

TPS61085A-Q1 650kHz 和 1.2MHz、18.5V 升压直流/直流转换器

1 特性

- 符合面向汽车应用的 AEC-Q100 标准：
 - 器件温度等级 2: -40°C 至 $+105^{\circ}\text{C}$, T_A
- 2.3V 至 6V 输入电压范围
- 具有 2A 开关电流的 18.5V 升压转换器
- 650kHz 或 1.2MHz 可选开关频率
- 可调节软启动
- 热关断
- 欠压锁定
- 8 引脚 VSSOP 封装

2 应用

- 汽车信息娱乐系统仪表组
 - 仪表组、音响主机
 - 无线电、导航
 - 音频放大器
- 汽车车身电子设备
 - 车身控制模块
 - 网关
- 远程信息处理和紧急呼叫
- 高级驾驶辅助系统 (ADAS)

3 说明

TPS61085A-Q1 器件是一款高频、高效的直流/直流升压转换器，具有能够提供高达 18.5V 输出电压的集成 2A、 0.13Ω 电源开关。650kHz 或 1.2MHz 的可选频率使得此器件可使用小型外部电感器和电容器并提供快速瞬态响应。利用外部补偿，可以针对应用条件优化稳压器。连接至特定软启动引脚的电容器可最大程度地减小启动时的浪涌电流。

5 Pin Configuration and Functions

Pin Functions

PIN		TYPE	DESCRIPTION
NO.	NAME		
1	COMP	I/O	Compensation pin
2	FB	I	Feedback pin
3	EN	I	Shutdown control input. Connect this pin to logic high level to enable the device.
4	PGND	—	Power ground
5	SW	I	Switch pin
6	IN	PWR	Input supply pin
7	FREQ	I	Frequency select pin. The power switch operates at 650 kHz if FREQ is connected to GND and at 1.2 MHz if FREQ is connected to IN.
8	SS	O	Soft-start control pin. Connect a capacitor to this pin if soft-start required. Open = no soft start

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

	MIN	MAX	UNIT
Input voltage, V_{IN} ⁽²⁾	−0.3	7	V
Voltage on pins EN, FB, SS, FREQ, COMP	−0.3	7	V

7 Detailed Description

7.1 Overview

The TPS61085A-Q1 boost converter is designed for output voltages up to 18.5 V with a switch-peak current limit of 2 A minimum. The device, which operates in a current mode scheme with quasi-constant frequency, is externally compensated for maximum flexibility and stability. The switching frequency is selectable between 650 kHz or 1.2 MHz and the minimum input voltage is 2.3 V. To control the inrush current at start-up, a soft-start pin is available.

The novel topology of the TPS61085A-Q1 boost converter uses adaptive OFF-time to provide superior load and line transient responses. The device also operates over a wider range of applications than conventional converters.

The selectable switching frequency offers the possibility to optimize the design either for the use of small sized components (1.2 MHz) or for higher system efficiency (650 kHz). However, the frequency changes slightly because the voltage drop across the $R_{DS(on)}$ has some influence on the current and voltage measurement and thus on the ON-time (the OFF-time remains constant).

Depending on the load current, the converter operates in continuous conduction mode (CCM), discontinuous conduction mode (DCM), or pulse skip mode to maintain the output voltage.

7.2 Functional Block Diagram

Copyright © 2016, Texas Instruments Incorporated

7.3 Feature Description

7.3.1 Soft Start

The boost converter has an adjustable soft start to prevent high inrush current during start-up. To minimize the inrush current during start-up an external capacitor connected to the soft-start pin SS is used to slowly ramp up the internal current limit of the boost converter when charged with a constant current. When the EN pin is pulled high, the soft-start capacitor (C_{SS}) is immediately charged to 0.3 V. The capacitor is then charged at a constant current of 10 μ A typically until the output of the boost converter V_S has reached its power good threshold (90% of V_S nominal value). During this time, the SS voltage directly controls the peak inductor current, starting with 0 A at $V_{SS} = 0.3$ V up to the full current limit at $V_{SS} \approx 800$ mV. The maximum load current is available after the soft start is completed. The larger the capacitor the slower the ramp of the current limit and the longer the soft-start time. A 100-nF capacitor is usually sufficient for most of the applications. When the EN pin is pulled low, the soft-start capacitor is discharged to ground.

7.3.2 Frequency Select Pin (FREQ)

The frequency select pin FREQ allows to set the switching frequency of the device to 650 kHz (FREQ = low) or 1.2 MHz (FREQ = high). Higher switching frequency improves load transient response but reduces slightly the efficiency. The other benefits of higher switching frequency are a lower output ripple voltage and smaller inductor size. Usually, TI recommends using 1.2-MHz switching frequency unless light-load efficiency is a major concern.

7.3.3 Undervoltage Lockout (UVLO)

To avoid misoperation of the device at low input voltages an undervoltage lockout is included that disables the device, if the input voltage falls below 2.2 V.

7.3.4 Thermal Shutdown

A thermal shutdown is implemented to prevent damages due to excessive heat and power dissipation. Typically the thermal shutdown threshold is at $T_J = 150^\circ\text{C}$. When the thermal shutdown is triggered the device stops switching until the temperature falls below typically $T_J = 136^\circ\text{C}$. Then the device starts switching again.

7.3.5 Overvoltage Prevention

If overvoltage is detected on the FB pin (typically 3% above the nominal value of 1.238 V) the part stops switching immediately until the voltage on this pin drops to its nominal value. This prevents overvoltage on the output and secures the circuits connected to the output from excessive overvoltage.

7.4 Device Functional Modes

The converter operates in continuous conduction mode (CCM) as soon as the input current increases above half the ripple current in the inductor. For lower load currents it switches into discontinuous conduction mode (DCM). If the load is further reduced, the part starts to skip pulses to maintain the output voltage.

8 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

With the TPS61085A-Q1 device, a boost regulator with an output voltage of up to 18.5 V can be designed with input voltage ranging from 2.3 V to 6 V. The TPS61085A-Q1 device has a peak switch current limit of 2 A minimum. The device, which operates in a current mode scheme and uses simple external compensation scheme for maximum flexibility and stability. Selectable switching frequency allows the regulator to be optimized either for smaller size (1.2 MHz) or for higher system efficiency (650 KHz). A dedicated soft-start (SS) pin allows the designer to control the inrush current at start-up.

The following section provides a step-by-step design approach for configuring the TPS61085A-Q1 as a voltage regulating boost converter.

8.2 Typical Application

Copyright © 2017, Texas Instruments Incorporated

Figure 8. Typical Application, 3.3 V to 12 V ($f_{sw} = 1.2$ MHz)

8.2.1 Design Requirements

Table 2 lists the design parameters for this application example.

Table 2. TPS61085A-Q1 Output Design Requirements

PARAMETER	VALUE
Input voltage	3.3 V $\pm$ 20%
Output voltage	12 V
Output current	600 mA
Switching frequency	1.2 MHz

8.2.2 Detailed Design Procedure

The first step in the design procedure is to verify that the maximum possible output current of the boost converter supports the specific application requirements. A simple approach is to estimate the converter efficiency, by taking the efficiency numbers from the provided efficiency curves or to use a worst-case assumption for the expected efficiency, for example, 90%.

1. Duty cycle:

$$D = 1 - \frac{V_{IN} \times \eta}{V_S} \quad (1)$$

2. Maximum output current:

$$I_{out} = \left(I_{swpeak} - \frac{\Delta I_L}{2} \right) \times (1 - D) \quad (2)$$

3. Peak switch current:

$$I_{swpeak} = \frac{\Delta I_L}{2} + \frac{I_{out}}{1 - D}$$

where

- $\Delta I_L = \frac{V_{IN} \times D}{f_s \times L}$
- I_{swpeak} = converter switch current (minimum switch current limit = 2 A)
- f_s = Converter switching frequency (typically 1.2 MHz)
- L = Selected inductor value
- η = Estimated converter efficiency (please use the number from the efficiency plots or 90% as an estimation)
- ΔI_L = Inductor peak-to-peak ripple current (3)

The peak switch current is the steady-state peak switch current that the integrated switch, inductor, and external Schottky diode must be able to handle. The calculation must be done for the minimum input voltage where the peak switch current is the highest.

8.2.2.1 Inductor Selection

The TPS61085A-Q1 is designed to work with a wide range of inductors. The main parameter for the inductor selection is the saturation current of the inductor which must be higher than the peak switch current as calculated in [Detailed Design Procedure](#) with additional margin to cover for heavy load transients. An alternative, more conservative option is to choose an inductor with a saturation current at least as high as the maximum switch current limit of 3.2 A. The other important parameter is the inductor DC resistance. Usually, the lower the DC resistance the higher the efficiency. It is important to note that the inductor DC resistance is not the only parameter determining the efficiency. Especially for a boost converter where the inductor is the energy storage element, the type and core material of the inductor influences the efficiency as well. At high switching frequencies of 1.2-MHz inductor core losses, proximity effects and skin effects become more important. Usually, an inductor with a larger form factor gives higher efficiency. The efficiency difference between different inductors can vary between 2% to 10%. For the TPS61085A-Q1, inductor values between 3 μ H and 6 μ H are a good choice with a switching frequency of 1.2 MHz, typically 3.3 μ H. At 650 kHz, TI recommends inductors between 6 μ H and 13 μ H, typically 6.8 μ H. [Table 3](#) shows a few inductors. Customers must verify and validate these components for suitability with their application before using them.

Typically, TI recommends the inductor current ripple is below 20% of the average inductor current. Calculate the inductor value using [Equation 4](#).

$$L = \left(\frac{V_{IN}}{V_S} \right)^2 \times \left(\frac{V_S - V_{IN}}{I_{out_max} \times f} \right) \times \left(\frac{\eta}{0.35} \right)$$

where

- L is the inductor value
- V_{IN} is input voltage
- V_S is boost output voltage
- η is efficiency
- I_{out_max} is the maximum output current
- f is frequency

(4)

Table 3. Inductor Selection

(1) See [Third-party Products Disclaimer](#)

8.2.2.2 Rectifier Diode Selection

To achieve high efficiency, a Schottky type must be used for the rectifier diode. The reverse voltage rating must be higher than the maximum output voltage of the converter. The averaged rectified forward current I_{avg} , the Schottky diode requirement is rated for, is equal to the output current I_{out} :

$$I_{avg} = I_{out} \quad (5)$$

Usually a Schottky diode with 2-A maximum average rectified forward current rating is sufficient for most applications. The Schottky rectifier can be selected with lower forward current capability depending on the output current I_{out} but must be able to dissipate the power. The dissipated power is the average rectified forward current times the diode forward voltage.

$$P_D = I_{avg} \times V_{forward} \quad (6)$$

Typically the diode must be able to dissipate around 500 mW depending on the load current and forward voltage. See [Table 4](#) for few diode options. Customers must verify and validate these components for suitability with their application before using them.

Table 4. Rectifier Diode Selection

CURRENT RATING (I _{avg})	V _r	V _{forward} / I _{avg}	SUPPLIER ⁽¹⁾	COMPONENT CODE	PACKAGE TYPE
750 mA	20 V	0.425 V / 750 mA	Fairchild Semiconductor	FYV0704S	SOT-23
1 A	20 V	0.39 V / 1 A	NXP	PMEG2010AEH	SOD-123
1 A	20 V	0.52 V / 1 A	Vishay Semiconductor	B120	SMA
1 A	20 V	0.5 V / 1 A	Vishay Semiconductor	SS12	SMA
1 A	20 V	0.44 V / 1 A	Vishay Semiconductor	MSS1P2L	μ-SMP (Low Profile)

(1) See [Third-party Products Disclaimer](#)

8.2.2.3 Setting the Output Voltage

The output voltage is set by an external resistor divider. Typically, a minimum current of 50 μA flowing through the feedback divider gives good accuracy and noise covering. A standard low-side resistor of 18 kΩ is typically selected. The resistors are then calculated as:

$$R2 = \frac{V_{ref}}{70\mu A} \approx 18k\Omega \quad R1 = R2 \times \left(\frac{V_s}{V_{ref}} - 1 \right) \quad (7)$$

8.2.2.4 Compensation (COMP)

The regulator loop must be compensated by adjusting the external components connected to the COMP pin. The COMP pin is the output of the internal transconductance error amplifier. Standard values of R_{COMP} = 13 kΩ and C_{COMP} = 3.3 nF works for the majority of the applications.

See [Table 5](#) for dedicated compensation networks giving an improved load transient response. [Equation 8](#) can be used to calculate R_{COMP} and C_{COMP}:

$$R_{COMP} = \frac{110 \cdot V_{IN} \cdot V_s \cdot C_{OUT}}{L \cdot I_{OUT}} \quad C_{COMP} = \frac{V_s \cdot C_{OUT}}{7.5 \cdot I_{OUT} \cdot R_{COMP}} \quad (8)$$

Table 5. Recommended Compensation Network Values at High/Low Frequency

FREQUENCY	L	V _s	V _{IN} ±20%	R _{COMP}	C _{COMP}
High (1.2 MHz)	3.3 μH	15 V	5 V	82 kΩ	1.1 nF
			3.3 V	75 kΩ	1.6 nF
		12 V	5 V	51 kΩ	1.1 nF
			3.3 V	47 kΩ	1.6 nF
		9 V	5 V	30 kΩ	1.1 nF
			3.3 V	27 kΩ	1.6 nF
Low (650 kHz)	6.8 μH	15 V	5 V	43 kΩ	2.2 nF
			3.3 V	39 kΩ	3.3 nF
		12 V	5 V	27 kΩ	2.2 nF
			3.3 V	24 kΩ	3.3 nF
		9 V	5 V	15 kΩ	2.2 nF
			3.3 V	13 kΩ	3.3 nF

Table 5 gives conservatives R_{COMP} and C_{COMP} values for certain inductors, input and output voltages providing a very stable system. For a faster response time, a higher R_{COMP} value can be used to enlarge the bandwidth, as well as a slightly lower value of C_{COMP} to keep enough phase margin. These adjustments must be performed in parallel with the load transient response monitoring of TPS61085A-Q1.

8.2.2.5 Input Capacitor Selection

For good input voltage filtering, TI recommends low-ESR ceramic capacitors. TPS61085A-Q1 has an analog input (IN). Therefore, TI highly recommends placing a 1- μ F bypass capacitor as close as possible to the IC from IN to GND.

One 10- μ F ceramic input capacitor is sufficient for most of the applications. For better input voltage, filtering this value can be increased. Refer to Table 6 and typical applications for input capacitor recommendations. Customers must verify and validate these components for suitability with their application before using them.

8.2.2.6 Output Capacitor Selection

For best output voltage filtering, TI recommends a low ESR output capacitor like ceramic capacitor. Two 10- μ F ceramic output capacitors (or one 22- μ F) work for most of the applications. Higher capacitor values can be used to improve the load transient response.

Pay attention to the derating of capacitor value with the DC voltage.

Table 6. Rectifier Input and Output Capacitor Selection

	CAPACITOR	VOLTAGE RATING	SUPPLIER ⁽¹⁾	COMPONENT CODE
C_{IN}	10 μ F/1206	16 V	Taiyo Yuden	EMK212 BJ 106KG
IN bypass	1 μ F/0603	16 V	Taiyo Yuden	EMK107 BJ 105KA
C_{OUT}	10 μ F/1206	25 V	Taiyo Yuden	TMK316 BJ 106KL

9 Power Supply Recommendations

The TPS61085A-Q1 is designed to operate from an input voltage supply range from 2.3 V to 6 V. The required power supply for the TPS61085A-Q1 must have a current rating according to the output voltage and output current of the TPS61085A-Q1.

10 Layout

10.1 Layout Guidelines

For all switching power supplies, the layout is an important step in the design, especially at high peak currents and high switching frequencies. If the layout is not carefully done, the regulator could show stability problems as well as EMI problems.

[Layout Example](#) provides an example of layout design with the TPS61085A-Q1 device.

- Use wide and short traces for the main current path and for the power ground tracks.
- The input capacitor, output capacitor, and the inductor must be placed as close as possible to the IC.
- Use a common ground node for power ground and a different one for control ground to minimize the effects of ground noise. Connect these ground nodes at the GND terminal of the IC.
- The most critical current path for all boost converters is from the switching FET, through the rectifier diode, then the output capacitors, and back to ground of the switching FET. Therefore, the output capacitors and their traces must be placed on the same board layer as the IC and as close as possible between the SW pin and the GND terminal of the IC.

10.2 Layout Example

11 器件和文档支持

11.1 器件支持

11.1.1 第三方产品免责声明

TI 发布的与第三方产品或服务有关的信息，不能构成与此类产品或服务或保修的适用性有关的认可，不能构成此类产品或服务单独或与任何 TI 产品或服务一起的表示或认可。

11.2 接收文档更新通知

如需接收文档更新通知，请导航至 TI.com.cn 上的器件产品文件夹。单击右上角的通知我 进行注册，即可每周接收产品信息更改摘要。有关更改的详细信息，请查看任何已修订文档中包含的修订历史记录。

11.3 社区资源

下列链接提供到 TI 社区资源的连接。链接的内容由各个分销商“按照原样”提供。这些内容并不构成 TI 技术规范，并且不一定反映 TI 的观点；请参阅 TI 的《使用条款》。

TI E2E™ Online Community *TI's Engineer-to-Engineer (E2E) Community*. Created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

Design Support *TI's Design Support* Quickly find helpful E2E forums along with design support tools and contact information for technical support.

11.4 商标

E2E is a trademark of Texas Instruments.
All other trademarks are the property of their respective owners.

11.5 静电放电警告

这些装置包含有限的内置 ESD 保护。存储或装卸时，应将导线一起截短或将装置放置于导电泡棉中，以防止 MOS 门极遭受静电损伤。

11.6 术语表

SLYZ022 — TI 术语表。

这份术语表列出并解释术语、缩写和定义。

12 机械、封装和可订购信息

以下页面包含机械、封装和可订购信息。这些信息是指定器件的最新可用数据。数据如有变更，恕不另行通知，且不会对此文档进行修订。如需获取此数据表的浏览器版本，请查阅左侧的导航栏。

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TPS61085ATDGKRQ1	ACTIVE	VSSOP	DGK	8	2000	RoHS & Green	Call TI NIPDAUAG	Level-3-260C-168 HR	-40 to 125	1EGV	Samples
TPS61085ATDGKTQ1	ACTIVE	VSSOP	DGK	8	250	RoHS & Green	Call TI NIPDAUAG	Level-3-260C-168 HR	-40 to 125	1EGV	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer:The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

TAPE AND REEL INFORMATION

*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Reel Diameter (mm)	Reel Width W1 (mm)	A0 (mm)	B0 (mm)	K0 (mm)	P1 (mm)	W (mm)	Pin1 Quadrant
TPS61085ATDGKRQ1	VSSOP	DGK	8	2000	330.0	12.4	5.3	3.4	1.4	8.0	12.0	Q1
TPS61085ATDGKTQ1	VSSOP	DGK	8	250	180.0	12.4	5.3	3.4	1.4	8.0	12.0	Q1

TAPE AND REEL BOX DIMENSIONS

*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Length (mm)	Width (mm)	Height (mm)
TPS61085ATDGKRQ1	VSSOP	DGK	8	2000	367.0	367.0	35.0
TPS61085ATDGKTQ1	VSSOP	DGK	8	250	210.0	185.0	35.0

DGK (S-PDSO-G8)

PLASTIC SMALL-OUTLINE PACKAGE

- NOTES:
- A. All linear dimensions are in millimeters.
 - B. This drawing is subject to change without notice.
 - C. Body length does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 per end.
 - D. Body width does not include interlead flash. Interlead flash shall not exceed 0.50 per side.
 - E. Falls within JEDEC MO-187 variation AA, except interlead flash.

DGK (S-PDSO-G8)

PLASTIC SMALL OUTLINE PACKAGE

- NOTES:
- All linear dimensions are in millimeters.
 - This drawing is subject to change without notice.
 - Publication IPC-7351 is recommended for alternate designs.
 - Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC-7525 for other stencil recommendations.
 - Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

重要声明和免责声明

TI“按原样”提供技术和可靠性数据（包括数据表）、设计资源（包括参考设计）、应用或其他设计建议、网络工具、安全信息和其他资源，不保证没有瑕疵且不做任何明示或暗示的担保，包括但不限于对适销性、某特定用途方面的适用性或不侵犯任何第三方知识产权的暗示担保。

这些资源可供使用 TI 产品进行设计的熟练开发人员使用。您将自行承担以下全部责任：(1) 针对您的应用选择合适的 TI 产品，(2) 设计、验证并测试您的应用，(3) 确保您的应用满足相应标准以及任何其他功能安全、信息安全、监管或其他要求。

这些资源如有变更，恕不另行通知。TI 授权您仅可将这些资源用于研发本资源所述的 TI 产品的应用。严禁对这些资源进行其他复制或展示。您无权使用任何其他 TI 知识产权或任何第三方知识产权。您应全额赔偿因在这些资源的使用中对 TI 及其代表造成的任何索赔、损害、成本、损失和债务，TI 对此概不负责。
