TPS7H2201-SP 和 TPS7H2201-SEP 耐辐射 1.5V 至 7V、6A 电子保险丝

1 特性

- 提供标准微型电路，SMD 5962R17220
- 提供供应商项目图，VID V62/23608
- 辐射性能：
  - 耐辐射保障 (RHA) 高达 TID 100krad(Si)
  - 单粒子锁定 (SEL)、单粒子烧毁 (SEB) 和单粒子栅穿 (SEGR) 对于 LET 的抗扰度 = 75MeV-cm^2/mg
  - SEFI/SET 对于 LET 的额定抗扰度 = 75MeV-cm^2/mg
- 集成式单通道电子保险丝
- 输入电压范围：1.5V 至 7V
- 低导通电阻 (R_{ON})：
  - 对于 CFP 和 KGD 封装，在 25°C 且 VIN = 5V 时的最大值为 35mΩ
  - 对于 HTSSOP 封装，在 25°C 且 VIN = 5V 时的最大值为 23mΩ
- 6A 最大持续开关电流
- 低控制输入阈值支持使用 1.2V、1.8V、2.5V 和 3.3V 逻辑电平
- 可配置上升时间（软启动）
- 反向电流保护
- 可编程和内部电流限制（快速跳变）
- 可编程故障计时器（电流限制和重试模式）
- 热关断
- 带散热焊盘的陶瓷和塑料封装

2 应用

- 航天卫星电源管理和配电
- 耐辐射和抗辐射电源树应用
- 支持军用（–55°C 至 125°C）温度范围

3 说明

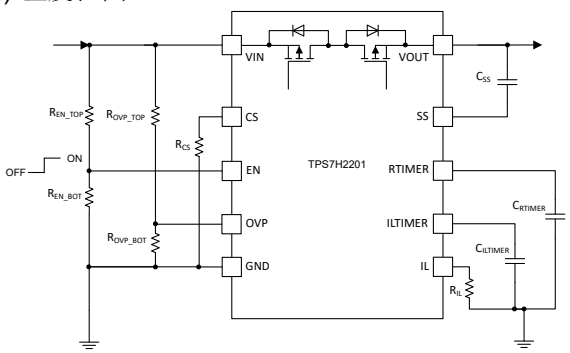

TPS7H2201 是一款单通道电子保险丝，可提供用于更大限度地降低浪涌电流的可配置上升时间和反向电流保护。该器件包含一个可在 1.5V 至 7V 输入电压范围内运行的 P 沟道 MOSFET，并且支持 6A 的最大持续电流。开关由可与低压控制信号直接连接的打开和关闭输入 (EN) 控制。

TPS7H2201 采用具有集成散热焊盘的陶瓷和塑料封装，可支持高功率耗散。该器件在自然通风环境下的额定运行温度范围为 –55°C 至 125°C。

器件信息

器件型号(1)	等级	封装
5962R1722001VXC	飞行等级 RHA 100krad (Si)	16 引脚 CDFP 11.00 × 9.60mm 重量：1.56g(3)
5962-1722001VXC	飞行等级 QMLV	
TPS7H2201HKR/EM	工程样片(2)	
TPS7H2201MDAPTSEP	9 月	32 引脚 HTSSOP 6.10 × 11.00mm 重量：0.191g(3)
TPS7H2201EVM-CVAL	陶瓷评估板	EVM

(1) 如需了解所有可用封装，请参阅数据表末尾的可订购产品附录。另请参阅器件选项。
(2) 这些器件仅适用于工程评估。器件按照不合规的流程进行加工处理。这些器件不适用于鉴定、量产、辐射测试或飞行。也不保证这些器件在 MIL 规定的 –55°C 至 125°C 完整温度范围内或运行寿命中的性能。
(3) 尺寸和质量值为标称值。

TPS7H2201-SEP	TID of 50 krad(Si) RLAT, DSEE free to 43 MeV-cm^2/mg	Space Enhanced Plastic	32-pin DAP HTSSOP	TPS7H2201MDAPTSEP

(1) TID is total ionizing dose and DSEE is destructive single event effects. Additional information is available in the associated TID reports and SEE reports for each product.
(2) For additional information about part grade, view SLYB235.
(3) These units are intended for engineering evaluation only. They are processed to a non-compliant flow (such as no burn-in and only 25°C testing). These units are not suitable for qualification, production, radiation testing, or flight use. Parts are not warranted as to performance over temperature or operating life.

表 5-1. Pin Functions

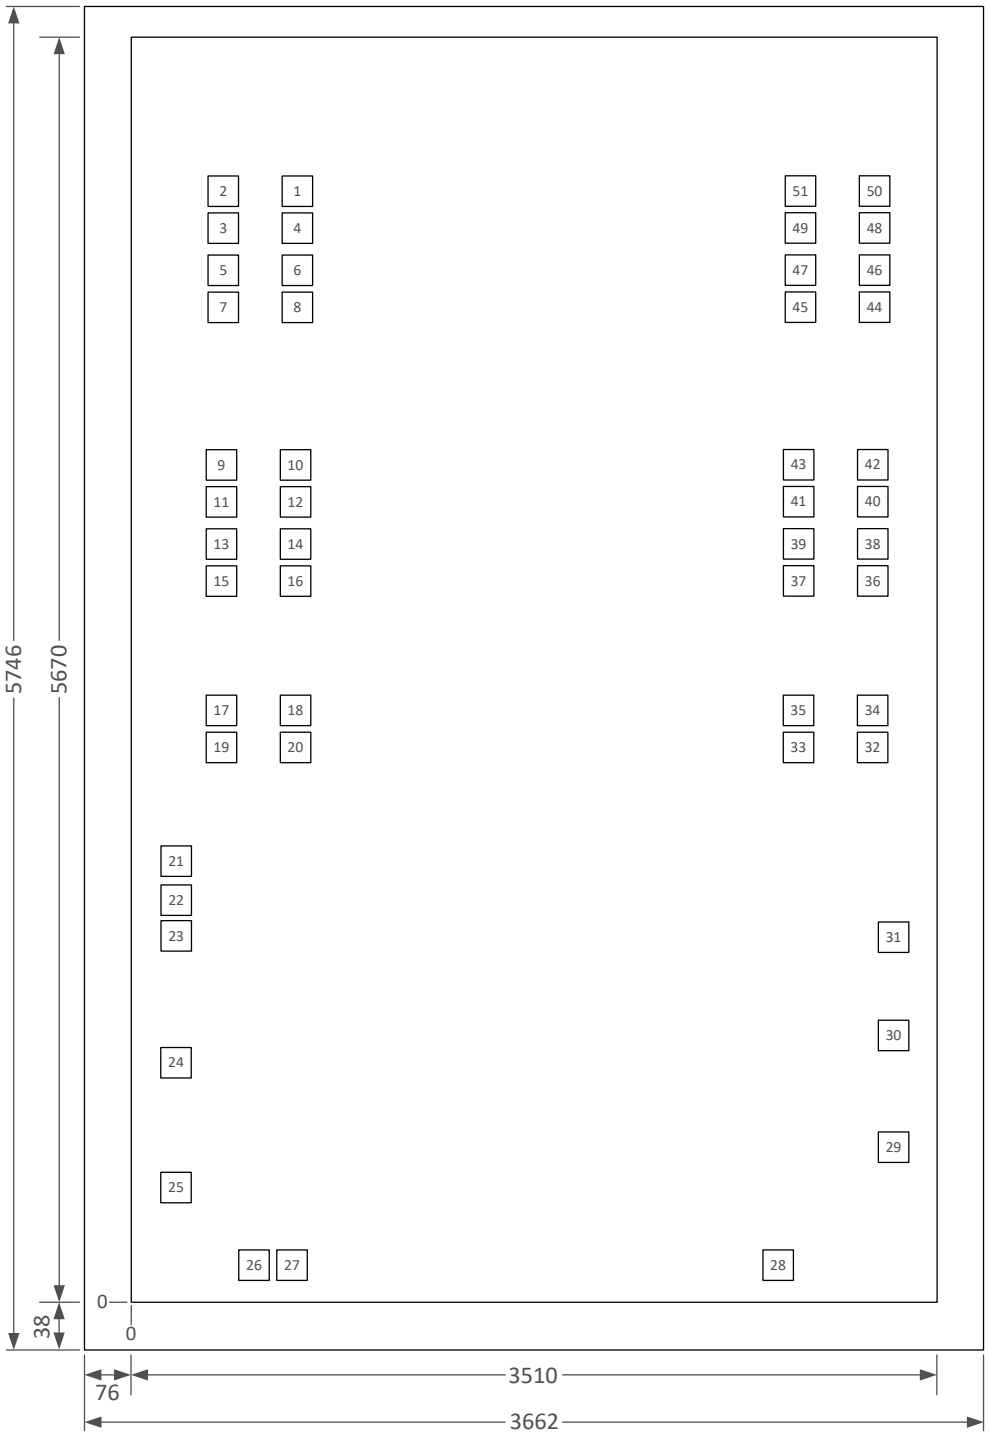

PIN			I/O[1]	DESCRIPTION
HKR (16) NO.	PW (32) NO.	NAME		
1-4	1-10	VIN	I	Switch input. Input bypass capacitor recommended for minimizing V_{IN} dip.
5	11	CS	O	Current sense pin proportional to output current. Connect a resistor to GND.
6	12	EN	I	Active high switch control input. Do not leave floating.
7	13	OVP	I	Overvoltage protection. Programmable using an external resistor divider. If no OVP is desired, this pin should be connected to GND.
8	15	GND	—	Device ground. [2]
9	18	RTIMER	I/O	Capacitor programmed fault timer control during disabled and retry mode. Connecting this pin to GND holds the switch disabled until the EN pin is cycled. Do not float this pin or connect it to VIN.
10	20	IL	I/O	Current limiter control. Programmable using an external resistor to GND. Do not float this pin.
11	21	ILTIMER	I	Capacitor programmed fault timer control during current limiting mode. Connecting this pin to VIN uses the internal current limit timer and connecting this pin to GND disables the internal timer functionality for the ILTIMER as well as retry mode. In this case, the device will remain at programmed current limit indefinitely in the event of a short without going intro retry mode. Do not float this pin.
12	22	SS	I/O	Switch slew rate control. See the *节 8.3.2* section for more information.
13-16	23-32	VOUT	O	Switch output. A minimum 10-µF output capacitor is recommended.
	14,16,17,19	NC	—	No connect. This pin is not internally connected. It is recommended to connect these pins to GND to prevent charge buildup; however, these pins can also be left open or tied to any voltage between GND and VIN.
	—	Thermal Pad	—	Thermal pad (exposed center pad) for heat dissipation purposes. Thermal pad is internally connected to seal ring and GND.

(1) I = Input, O = Output, I/O = Input or Output, — = Other
(2) Thermal pad is internally connected to the seal ring and GND for HKR option.

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)(1) (2)

		MIN	MAX	UNIT
VIN	Input voltage	–0.3	7.5	V
VOUT	Output voltage	–0.3	7.5	V
EN, OVP	Enable and over voltage protection pins	–0.3	7.5	V
CS, ILTIMER, RTIMER, IL, SS	Current sense, current limit timer, retry timer, current limit and soft start pins	–0.3	VIN + 0.3	V
I_{MAX}	Maximum continuous switch current		9	A
I_{PLS}	Maximum pulsed switch current (t≤5µs)		45	A
T_J	Maximum junction temperature	–55	150	°C
T_{stg}	Storage temperature	–65	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) All voltage values are with respect to network ground pin.

6.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001(1)	±4000	V
		Charged-device model (CDM), per JEDEC specification JESD22-C101(2)	±750	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process. Manufacturing with less than 500-V HBM is possible with the necessary precautions.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process. Manufacturing with less than 250-V CDM is possible with the necessary precautions.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	MAX	UNIT
VIN	Input voltage	1.5	7	V
SR_{VIN}	Input voltage slew rate		0.01	V/µs
VOUT	Output voltage	0	7 (1)	V
I_{MAX}	Maximum continuous switch current		6	A
T_J	Operating junction temperature(2)	–55	125	°C

(1) This maximum VOUT voltage is only applicable when the device is disabled (EN = Low). When the device is enabled (EN = High), the maximum VOUT voltage is the input voltage, VIN.
(2) In applications where high power dissipation and/or poor package thermal resistance is present, the maximum ambient temperature may have to be derated. Maximum ambient temperature [$T_{A(max)}$] is dependent on the maximum operating junction temperature [$T_{J(max)}$], the maximum power dissipation of the device in the application [$P_{D(max)}$], and the junction-to-ambient thermal resistance of the part/package in the application (θ_{JA}), as given by the equation: $T_{A\ (max)} = T_{J(max)} - (\theta_{JA} \times P_{D(max)})$.

6.5 Electrical Characteristics: All Devices（续）

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	SUBGROUP (1)	MIN	TYP	MAX	UNIT
OVERVOLTAGE PROTECTION (OVP)							
V_{OVPR}	OVPR thresold voltage, rising		1, 2, 3	0.52	0.57	0.63	V
V_{OVPF}	OVPF threshold voltage, falling		1, 2, 3	0.5	0.55	0.59	V
$HYST_{OVP}$	OVP hysteresis voltage	1.6 V < VIN < 7 V	1, 2, 3		20	55	mV
I_{OVP}	OVP pin input leakage current		1, 2, 3			15	nA
CURRENT LIMIT AND CURRENT SENSE							
t_{CSEN}	Time for valid CS output after enable	C_{SS} = 120 nF	9, 10, 11			5	ms
Minimum VOUT current for valid CS output			1, 2, 3	750			mA
VOUT current change to CS change delay time		0.5-A rising step, 100 mA/µs, 1.5 V ⩽ VIN ⩽ 7 V	9, 10, 11		16	74	µs
VOUT current change to CS change delay time		0.5-A falling step, 100 mA/µs, 1.5 V ⩽ VIN ⩽ 7 V	9, 10, 11		16	73	µs
CS pin accuracy		0.75 A ⩽ I_{VOUT} ⩽ 7.5 A	4, 5, 6	–10%		10%	
CS pin voltage		0.75 A ⩽ I_{VOUT} ⩽ 7.5 A, no OCP	1, 2, 3			VIN – 0.4	V
Current limit setting, I_{IL}		I_{VOUT} ⩽ 1 A	1, 2, 3	I_{VOUT} + 0.5			A
		1A < I_{VOUT} ⩽ 3 A	1, 2, 3	I_{VOUT} + 1			
		I_{VOUT} > 3 A	1, 2, 3	I_{VOUT} + 1.5			
Programmable current limit accuracy		1.5 V ⩽ VIN ⩽ 7 V	4, 5, 6	–20%		20%	
Fast trip off current limit		VIN = 5 V, 10-mΩ short in 10 µs			22		A
TIMERS							
$I_{ILTIMER}$	ILTIMER charge current		1, 2, 3	0.7	1	1.38	µA
$PD_{ILTIMER}$	ILTIMER internal pull-down resistance	40 mV on ILTIMER pin	1, 2, 3		38	153	Ω
I_{RTIMER}	RTIMER charge current		1, 2, 3	0.7	1	1.38	µA
PD_{RTIMER}	RTIMER internal pull-down resistance	40 mV on RTIMER pin	1, 2, 3		38	153	Ω
THERMAL SHUTDOWN							
Thermal shutdown		VIN = 5 V			175		°C
Thermal shutdown hysteresis		VIN = 5 V			20		°C

(1) For subgroup definitions, see Quality Conformance Inspection table.
(2) VIN must be ⩾ 75% of its final value before EN is asserted only if VIN_{SR} > $VOUT_{SR}$.

8 Detailed Description

8.1 Overview

The TPS7H2201 device is a single channel, 6-A eFuse with a programmable slew rate for applications that require specific rise-time as well as programmable current limit for protection purposes. In addition, the TPS7H2201 features a reverse current protection capability for power distribution applications.

8.2 Functional Block Diagram

Copyright © 2024 Texas Instruments Incorporated

8.3 Feature Description

8.3.1 Enable, Undervoltage, and Overvoltage Protection

图 8-1 shows how resistor dividers from VIN connected to the EN and OVP pins can be used to set the UVLO and OVP trip voltages. The EN pin controls the ON and OFF state of the internal FET. A voltage at this pin greater than V_{IHEN} turns on the FET and a voltage less than V_{ILEN} turns it off. The addition of an external resistor divider from VIN allows the EN pin to configure a different enable rising voltage or an undervoltage monitor (UVLO) based on the V_{IHEN} and V_{ILEN} specifications respectively. Typically, applications are optimized to either configure the enable rising voltage or the UVLO threshold. As an example, 方程式 1 can be used to calculate the UVLO trip point fixing R_{TOP_EN} = 100 kΩ.

In a similar way to the EN pin, the overvoltage protection (OVP) feature of the device can be configured using a resistor divider from VIN connected to the OVP pin. The trip voltage for the OVP has to be less than the absolute maximum VIN voltage. A voltage at the OVP pin greater than V_{OVPR} will trip the OVP feature and will turn off the FET and a voltage less than V_{OVPF} will keep the FET on. If this feature is not desired, the OVP pin should be grounded. 方程式 2 can be used to calculated the rising OVP trip point fixing R_{TOP_OVP} = 100 kΩ.

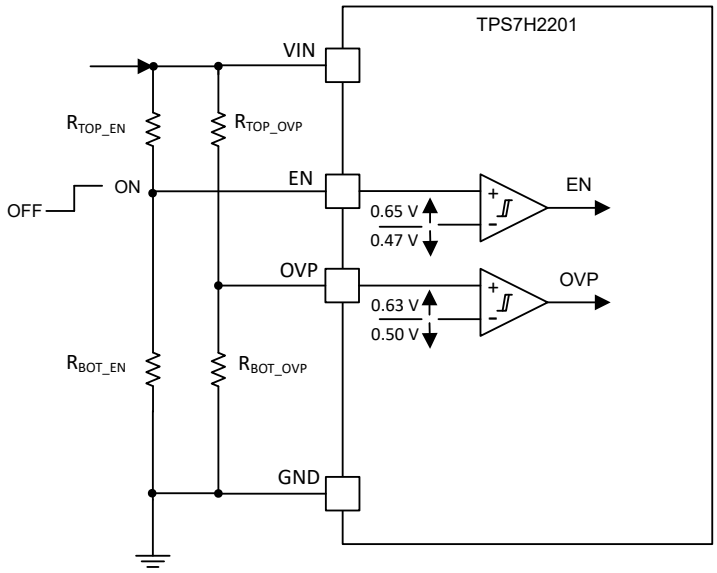

图 8-1. UVLO and OVP Thresholds Set by Resistor Dividers

$$R_{BOT_EN}\,(k\Omega) \le \frac{47}{V_{UVLO_TRIP}\,(V) - 0.47} \tag{1}$$

$$R_{BOT_OVP}\,(k\Omega) \ge \frac{63}{V_{OVP_TRIP}\,(V) - 0.63} \tag{2}$$

8.3.2 Adjustable Rise Time

An external capacitor, C_{SS}, connected between the VOUT and SS pins sets the slew rate. The desired slew rate $VOUT_{SR}$ is determined by t_r, the rise time in seconds, and ΔV, the change in VOUT voltage in Volts as shown in 方程式 3.

$$VOUT_{SR}\,(V/s) = \frac{\Delta V_{OUT}\,(V)}{t_r\,(s)} \tag{3}$$

Copyright © 2024 Texas Instruments Incorporated

In order to avoid false trips due to the programmable current limit, the desired slew rate must be less than $VOUT_{SR,MAX}$ as shown in 方程式 4, where I_L is the programmed current limit, I_{VOUT} is the normal operation current flowing through the switch, and C_{OUT} is the output capacitor.

$$VOUT_{SR,MAX}\,(V/s) < \frac{0.8 \times I_L(A) - 0.95 \times I_{VOUT}\,(A)}{C_{OUT}\,(F)} \tag{4}$$

Once the slew rate has been calculated and meeting the constraint in 方程式 4, the C_{SS} capacitor is then calculated using 方程式 5 for VIN < 3-V and IOUT ⩾ 3-A applications. For all other applications, use 方程式 6.

$$C_{SS}\,(\mu F) = \frac{45}{VOUT_{SR}\,(V/s)} \tag{5}$$

for VIN < 3 V and IOUT ⩾ 3 A

$$C_{SS}\,(\mu F) = \frac{65}{VOUT_{SR}\,(V/s)} \tag{6}$$

for all other conditions

8.3.3 Programmable Current Limiting

A current limit can be programmed using an external resistor connected from the IL pin to GND. This programmed current limit (±20% accurate) refers to the continuous current through the device and therefore, when operated at its maximum current rating (6 A), the programmed current limit needs to be set 20% higher. As shown in 图 8-2, a current limit event of this nature is defined as a soft short. The resistor value R_{IL}, can be calculated using 方程式 7 for VIN ⩽ 3 V, and 方程式 8 for VIN > 3 V, where I_L is the programmed current limit value in amperes. This programmable current limiting feature is different from the internal current limiting activated during fast trip mode as shown in 图 8-3. A current limit event in this case is defined as a hard short and this current limit (typical of 22 A) cannot be programmed.

$$R_{IL}\,(\Omega) = \frac{45500}{I_L(A)} \tag{7}$$

for VIN ⩽ 3 V

$$R_{IL}\,(\Omega) = \frac{49000}{I_L(A)} \tag{8}$$

for VIN > 3 V

8.3.4 Programmable Fault Timer

A capacitor connected from the ILTIMER pin to GND determines the programmable current limit fault time duration. The ILTIMER pin will charge the capacitor to 0.5 V during an overload condition and will discharge it otherwise through an internal pull down resistance. The time that the device will be in current limit before turning off is configured by $C_{ILTIMER}$ and the time can be calculated using 方程式 9. Connecting this pin to VIN will cause the device to be disabled once the internal current limit timer expires as shown in 图 7-5. However, connecting it to GND will disable the internal timer functionality completely and therefore, in the case of a short, the device will remain at the programmed current limit indefinitely. When using the internal timer, the programmable current limit may not have time to settle to its programmed value. Because of this, the programmable current limit could briefly fall outside of its defined accuracy threshold. The fast trip off current limit, however, will remain valid.

Copyright © 2024 Texas Instruments Incorporated

$$t(\mu s) = \frac{C(pF)}{2} \quad (9)$$

The time that the device remains disabled after the current limit timer expires is configurable through a capacitor connected from the RTIMER pin to GND. The RTIMER pin will charge the capacitor to 0.5 V after the switch is turned off and will discharge it otherwise. The time can be calculated using 方程式 9. Connecting this pin to GND will keep the device disabled and it will require the device to be enabled by cycling the EN pin (Refer to EN Signal Low Time to Restart Device (t_{LOW})). The behavior of the ILTIMER and RTIMER pins for a soft short, hard short and internal timer conditions are shown in 图 8-2, 图 8-3, and 图 8-4, respectively. Please notice that 图 8-2 and 图 8-3 assume the fault is not present after the switch has been disabled and enabled again (retry mode). If the fault is present after the retry mode, the device will go into current limit mode and this cycle will repeat until the fault is no longer present.

表 8-1 and 表 8-2 summarizes the fault duration time and retry time based on the pin conditions.

表 8-1. Fault Time Duration for ILTIMER Pin Conditions

ILTIMER Pin Condition	Fault Time Duration During Overload
VIN	15 μs (typ), 35 μs (max)
GND	Indefinitely
Capacitor to GND ($C_{ILTIMER}$)	方程式 9
Float	Not valid (do not float pin)

表 8-2. Time to Retry During an Overload Condition for RTIMER Pin Conditions

RTIMER Pin Condition	Time to Retry During an Overload
GND	Disabled (switch off) until EN is low for t > t_{LOW} (20 μs)
Capacitor to GND (C_{RTIMER})	方程式 9
Float	Not valid (do not float pin)

Copyright © 2024 Texas Instruments Incorporated

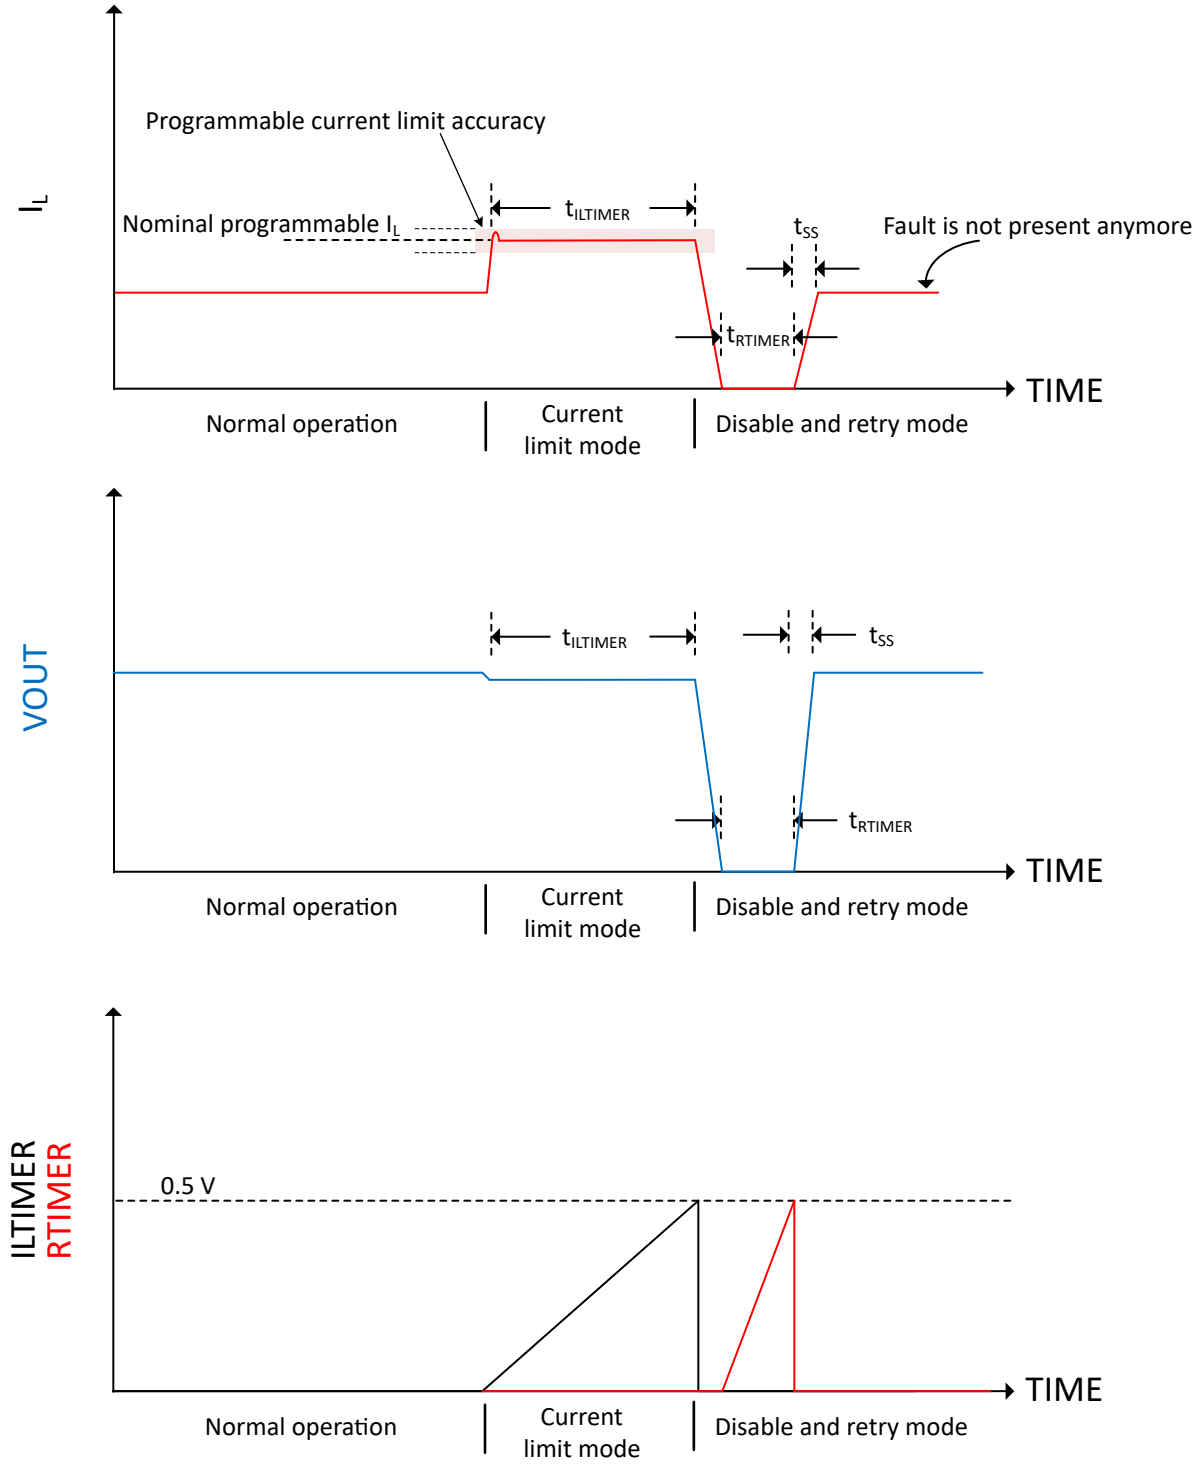

图 8-2. Soft Short Programmable Fault Timer Operation Connecting Capacitors to ILTIMER and RTIMER Pins

Copyright © 2024 Texas Instruments Incorporated

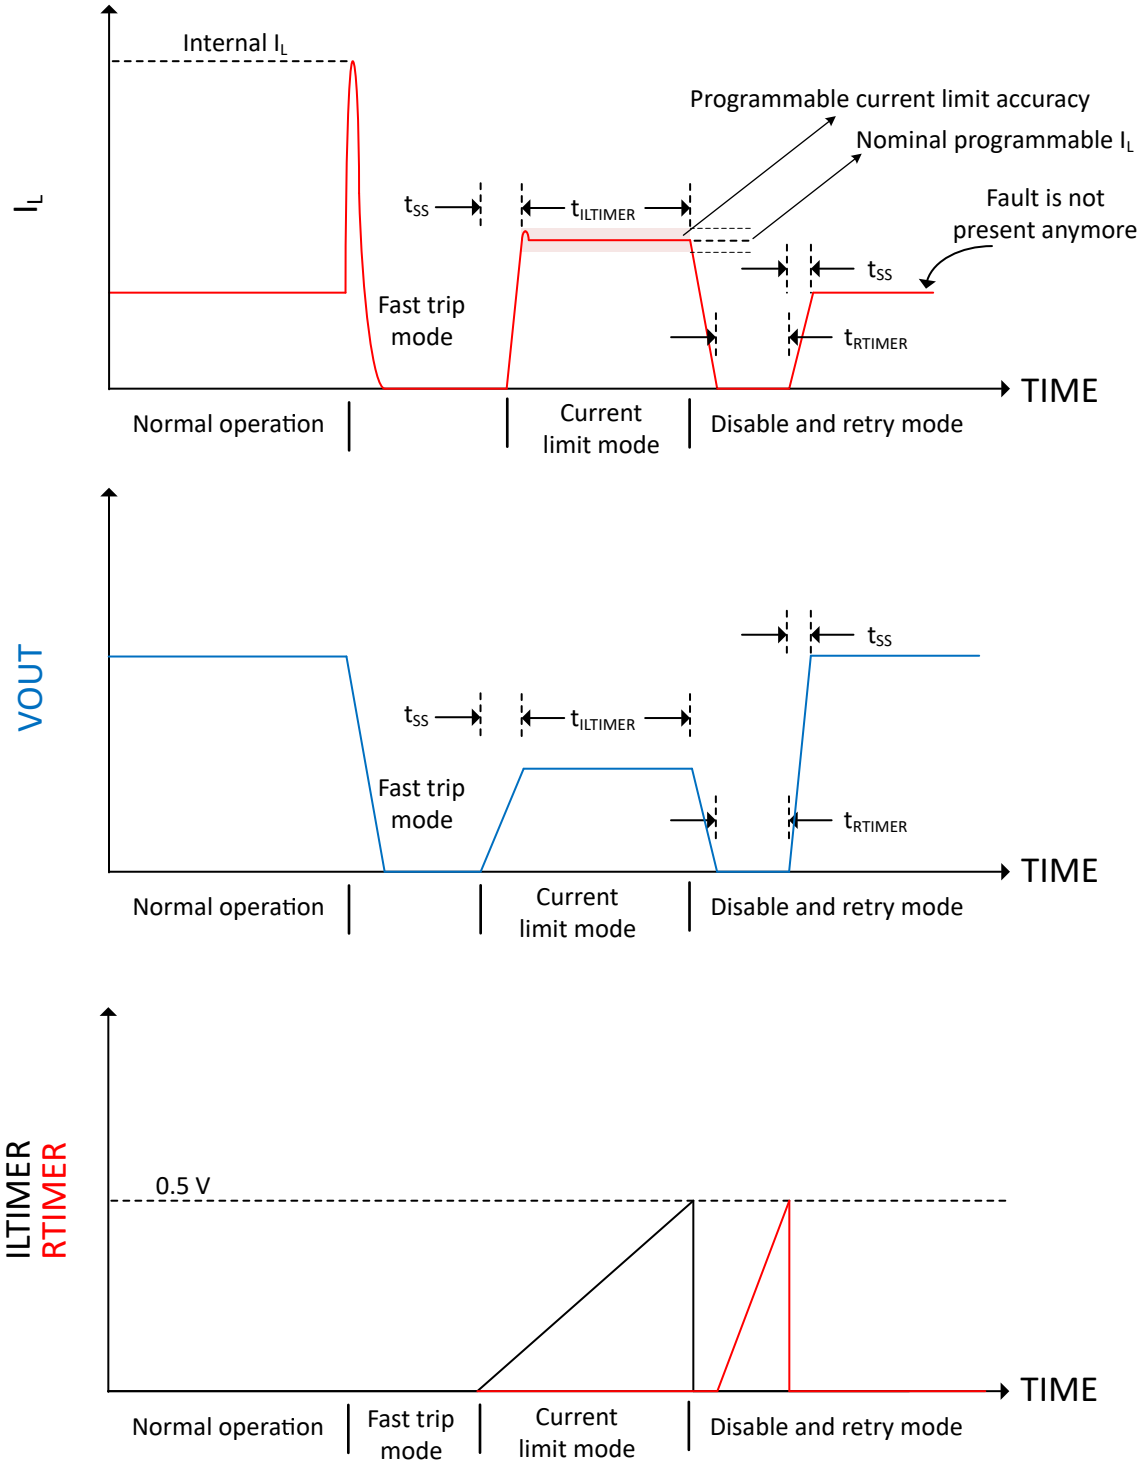

图 8-3. Hard Short Programmable Fault Timer Operation Connecting Capacitors to ILTIMER and RTIMER Pins

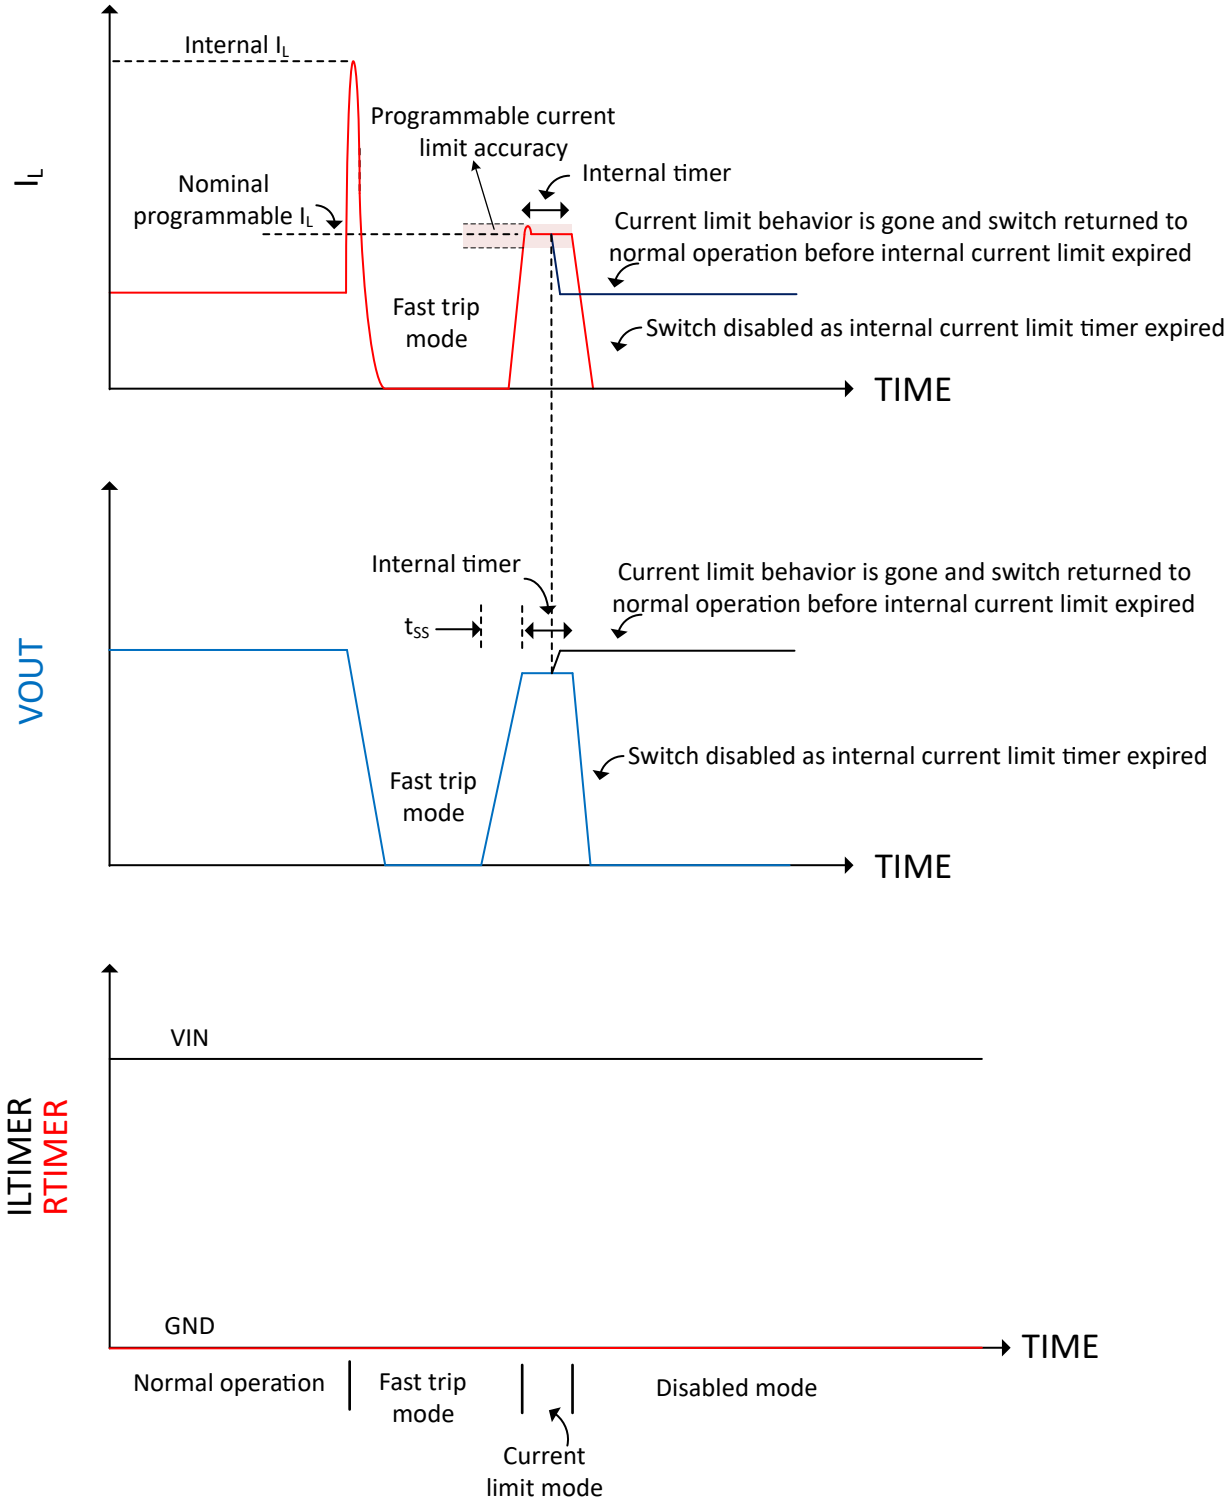

图 8-4. Programmable Fault Timer Operation Using the Internal Current Limit Timer and Disabling the Retry Mode

The programmable fault timers, ILTIMER and RTIMER, should be set in such a way that the capacitor for one timer is discharged before the other timer expires to ensure proper operation. In the specific case of using the internal ILTIMER, the RTIMER capacitor should be sized such that it is discharged before the internal ILTIMER

Copyright © 2024 Texas Instruments Incorporated

expires, assuming the fault is still present. 图 8-5 shows a situation where this constraint is not met as the RTIMER is much larger than the ILTIMER and therefore, the C_{RTIMER} is not discharged before the $C_{ILTIMER}$ reaches 0.5 V, which is when the ILTIMER will expire. In order to avoid this situation, the constraint shown in 方程式 10 must be met. Using this equation, once a capacitor for a timer has been selected (C_1 in 方程式 10), the maximum value for the capacitor of the second timer can be determined. The internal pull-down resistance for each of the timers can be found in the *Electrical Characteristics: All Devices* table. For the situation shown in 图 8-5, C_1 and R_{PD1} in 方程式 10 correspond to the RTIMER.

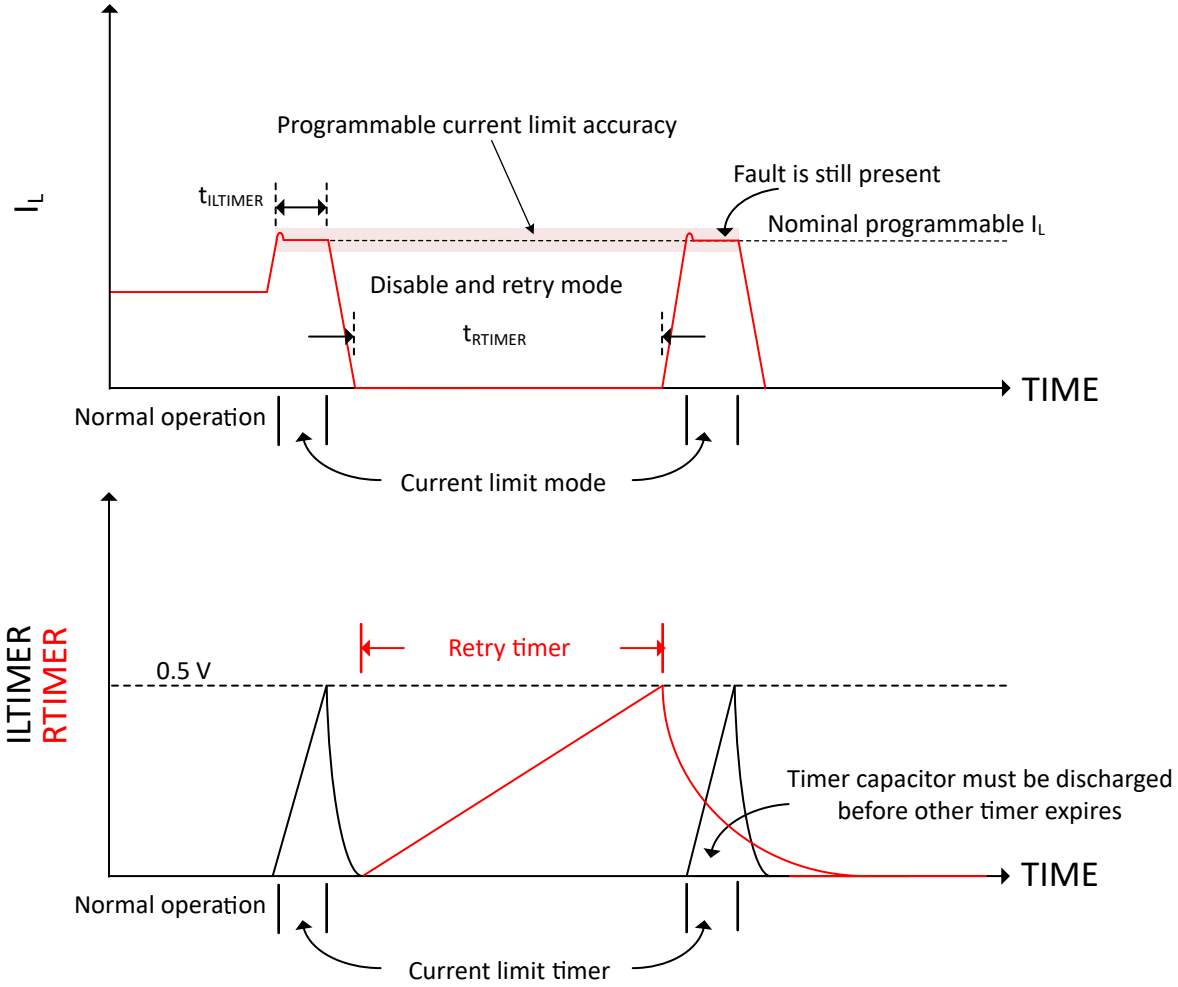

图 8-5. Programmable Fault Timer Capacitors Constraint

$$C_1(\mu F) < \frac{C_2(pF)}{8 \times R_{PD1}(\Omega)} \quad (10)$$

8.3.5 Current Sense

This pin will output a current proportional to the output current of the switch for current sensing applications. A resistor to GND will convert this current to voltage for current sensing purposes. The output current will be the switch current divided by 41,500. The CS pin will have a valid output 5 ms after the device has been enabled. To operate the current sense in the linear region, the voltage at the CS pin at the application maximum load, should not exceed the CS pin voltage sepcification (VIN - 400 mV).

Copyright © 2024 Texas Instruments Incorporated

8.3.6 Parallel Operation

The TPS7H2201 can be configured in parallel operation either to increase the current capability, up to 12 A, or to reduce the on-state resistance. In this case, all pins are shared as shown in 图 8-6, except the current limit resistor (R_{IL}) for proper operation of the internal current limit loop. The current limiting resistors must be sized as described in the *Programmable Current Limiting* section.

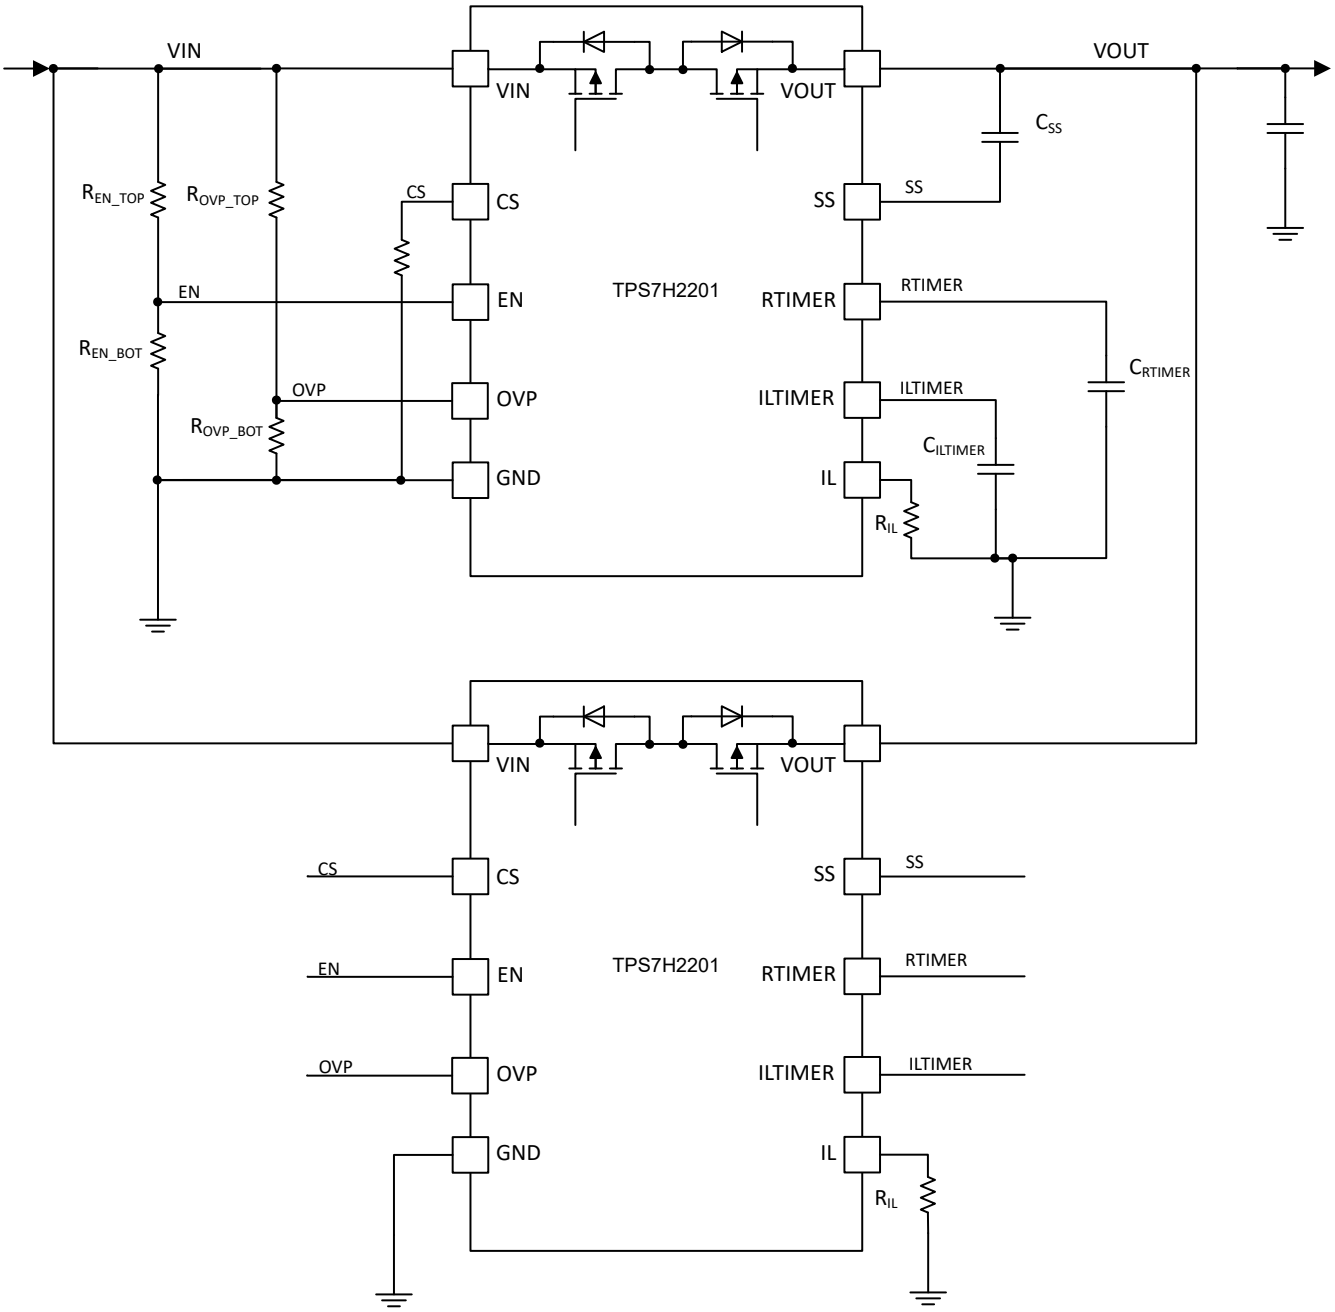

图 8-6. Parallel Configuration to Reduce Resistance or Increase Current Capability

Copyright © 2024 Texas Instruments Incorporated

8.3.7 Reverse Current Protection

The TPS72201 eFuse features back to back FETs to prevent current flow from VIN to VOUT and from VOUT to VIN when the switch is disabled (excluding leakage currents). This supports cold sparing (redundancy) applications. For example, VOUT may be up to 7 V while VIN is between 0 V and 7 V. In all cases, only small leakage current will result.

8.3.8 Forward Leakage Current

When VIN is powered but the TPS7H2201 is disabled (EN is low), the internal FETs are disabled, creating a high impedance path from VIN to VOUT. However, there are parasitic leakage paths that can cause VOUT to slowly charge. The forward leakage current, I_F, indicates how much current flows from VIN to VOUT during this situation. The maximum forward of the TPS7H2201-SP current is specified at 250 μA across voltage, temperature and radiation.

Some applications need to pay particular attention to this behavior. Is particularly relevant when VOUT is a high impedance node (and therefore the leakage current goes entirely to charging VOUT instead of being dissipated). By using the basic capacitor equation shown in 方程式 11, the time for the voltage to rise to a given value can be theoretically calculated.

$$\Delta t = \Delta V_{OUT} \times C_{OUT} / I_F \quad (11)$$

where

- Δt = time to charge to final value
- ΔV_{OUT} = change in output voltage; for a 0 V starting voltage, use V_{IN}

For example, with a 7-V input voltage and a 220-μF output capacitance, VOUT typically charge to 7 V in approximately 6.2 seconds (using I_F = 150 μA, ΔV_{OUT} = 7 V, C_{OUT} = 220 μF).

If the output voltage must remain below a certain value, a pull-down resistor can be utilized with a value as calculated by using 方程式 12.

$$VOUT_{LKG_MAX} = I_F \times R_{PULL_DOWN} \quad (12)$$

where

- $VOUT_{LKG_MAX}$ = maximum output voltage due to leakage current, I_F
- R_{PULL_DOWN} = external pull-down resistor from VOUT to GND

For example, placing a 2.6-kΩ resistor between VOUT and ground makes sure VOUT does not rise above 0.65-V worse case due to the I_F current. The resistor need to be able to handle the worst case power dissipation when the switch is enabled and VOUT ≈ VIN.

9 Application and Implementation

备注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI’s customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

The TPS7H2201 device is a single channel, 6-A eFuse with multiple programmable features such as current limit, undervoltage and overvoltage, current limit and retry timers, and soft start. In addition, the TPS7H2201 features a reverse current protection capability for power distribution applications and current sensing for load monitoring purpose. The TPS7H2201-SP user's guide is available on the TI website, *TPS7H2201EVM-CVAL Evaluation Module (EVM) User's Guide*. The guide highlights standard EVM configurations, test results, schematic, and BOM for reference.

9.2 Typical Applications

In addition to the standard power management applications where a power switch can be used, there are 2 main applications in which the TPS7H2201 can be used in space power applications:

- Redundancy for primary and secondary voltage rails common in satellite applications
- Protection for critical or SEL sensitive loads

9.2.1 Redundancy

In applications where primary and secondary (redundant) power rails are present, the TPS7H2201 is ideal to implement redundancy because of its reverse current blocking capability. In this case, since the eFuse is placed at the input of the point of load regulator, the on-resistance of the switch is not as critical.

Copyright © 2024 Texas Instruments Incorporated

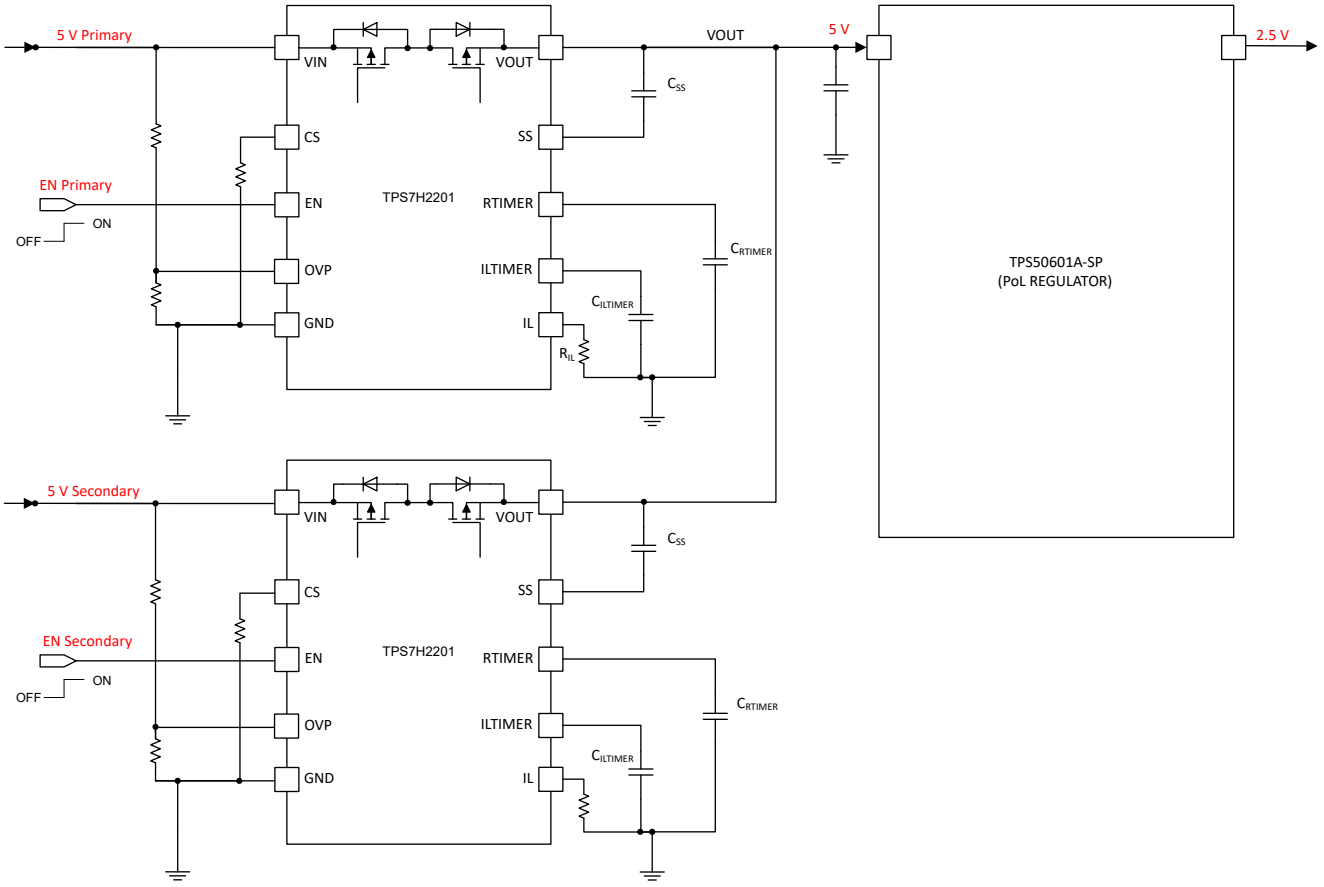

图 9-1. Redundancy Example Using the TPS7H2201

9.2.2 Protection

The protection features of the TPS7H2201 can also be used for SEL sensitive loads. In such case, the on-resistance of the switch might be more relevant as it is placed after the point of load regulator but in such case, two eFuse can be placed in parallel to reduce the on-resistance if needed. The main advantages of using the eFuse at this location is faster response to SEL events and automatic recovery due to the retry mode of the programmable fault timer.

Copyright © 2024 Texas Instruments Incorporated

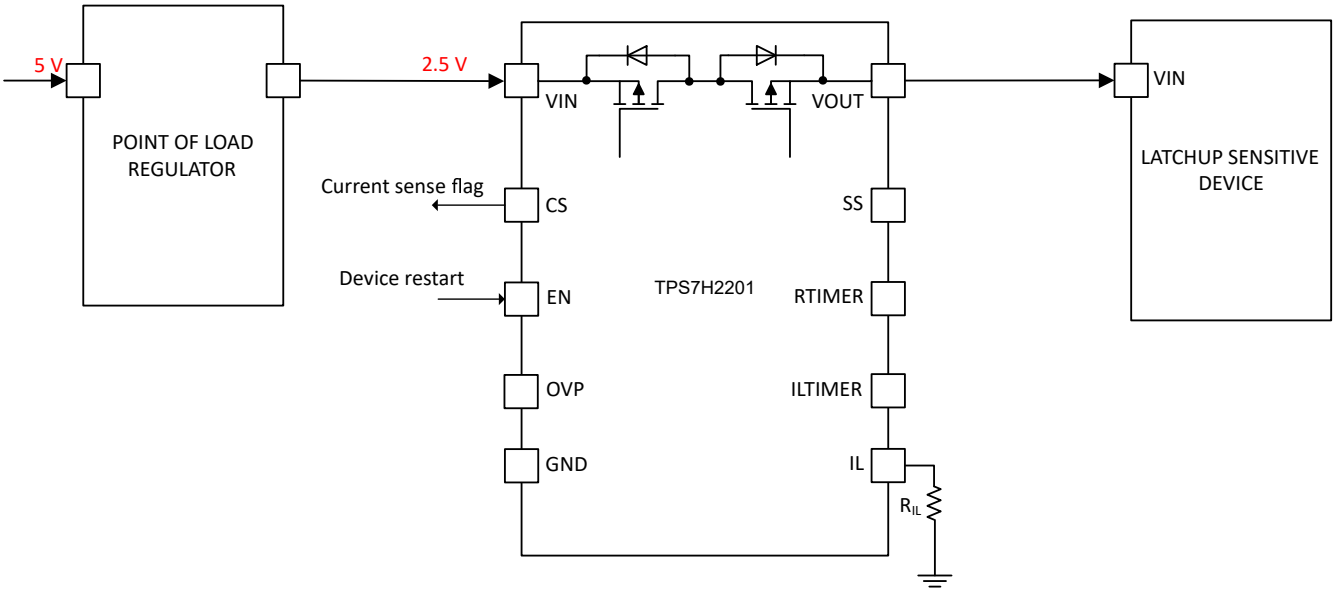

图 9-2. Protection Example Using the TPS7H2201

9.2.3 Design Requirements

图 9-3 shows a typical application schematic that is applicable to both the redundancy and the protection applications previously discussed.

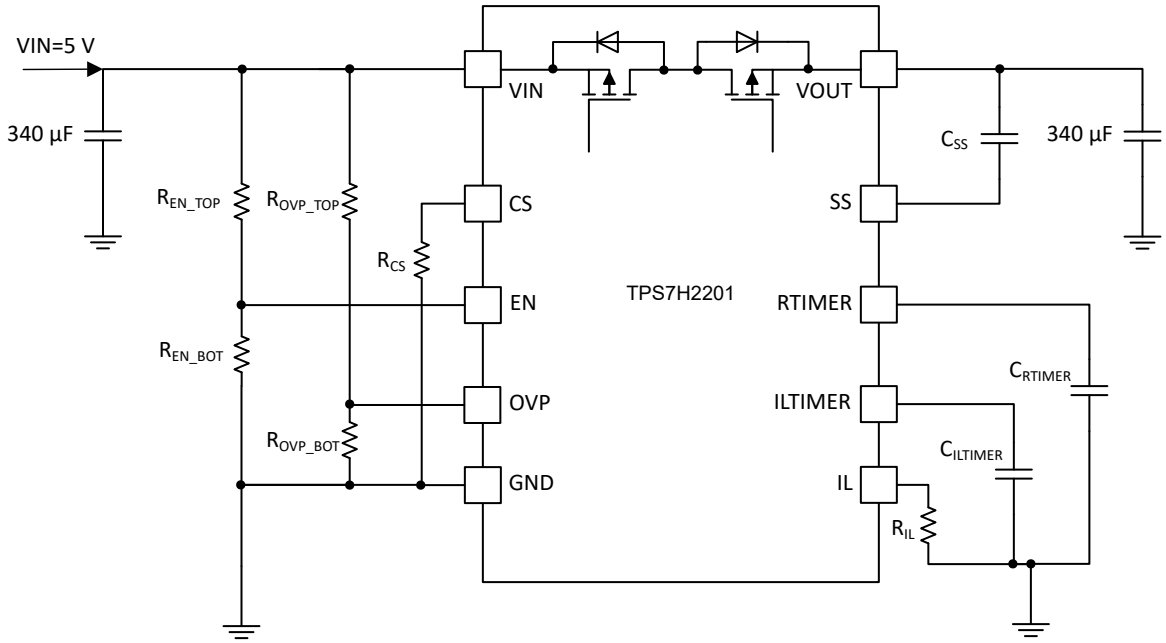

图 9-3. Typical Application Schematic

表 9-1 shows the design parameters.

表 9-1. Design Parameters

DESIGN PARAMETER	EXAMPLE VALUE
VIN	5 V
Undervoltage lockout set point	3.5 V

Copyright © 2024 Texas Instruments Incorporated

表 9-1. Design Parameters（续）

DESIGN PARAMETER	EXAMPLE VALUE
Overvoltage protection set point	6.5 V
Output current	6 A
Current limit	7.5 A
Current limit timer	1 ms
Retry timer	1 ms
Soft start time	9 ms
Input and output capacitors	340 µF

9.2.4 Detailed Design Procedure

9.2.4.1 Undervoltage Lockout

The undervoltage lockout set point is configured using the resistor divider, R_{EN_TOP} and R_{EN_BOT} connected to the EN pin. Set the R_{EN_TOP} = 100 kΩ and, using 方程式 1, calculate the value for R_{EN_BOT}. For an UVLO = 3.5 V, R_{EN_BOT} = 15.5 kΩ. When choosing the UVLO set point, the resistor divider must ensure that the device will still get enabled for the VIN used in the application. This is achieved by making sure that the V_{IHEN} requirement is still met with the chosen resistor divider and that the VIN needed to meet the requirement is smaller than the VIN used in the application. 方程式 13 shows this VIN and V_{IHEN} requirement to set the UVLO point. For this particular application, the requirement is met as the result is 4.84 V.

$$V_{IHEN} \times \frac{R_{EN_TOP} + R_{EN_BOT}}{R_{EN_BOT}} \leq VIN \tag{13}$$

9.2.4.2 Overvoltage Protection

In a similar way to the UVLO set point, the overvoltage protection set point is configured using the resistor divider, R_{OVP_TOP} and R_{OVP_BOT} connected to the OVP pin. Set the R_{OVP_TOP} = 100 kΩ and, using 方程式 2, calculate the value for R_{OVP_BOT}. For an OVP = 6.5 V, R_{OVP_BOT} = 10.7 kΩ. When choosing the OVP set point, the resistor divider must ensure that the device will still get enabled for the VIN used in the application. This is achieved by making sure that the V_{OVPF} requirement is still met with the chosen resistor divider and that the VIN needed to meet the requirement is larger than the VIN used in the application. 方程式 14 shows this VIN and V_{OVPF} requirement to set the OVP point. For this particular application, the requirement is met as the result is 5.16 V.

$$V_{OVPF} \times \frac{R_{OVP_TOP} + R_{OVP_BOT}}{R_{OVP_BOT}} \geq VIN \tag{14}$$

9.2.4.3 Current Limit

The current limit is configured using R_{IL}. Based on the output current for this design, the minimum current limit that can be programmed is IOUT + 1.5 A for a total of 7.5 A. As a result, using 方程式 8, the resistor value is 6.53 kΩ.

9.2.4.4 Programmable Fault Timers

The programmable fault timers are configured using the $C_{ILTIMER}$ and the C_{RTIMER} capacitors. For this particular design, both timers are set to 1 ms. Therefore, using 方程式 9, the value for each capacitor is 2000 pF. These capacitor values meet the requirement in 方程式 10.

9.2.4.5 Soft Start Time

The soft start time is configured using the C_{SS} capacitor. In order to calculate the value of the capacitor, the VOUT slew rate needs to be calculated using 方程式 3 to make sure the maximum VOUT slew rate requirement

Copyright © 2024 Texas Instruments Incorporated

shown in 方程式 4 is satisfied. This requirement is particularly important for space applications where large output capacitance is typically used, which translates to a lower maximum allowable VOUT slew rate. For this particular design, the VOUT slew rate is 555 V/s which is less than the maximum VOUT slew rate of 882 V/s, meeting the requirement from 方程式 4. Now, the soft start capacitor value can be calculated as 117 nF using 方程式 6, since VIN = 5 V for this application.

9.2.5 Application Curves

The power-up behavior of this design example is shown in 图 9-4 and the current limit behavior is shown in 图 9-5.

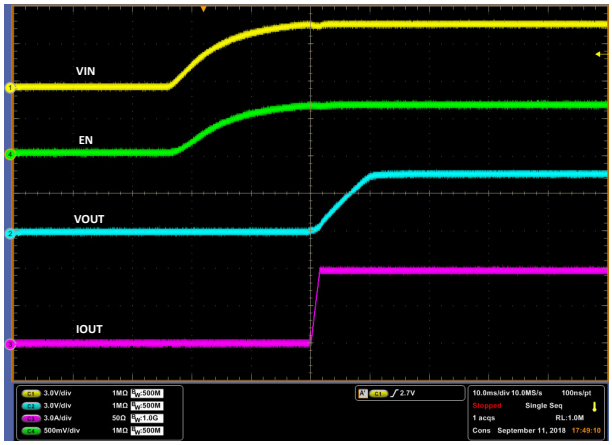

图 9-4. Power-up Behavior of the TPS7H2201-SP

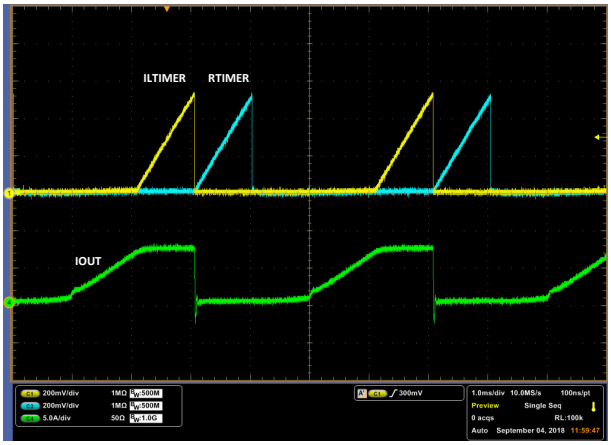

图 9-5. ILTIMER and RTIMER Waveforms When IL is Set to 7.5 A

9.3 Power Supply Recommendations

The TPS7H2201 is designed to operate from an input voltage supply range between 1.5 V to 7 V. This supply voltage must be well regulated and proper local bypass capacitors should be used for proper electrical performance from VIN to GND. Due to stringent requirements for space applications, typically numerous input bypass capacitors are used and the total capacitance is much larger than for commercial applications. The TPS7H2201-SP Evaluation Module uses one 330-µF tantalum capacitor in parallel with one 10-µF and one 0.1-µF ceramic capacitor.

9.4 Layout

9.4.1 Layout Guidelines

For best performance, all traces should be as short as possible. To be most effective, the input and output capacitors should be placed close to the device to minimize the effects that parasitic trace inductances may have on normal operation. Using wide traces for VIN, VOUT, and GND helps minimize the parasitic electrical effects. In general, the components should be placed close to the device such that traces remain as short as possible to avoid parasitic capacitance. In addition, due to the possibility of large power dissipation in fault conditions (short at VOUT), thermal vias should be placed in the PCB for the thermal pad.

9.4.2 Layout Example

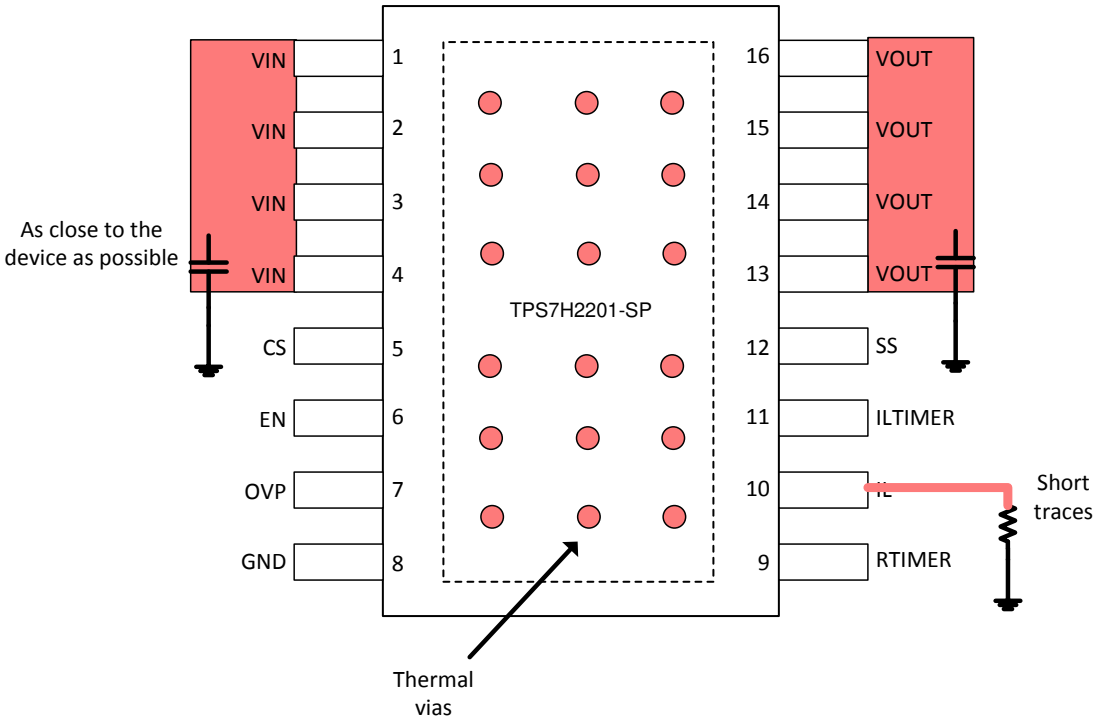

图 9-6. Layout Recommendation

10.2 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. In the upper right corner, click on *Alert me* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

10.3 支持资源

TI E2E™ 中文支持论坛是工程师的重要参考资料，可直接从专家处获得快速、经过验证的解答和设计帮助。搜索现有解答或提出自己的问题，获得所需的快速设计帮助。

链接的内容由各个贡献者“按原样”提供。这些内容并不构成 TI 技术规范，并且不一定反映 TI 的观点；请参阅 TI 的使用条款。

10.4 Trademarks

TI E2E™ is a trademark of Texas Instruments.
所有商标均为其各自所有者的财产。

10.5 静电放电警告

静电放电 (ESD) 会损坏这个集成电路。德州仪器 (TI) 建议通过适当的预防措施处理所有集成电路。如果不遵守正确的处理和安装程序，可能会损坏集成电路。

ESD 的损坏小至导致微小的性能降级，大至整个器件故障。精密的集成电路可能更容易受到损坏，这是因为非常细微的参数更改都可能会导致器件与其发布的规格不相符。

10.6 术语表

TI 术语表　　本术语表列出并解释了术语、首字母缩略词和定义。

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

OTHER QUALIFIED VERSIONS OF TPS7H2201-SEP, TPS7H2201-SP :

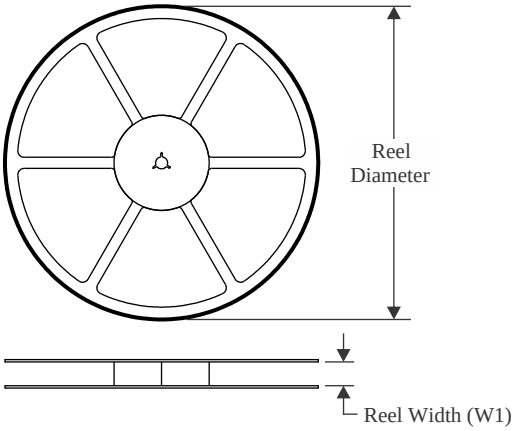

- Catalog : TPS7H2201-SEP
- Space : TPS7H2201-SP

NOTE: Qualified Version Definitions:

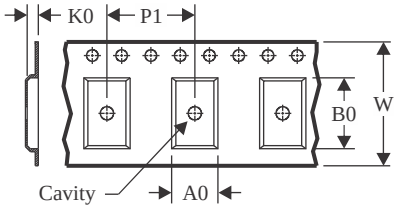

- Catalog - TI's standard catalog product
- Space - Radiation tolerant, ceramic packaging and qualified for use in Space-based application

TAPE AND REEL INFORMATION

REEL DIMENSIONS

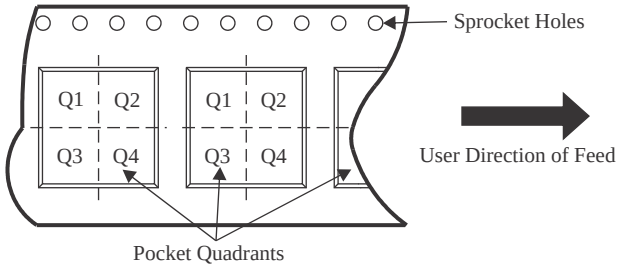

TAPE DIMENSIONS

A0	Dimension designed to accommodate the component width
B0	Dimension designed to accommodate the component length
K0	Dimension designed to accommodate the component thickness
W	Overall width of the carrier tape
P1	Pitch between successive cavity centers

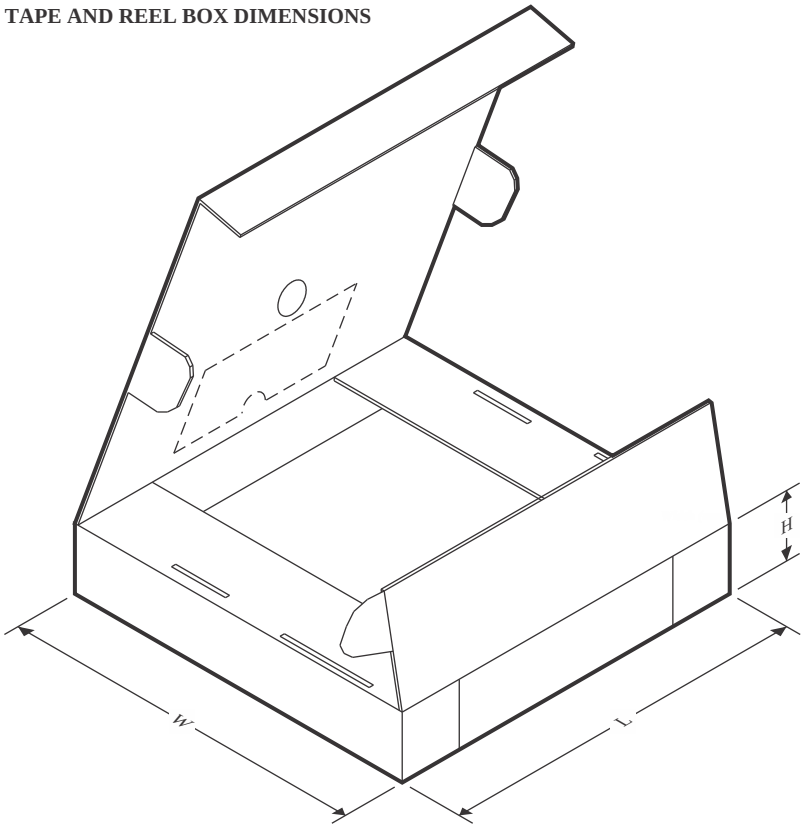

QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE

*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Reel Diameter (mm)	Reel Width W1 (mm)	A0 (mm)	B0 (mm)	K0 (mm)	P1 (mm)	W (mm)	Pin1 Quadrant

PACKAGE OUTLINE

HKR0016A

CFP - 2.416 mm max height

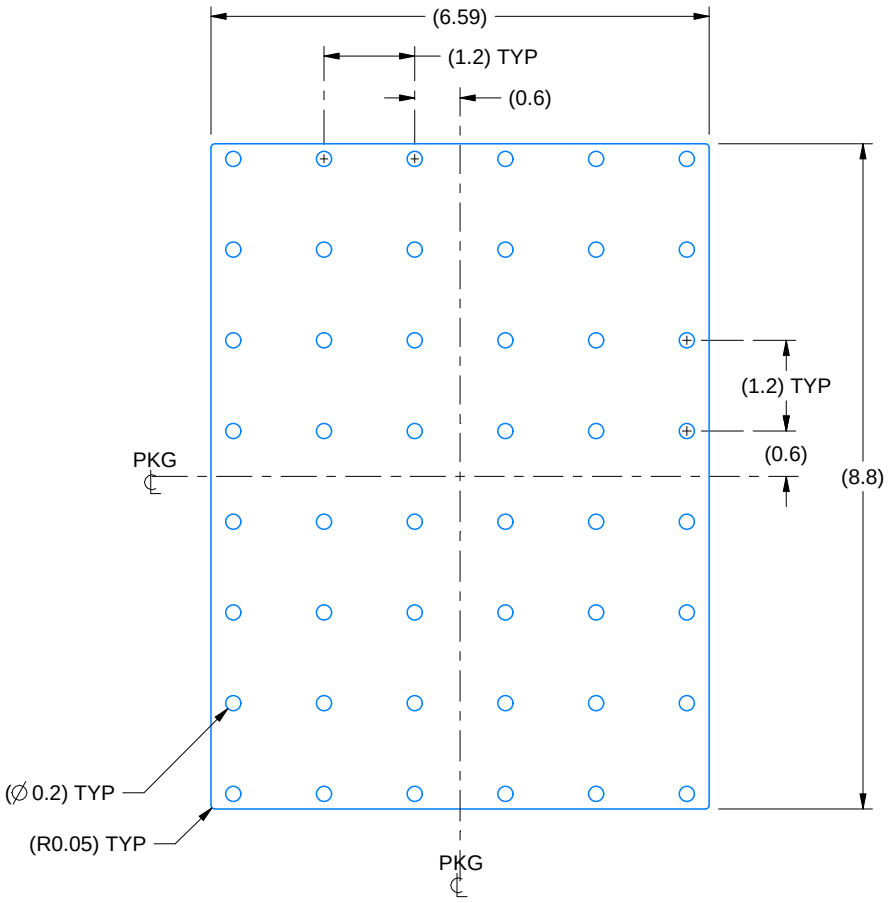

CERAMIC DUAL FLATPACK

4226020/C 08/2022

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This package is hermetically sealed with a metal lid. Lid is connected to Heatsink.
4. The terminals are gold plated.
5. Falls within MIL-STD-1835 CDFP-F11A.

SOLDER MASK DETAILS
NOT TO SCALE

4229179/A 11/2022

NOTES: (continued)

6. Publication IPC-7351 may have alternate designs.
7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.
8. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature numbers SLMA002 (www.ti.com/lit/slma002) and SLMA004 (www.ti.com/lit/slma004).
9. Size of metal pad may vary due to creepage requirement.

SOLDER PASTE EXAMPLE
EXPOSED PAD
100% PRINTED SOLDER COVERAGE BY AREA
SCALE:8X

STENCIL THICKNESS	SOLDER STENCIL OPENING
0.1	4.36 X 6.71
0.125	3.90 X 6.00 (SHOWN)
0.15	3.56 X 5.48
0.175	3.30 X 5.07

4229179/A 11/2022

NOTES: (continued)

10. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
11. Board assembly site may have different recommendations for stencil design.

重要声明和免责声明
