## 1 Overview

This document contains information for TCAN1046-Q1 and TCAN1046V-Q1 (VSON package) to aid in a functional safety system design. Information provided are:

- Functional Safety Failure In Time (FIT) rates of the semiconductor component estimated by the application of industry reliability standards
- · Component failure modes and their distribution (FMD) based on the primary function of the device
- Pin failure mode analysis (Pin FMA)

Figure 1-1 shows the TCAN1046-Q1 functional block diagram for reference. Figure 1-2 shows the TCAN1046V-Q1 functional block diagram for reference.

TCAN1046-Q1 and TCAN1046V-Q1 were developed using a quality-managed development process, but were not developed in accordance with the IEC 61508 or ISO 26262 standards.

## 2 Functional Safety Failure In Time (FIT) Rates

This section provides Functional Safety Failure In Time (FIT) rates for TCAN1046-Q1/TCAN1046V-Q1 based on two different industry-wide used reliability standards:

- Table 2-1 provides FIT rates based on IEC TR 62380 / ISO 26262 part 11
- Table 2-2 provides FIT rates based on the Siemens Norm SN 29500-2

Table 2-1. Component Failure Rates per IEC TR 62380 / ISO 26262 Part 11

FIT IEC TR 62380 / ISO 26262	FIT (Failures Per 10 <sup>9</sup> Hours) 14-pin VSON (DMT)
Total Component FIT Rate	9
Die FIT Rate	3
Package FIT Rate	6

The failure rate and mission profile information in Table 2-1 comes from the Reliability data handbook IEC TR 62380 / ISO 26262 part 11:

Mission Profile: Motor Control from Table 11

Power dissipation: 250 mW

Climate type: World-wide Table 8Package factor (lambda 3): Table 17b

Substrate Material: FR4EOS FIT rate assumed: 0 FIT

Table 2-2. Component Failure Rates per Siemens Norm SN 29500-2

Table	Category	Reference FIT Rate	Reference Virtual T <sub>J</sub>
5	CMOS, BICMOS Digital, analog / mixed	20 FIT	55°C

The Reference FIT Rate and Reference Virtual  $T_J$  (junction temperature) in Table 2-2 come from the Siemens Norm SN 29500-2 tables 1 through 5. Failure rates under operating conditions are calculated from the reference failure rate and virtual junction temperature using conversion information in SN 29500-2 section 4.

## 3 Failure Mode Distribution (FMD)

The failure mode distribution estimation for TCAN1046-Q1 and TCAN1046V-Q1 in Table 3-1 comes from the combination of common failure modes listed in standards such as IEC 61508 and ISO 26262, the ratio of sub-circuit function size and complexity and from best engineering judgment.

The failure modes listed in this section reflect random failure events and do not include failures due to misuse or overstress.

Table 3-1. Die Failure Modes and Distribution

Die Failure Modes	Failure Mode Distribution (%)
Receiver Fail	45%
Transmitter Fail	45%
CANH or CANL driver stuck dominant	5%
Short circuit any two pins	5%

## 4 Pin Failure Mode Analysis (Pin FMA)

This section provides a Failure Mode Analysis (FMA) for the pins of the TCAN1046-Q1 and TCAN1046V-Q1. The failure modes covered in this document include the typical pin-by-pin failure scenarios:

- Pin short-circuited to Ground (see Table 4-2)
- Pin open-circuited (see Table 4-3)
- Pin short-circuited to an adjacent pin (see Table 4-4)
- Pin short-circuited to VCC (see Table 4-6)
- Pin short-circuited to VIO (see Table 4-7)
- Pin short-circuited to VBAT (see Table 4-8)

Table 4-2 through Table 4-8 also indicate how these pin conditions can affect the device as per the failure effects classification in Table 4-1.

Table 4-1. T	Classification	of Failure Effects
--------------	----------------	--------------------

Class	Failure Effects
А	Potential device damage that affects functionality
В	No device damage, but loss of functionality
С	No device damage, but performance degradation
D	No device damage, no impact to functionality or performance

Figure 4-1 shows the TCAN1046-Q1 pin diagram, and Figure 4-2 shows the TCAN1046V-Q1 pin diagram. For a detailed description of the device pins please refer to the *Pin Configuration and Functions* section in the TCAN1046-Q1/TCAN1046V-Q1 data sheet.

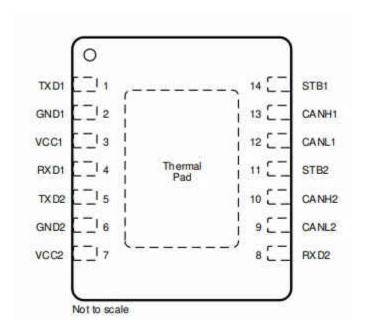

Figure 4-1. TCAN1046-Q1 Pin Diagram

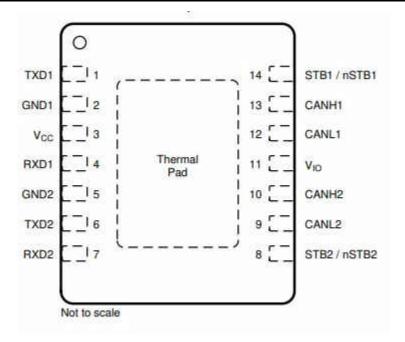

Figure 4-2. TCAN1046V-Q1 Pin Diagram

Following are the assumptions of use and the device configuration assumed for the pin FMA in this section:

- VCC = 4.5 to 5.5V
- VIO (if applicable) = 1.7 to 5.5V

#### Note

The VSON package includes a thermal pad. All device pins are adjacent to the thermal pad. The device behavior when pins are shorted to the thermal pad depends on which net is connected to the thermal pad.
