

## 说明

TIDM-1005 实现了可在仪表总线 (M-Bus) 网络和 RS-485 网络之间进行协议转换的智能仪表数据收集器。M-Bus 网络和 RS-485 网络可以在某些网络域中混用，这种情况下需要使用桥接功能来实现系统完全集成。此 TI 参考设计将成为一个中间节点，它从各个流量计收集 M-Bus 数据包，然后对其进行格式处理，以便通过较大的 RS-485 网络传输到主数据集中器。

## 特性

- 可在 M-Bus 和 RS-485 收发器之间进行协议转换的低成本数据收集器应用
- 通过 24V 隔离式电源输出可提供足够电力供 M-Bus 主设备模块支持 100 个 M-Bus 从属设备，通过 3.3V 输出可为 MSP432™ 供电，而通过 5V 输出可为 RS-485 信号链供电
- 已通过测试的 ±2-KV IEC61000-4-4 EFT、±8-KV IEC61000-4-2 ESD 和 CISPR22 B 类传导发射
- TI 参考设计 EVM 包括额外的引脚（用于 SPI、UART 和 GPIO），而通过软件示例可轻松评估是否支持其他无线和有线通信协议

## 应用

- 数据收集器
- 数据集中器
- 电表

## 1 System Description

The TIDM-1005 provides a cost-constrained and low-power data collector with protocol conversion between M-Bus and RS-485 transceiver. The design's primary goal is to provide seamless connection among devices with mixed connectivity of M-Bus or RS-485 transceiver. 图 1 shows the TIDM-1005 system overview. The design runs as M-Bus master to manage the smart meters having M-Bus slave communication and to collect meter reading information from those meters. On the other side to the RS-485 lines, this design runs as a RS-485 slave node to the data concentrator having the RS-485 communication.

This design can also be a reference design for the electrical meter with RS-485 communication because the design is built with the complete RS-485 signal chains [protection, isolation, RS-485 transceiver, and microcontroller (MCU)]. For this purpose, this design provides the software examples for RS-485 standalone operation as well as RS-485 and M-Bus protocol converter.

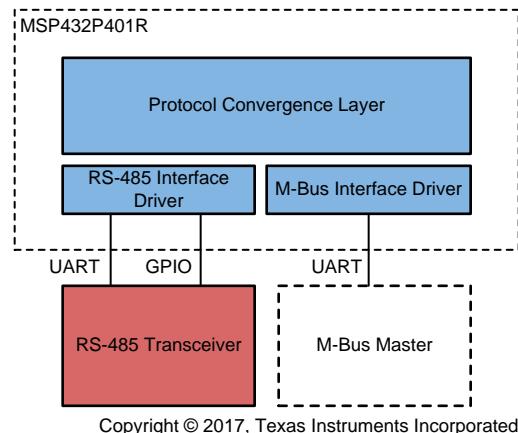

图 1. TIDM-1005 System Overview

图 2 shows the software architecture. The MSP432™ runs the protocol convergence protocol implemented in software interfacing to RS-485 transceiver from UART and GPIO and to M-Bus from UART. The UARTs for the RS-485 and the M-Bus are used for data TX and RX, and the GPIO for the RS-485 is to enable the RS-485 TX or RX. The protocol convergence layer includes M-Bus data link framing and parsing per EN 13757-2 standard in addition to passing the received data from one to the other interface.

The M-Bus master module is not included as part of the TIDM-1005. The details for testing with the external M-Bus master module can be found in [节 3.2.1](#).

## 1.1 Key System Specifications

**表 1. Key System Specifications**

PARAMETER	SPECIFICATIONS	DETAILS
Input power source	Option one: internal AC-DC power supply (input of 85 VAC to 264 VAC, 50 or 60 Hz, and output of 0.42 A at 24 V) Option two: external AC-DC power adaptor (output $\geq$ 0.42 A at 24 V)	<a href="#">节 3.1.1</a>
RS-485 transceiver	200-kbps, half-duplex, 5-V supply power	<a href="#">节 2.3.2</a>
Host processor	ARM® 32-bit Cortex®-M4F CPU, 48 MHz, 256KB Flash, 64-kB RAM	<a href="#">节 2.3.1</a>
DC-DC converter	Input: 0.42 A at 24 V Output: 3.3 V and 5 V	<a href="#">节 2.3.5</a>
Digital isolator	Integrated DC-DC converter with on-chip transformer, 3-V to 5.5-V wide input supply range, forward/reverse channels: 3/1	<a href="#">节 2.3.3</a>
IEC61000-4-2 electro static discharge (ESD) protection	$\pm 8$ KV, contact discharge	<a href="#">节 3.2.4</a>
IEC61000-4-4 electrical fast transient (EFT) protection	$\pm 2$ KV, BER $< 10^{-7}$	<a href="#">节 3.2.5</a>
Conducted emission	CISPR22 Class-B	<a href="#">节 3.2.3</a>

## 2 System Overview

### 2.1 Block Diagram

图 3 shows the system block diagram. The MSP432P401R is the host processor that runs protocol convergence protocol in software and that interfaces to RS-485 and M-Bus transceiver from UART. The temperature sensor (TMP102) and power-on reset (TPS3808) are built in the design as optional features to supervise reset line and temperature.

The ISOW7841 isolates the RS-485 signal chain from the MCU (MSP432P401R) to reduce noise currents on a data bus and to protect sensitive circuitry. The ISOW7841 is integrated with reinforced power converter to supply 5-V power to the RS-485 transceiver. The level shifter (SN74LV1T34DBVR) installed between the ISOW7841 and MSP432P401R adjusts the voltage level in the control (GPIO) and data (UART) paths between the MSP432 and THVD1500 to deliver the proper logical value to each device.

The THVD1500 is a cost-optimized, half-duplex RS-485 transceiver (up to 300 kbps). The THVD1500 operate from a single 5-V supply, which is provided by the ISOW7841.

The AC-DC power supply supports a wide range of AC voltage input from 85 VAC to 264 VAC and output 0.42 mA at 24 V to power an external M-Bus master and to input to the DC-DC converter. The DC-DC converter steps the input voltage down to 3.3 V and 5 V to power the host processor and the RS-485 transceiver, respectively.

### 2.2 Design Considerations

For this design, these devices were chosen due to:

- The MSP432P401R is a cost-constrained and ultra-low-power 32-bit, ARM Cortex-M4F processor that

supports necessary peripherals and speed for M-Bus and RS-485 transceiver.

- The THVD1500 is a robust half-duplex RS-485 transceiver with external protection circuitry to satisfy  $\pm 8\text{-KV}$  IEC61000-4-2 contact discharge and  $\pm 2\text{-KV}$  IEC61000-4-4 fast transient burst.
- The ISOW7841 is a high-performance, digital isolator with on-chip transformer and an integrated reinforced power converter with up to 650 mW of isolated power.
- The UCC28711 is a flyback power supply controller that provides isolated-output constant-voltage (CV) and constant-current (CC) output regulation.
- The TPS62177 or TPS62175 is a high-efficiency, synchronous, step-down, DC-DC converter with a wide operating input voltage range of 4.75 V to 28 V, which provides up to 500-mA output current.

## 2.3 *Highlighted Products*

### 2.3.1 MSP432P401R

The MSP432P401x MCU family is TI's latest addition to its portfolio of efficient ultra-low-power mixed-signal MCUs. The MSP432P401x MCUs feature the ARM Cortex-M4 processor in a wide configuration of device options, which include a rich set of analog, timing, and communication peripherals, thereby catering to a large number of application scenarios where both efficient data processing and enhanced low-power operation are paramount.

Overall, the MSP432P401x is an ideal combination of the TI MSP430™ low-power DNA, advance mixed-signal features, and the processing capabilities of the ARM 32-bit Cortex-M4 RISC engine. The devices ship with bundled peripheral driver libraries and are compatible with standard components of the ARM ecosystem.

图 4 shows the MSP432 functional block diagram.

Copyright © 2017, Texas Instruments Incorporated

图 4. MSP432™ Functional Block Diagram

### 2.3.2 THVD1500

THVD1500 is a robust half-duplex RS-485 transceiver for industrial applications. The bus pins are immune to high levels of IEC Contact Discharge ESD events eliminating need of additional system level protection components. The device operates from a single 5-V supply. The wide common-mode voltage range and low input leakage on bus pins make THVD1500 suitable for multi-point applications over long cable runs. THVD1500 is available in industry standard 8-pin SOIC package for drop-in compatibility. The device is characterized from -40°C to 125°C.

图 5 shows the THVD1500 functional block diagram.

图 5. Functional Block Diagram

### 2.3.3 ISOW7841

The ISOW784x family of devices comprises a high-efficiency, low-emissions isolated DC-DC converter and four high-speed isolated data channels. 图 6 shows the functional block diagram of the ISOW784x family of devices.

The integrated DC-DC converter uses switched mode operation and proprietary circuit techniques to reduce power losses and boost efficiency. Specialized control mechanisms, clocking schemes, and the use of a high-Q, on-chip transformer provide high efficiency and low radiated emissions. The integrated transformer uses thin film polymer as the insulation barrier.

The  $V_{CC}$  supply is provided to the primary power controller that switches the power stage connected to the integrated transformer. Power is transferred to the secondary side, rectified, and regulated to either 3.3 V or 5 V depending on the SEL pin. The output voltage,  $V_{ISO}$ , is monitored, and feedback information is conveyed to the primary side through a dedicated isolation channel. The duty cycle of the primary switching stage is adjusted accordingly. The fast feedback control loop of the power converter ensures low overshoots and undershoots during load transients. Undervoltage lockout (UVLO) with hysteresis is integrated on the  $V_{CC}$  and  $V_{ISO}$  supplies, which ensures robust system performance under noisy conditions. An integrated soft-start mechanism ensures controlled inrush current and avoids any overshoot on the output during power up.

The integrated signal-isolation channels employ an ON-OFF keying (OOK) modulation scheme to transmit the digital data across a silicon-dioxide based isolation barrier. The transmitter sends a high-frequency carrier across the barrier to represent one state and sends no signal to represent the other state. The receiver demodulates the signal after signal conditioning and produces the output through a buffer stage. The signal-isolation channels incorporate advanced circuit techniques to maximize the CMTI performance and minimize the radiated emissions from the high frequency carrier and IO buffer switching. 图 7 shows a functional block diagram of a typical signal isolation channel.

The ISOW784x family of devices is suitable for applications that have limited board space and require more integration. These devices are also suitable for very-high voltage applications where power transformers meeting the required isolation specifications are bulky and expensive.

图 6. Functional Block Diagram

图 7. Conceptual Block Diagram of a Capacitive Data Channel

### 2.3.4 UCC28711

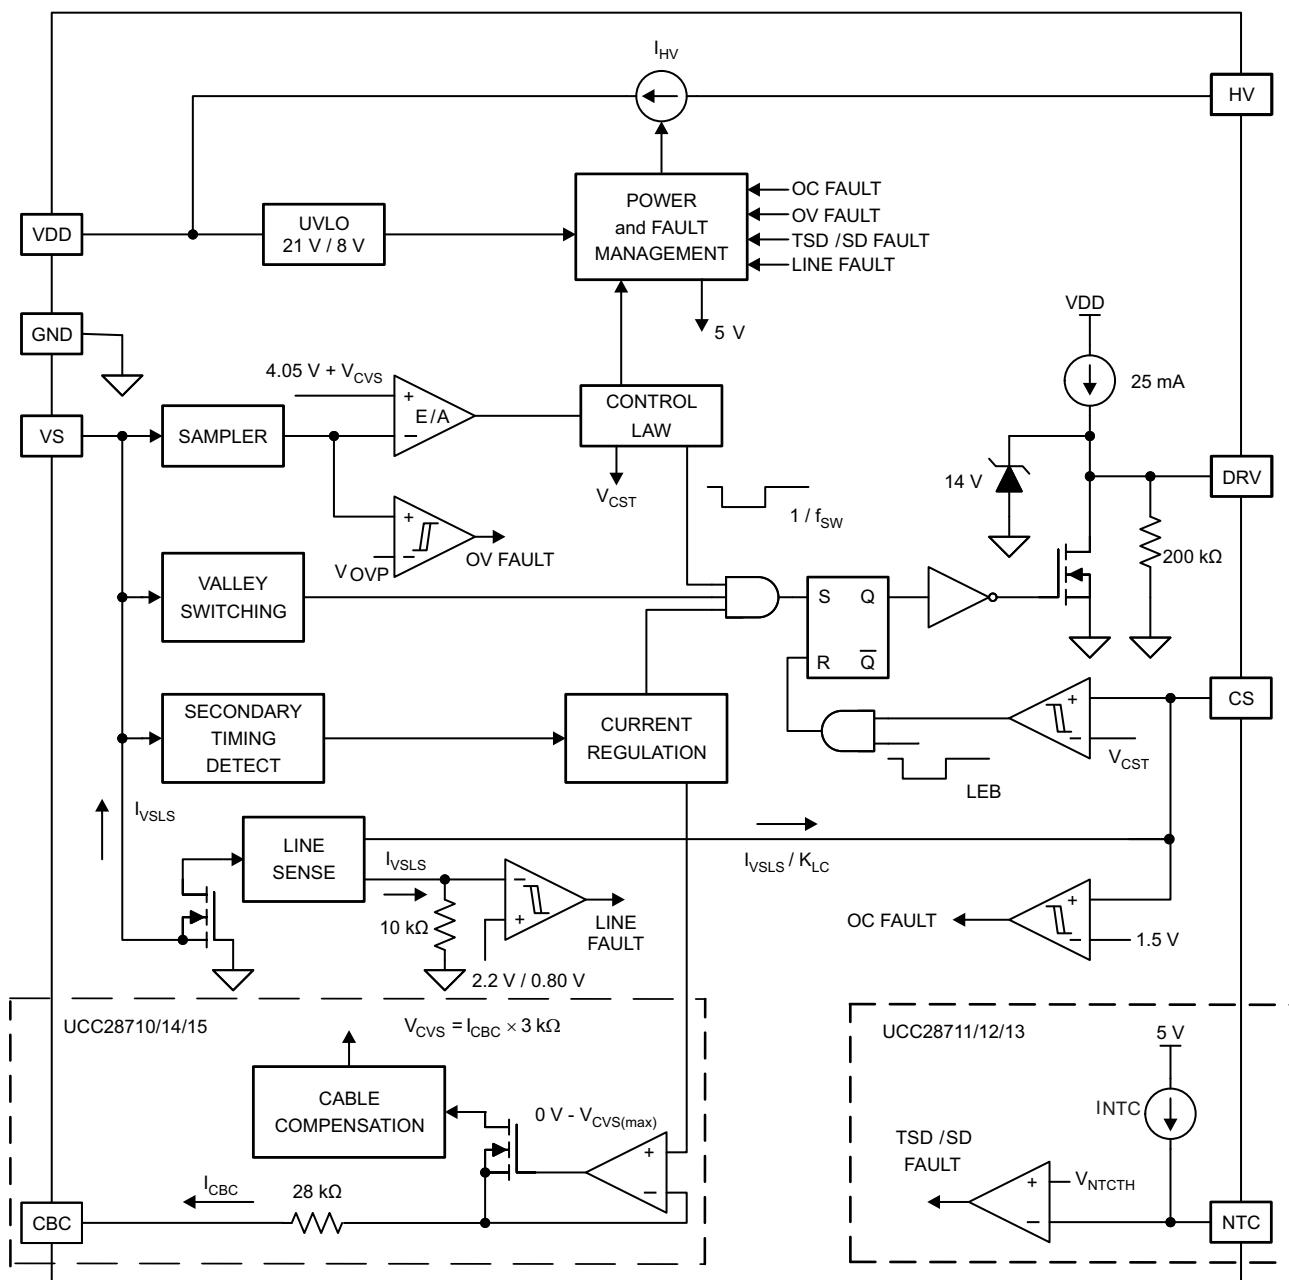

The UCC2871x family of flyback power supply controllers provides isolated-output CV and CC output regulation without the use of an optical coupler. The devices process information from the primary power switch and an auxiliary flyback winding for precise control of output voltage and current.

An internal, 700-V start-up switch, dynamically-controlled operating states, and a tailored modulation profile support ultra-low standby power without sacrificing start-up time or output transient response.

Control algorithms in the UCC28710 family allow operating efficiencies to meet or exceed applicable standards. The output drive interfaces to a MOSFET power switch. Discontinuous conduction mode (DCM) with valley switching reduces switching losses. Modulation of switching frequency and primary current peak amplitude (FM and AM) keeps the conversion efficiency high across the entire load and line ranges.

The controllers have a maximum switching frequency of 100 kHz and always maintain control of the peak-primary current in the transformer. Protection features help keep primary and secondary component stresses in check. The UCC28710, UCC28714, and UCC28715 allow the cable compensation to be programmed. The UCC28711, UCC28712, and UCC28713 devices allow remote temperature sensing using a negative temperature coefficient (NTC) resistor while providing fixed cable-compensation levels.

图 8 shows the functional block diagram.

**图 8. Functional Block Diagram**

### 2.3.5 TPS62175 and TPS62177

The TPS6217x synchronous switch mode power converters are based on DCS-Control™ (direct control with seamless transition into power save mode), which is an advanced regulation topology that combines the advantages of hysteretic, voltage mode, and current mode control that includes an AC loop directly associated to the output voltage. This control loop takes information about output voltage changes and feeds the information directly to a fast comparator stage. The control loop sets the switching frequency, which is constant for steady state operating conditions, and provides immediate response to dynamic load changes. To get accurate DC load regulation, a voltage feedback loop is used. The internally compensated regulation network achieves fast and stable operation with small external components and low-ESR capacitors. The DCS-Control topology supports pulse width modulation (PWM) mode for medium and heavy load conditions and a power save mode at light loads. During PWM, the DCS-Control topology operates at its nominal switching frequency in continuous conduction mode. This frequency is typically about 1 MHz with a controlled frequency variation depending on the input voltage. If the load current decreases, the converter enters power save mode to sustain high efficiency down to very light loads. In power save mode the switching frequency decreases linearly with the load current. Because DCS-Control supports both operation modes within one single building block, the transition from PWM to power save mode is seamless without effects on the output voltage. Fixed output voltage versions provide smallest solution size and lowest current consumption requiring only three external components. An internal current limit supports nominal output currents of up to 500 mA.

The TPS6217x offer both excellent DC voltage and superior load transient regulation, combined with very low output voltage ripple, which minimizes interference with RF circuits [6].

图 9 和 图 10 展示了 TPS62175 和 TPS62177 的功能框图。

### 3 Hardware, Software, Testing Requirements, and Test Results

#### 3.1 Required Hardware and Software

##### 3.1.1 Hardware

图 11 显示了 TIDM-1005 硬件架构。TIDM-1005 设计包括四个子块：隔离 RS-485 信号链，MSP432P401R 主处理器通过 TMP102 和 TPS3808，AC-DC 电源供应（UCC28711），以及 DC-DC 电源供应以将输入电压降至 3.3 V 和 5 V。

The M-Bus module (master or slave) is not included as part of the TIDM-1005 design. Instead, the TIDM-1005 design experiments the M-Bus communication by connecting external M-Bus modules (master or slave) with powering the M-Bus master through 24-V output pin and M-Bus transmission or reception through a dedicated M-Bus pin (UART). The details of the external M-Bus module used for testing will be discussed in 节 3.2.1.

#### CAUTION

HIGH VOLTAGE! Use caution when connecting to the power grid. Do not leave EVM powered when unattended when the internal AC-DC power supply is used.

Copyright © 2017, Texas Instruments Incorporated

**图 11. TIDM-1005 Hardware Architecture**

### 3.1.1.1 MSP432™ Host Processor

The host processor block includes the MSP432P401R, which includes 32-bit ARM Cortex-M4F core that runs the protocol converter software example. As optional features, the host processor block includes the supervisory IC of TPS3808 to monitor the reset line to the MCU and TMP102 to sense temperature. The host process block includes pin-out for multiple peripherals for extensive usage of the board on the end-product development: three UARTs (one for M-Bus signal chain, the others for RS-232, host connection, and so on), one SPI, and two GPIOs. In addition, this block includes three LEDs that indicate software status, TRX status, and so on. The 10-pin JTAG connector is used to program firmware to the MSP432 and to debug the developing software.

### 3.1.1.2 Isolated RS-485 Transceiver

The isolated RS-485 signal chain consists of a protection circuit against 1-kV surge (IEC 61000-4-5) transients, THVD1500, RS-485 transceiver, and ISOW7841 to isolate the RS-485 signal domain from the MCU domain as well as to power 5 V to the RS-485 transceiver. The two-pin jumper of *RS485\_GND* can be connected to the earth ground when performing the ESD testing. 图 12 shows the schematic of the isolated RS-485 signal chain.

图 12. Schematic: Isolated RS-485 Signal Chain

### 3.1.1.3 AC-DC Power Supply

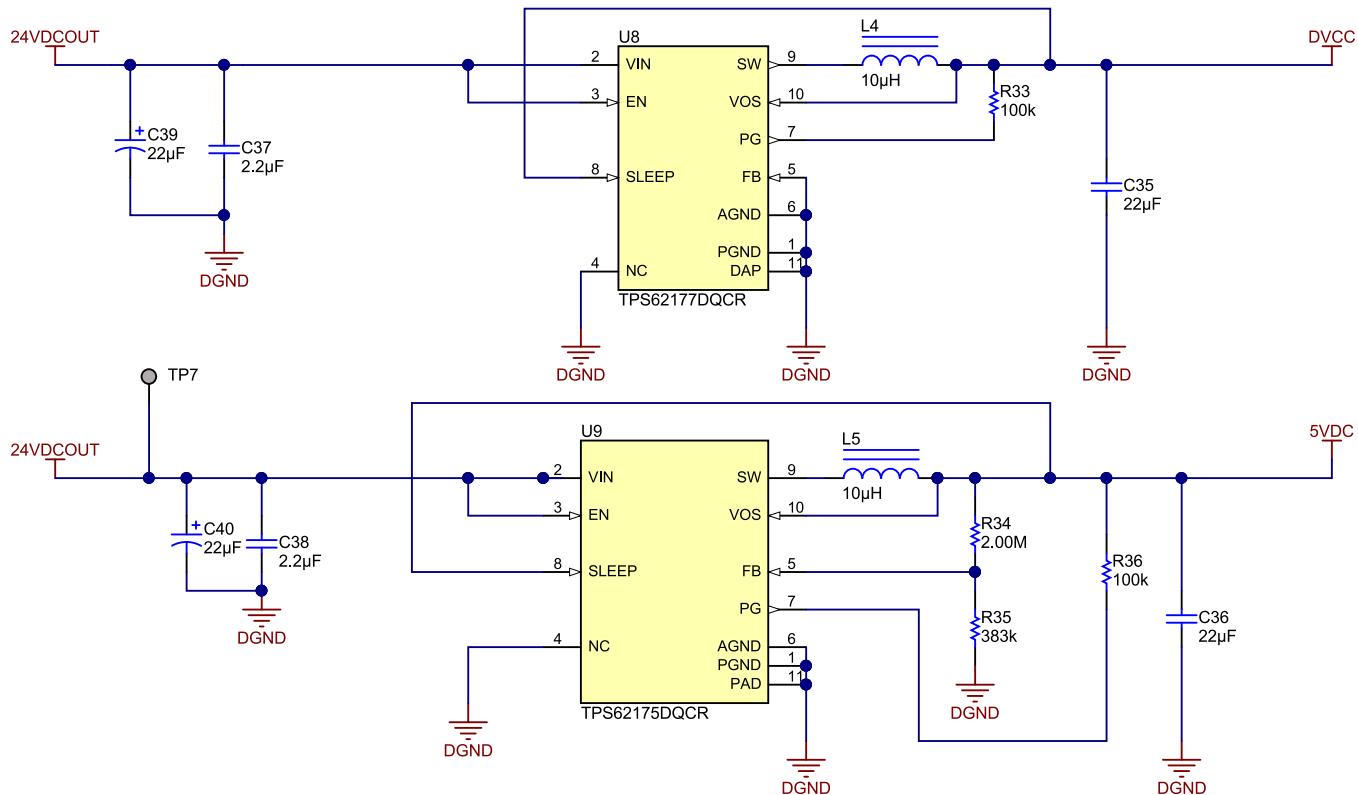

The AC-DC power supply block includes UCC28711, a flyback power supply controller. The AC-DC power supply inputs a wide range of voltages from 85 VAC to 264 VAC and outputs at 420 mA at 24 V. The 24-V voltage output is used to power M-Bus master module as well as to input voltages to the DC-DC converter block. 图 13 shows the schematic of the AC-DC power supply.

**图 13. Schematic: AC-DC Power Supply**

### 3.1.1.4 DC-DC Converter

The DC-DC converter block includes two buck converters of TPS62175 and TPS62177. The TPS62175 converts the input voltage of 24 V to 5 V to power the RS-485 signal chain block. The TPS62177 steps down the input voltage of 24 V to 3.3 V to power the host processor block. 图 14 shows the schematic of the DC-DC converter. C39 and C40 protect the TPS62177 and TPS62175 to be damaged from the transient voltage.

Copyright © 2017, Texas Instruments Incorporated

图 14. Schematic: DC-DC Converter

### 3.1.1.5 Power Options

The TIDM-1005 has two power options: one is powering from the internal AC-DC power supply and another option is to input 24-V DC power from the AC-DC wall power adaptor (0.5 A at 24 V). This can be selected by SW1. 图 15 shows the schematic of the power switch block.

Copyright © 2017, Texas Instruments Incorporated

图 15. Schematic: Power Switch (SW1)

### 3.1.2 Software

The TIDM-1005 provides a Code Composer Studio™ (CCS) software example (RS485\_MBus\_Protocol\_Converter\_Example) including protocol convergence protocol, M-Bus framing and parsing, RS-485 framing and parsing, RS-485 UART driver, and M-Bus UART driver. This section covers details of the example software architecture and is followed by instructions to build and flash the binaries with the CCS.

The prerequisite to build the software example is to install CCS v7.1 (or above) with the software update (select *Help → Check for Updates* in the CCS top menu) and the MSP43x TI-RTOS version of v2.20.0.06. The TI-RTOS version can be checked in the RTSC menu (right-click on the example CCS project and then property → *General*) as shown in **图 16**.

**图 16. CCS TI-RTOS Version**

The RS485\_MBus\_Protocol\_Converter project consists of three build configurations for demonstration purposes: Debug\_Protocol\_Converter, Debug\_RS485\_Data\_Collector, and Debug\_MBus\_Slave. 图 17 shows the available build configurations for the example project. The Debug\_Protocol\_Converter is the target example that includes protocol convergence layer for RS-485 and M-Bus, which will be discussed in this section. The Debug\_RS485\_Data\_Collector build configuration is to emulate the data collector having RS-485 only, and the Debug\_MBus\_Slave build configuration is to emulate the slave meter having M-Bus slave module only. These two binaries can be used for 3-node demonstration that will be discussed in 图 23.

图 17. CCS Build Configuration

### 3.1.2.1 RS485\_MBus\_Protocol\_Converter Example

The RS485\_MBus\_Protocol\_Converter example runs TI-RTOS on ARM Cortex-M4 core in the MSP432. The software example includes three tasks: ProtocolConverterTask, uartRS485RxTask, and uartMbusRxTask.

图 18 shows the interaction among the tasks. The uartRS485RxTask and uartMbusRxTask signals to ProtocolConverterTask through mailbox messages when RX events from RS-485 or M-Bus happen.

图 18. Task Interaction in RS485\_MBus\_Protocol\_Converter Example

**注:** The example software is provided as a working example but does not consider optimizing software in terms of performance, code size, and memory usage.

### 3.1.2.1.1 *uartRS485RxTask*

The task initially configures the UART with baud rate of 115200 bps and waits to receive data from the UART. The task first extracts the 2-byte header, which includes payload length, and then the task extracts the payload by reading the UART buffer based on the given payload length. For the RS-485 communication, a simple frame format is used in this example: 2-byte length header followed by payload as shown in [图 19](#).

**图 19. RS-485 Frame Format in Example Project**

Once the received data is verified, the message with the ID of TX\_MBUS is posted in the mailbox to deliver to the ProtocolConverterTask. In this example, the task fills the TX buffer with REQ\_UD2 message (SHORT frame based on [EN 13757-2](#)) with the TX\_MBUS ID. This example assumes that the received RS-485 message from the primary data collector triggers the protocol converter with a meter reading request to the M\_Bus slave meter. The details will be discussed in [节 3.2.1](#).

### 3.1.2.1.2 *uartMbusRxTask*

The task initially configures the UART with baud rate of 9600bps and then 1-byte M-Bus address. Because the RS485\_MBus\_Protocol\_Converter acts as M-Bus master node, this example sets the M-Bus master address to 0x00.

This example implements the M-Bus link-layer frame format per [EN 13757-2](#). The task waits for 1-byte START from the UART, which indicates whether the received frame is SHORT frame or not. If the received byte is 0x10, this is the fixed-size short frame (5-byte in total), and thus the task extracts the remaining 4-byte payload. If the received byte is 0x68, the received frame can be CONTROL or LONG frame. To figure out the message type, the task reads 2-byte L-field. If each byte of the L-field is equal to 0x03, this is the fixed-size CONTROL frame and the task extracts the remaining 6-byte payload. If each byte of the L-field is not equal to 0x03, the received frame is variable-sized LONG frame. The task then reads the payload size, indicated by the L-field, plus 3-byte since the 3B control fields (1B START, 1B Checksum, and 1B STOP fields) are not counted as payload length in the L-field.

Once receiving the frame, the next step is to parse the frame (`parseMBusRxData` function in the example). The parsing routine includes validating the received frame in terms of size, checksum, destination address, and subfield values. Once the verification passes, the task posts the message with the ID of TX\_RS485 to the ProtocolConverterTask. This post is because the message received from M-Bus slave will be forwarded to the data collector through RS-485.

### 3.1.2.1.3 *ProtocolConverterTask*

The ProtocolConverterTask waits for mailbox messages. Once receiving the mailbox messages, the task sends data from either M-Bus or RS-485 depending on the message ID.

### 3.1.2.1.4 LED Configuration

This example configures LED1 (red) for RS-485 TX and RX events, LED2 (yellow) for M-Bus TX and RX events, and LED3 (blue) for invalid RX events.

### 3.1.2.2 Building the Software Example With CCS

The example project is built with CCS IDE v7.1 (or above). The CCS project can be opened by importing the CCS project files in the installation directory (by default C:\TI\RS485\_MBus\_Protocol\_Converter\_Example\_V1.0.0.0). Then choose one of three build configurations in the project. 图 20 shows a screen capture. The final step is to build the project. Note to clean the project before rebuilding the project. Once built successfully, the binary file can be found under the Debug\_directory.

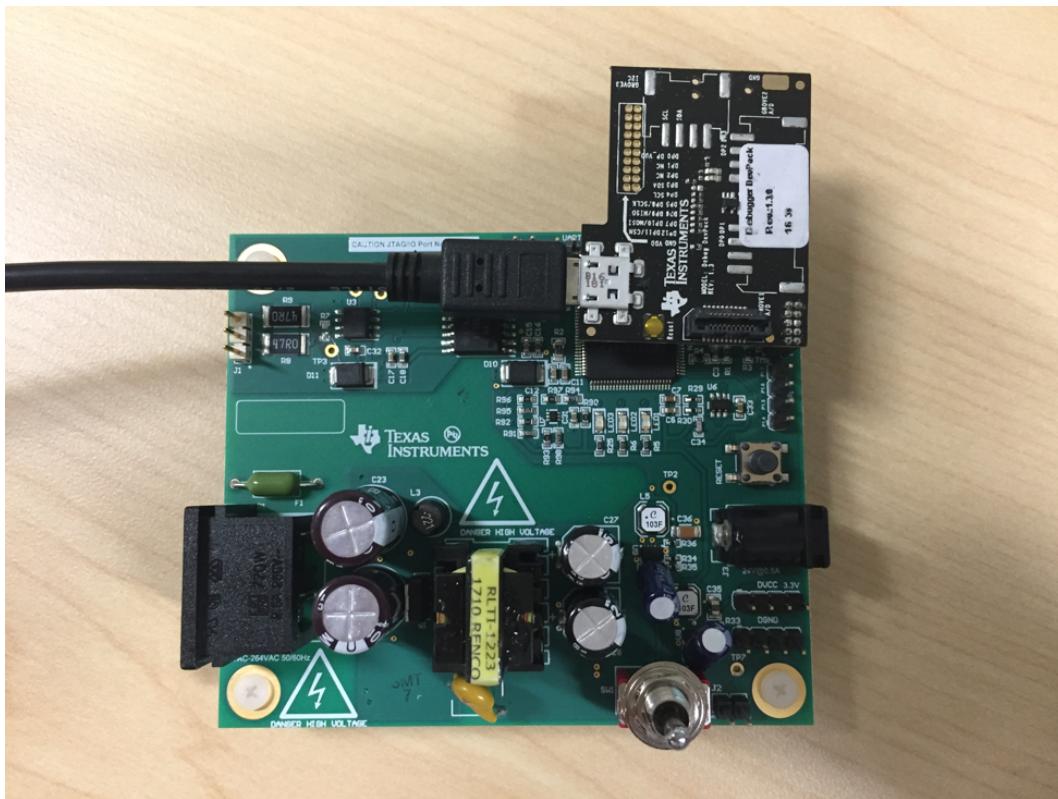

图 20. Build Configuration of RS485\_MBus\_Protocol\_Converter Example

The software example package provides three prebuilt binaries that can be used for 3-node demonstration described in 节 3.2.1:

- RS485\_MBus\_Protocol\_Converter\_protocol\_converter.out
- RS485\_MBus\_Protocol\_Converter\_rs485\_data\_collector.out
- RS485\_MBus\_Protocol\_Converter\_mbus\_slave.out

### 3.1.2.3 Flushing the Software Example With CCS

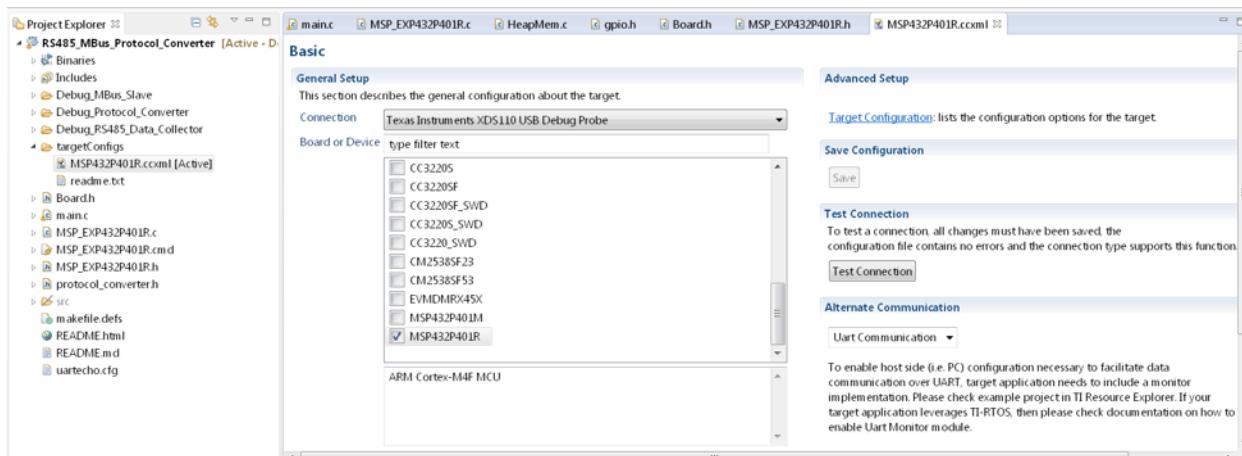

The first step to flash the example binary on the MSP432 is to connect the 10-pin JTAG debugger ([SimpleLink SensorTage Debugger DevPack](#)) on the JTAG pin-out on the board. [图 21](#) shows the connection between the JTAG debugger and the TIDM-1005 EVM.

Need additional header on the 10-pin JTAG connector to connect properly on the TIDM-1005 EVM.

**图 21. 10-pin JTAG Debugger Connection**

Once properly connected to the JTAG pin, the next step is to launch the target configuration and to flash the binary in the CCS. The example project includes the target configuration file (MSP432P401R.ccxml) under targetConfigs as shown in [图 22](#).

**图 22. CCS Target Configuration**

### 3.2 Testing and Results

#### 3.2.1 Test Setup and 3-Node Demonstration

图 23 shows the 3-node setup for testing and demonstration. The setup consists of RS-485 data collector, TIDM-1005 protocol converter connected with external M-Bus master module, and M-Bus slave with external M-Bus slave modem. In the setup the RS-485 data collector installs RS-485 communication only. The TIDM-1005 protocol converter acts as a mini data collector to interconnect between the RS-485 data collector and M-Bus slave node by using RS-485 (for the RS-485 data collector) and M-Bus (for M-Bus slave).

The demonstration with the prebuilt binaries runs in the following sequences:

1. The RS-485 data collector triggers 10B meter reading request message to the TIDM-1005 protocol converter from RS-485. In this example, the data collector trigger the 10B message every 5 seconds.
2. The TIDM-1005 protocol converter processes the request message and sends out REQ\_UD2 frame (request for Class 2 Data) to M-Bus slave from M-Bus.
3. The M-Bus slave responds back to the TIDM-1005 protocol converter with RSP\_UD message from M-Bus. The RSP\_UD payload size varies. In this example for every transmission, the payload size increases by 1 B, starting from 1B (minimum) to 255B (maximum).
4. The TIDM-1005 protocol converter processes the RSP\_UD message, converts payload into the RS-485 format, and delivers to RS-485 data collector through RS-485.

Copyright © 2017, Texas Instruments Incorporated

**图 23. 3-Node Test Setup**

表 2 summarizes the binary to be flashed on each of board for the demonstration setup.

**表 2. Demonstration Software Setup**

BOARD	BINARY TO BE FLASHED
RS-485 data collector	RS485_MBUs_Protocol_Converter_rs485_data_collector.out
TIDM-1005 protocol converter	RS485_MBUs_Protocol_Converter_protocol_converter.out
M-Bus slave	RS485_MBUs_Protocol_Converter_mbust_slave.out

Because the RS-485 data collector only uses RS-485 and the TIDM-1005 EVM includes the complete path for RS-485, no external module is necessary to set up the RS-485 data collector.

The protocol converter acts as a M-Bus master and thus requires an external M-Bus master module as shown in [图 24](#). For the 3-node setup, [Solvimus M-Bus Master module](#) was used for the external M-Bus master module. The power supply module in the TIDM-1005 EVM is designed to provide sufficient power for the external M-Bus master to support more than 100 M-Bus slave nodes. In addition, the software example is not limited to support the maximum number of M-Bus slave nodes. Depending on the external M-Bus master module specification, further limitation can be applied on the number of M-Bus slave nodes to be supported.

Copyright © 2017, Texas Instruments Incorporated

**图 24. TIDM-1005 Protocol Converter With External M-Bus Master Module (Protocol Converter)**

[图 25](#) shows the details on pin connections between TIDM-1005 and the external M-Bus master module.

**图 25. Pin Connection Between TIDM-1005 and M-Bus Master Module**

The M-Bus slave node is built with TIDM-1005 board and M-Bus slave module.

图 26 shows the detailed pin connection between the TIDM-1005 and M-Bus slave module. 图 27 and 表 3 show the schematic and BOM for the M-Bus slave module.

**注:** The BOM and schematic for the M-Bus slave module are provided as a working example for the 3-node setup. For general setup for the M-Bus slave, refer to the *METER-BUS TRANSCEIVER* [7].

表 3. BOM of the M-Bus Slave Module

PART	VALUE	DIGIKEY PART NUMBER	QUANTITY
$C_{STC}$	47 $\mu$ F	P10321-ND	1
$R_{RIS}$	100	CF18JT100RCT-ND	1
$C_{SC}$	220 nF	493-10257-1-ND	1
$R_{RIDD}$	30 K	CF14JT30K0CT-ND	1

表 3. BOM of the M-Bus Slave Module (continued)

PART	VALUE	DIGIKEY PART NUMBER	QUANTITY
RL1	220	CF14JT220RCT-ND	1
RL2	220	CF14JT220RCT-ND	1

### 3.2.2 Software Functionality Testing

The delivery ratio is measured in the 3-node setup by counting the number of TX and RX measured at the RS-485 data collector. The TX is initiated by the data collector at the step one in [节 3.2.1](#). The RX is initiated by the M-Bus slave node at the step four in [节 3.2.1](#). To ensure the protocol converter to handle all the data sizes properly, the testing runs 4-cycle of a complete set of data size (1B to 255B). [表 4](#) summarizes the delivery ratio result.

表 4. Delivery Ratio Performance

DELIVERY RATIO	NUMBER OF TX	NUMBER OF RX
100%	1065	1065

### 3.2.3 CISPR22 Class-B Conducted Emission

[图 28](#) 和 [图 29](#) shows CISPR22 Class-B conducted emission test results. For the measurement, the TIDM-1005 EVM is powered by the internal AC-DC power supply to measure the impact of the AC-DC power supply on the conducted emission. The quasi-peak voltages on line and neutral were measured at 120 VAC and 60 Hz and 230 VAC and 50 Hz over the frequency range from 150 kHz to 30 MHz. The test results show that the TIDM-1005 passes the CISPR22 Class-B conducted emission.

图 28. Quasi-peak Measurement With 120-V and 60-Hz Input

图 29. Quasi-peak Measurement With 230-VAC and 50-Hz Input

### 3.2.4 IEC61000-4-2 ESD Testing

图 30 和 图 31 显示了 IEC61000-4-2 ESD 测试设置。IEC61000-4-2 ESD 测试是在接触放电从  $\pm 8$  KV 到  $\pm 12$  KV 范围内进行的，同时 TIDM-1005 EVM 打开。对于测试设置，RS485\_GND 连接到地线。如果 TIDM-1005 EVM 在经历一系列电压尖峰后仍处于正常工作状态，则通过测试。表 5 总结了 IEC61000-4-2 ESD 测试结果。

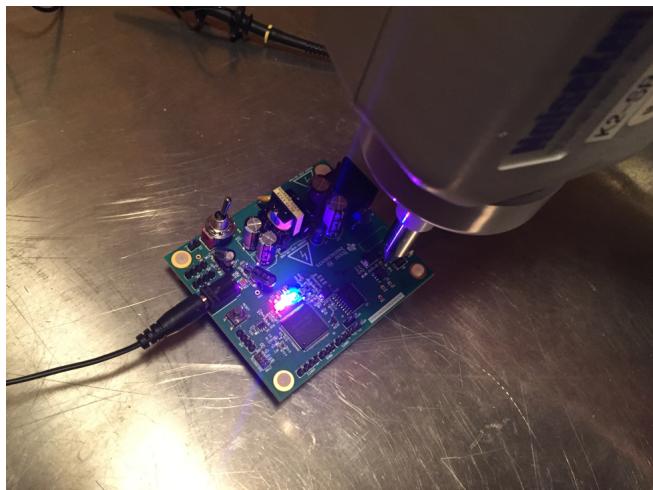

图 30. IEC61000-4-2 ESD Testing (Contact Discharge When TIDM-1005 Turns on)

图 31. IEC61000-4-2 ESD Testing Configuration (12 KV With Interval of 1-s Voltage Spike Over 10-s Period)

表 5. IEC61000-4-2 ESD Test Results

TEST VOLTAGE IN KV	TEST RESULT
$\pm 8$	Pass
$\pm 10$	Pass
$\pm 12$	Pass

### 3.2.5 IEC61000-4-4 EFT Testing

图 32 显示了 IEC61000-4-4 EFT 测试设置。为了进行测试，两个 TIDM-1005 EVMs 连接在每端，且在 RS-485 线上注入脉冲电压。根据 IEC61000-4-4 EFT 规格，使用三种电压重复率为 100 KHz (0.75-ms 周期)，20 KHz (3.75-ms 周期) 和 5 KHz (15-ms 周期) 的脉冲。表 6 总结了测试结果。每组测试运行 120 秒以确保有足够的 TXs 来测量比特错误率 (BER) 表现。如果 BER 表现低于  $10^{-7}$ ，则通过测试。TX 生成连续字节流，具有已知模式。RX 测量 RX 的总字节数和不正确字节数，以计算 BER。表 6 总结了测试结果。

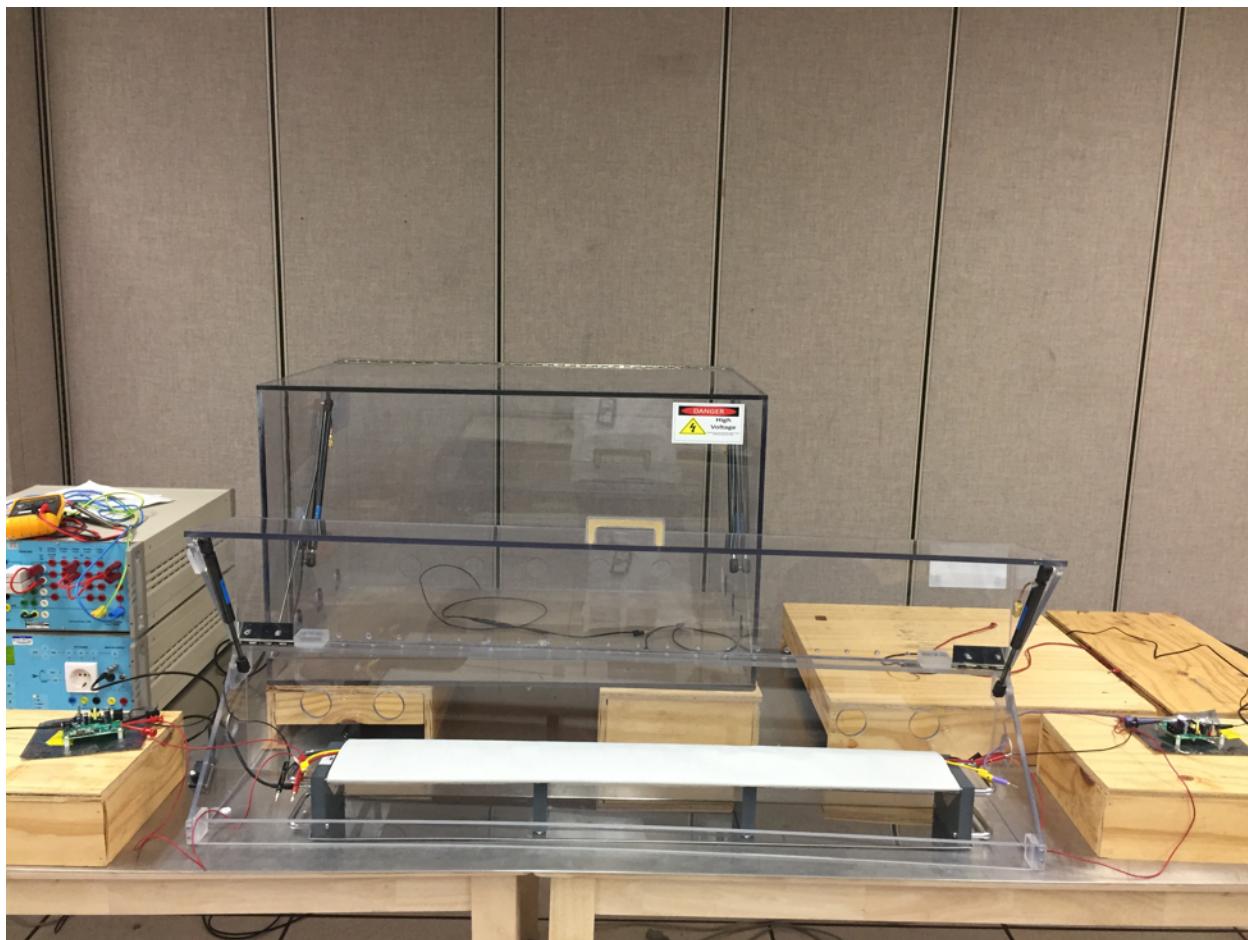

图 32. IEC61000-4-4 EFT Testing Setup

表 6. IEC61000-4-4 EFT Test Results

VOLTAGE PEAK IN KV	REPETITION RATE IN KHz	BER PERFORMANCE (<10 <sup>-7</sup> )
±2	100	Pass
±2	20	Pass
±2	5	Pass

## 4 Design Files

### 4.1 Schematics

To download the schematics, see the design files at [TIDM-1005](#).

### 4.2 Bill of Materials

To download the bill of materials (BOM), see the design files at [TIDM-1005](#).

### 4.3 PCB Layout Recommendations

#### 4.3.1 Layout Prints

To download the layer plots, see the design files at [TIDM-1005](#).

### 4.4 Altium Project

To download the Altium project files, see the design files at [TIDM-1005](#).

### 4.5 Gerber Files

To download the Gerber files, see the design files at [TIDM-1005](#).

### 4.6 Assembly Drawings

To download the assembly drawings, see the design files at [TIDM-1005](#).

## 5 Software Files

## 7 About the Author

**WONSOO KIM** is a system engineer at Texas Instruments, where he is responsible for driving Grid communication system solutions, defining future requirements in TI product roadmap, and providing system-level support and training focusing on communication systems for Smart Grid customers. He received the Ph.D. degree in Electrical and Computer Engineering from the University of Texas at Austin, Austin, Texas.

## 修订版本 A 历史记录

注：之前版本的页码可能与当前版本有所不同。

### **Changes from Original (June 2017) to A Revision**

### **Page**

• 已更改 标题从适用于低成本应用且支持 M-Bus 和 RS-485 协议转换的数据收集器参考设计 .....	1
• 已更改 在资源中，SN65HVD3082E 的链接更改为 THVD1500 的链接 .....	1
• 已更改 在特性中，将已通过测试的 $\pm 2\text{-KV IEC61000-4-4 EFT}$ 、 $\pm 12\text{-KV IEC61000-4-2 ESD}$ 和 CISPR22 B 类传导发射更改为已通过测试的 $\pm 2\text{-KV IEC61000-4-4 EFT}$ 、 $\pm 8\text{-KV IEC61000-4-2 ESD}$ 和 CISPR22 B 类传导发射。 .....	1
• 已更改 首页上的方框图 .....	1
• 已更改 $\pm 12\text{ KV, contact discharge to } \pm 8\text{ KV, contact discharge in 表 1}$ .....	4
• 已更改 instances of SN65HVD3082E to THVD1500 .....	4
• 已更改 (up to 200 kbps) to (up to 300 kbps).....	4
• 已更改 图 3 .....	4
• 已更改 <i>The SN65HVD3082E is a cost-optimized, half-duplex RS-485 transceiver with external protection circuitry to satisfy <math>\pm 12\text{-KV IEC61000-4-2 contact discharge and } \pm 2\text{-KV IEC61000-4-4 fast transient burst.}</math> to The THVD1500 is a robust half-duplex RS-485 transceiver with external protection circuitry to satisfy <math>\pm 8\text{-KV IEC61000-4-2 contact discharge and } \pm 2\text{-KV IEC61000-4-4 fast transient burst.}</math></i> .....	5
• 已更改 title of 节 2.3.2 from SN65HVD3082E to THVD1500.....	6
• 已删除 <i>The SNx5HVD308xE devices are half-duplex transceivers designed for RS-485 data bus networks. Powered by a 5-V supply, the transceivers are fully compliant with TIA/EIA-485A standard. With controlled transition times, these devices are suitable for transmitting data over long twisted-pair cables. SN65HVD3082E and SN75HVD3082E devices are optimized for signaling rates up to 200 kbps. The SN65HVD3085E device is suitable for data transmission up to 1 Mbps, whereas the SN65HVD3088E device is suitable for applications that require signaling rates up to 20 Mbps.....</i>	6
• 已删除 <i>The wide common-mode range and high ESD-protection levels of these devices makes them suitable for demanding applications, such as energy meter networks, electrical inverters, status and command signals across telecom racks, cabled chassis interconnects, and industrial automation networks where noise tolerance is essential. These devices match the industry-standard footprint of the SN75176 device. Power-on-reset circuits keep the outputs in a high-impedance state until the supply voltage has stabilized. A thermal-shutdown function protects the device from damage due to system fault conditions. The SN75HVD3082E is characterized for operation from 0°C to 70°C and SN65HVD308xE are characterized for operation from -40°C to 85°C air temperature. The D package version of the SN65HVD3082E has been characterized for operation from -40°C to 105°C. ....</i>	6
• 已添加 <i>THVD1500 is a robust half-duplex RS-485 transceiver for industrial applications. The bus pins are immune to high levels of IEC Contact Discharge ESD events eliminating need of additional system level protection components. The device operates from a singl 5-V supply. The wide common-mode voltage range and low input leakage on bus pins make THVD1500 suitable for multi-point applications over long cable runs. THVD1500 is available in industry standard 8-pin SOIC package for drop-in compatibility. The device is characterized from -40°C to 125°C.</i> .....	6
• 已更改 reference 2 from <i>SNx5HVD308xE Low-Power RS-485 Transceivers, Available in a Small MSOP-8 Package (SLLS562)</i> to <i>THVD1500 300 kbps RS-485 Transceivers With 8-kV IEC ESD Protection (SLLSEY4)</i> .....	27

## 有关 TI 设计信息和资源的重要通知

德州仪器 (TI) 公司提供的技术、应用或其他设计建议、服务或信息，包括但不限于与评估模块有关的参考设计和材料（总称“TI 资源”），旨在帮助设计人员开发整合了 TI 产品的应用；如果您（个人，或如果是代表贵公司，则为贵公司）以任何方式下载、访问或使用了任何特定的 TI 资源，即表示贵方同意仅为该等目标，按照本通知的条款进行使用。

TI 所提供的 TI 资源，并未扩大或以其他方式修改 TI 对 TI 产品的公开适用的质保及质保免责声明；也未导致 TI 承担任何额外的义务或责任。TI 有权对其 TI 资源进行纠正、增强、改进和其他修改。

您理解并同意，在设计应用时应自行实施独立的分析、评价和判断，且应全权负责并确保应用的安全性，以及您的应用（包括应用中使用的所有 TI 产品）应符合所有适用的法律法规及其他相关要求。你就您的应用声明，您具备制订和实施下列保障措施所需的一切必要专业知识，能够（1）预见故障的危险后果，（2）监视故障及其后果，以及（3）降低可能导致危险的故障几率并采取适当措施。您同意，在使用或分发包含 TI 产品的任何应用前，您将彻底测试该等应用和该等应用所用 TI 产品的功能。除特定 TI 资源的公开文档中明确列出的测试外，TI 未进行任何其他测试。

您只有在为开发包含该等 TI 资源所列 TI 产品的应用时，才被授权使用、复制和修改任何相关单项 TI 资源。但并未依据禁止反言原则或其他法理授予您任何 TI 知识产权的任何其他明示或默示的许可，也未授予您 TI 或第三方的任何技术或知识产权的许可，该等产权包括但不限于任何专利权、版权、屏蔽作品权或与使用 TI 产品或服务的任何整合、机器制作、流程相关的其他知识产权。涉及或参考了第三方产品或服务的信息不构成使用此类产品或服务的许可或与其相关的保证或认可。使用 TI 资源可能需要您向第三方获得对该等第三方专利或其他知识产权的许可。

TI 资源系“按原样”提供。TI 兹免除对 TI 资源及其使用作出所有其他明确或默认的保证或陈述，包括但不限于对准确性或完整性、产权保证、无屡发故障保证，以及适销性、适合特定用途和不侵犯任何第三方知识产权的任何默认保证。

TI 不负责任何申索，包括但不限于因组合产品所致或与之有关的申索，也不为您辩护或赔偿，即使该等产品组合已列于 TI 资源或其他地方。对因 TI 资源或其使用引起或与之有关的任何实际的、直接的、特殊的、附带的、间接的、惩罚性的、偶发的、从属或惩戒性损害赔偿，不管 TI 是否获悉可能会产生上述损害赔偿，TI 概不负责。

您同意向 TI 及其代表全额赔偿因您不遵守本通知条款和条件而引起的任何损害、费用、损失和/或责任。

本通知适用于 TI 资源。另有其他条款适用于某些类型的材料、TI 产品和服务的使用和采购。这些条款包括但不限于适用于 TI 的半导体产品 (<http://www.ti.com/sc/docs/stdterms.htm>)、评估模块和样品 (<http://www.ti.com/sc/docs/samptersms.htm>) 的标准条款。
