This register indicates the command to be executed by the TUSB73X0.

Operational Base register offset: 00h

Register type: Read-Only, Read/Write

Default value: 0000 0000h

**表 8-142. HC Operational Register (Operational Base + 00h)**

| Bit No.     | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Reset State | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

| Bit No.     | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|

### 8.3.3.3 USB Status Register

This register indicates pending interrupts and various states of the TUSB73X0.

Operational Base register offset: 04h

Register type: Read-Only, Read/Clear

Default value: 0000 0801h

表 8-145. HC Operational Register (Operational Base + 04h)

| Bit No.     | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Reset State | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

### 8.3.3.4 Page Size Register

This register indicates the page size supported by the TUSB73X0.

Operational Base register offset: 08h

Register type: Read-Only

Default value: 0000 0001h

**表 8-147. HC Operational Register (Operational Base + 08h)**

| Bit No.     | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Reset State | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

| Bit No.     | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Reset State | 0  | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |

**表 8-148. Page Size Register Description**

| BIT   | FIELD NAME | ACCESS | DESCRIPTION                                                                               |
|-------|------------|--------|-------------------------------------------------------------------------------------------|
| 31:16 | RSVD       | r      | Reserved. Returns zeros when read.                                                        |
| 15:0  | PAGE_SIZE  | r      | Page Size. The TUSB73X0 supports a 4k byte page size, so this field is set to 0000 0001h. |

### 8.3.3.5 Device Notification Control Register

This register is used by software to enable or disable the reporting of the reception of specific USB Device Notification Transaction Packets.

Operational Base register offset: 14h

Register type: Read-Only, Read/Write

Default value: 0000 0000h

表 8-149. HC Operational Register (Operational Base + 14h)

| Bit No.     | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

表 8-150. Device Notification Control Register Description

| BIT   | FIELD NAME | ACCESS | DESCRIPTION                        |
|-------|------------|--------|------------------------------------|
| 31:16 | RSVD       | r      | Reserved. Returns zeros when read. |
| 15:0  | NOTE_EN    | rw     | Notification Enable (N0-N15).      |

### 8.3.3.6 Command Ring Control Register

This 64-bit register provides Command Ring control and status capabilities, and identifies the address and Cycle bit state of the Command Ring Dequeue Pointer.

Operational Base register offset: 18h

Register type: Read-Only, Read/Write

Default value: 0000 0000 0000 0000h

表 8-151. HC Operational Register (Operational Base + 18h)

| Bit No.     | 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 |

| BIT  | FIELD NAME     | ACCESS | DESCRIPTION                        |
|------|----------------|--------|------------------------------------|
| 31:6 | COM_RING_POINT | rw     | Command Ring Pointer.              |
| 5:4  | RSVD           | r      | Reserved. Returns zeros when read. |
| 3    | CRR            | r      | Command Ring Running.              |
| 2    | CA             | rw     | Command Abort.                     |
| 1    | CS             | rw     | Command Stop.                      |
| 0    | RCS            | rw     | Ring Cycle State.                  |

### 8.3.3.7 Device Context Base Address Array Pointer Register

This 64-bit register identifies the base address of the Device Context Base Address Array.

Operational Base register offset: 30h

Register type: Read-Only, Read/Write

Default value: 0000 0000 0000 0000h

**表 8-153. HC Operational Register (Operational Base + 30h)**

| Bit No.     | 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 |

| BIT  | FIELD NAME | ACCESS | DESCRIPTION                                |
|------|------------|--------|--------------------------------------------|
| 31:6 | DCBAAP     | rw     | Device Context Base Address Array Pointer. |
| 5:0  | RSVD       | r      | Reserved. Returns zeros when read.         |

### 8.3.3.8 Configure Register

This register defines runtime xHC configuration parameters.

Operational Base register offset: 38h

Register type: Read-Only, Read/Write

Default value: 0000 0000h

表 8-155. HC Operational Register (Operational Base + 38h)

| Bit No.     | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Reset State | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

表 8-156. Configure Register Description

| BITS | FIELD NAME   | ACCESS | DESCRIPTION                        |
|------|--------------|--------|------------------------------------|
| 31:8 | RSVD         | r      | Reserved. Returns zeros when read. |
| 7:0  | MAX_SLOTS_EN | rw     | Max Device Slots Enabled.          |

### 8.3.3.9 Port Status and Control Register

The TUSB73X0 implements a Port Status and Control Register for each port that is implemented. The number of Port Status and Control Registers is the same as the value in the MAX\_PORTS field in the Host Controller Structural Parameters 1 Register (see [Host Controller Structural Parameters 1](#)).

Operational Base register offset: 400h + (10h × (n-1)), where n = Port Number

Register type: Read-Only, Read/Write, Read/Clear

Default value: X000 02A0h

表 8-157. HC Operational Register (Operational Base + 400h + (10h × (n-1))), where n = Port Number

| Bit No.     | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

(1) This bit is a sticky bit and is reset by a global reset (GRST) or the internally-generated power-on-reset.

### 8.3.3.10 Port PM Status and Control Register (USB 3.0 Ports)

The TUSB73X0 implements a Port PM Status and Control Register for each port that is implemented. The number of Port PM Status and Control Registers is the same as the value in the MAX\_PORTS field in the Host Controller Structural Parameters 1 Register (see [Host Controller Structural Parameters 1](#)).

Operational Base register offset: 404h + (10h × (n-1)), where n = Port Number

Register type: Read-Only, Read/Write

Default value: 0000 0000h

### 8.3.3.12 Port Link Info Register

The TUSB73X0 implements a Port Link Info Register for each port USB 3.0 port that is implemented. For USB 2.0 ports, the Port Link Info Register is reserved and returns zeros when read. The number of Port Link Info Registers is the same as the value in the MAX\_PORTS field in the Host Controller Structural Parameters 1 Register (see [Host Controller Structural Parameters 1](#)).

Operational Base register offset:  $408h + (10h \times (n-1))$ , where n = Port Number

Register type: Read-Only

Default value: 0000 0000h

**表 8-163. HC Operational Register (Operational Base + 408h + (10h × (n-1))), where n = Port Number**

| Bit No.     | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| BIT   | FIELD NAME       | ACCESS | DESCRIPTION                        |
|-------|------------------|--------|------------------------------------|
| 31:16 | RSVD             | r      | Reserved. Returns zeros when read. |
| 15:0  | LINK_ERROR_COUNT | r      | Link Error Count.                  |

### 8.3.4 Host Controller Runtime Registers

These registers are used to read the current microframe and to control the interrupters of the TUSB73X0. The offset in 表 8-165 is from the Runtime Base, which is the address programmed into the Base Address Register 0 plus the value programmed into the Runtime Register Space Offset (see [Runtime Register Space Offset](#)).

表 8-165. Host Controller Runtime Register Map

| REGISTER NAME              | OFFSET    |
|----------------------------|-----------|
| Microframe Index           | 00h       |
| Reserved                   | 04h-1Fh   |
| Interrupter Register Set 0 | 20h-3Fh   |
| Interrupter Register Set 1 | 40h-5Fh   |
| Interrupter Register Set 2 | 60h-7Fh   |
| Interrupter Register Set 3 | 80h-9Fh   |
| Interrupter Register Set 4 | A0h-BFh   |
| Interrupter Register Set 5 | C0h-DFh   |
| Interrupter Register Set 6 | E0h-FFh   |
| Interrupter Register Set 7 | 100h-11Fh |

#### 8.3.4.1 Microframe Index Register

This register is used by the system software to determine the current periodic frame. The register value is incremented every 125 microseconds.

Runtime Base register offset: 00h

Register type: Read-Only

Default value: 0000 0000h

表 8-166. HC Runtime Register (Runtime Base + 00h)

| Bit No.     | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Reset State | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

| 13:0  | MICROFRAME_IDX | r      | Microframe Index.                  |

#### 8.3.4.2 Interrupter Management Register

The TUSB73X0 implements 8 Interrupter Management Registers, one for each Interrupter implemented.

Runtime Base register offset: 20h + (20h × Interrupter), where Interrupter = 0 through 7

Register type: Read-Only, Read/Write

Default value: 0000 0000h

**表 8-168. HC Runtime Register (Runtime Base + 20h + (20h × Interrupter)),  
where Interrupter = 0 through 7**

| 0    | IP         | rc     | Interrupt Pending.                 |

#### 8.3.4.3 Interrupter Moderation Register

The TUSB73X0 implements 8 Interrupter Moderation Registers, one for each Interrupter implemented.

Runtime Base register offset: 24h + (20h × Interrupter), where Interrupter = 0 through 7

Register type: Read/Write

Default value: 0000 0FA0h

**表 8-170. HC Runtime Register (Runtime Base + 24h + (20h × Interrupter)),  
where Interrupter = 0 through 7**

| Bit No.     | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

### 8.3.4.5 Event Ring Segment Table Base Address Register

The TUSB73X0 implements 8 Event Ring Segment Table Base Address Registers, one for each Interrupter implemented.

Runtime Base register offset: 30h + (20h × Interrupter), where Interrupter = 0 through 7

Register type: Read-Only, Read/Write

Default value: 0000 0000 0000 0000h

**表 8-174. HC Runtime Register (Runtime Base + 30h + (20h × Interrupter)),

### 8.3.4.6 Event Ring Dequeue Pointer Register

The TUSB73X0 implements 8 Event Ring Dequeue Pointer Registers, one for each Interrupter implemented.

Runtime Base register offset:  $38h + (20h \times \text{Interrupter})$ , where Interrupter = 0 through 7

Register type: Read/Write, Read/Clear

Default value: 0000 0000 0000 0000h

**表 8-177. Event Ring Dequeue Pointer Register Description**

| BIT  | FIELD NAME | ACCESS | DESCRIPTION                 |
|------|------------|--------|-----------------------------|
| 64:4 | ERDP       | rw     | Event Ring Dequeue Pointer. |
| 3    | EHB        | rc     | Event Handler Busy.         |
| 2:0  | DESI       | rw     | Dequeue ERST Segment Index. |

### 8.3.5 Host Controller Doorbell Registers

The TUSB73X0 supports an array of 65 Doorbell Registers, one for the host controller plus one for each Device Slot supported. The address of the first Doorbell Register is the address programmed into the Base Address Register 0 plus the value programmed into the [Doorbell Offset](#).

Doorbell Base register offset:  $00h + (04h \times \text{Device Slot})$ , where Device Slot = 0 through 64

Register type: Read-Only, Read/Write

Default value: 0000 0000h

**表 8-178. HC Doorbell Register (Doorbell Base +  $(04h \times \text{Device Slot})$ ), where Device Slot = 0 through 64**

**表 8-179. Interrupter Management Register Description**

| BIT   | FIELD NAME   | ACCESS | DESCRIPTION                                             |
|-------|--------------|--------|---------------------------------------------------------|
| 31:16 | DB_STREAM_ID | rw     | Doorbell Stream ID. This field returns zeros when read. |
| 15:8  | RSVD         | r      | Reserved. Returns zeros when read.                      |
| 7:0   | DB_TARGET    | rw     | Doorbell Target. This field returns zeros when read.    |

### 8.3.6 xHCI Extended Capabilities Registers

These registers are used for the xHCI Extended Capabilities in the TUSB73X0. The offset in [表 8-180](#) is from the xHCI Extended Capabilities Base, which is the address programmed into the Base Address Register 0 plus the value programmed into the xHCI Extended Capabilities Pointer field in the [Host Controller Capability Parameters](#).

**表 8-180. xHCI Extended Capabilities Register Map**

| REGISTER NAME                                | OFFSET  |
|----------------------------------------------|---------|
| Legacy Support Capability                    | 00h-07h |
| Reserved                                     | 08h-0Fh |
| xHCI Supported Protocol Capability (USB 2.0) | 10h-1Bh |
| Reserved                                     | 1Ch-1Fh |
| xHCI Supported Protocol Capability (USB 3.0) | 20h-2Bh |

#### 8.3.6.1 USB Legacy Support Capability Register

This register is used to coordinate the ownership of the host controller between BIOS and the operating system.

xHCI Extended Capabilities Base register offset: 00h

Register type: Read-Only, Read/Write

Default value: 0000 0201h

**表 8-181. xHCI Extended Capabilities Register (xHCI Extended Capabilities Base + 00h)**

| BIT   | FIELD NAME    | ACCESS | DESCRIPTION                                                                                                                                                                   |
|-------|---------------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31:25 | RSVD          | r      | Reserved. Returns zeros when read.                                                                                                                                            |
| 24    | HC_OS_SEMA    | rw     | HC OS Owned Semaphore.                                                                                                                                                        |
| 23:17 | RSVD          | r      | Reserved. Returns zeros when read.                                                                                                                                            |
| 16    | HC_BIOS_SEMA  | rw     | HC BIOS Owned Semaphore.                                                                                                                                                      |
| 15:8  | NEXT_CAP      | r      | Next Capability Pointer. This field is 04h, indicating that the xHCI Supported Protocol Capability for USB 2.0 starts at offset 10h from the xHCI Extended Capabilities Base. |
| 7:0   | CAPABILITY_ID | r      | Capability ID. This field is 01h, identifying this capability as a USB Legacy Support Capability.                                                                             |

### 8.3.6.2 USB Legacy Support Control/Status Register

This register is used by BIOS software to enable System Management Interrupts.

xHCI Extended Capabilities Base register offset: 04h

Register type: Read-Only, Read/Clear

Default value: 0000 0000h

**表 8-183. xHCI Extended Capabilities Register (xHCI Extended Capabilities Base + 04h)**

|             |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|-------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bit No.     | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**表 8-184. USB Legacy Support Control/Status Register Description**

| BIT   | FIELD NAME       | ACCESS | DESCRIPTION                        |
|-------|------------------|--------|------------------------------------|
| 31    | SMI_BAR          | rc     | SMI on BAR.                        |
| 30    | SMI_PCI_COM      | rc     | SMI on PCI Command.                |
| 29    | SMI_OS_CHANGE    | rc     | SMI on OS Ownership Change.        |
| 28:21 | RSVD             | r      | Reserved. Returns zeros when read. |
| 20    | SMI_HOST_SYS_ERR | r      | SMI on Host System Error.          |
| 19:17 | RSVD             | r      | Reserved. Returns zeros when read. |
| 16    | SMI_EVENT_INT    | r      | SMI on Event Interrupt.            |
| 15    | SMI_BAR_EN       | rw     | SMI on BAR Enable.                 |
| 14    | SMI_PCI_COM_EN   | rw     | SMI on PCI Command Enable.         |
| 13    | SMI_OS_EN        | rw     | SMI on OS Ownership Enable.        |
| 12:5  | RSVD             | r      | Reserved. Returns zeros when read. |

表 8-184. USB Legacy Support Control/Status Register Description (续)

| BIT | FIELD NAME          | ACCESS | DESCRIPTION                        |
|-----|---------------------|--------|------------------------------------|
| 4   | SMI_HOST_SYS_ERR_EN | rw     | SMI on Host System Error Enable.   |
| 3:1 | RSVD                | r      | Reserved. Returns zeros when read. |
| 0   | USB_SMI_EN          | rw     | USB SMI Enable.                    |

**8.3.6.3 xHCI Supported Protocol Capability Register (USB 2.0)**

This register indicates that the Supported Protocol Capability is for USB 2.0.

xHCI Extended Capabilities Base register offset: 10h

Register type: Read-Only

Default value: 0200 0402h

表 8-185. xHCI Extended Capabilities Register (xHCI Extended Capabilities Base + 10h)

| Bit No.     | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**表 8-189. xHCI Supported Protocol Capability Register (USB 2.0) Description**

| BIT   | FIELD NAME          | ACCESS | DESCRIPTION                                                                                                                                                                                         |
|-------|---------------------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31:19 | RSVD                | r      | Reserved. Returns zeros when read.                                                                                                                                                                  |
| 18    | IHI                 | r      | Integrated Hub Implemented. This field is 0 to indicate that the root hub to external port mapping adheres to the default mapping in the xHCI Specification.                                        |
| 17    | HSO                 | r      | High-speed Only. This field is 0 to indicate that the USB 2.0 ports are Low-, Full-, and High-speed capable.                                                                                        |
| 16    | L1C                 | r      | L1 Capability. This field is 1 to indicate that the TUSB73X0 supports the USB 2.0 Link Power Management L1 state.                                                                                   |
| 15:8  | COMPATIBLE_PORT_CNT | r      | Compatible Port Count. For the TUSB7340, this field is 04h to indicate that four USB 2.0 ports are supported. For the TUSB7320, this field is 02h to indicate that two USB 2.0 ports are supported. |
| 7:0   | COMPATIBLE_PORT_OFF | r      | Compatible Port Offset. This field is 01h to indicate that the first USB 2.0 port is port 1.                                                                                                        |

### 8.3.6.6 xHCI Supported Protocol Capability Register (USB 3.0)

This register indicates that the Supported Protocol Capability is for USB 3.0.

xHCI Extended Capabilities Base register offset:20h

Register type: Read-Only

Default value: 0300 0002h

**表 8-190. xHCI Extended Capabilities Register (xHCI Extended Capabilities Base + 20h)**

| Bit No.     | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Reset State | 0  | 0  | 0  | 0  | 0  | 0  | 1  | 1  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

|-------------|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Reset State | 0  | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 |

**表 8-191. xHCI Supported Protocol Capability Register (USB 3.0) Description**

| BIT   | FIELD NAME    | ACCESS | DESCRIPTION                                                                                                                |
|-------|---------------|--------|----------------------------------------------------------------------------------------------------------------------------|
| 31:24 | MAJOR_REV     | r      | Major Revision. This field is 03h, because this Supported Protocol Capability is for release 3.0 of the USB specification. |
| 23:16 | MINOR_REV     | r      | Minor Revision. This field is 00h, because this Supported Protocol Capability is for release 3.0 of the USB specification. |
| 15:8  | NEXT_CAP      | r      | Next Capability Pointer. This field is 00h, indicating that this is the last capability.                                   |
| 7:0   | CAPABILITY_ID | r      | Capability ID. This field is 02h, identifying this capability as a Supported Protocol Capability.                          |

### 8.3.6.7 xHCI Supported Protocol Name String Register (USB 3.0)

This read only register is set to 2042 5355h, indicating that the Supported Protocol Capability is for USB 3.0.

xHCI Extended Capabilities Base register offset:24h

Register type: Read-Only

Default value: 2042 5355h

**表 8-192. xHCI Extended Capabilities Register (xHCI Extended Capabilities Base + 24h)**

| Bit No.     | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Reset State | 0  | 0  | 1  | 0  | 0  | 0  | 0  | 0  | 0  | 1  | 0  | 0  | 0  | 0  | 1  | 0  |

| Bit No.     | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| Reset State | 0  | 1  | 0  | 1  | 0  | 0  | 1 | 1 | 0 | 1 | 0 | 1 | 0 | 1 | 0 | 1 |

### 8.3.6.8 xHCI Supported Protocol Port Register (USB 3.0)

This register indicates how many USB 3.0 ports are supported and what their port numbers are.

xHCI Extended Capabilities Base register offset:28h

Register type: Read-Only

Default value: 0000 0X0Xh

**表 8-193. xHCI Extended Capabilities Register (xHCI Extended Capabilities Base + 28h)**

| Bit No.     | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**表 8-194. xHCI Supported Protocol Capability Register (USB 3.0) Description**

| BIT   | FIELD NAME          | ACCESS | DESCRIPTION                                                                                                                                                                                            |
|-------|---------------------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31:19 | RSVD                | r      | Reserved. Returns zeros when read.                                                                                                                                                                     |
| 18    | IHI                 | r      | Integrated Hub Implemented. This field is 0 to indicate that the root hub to external port mapping adheres to the default mapping in the xHCI Specification.                                           |
| 17    | HSO                 | r      | High-speed Only. This field is not applicable to USB 3.0 and is 0.                                                                                                                                     |
| 16    | L1C                 | r      | L1 Capability. This field is not applicable to USB 3.0 and is 0.                                                                                                                                       |
| 15:8  | COMPATIBLE_PORT_CNT | r      | Compatible Port Count. For the TUSB7340 , this field is 04h to indicate that four USB 3.0 ports are supported. For the TUSB7320, this field is 02h to indicate that two USB 3.0 ports are supported.   |
| 7:0   | COMPATIBLE_PORT_OFF | r      | Compatible Port Offset. For the TUSB7340 , this field is 05h to indicate that the first USB 3.0 port is port 5. For the TUSB7320, this field is 03h to indicate that the first USB 3.0 port is port 3. |

## 8.4 MSI-X Memory Mapped Register Space

### 8.4.1 The MSI-X Table and PBA in Memory Mapped Register Space

The TUSB73X0 includes the MSI-X Table and PBA in memory mapped register space. These registers are accessible through the address programmed into the Base Address Register 2/3. See the [PCI Express Power Management](#) section for more information.

**表 8-195. MSI-X Table and PBA Register Map**

| REGISTER NAME                 | OFFSET |
|-------------------------------|--------|
| Entry 0 Message Address       | 0000h  |
| Entry 0 Message Upper Address | 0004h  |
| Entry 0 Message Data          | 0008h  |
| Entry 0 Vector Control        | 000Ch  |
| Entry 1 Message Address       | 0010h  |
| Entry 1 Message Upper Address | 0014h  |
| Entry 1 Message Data          | 0018h  |
| Entry 1 Vector Control        | 001Ch  |
| Entry 2 Message Address       | 0020h  |
| Entry 2 Message Upper Address | 0024h  |
| Entry 2 Message Data          | 0028h  |

表 8-195. MSI-X Table and PBA Register Map (续)

| REGISTER NAME                 | OFFSET      |
|-------------------------------|-------------|
| Entry 2 Vector Control        | 002Ch       |
| Entry 3 Message Address       | 0030h       |
| Entry 3 Message Upper Address | 0034h       |
| Entry 3 Message Data          | 0038h       |
| Entry 3 Vector Control        | 003Ch       |
| Entry 4 Message Address       | 0040h       |
| Entry 4 Message Upper Address | 0044h       |
| Entry 4 Message Data          | 0048h       |
| Entry 4 Vector Control        | 004Ch       |
| Entry 5 Message Address       | 0050h       |
| Entry 5 Message Upper Address | 0054h       |
| Entry 5 Message Data          | 0058h       |
| Entry 5 Vector Control        | 005Ch       |
| Entry 6 Message Address       | 0060h       |
| Entry 6 Message Upper Address | 0064h       |
| Entry 6 Message Data          | 0068h       |
| Entry 6 Vector Control        | 006Ch       |
| Entry 7 Message Address       | 0070h       |
| Entry 7 Message Upper Address | 0074h       |
| Entry 7 Message Data          | 0078h       |
| Entry 7 Vector Control        | 007Ch       |
| Reserved                      | 0080h-0FFFh |
| Pending Bits 7 through 0      | 1000h       |
| Reserved                      | 1001h-1FFFh |

Refer to the PCI Local Bus Specification, Revision 3.0 for descriptions of these registers.

## 8.5 The MSI-X Table and PBA in Memory Mapped Register Space

表 8-196. MSI-X Table and PBA Register Map

| REGISTER NAME                 | OFFSET |
|-------------------------------|--------|
| Entry 0 Message Address       | 0000h  |
| Entry 0 Message Upper Address | 0004h  |
| Entry 0 Message Data          | 0008h  |
| Entry 0 Vector Control        | 000Ch  |
| Entry 1 Message Address       | 0010h  |
| Entry 1 Message Upper Address | 0014h  |
| Entry 1 Message Data          | 0018h  |
| Entry 1 Vector Control        | 001Ch  |
| Entry 2 Message Address       | 0020h  |
| Entry 2 Message Upper Address | 0024h  |
| Entry 2 Message Data          | 0028h  |
| Entry 2 Vector Control        | 002Ch  |
| Entry 3 Message Address       | 0030h  |
| Entry 3 Message Upper Address | 0034h  |
| Entry 3 Message Data          | 0038h  |

**表 8-196. MSI-X Table and PBA Register Map (续)**

| REGISTER NAME                 | OFFSET      |
|-------------------------------|-------------|
| Entry 3 Vector Control        | 003Ch       |
| Entry 4 Message Address       | 0040h       |
| Entry 4 Message Upper Address | 0044h       |
| Entry 4 Message Data          | 0048h       |
| Entry 4 Vector Control        | 004Ch       |
| Entry 5 Message Address       | 0050h       |
| Entry 5 Message Upper Address | 0054h       |
| Entry 5 Message Data          | 0058h       |
| Entry 5 Vector Control        | 005Ch       |
| Entry 6 Message Address       | 0060h       |
| Entry 6 Message Upper Address | 0064h       |
| Entry 6 Message Data          | 0068h       |
| Entry 6 Vector Control        | 006Ch       |
| Entry 7 Message Address       | 0070h       |
| Entry 7 Message Upper Address | 0074h       |
| Entry 7 Message Data          | 0078h       |
| Entry 7 Vector Control        | 007Ch       |
| Reserved                      | 0080h-0FFFh |
| Pending Bits 7 through 0      | 1000h       |
| Reserved                      | 1001h-1FFFh |

Refer to the PCI Local Bus Specification, Revision 3.0 for descriptions of these registers.

## 9 Device and Documentation Support

### 9.1 Device Support

#### 9.1.1 第三方产品免责声明

TI 发布的与第三方产品或服务有关的信息，不能构成与此类产品或服务或保修的适用性有关的认可，不能构成此类产品或服务单独或与任何 TI 产品或服务一起的表示或认可。

#### 9.1.2 Device Nomenclature

Throughout this data sheet, several conventions are used to convey information. A list of these conventions are as follows:

1. To identify a binary number or field, a lower case b follows the numbers. For example: 000b is a 3-bit binary field.
2. To identify a hexadecimal number or field, a lower case h follows the numbers. For example: 8AFh is a 12-bit hexadecimal field.
3. All other numbers that appear in this document that do not have either a b or h following the number are assumed to be decimal format.
4. If the signal or terminal name has a bar above the name (for example, GRST), then this indicates the logical NOT function. When asserted, this signal is a logic low, 0, or 0b.
5. Differential signal names end with P, N, +, or – designators. The P or + designators signify the positive signal associated with the differential pair. The N or – designators signify the negative signal associated with the differential pair.
6. RSVD indicates that the referenced item is reserved.
7. For each register bit in [Register Maps](#), the software access method is identified in an access column. The legend for this access column includes the following entries:
  - r – read access by software
  - u – updates by the host controller internal hardware
  - w – write access by software
  - c – clear an asserted bit with a write-back of 1b by software. Write of zero to the field has no effect
  - s – the field may be set by a write of one. Write of zero to the field has no effect
  - na – not accessible or not applicable

### 9.2 Documentation Support

#### 9.2.1 Related Documentation

For related documentation, see the following:

- Texas Instruments, [USB 2.0 Board Design and Layout Guidelines application note](#)
- [Universal Serial Bus 2.0 Specification](#)
- [Universal Serial Bus 3.0 Specification](#)
- [Extensible Host Controller Interface for Universal Serial Bus \(xHCI\), Revision 0.96](#)
- [PCI Express Base Specification, Revision 2.1](#)
- [PCI Express Card Electromechanical Specification, Revision 2.0](#)
- [PCI Express Mini Card Electromechanical Specification, Revision 1.2](#)
- [PCI Bus Power Management Interface Specification, Revision 1.2](#)
- [PCI Local Bus Specification, Revision 3.0](#)
- [Guidelines for 64-Bit Global Identifier \(EUI-64\) Registration Authority](#)

#### 9.3 接收文档更新通知

要接收文档更新通知，请导航至 [ti.com](http://ti.com) 上的器件产品文件夹。点击 [通知](#) 进行注册，即可每周接收产品信息更改摘要。有关更改的详细信息，请查看任何已修订文档中包含的修订历史记录。

## 9.4 支持资源

[TI E2E™ 中文支持论坛](#)是工程师的重要参考资料，可直接从专家处获得快速、经过验证的解答和设计帮助。搜索现有解答或提出自己的问题，获得所需的快速设计帮助。

链接的内容由各个贡献者“按原样”提供。这些内容并不构成 TI 技术规范，并且不一定反映 TI 的观点；请参阅 TI 的[使用条款](#)。

## 9.5 Trademarks

Windows XP™ and Windows Vista™ are trademarks of Microsoft Corporation.

TI E2E™ is a trademark of Texas Instruments.

Microsoft® and Windows® are registered trademarks of Microsoft Corporation.

Linux® is a registered trademark of Linus Torvalds.

所有商标均为其各自所有者的财产。

## 9.6 静电放电警告

静电放电 (ESD) 会损坏这个集成电路。德州仪器 (TI) 建议通过适当的预防措施处理所有集成电路。如果不遵守正确的处理和安装程序，可能会损坏集成电路。

ESD 的损坏小至导致微小的性能降级，大至整个器件故障。精密的集成电路可能更容易受到损坏，这是因为非常细微的参数更改都可能会导致器件与其发布的规格不相符。

## 9.7 术语表

[TI 术语表](#) 本术语表列出并解释了术语、首字母缩略词和定义。

## 10 Revision History

注：以前版本的页码可能与当前版本的页码不同

| Changes from Revision P (August 2023) to Revision Q (March 2024)                                                                                                                | Page               |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------|
| • Added text "The recommended 1.1-V and 3.3-V power supply ramp time is greater than or equal to 1 ms (measured from 0% to 100%)" to the <i>Power-Up Sequence</i> section ..... | <a href="#">32</a> |

| Changes from Revision O (August 2023) to Revision P (August 2023)                         | Page               |
|-------------------------------------------------------------------------------------------|--------------------|
| • Updated the <i>Reference Design 1</i> figure to correct the pin name for A4 and B8..... | <a href="#">26</a> |

| Changes from Revision N (August 2022) to Revision O (August 2023)                                      | Page               |
|--------------------------------------------------------------------------------------------------------|--------------------|
| • 更新了 <i>器件信息</i> 表的格式以包含 USB 端口计数.....                                                                | <a href="#">1</a>  |
| • Updated the <i>Power-Up Sequence</i> figure to have VDD11 supply ramp after VDDA_3P3 and VDD33 ..... | <a href="#">32</a> |

| Changes from Revision M (July 2015) to Revision N (August 2022)                         | Page               |
|-----------------------------------------------------------------------------------------|--------------------|
| • 更新了 <i>应用</i> 部分.....                                                                 | <a href="#">1</a>  |
| • 更新了整个文档中的表格、图和交叉参考的编号格式.....                                                          | <a href="#">1</a>  |
| • 更新了数据表以包含丰富的术语.....                                                                   | <a href="#">1</a>  |
| • Change recommended VDD11 minimum to 1.045 V from 0.99 V.....                          | <a href="#">9</a>  |
| • Added the 1.1 V -5% / +10% supply is recommended footnote for VDD11.....              | <a href="#">9</a>  |
| • Changed the pin name for B8 in the Reference Design 1 figure from: VDD11 to: NC ..... | <a href="#">26</a> |

## Changes from Revision L (August 2013) to Revision M (July 2015) Page

|                                                                                                                                             |    |
|---------------------------------------------------------------------------------------------------------------------------------------------|----|
| • 添加了引脚配置和功能、ESD 等级、特性说明、器件功能模式、应用和实施、电源相关建议、布局、器件和文档支持，以及机械、封装和可订购信息 部分 .....                                                              | 1  |
| • Deleted from Section Clock Source Requirements part of the paragraph; -50 MHz. Changed supported Crystal value to 24 MHz and 48 MHz ..... | 18 |
| • Deleted the first ItemizedList under Two-Wire Serial-Bus Interface section .....                                                          | 19 |
| • Deleted part of sentence from Table 112. in bit row 30, description; 'with the PLL....SEL field.....                                      | 73 |
| • Deleted the Description from Table 112, in row 29:24 and replaced with Reserved also, replaced rw with w in same row .....                | 73 |

## Changes from Revision K (March 2011) to Revision L (May 2013) Page

|                                                                                                                                             |    |
|---------------------------------------------------------------------------------------------------------------------------------------------|----|
| • Added text "If a 48 MHz reference clock is used instead of a crystal, GRST# must remain asserted until the 48 MHz clock is stable".....   | 3  |
| • Added text - "If a 48 MHz reference clock is used instead of a crystal, GRST# must remain asserted until the 48 MHz clock is stable"..... | 32 |
| • Replaced the Power Up Sequence image.....                                                                                                 | 32 |

## 11 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

<sup>(5)</sup> Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

<sup>(6)</sup> Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

## TAPE AND REEL INFORMATION

RKM (S-PWQFN-N100)

PLASTIC QUAD FLATPACK NO-LEAD

4211055/C 10/11

- NOTES:
- All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
  - This drawing is subject to change without notice.
  - Quad Flatpack, No-leads (QFN) staggered multi-row package configuration.
  - Pin A1 identifiers are located on both top and bottom of the package and within the zone indicated.  
The Pin A1 identifiers are either a molded, marked, or metal feature.
  - The package thermal pad must be soldered to the board for thermal and mechanical performance.
  - See the additional figure in the Product Data Sheet for details regarding the exposed thermal pad features and dimensions.

RKM (S-PWQFN-N100)

PLASTIC QUAD FLATPACK NO-LEAD

## THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at [www.ti.com](http://www.ti.com).

The exposed thermal pad dimensions for this package are shown in the following illustration.

Exposed Thermal Pad Dimensions

4211101/D 01/14

NOTE: All linear dimensions are in millimeters

RKM (S-PWQFN-N100)

PLASTIC QUAD FLATPACK NO-LEAD

4211126/H 01/14

- NOTES:
- All linear dimensions are in millimeters.
  - This drawing is subject to change without notice.
  - This package is designed to be soldered to a thermal pad on the board. Refer to Application Note, Quad Flat-Pack Packages, Texas Instruments Literature No. SLUA271, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at [www.ti.com](http://www.ti.com) <<http://www.ti.com>>.
  - Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.
  - Customers should contact their board fabrication site for minimum solder mask web tolerances between signal pads.

## 重要声明和免责声明
