## 带有 DCSTM 控制的 3A 高效同步降压转换器

查询样品：TPS62090，TPS62091，TPS62092，TPS62093

## 特性

- 2.5 V 至 6 V 输入电压范围
- DCS ${ }^{\text {TM }}$ 控制
- 转换器效率 $95 \%$
- 省电模式
- $20 \mu \mathrm{~A}$ 运行静态电流
- 针对最低压降的 $\mathbf{1 0 0 \%}$ 占空比
- $2.8 \mathrm{MHz} / 1.4 \mathrm{MHz}$ 典型开关频率
- 0.8 V 至 $\mathrm{V}_{\mathrm{IN}}$ 的可调输出电压
- 固定输出电压版本
- 输出放电功能
- 可调节软启动
- 两级短路保护
- 输出电压跟踪
- 宽输出电容值选择
- 采用 $3 \mathrm{~mm} \times 3 \mathrm{~mm} 16$ 引脚四方扁平无引线（QFN）封装

## 应用

- 分布式电源
- 笔记本，笔记本电脑
- 硬盘驱动器
- 处理器电源
- 电池供电型应用

说明
TPS6209x 器件是一款高效同步降压转换器，此转换器针对小外形尺寸，高效应用进行了优化并适合于电池供电类应用。为了最大限度地提升效率，此转换器运行在 $2.8 \mathrm{MHz} / 1.4 \mathrm{MHz}$ 的标称开关频率的脉宽调制 （PWM）模式下并在轻负载时自动进入省电运行模式。当被用于分布式电源和负载点调制时，此器件允许到其它电源轨的电压跟踪并可耐受范围在 $10 \mu \mathrm{~F}$ 到高达 $150 \mu \mathrm{~F}$ 甚至更高的输出电容。通过使用 DCS ${ }^{\text {TM }}$ 控制技术，此器件可实现出色的负载静态性能以及精确的输出电压调制。

此输出电压启动斜波由软启动引脚控制，从而使器件可作为独立电源运行或运行在跟踪配置下。通过配置使能和开漏电源正常引脚也有可能实现电源排序。在省电模式下，此器件运行在典型值为 $20 \mu \mathrm{~A}$ 静态电流下。在全部负载电流范围内，自动进入省电模式并且无缝保持高效。

Please be aware that an important notice concerning availability，standard warranty，and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet．

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

ORDERING INFORMATION ${ }^{(1)}$

| $\mathbf{T}_{\mathbf{A}}$ | VOUT | ORDERING | PACKAGE | PACKAGE MARKING |
| :---: | :---: | :---: | :---: | :---: |
| $-40^{\circ} \mathrm{C}$ to $85^{\circ} \mathrm{C}$ | adjustable | TPS62090 | RGT | SBW |
|  | 3.3 V | TPS62091 | RGT | SBX |
|  | 2.5 V | TPS62092 | RGT | SBY |
|  | 1.8 V | TPS62093 | RGT | SBZ |

(1) For detailed ordering information please see the PACKAGE OPTION ADDENDUM section at the end of the datasheet.

## ABSOLUTE MAXIMUM RATINGS ${ }^{(1)}$

over operating free-air temperature range (unless otherwise noted)

(1) Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) All voltage values are with respect to network ground terminal.

## DEVICE INFORMATION

NOTE: *The exposed Thermal Pad is connected to AGND.

## PIN FUNCTIONS

| PIN |  | I/O | DESCRIPTION |
| :---: | :---: | :---: | :---: |
| NAME | NO. |  |  |
| SW | 1, 2 | 1 | Switch pin of the power stage. |
| FREQ | 3 | 1 | This pin selects the switching frequency of the device. FREQ=low sets the typical switching frequency to 2.8 MHz . FREQ=high sets the typical switching frequency to 1.4 MHz . This pin has an active pull down resistor of typically $400 \mathrm{k} \Omega$ and can be left floating for 2.8 MHz operation. |
| PG | 4 | 0 | Power good open drain output. This pin is high impedance if the output voltage is within regulation. This pin is pulled low if the output is below its nominal value. The pull up resistor can not be connected to any voltage higher than the input voltage of the device. |
| FB | 5 |  | Feedback pin of the device. For the fixed output voltage versions this pin needs to be connected to GND for improved thermal performance. If, desired then this pin can also be left floating since it is internally connected with $400 \mathrm{k} \Omega$ to GND for fixed output voltage versions. |
| AGND | 6 |  | Analog ground. |
| CP | 7 |  | Internal charge pump flying capacitor. Connect a 10 nF capacitor between CP and CN. |
| CN | 8 |  | Internal charge pump flying capacitor. Connect a 10 nF capacitor between CP and CN. |
| SS | 9 | I | Soft-start control pin. A capacitor is connected to this pin and sets the softstart time. Leaving this pin floating sets the minimum start-up time. |
| AVIN | 10 |  | Bias supply input voltage pin. |
| PVIN | 11,12 |  | Power supply input voltage pin. |
| EN | 13 |  | Device enable. To enable the device this pin needs to be pulled high. Pulling this pin low disables the device. This pin has an active pull down resistor of typically $400 \mathrm{k} \Omega$. |
| PGND | 14,15 |  | Power ground connection. |
| VOS | 16 |  | Output voltage sense pin. This pin needs to be connected to the output voltage. |
| Thermal Pad |  |  | The exposed thermal pad is connected to AGND. |

## DETAILED DESCRIPTION

## Operation

The TPS6209x synchronous switched mode converters are based on DCS ${ }^{\text {TM }}$ Control (Direct Control with Seamless transition into Power Save Mode). This is an advanced regulation topology that combines the advantages of hysteretic and voltage mode control.
The DCS ${ }^{\text {TM }}$ Control topology operates in PWM (Pulse Width Modulation) mode for medium to heavy load conditions and in Power Save Mode at light load currents. In PWM, the converter operates with its nominal switching frequency of $2.8 \mathrm{MHz} / 1.4 \mathrm{MHz}$ having a controlled frequency variation over the input voltage range. As the load current decreases, the converter enters Power Save Mode, reducing the switching frequency and minimizing the IC quiescent current to achieve high efficiency over the entire load current range. DCS ${ }^{\text {TM }}$ Control supports both operation modes (PWM and PFM) using a single building block having a seamless transition from PWM to Power Save Mode without effects on the output voltage. Fixed output voltage versions provide smallest solution size combined with lowest quiescent current. The TPS6209x family offers excellent DC voltage regulation and load transient regulation, combined with low output voltage ripple, minimizing interference with RF circuits.

## PWM Operation

At medium to heavy load currents, the device operates with pulse width modulation (PWM) at a nominal switching frequency of 2.8 MHz or 1.4 MHz depending on the setting of the FREQ pin. As the load current decreases, the converter enters the Power Save Mode operation reducing its switching frequency. The device enters Power Save Mode at the boundary to discontinuous conduction mode (DCM).

## Power Save Mode Operation

As the load current decreases, the converter enters Power Save Mode operation. During Power Save Mode the converter operates with reduced switching frequency in PFM mode and with a minimum quiescent current while maintaining high efficiency. The Power Save Mode is based on a fixed on-time architecture following Equation 1. When operating at 1.4 MHz the on-time is twice as long as the on-time for 2.8 MHz operation. This results in larger output voltage ripple, as shown in Figure 17 and Figure 18, and slightly higher output voltage at no load, as shown in Figure 8 and Figure 9. To have the same output voltage ripple at 1.4 MHz during PFM mode, either the output capacitor or the inductor value needs to be increased. As an example, operating at $2.8 \mathrm{MHz} u s i n g$ $0.47 \mu \mathrm{H}$ inductor gives the same output voltage ripple as operating with 1.4 MHz using $1 \mu \mathrm{H}$ inductor.

$$
\begin{align*}
& \operatorname{ton}_{2 \text { RMHL }}=\frac{V_{\text {OUT }}}{V_{\text {IN }}} \times 360 \mathrm{~ns} \\
& \text { ton }_{1, \text { anHz }}=\frac{V_{\text {OUT }}}{V_{\text {IN }}} \times 360 \mathrm{~ns} \times 2 \\
& f=\frac{2 \times \text { I OUT }}{\tan ^{2}\left(1+\frac{\mathrm{V}_{\text {IN }}-\mathrm{V}_{\text {OUT }}}{\mathrm{V}_{\text {OUT }}}\right) \times \frac{\mathrm{V}_{\text {IN }}-\mathrm{V}_{\text {OUT }}}{\mathrm{L}}} \tag{1}
\end{align*}
$$

In Power Save Mode the output voltage rises slightly above the nominal output voltage in PWM mode, as shown in Figure 8 and Figure 9. This effect can be reduced by increasing the output capacitance or the inductor value. This effect can also be reduced by programming the output voltage of the TPS 62090 lower than the target value. As an example, if the target output voltage is 3.3 V , then the TPS 62090 can be programmed to $3.3 \mathrm{~V}-0.8 \%$. As a result the output voltage accuracy is now $-2.2 \%$ to $+2.2 \%$ instead of $-1.4 \%$ to $3 \%$. The output voltage accuracy in PFM operation is reflected in the electrical specification table and given for a $22 \mu \mathrm{~F}$ output capacitance.

## Low Dropout Operation (100\% Duty Cycle)

The device offers low input to output voltage difference by entering $100 \%$ duty cycle mode. In this mode the high side MOSFET switch is constantly turned on. This is particularly useful in battery powered applications to achieve longest operation time by taking full advantage of the whole battery voltage range. The minimum input voltage where the output voltage falls below its nominal regulation value is given by:

$$
\begin{equation*}
\mathrm{V}_{\mathrm{IN}(\text { min })}=\mathrm{V}_{\text {OUT(max) }}+\mathrm{l}_{\text {out }} \mathrm{x}\left(\mathrm{R}_{\mathrm{DS}(\text { on })}+\mathrm{R}_{\mathrm{L}}\right) \tag{2}
\end{equation*}
$$

Where
$\mathrm{R}_{\mathrm{DS}(\text { on) }}=$ High side FET on-resistance
$R_{L}=D C$ resistance of the inductor
$\mathrm{V}_{\mathrm{OUT}(\text { max })}=$ nominal output voltage plus maximum output voltage tolerance

## Softstart (SS)

To minimize inrush current during start up, the device has an adjustable softstart depending on the capacitor value connected to the SS pin. The device charges the softstart capacitor with a constant current of typically 7.5 $\mu \mathrm{A}$. The feedback voltage follows this voltage with a fraction of 1.56 until the internal reference voltage of 0.8 V is reached. The softstart operation is completed once the voltage at the softstart capacitor has reached typically 1.25 V . The soft-start time can be calculated using Equation 3. The larger the softstart capacitor the longer the softstart time. The relation between softstart voltage and feedback voltage can be estimated using Equation 4.

$$
\begin{align*}
& t_{S S}=C_{S S} \times \frac{1.25 \mathrm{~V}}{7.5 \mu \mathrm{~A}}  \tag{3}\\
& \mathrm{~V}_{\mathrm{FB}}=\frac{\mathrm{V}_{\mathrm{SS}}}{1.56} \tag{4}
\end{align*}
$$

This is also the case for the fixed output voltage option having the internal regulation voltage. Leaving the softstart pin floating sets the minimum start-up time.

## Start-up Tracking (SS)

The softstart pin can also be used to implement output voltage tracking with other supply rails. The internal reference voltage follows the voltage at the softstart pin with a fraction of 1.56 until the internal reference voltage of 0.8 V is reached. The softstart pin can be used to implement output voltage tracking as shown in Figure 28.

Figure 28. Output Voltage Tracking
In Figure 28, the output V2 will track the voltage applied to V1. The voltage will track simultaneously when following conditions are met:

$$
\begin{equation*}
\frac{R 3}{R 4}=\frac{R 1}{R 2} \times 1.56 \tag{5}
\end{equation*}
$$

As the fraction of R3/R4 becomes larger the voltage V1 will ramp up faster than V2 and if it gets smaller than the ramp will be slower than V2. R4 needs to be determined first using Equation 6.

$$
\begin{equation*}
\mathrm{R} 4=\frac{1.25 \mathrm{~V}}{300 \mu \mathrm{~A}} \tag{6}
\end{equation*}
$$

In the calculation of R4, $300 \mu \mathrm{~A}$ current is used to achieve sufficient accuracy by taking into account the typical $7.5 \mu \mathrm{~A}$ soft-start current. After determining R4, R3 can be calculated using Equation 5.

## Short Circuit Protection (Hiccup-Mode)

The device is protected against hard short circuits to GND and over-current events. This is implemented by a two level short circuit protection. During start-up and when the output is shorted to GND the switch current limit is reduced to $1 / 3$ of its typical current limit of 4.6 A . Once the output voltage exceeds typically 0.6 V the current limit is released to its nominal value. The full current limit is implemented as a hiccup current limit. Once the internal current limits is triggered 32 times the device stops switching and starts a new start-up sequence after a typical delay time of $66 \mu \mathrm{~S}$ passed by. The device will go through these cycles until the high current condition is released.

## Output Discharge Function

To make sure the device starts up under defined conditions, the output gets discharged via the VOS pin with a typical discharge resistor of $200 \Omega$ whenever the device shuts down. This happens when the device is disabled or if thermal shutdown, undervoltage lockout or short circuit hiccup-mode is triggered.

## Power Good Output (PG)

The power good output is low when the output voltage is below its nominal value. The power good will become high impedance once the output is within $5 \%$ of regulation. The PG pin is an open drain output and is specified to typically sink up to 1 mA . This output requires a pull-up resistor to be monitored properly. The pull-up resistor cannot be connected to any voltage higher than the input voltage of the device.

## Frequency Set Pin (FREQ)

The FREQ pin is a digital logic input which sets the nominal switching frequency. Pulling this pin to GND sets the nominal switching frequency to 2.8 MHz and pulling this pin high sets the nominal switching frequency to 1.4 MHz . Since this pin changes the switching frequency it also changes the on-time during PFM mode. At 1.4 MHz the on-time is twice the on-time as operating at 2.8 MHz . This pin has an active pull-down resistor of typically $400 \mathrm{k} \Omega$. For applications where efficiency is of highest importance, a lower switching frequency should be selected. A higher switching frequency allows the use of smaller external components, faster load transient response and lower output voltage ripple when using same L-C values.

## Undervoltage Lockout (UVLO)

To avoid mis-operation of the device at low input voltages, an undervoltage lockout is included. UVLO shuts down the device at input voltages lower than typically 2.2 V with a 200 mV hysteresis.

## Thermal Shutdown

The device goes into thermal shutdown once the junction temperature exceeds typically $150^{\circ} \mathrm{C}$ with a $20^{\circ} \mathrm{C}$ hysteresis.

## APPLICATION INFORMATION

## DESIGN PROCEDURE

The first step is the selection of the output filter components. To simplify this process, Table 2 and Table 3 outline possible inductor and capacitor value combinations.

Table 2. Output Filter Selection (2.8 MHz Operation, FREQ = GND)

| INDUCTOR VALUE $[\boldsymbol{\mu H}]^{(1)}$ | OUTPUT CAPACITOR VALUE $[\boldsymbol{\mu F}]^{(2)}$ |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\mathbf{1 0}$ | $\mathbf{2 2}$ | $\mathbf{4 7}$ | $\mathbf{1 0 0}$ | $\mathbf{1 5 0}$ |
| 0.47 |  | $\checkmark(3)$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |
| 1.0 | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |
| 2.2 |  |  |  |  |  |
| 3.3 |  |  |  |  |  |

(1) Inductor tolerance and current de-rating is anticipated. The effective inductance can vary by $+20 \%$ and $-30 \%$.
(2) Capacitance tolerance and bias voltage de-rating is anticipated. The effective capacitance can vary by $+20 \%$ and $-50 \%$.
(3) Typical application configuration. Other check mark indicates alternative filter combinations

Table 3. Output Filter Selection (1.4 MHz Operation, FREQ = $\mathrm{V}_{\mathrm{IN}}$ )

| ${\text { INDUCTOR VALUE }[\boldsymbol{\mu H}]^{(1)}}^{2}$ | OUTPUT CAPACITOR VALUE $[\boldsymbol{\mu F}]^{(\mathbf{2})}$ |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\mathbf{1 0}$ | $\mathbf{2 2}$ | $\mathbf{4 7}$ | $\mathbf{1 0 0}$ | $\mathbf{1 5 0}$ |
| 0.47 |  | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |
| 1.0 | $\checkmark$ | $\vee(3)$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |
| 2.2 | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |
| 3.3 |  |  |  |  |  |

(1) Inductor tolerance and current de-rating is anticipated. The effective inductance can vary by $+20 \%$ and $-30 \%$.
(2) Capacitance tolerance and bias voltage de-rating is anticipated. The effective capacitance can vary by $+20 \%$ and $-50 \%$.
(3) Typical application configuration. Other check mark indicates alternative filter combinations

## Inductor Selection

The inductor selection is affected by several parameter like inductor ripple current, output voltage ripple, transition point into Power Save Mode, and efficiency. See Table 4 for typical inductors.

Table 4. Inductor Selection

| INDUCTOR VALUE | COMPONENT SUPPLIER | SIZE (LxWxH mm) | Isat/DCR |
| :---: | :---: | :---: | :---: |
| $0.6 \mu \mathrm{H}$ | Coilcraft XAL4012-601 | $4 \times 4 \times 2.1$ | $7.1 \mathrm{~A} / 9.5 \mathrm{~m} \Omega$ |
| $1 \mu \mathrm{H}$ | Coilcraft XAL4020-102 | $4 \times 4 \times 2.1$ | $5.9 \mathrm{~A} / 13.2 \mathrm{~m} \Omega$ |
| $1 \mu \mathrm{H}$ | Coilcraft XFL4020-102 | $4 \times 4 \times 2.1$ | $5.1 \mathrm{~A} / 10.8 \mathrm{~m} \Omega$ |
| $0.47 \mu \mathrm{H}$ | TOKO DFE252012 R47 | $2.5 \times 2 \times 1.2$ | $3.7 \mathrm{~A} / 39 \mathrm{~m} \Omega$ |
| $1 \mu \mathrm{H}$ | TOKO DFE252012 $1 R 0$ | $2.5 \times 2 \times 1.2$ | $3.0 \mathrm{~A} / 59 \mathrm{~m} \Omega$ |
| $0.68 \mu \mathrm{H}$ | TOKO DFE322512 R68 | $3.2 \times 2.5 \times 1.2$ | $3.5 \mathrm{~A} / 37 \mathrm{~m} \Omega$ |
| $1 \mu \mathrm{H}$ | TOKO DFE322512 $1 R 0$ | $3.2 \times 2.5 \times 1.2$ | $3.1 \mathrm{~A} / 45 \mathrm{~m} \Omega$ |

In addition, the inductor has to be rated for the appropriate saturation current and DC resistance (DCR). The inductor needs to be rated for a saturation current as high as the typical switch current limit, of 4.6 A or according to Equation 7 and Equation 8 . Equation 7 and Equation 8 calculate the maximum inductor current under static load conditions. The formula takes the converter efficiency into account. The converter efficiency can be taken from the data sheet graph's or $80 \%$ can be used as a conservative approach. The calculation must be done for the maximum input voltage where the peak switch current is highest.

$$
\begin{align*}
& \mathrm{L}_{\mathrm{L}}=\mathrm{I}_{\text {OUT }}+\frac{\Delta_{\mathrm{L}}}{2}  \tag{7}\\
& \mathrm{~L}_{\mathrm{L}}=\mathrm{I}_{\text {OUT }}+\frac{\frac{\mathrm{V}_{\text {OUT }}}{\eta} \times\left(1-\frac{\mathrm{V}_{\text {OUT }}}{\mathrm{V}_{\text {IN }} \times \eta}\right)}{2 \times f \times \mathrm{L}} \tag{8}
\end{align*}
$$

where
$f=$ Converter switching frequency (typical 2.8 MHz or 1.4 MHz )
$\mathrm{L}=$ Selected inductor value
$\eta=$ Estimated converter efficiency (use the number from the efficiency curves or 0.80 as an conservative assumption)
Note: The calculation must be done for the maximum input voltage of the application
Calculating the maximum inductor current using the actual operating conditions gives the minimum saturation current. A margin of $20 \%$ needs to be added to cover for load transients during operation.

## Input and Output Capacitor Selection

For best output and input voltage filtering, low ESR ceramic capacitors are recommended. The input capacitor minimizes input voltage ripple, suppresses input voltage spikes and provides a stable system rail for the device. A $22 \mu \mathrm{~F}$ or larger input capacitor is recommended for 1.4 MHz operation frequency. For 2.8 MHz operation frequence a $10 \mu \mathrm{~F}$ input capacitor or larger is recommended. The output capacitor value can range from $10 \mu \mathrm{~F}$ up to $150 \mu \mathrm{~F}$ and beyond. The recommended typical output capacitor value is $22 \mu \mathrm{~F}$ and can vary over a wide range as outline in the output filter selection table.

Table 5. Input Capacitor Selection

| INPUT CAPACITOR | COMMENT |
| :---: | :---: |
| $10 \mu \mathrm{~F}$ | FREQ=low, $\mathrm{f}=2.8 \mathrm{MHz}$ |
| $22 \mu \mathrm{~F}$ | FREQ=high, $\mathrm{f}=1.4 \mathrm{MHz}$ |

## Setting the Output Voltage

The output voltage is set by an external resistor divider according to the following equations:

$$
\begin{align*}
& V_{O U T}=V_{F B} \times\left(1+\frac{R 1}{R 2}\right)=0.8 \mathrm{~V} \times\left(1+\frac{\mathrm{R} 1}{\mathrm{R} 2}\right)  \tag{9}\\
& \mathrm{R} 2=\frac{V_{\mathrm{FB}}}{\mathrm{I}_{\mathrm{FB}}}=\frac{0.8 \mathrm{~V}}{5 \mu \mathrm{~A}} \approx 160 \mathrm{k} \Omega  \tag{10}\\
& \mathrm{R} 1=\mathrm{R} 2 \times\left(\frac{\mathrm{V}_{\mathrm{OUT}}}{\mathrm{~V}_{\mathrm{FB}}}-1\right)=\mathrm{R} 2 \times\left(\frac{\mathrm{V}_{\mathrm{OUT}}}{0.8 \mathrm{~V}}-1\right) \tag{11}
\end{align*}
$$

When sizing R2, in order to achieve low quiescent current and acceptable noise sensitivity, use a minimum of 5 $\mu \mathrm{A}$ for the feedback current $\mathrm{I}_{\mathrm{FB}}$. Larger currents through R2 improve noise sensitivity and output voltage accuracy. Lowest quiescent current and best output voltage accuracy can be achieved with the fixed output voltage versions. For the fixed output voltage versions, the FB pin can be left floating or connected to GND to improve the thermal package performance.

## Layout Guideline

It is recommended to place all components as close as possible to the IC. The VOS connection is noise sensitive and needs to be routed as short and directly to the output terminal of the inductor. The exposed thermal pad of the package, analog ground (pin 6) and power ground (pin 14, 15) should have a single joint connection at the exposed thermal pad of the package. This minimizes switch node jitter. The charge pump capacitor connected to CP and CN should be placed close to the IC to minimize coupling of switching waveforms into other traces and circuits. Refer to the evaluation module User Guide (SLVU670) for an example of component placement, routing and thermal design.

## TYPICAL APPLICATIONS

${ }^{(1)}$ The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.
${ }^{(2)}$ RoHS: TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed $0.1 \%$ by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (CI) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.
${ }^{(3)}$ MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.
${ }^{(4)}$ There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device
${ }^{(5)}$ Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.
${ }^{(6)}$ Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
