

# TDA2Ex SoC for Advanced Driver Assistance Systems (ADAS)

## 17mm Package (CBD Package)

### 1 Device Overview

#### 1.1 Features

- Architecture designed for ADAS applications
- Video, image, and graphics processing support
  - Full-HD video (1920 × 1080p, 60 fps)
  - Multiple video input and video output
- Arm® Cortex®-A15 microprocessor subsystem
- C66x floating-point VLIW DSP
  - Fully object-code compatible with C67x and C64x+
  - Up to thirty-two 16 × 16-bit fixed-point multiplies per cycle
- Up to 512KB of on-chip L3 RAM
- Level 3 (L3) and Level 4 (L4) interconnects
- DDR3/DDR3L Memory Interface (EMIF) module
  - Supports up to DDR-1333 (667 MHz)
  - Up to 2GB across single chip select
- Dual Arm® Cortex®-M4 Image Processing Units (IPU)
- IVA-HD subsystem
- Display subsystem
  - Display controller With DMA engine and up to three pipelines
  - HDMI™ encoder: HDMI 1.4a and DVI 1.0 compliant
- Single-core PowerVR™ SGX544 3D GPU
- 2D-graphics accelerator (BB2D) subsystem
  - Vivante® GC320 core
- Video Processing Engine (VPE)
- One Video Input Port (VIP) module
  - Support for up to four multiplexed input ports
- General-Purpose Memory Controller (GPMC)
- Enhanced Direct Memory Access (EDMA) controller
- 2-port gigabit ethernet (GMAC)
  - Up to two external ports
- Sixteen 32-bit general-purpose timers
- 32-Bit MPU watchdog timer
- Six high-speed inter-integrated circuit (I<sup>2</sup>C) ports
- Ten configurable UART/IrDA/CIR modules
- Four Multichannel Serial Peripheral Interfaces (McSPI)
- Quad SPI Interface (QSPI)
- Eight Multichannel Audio Serial Port (McASP) modules
- SuperSpeed USB 3.0 dual-role device
- High-speed USB 2.0 dual-role device
- High-speed USB 2.0 on-the-go
- Four MultiMedia Card/Secure Digital/Secure Digital Input Output Interfaces (MMC™/ SD®/SDIO)
- PCI Express® 3.0 port with integrated PHY
  - One 2-lane Gen2-compliant port
  - or Two 1-lane Gen2-compliant ports
- Dual Controller Area Network (DCAN) modules
  - CAN 2.0B protocol
- MIPI® CSI-2 camera serial interface
- Up to 186 General-Purpose I/O (GPIO) pins
- Device security features
  - Hardware crypto accelerators and DMA
  - Firewalls
  - JTAG lock
  - Secure keys
  - Secure ROM and boot
  - Customer programmable keys
- Power, reset, and clock management
- On-chip debug with CTools technology
- 28-nm CMOS technology
- 17 mm × 17 mm, 0.65-mm pitch, 538-pin BGA (CBD)

An IMPORTANT NOTICE at the end of this data sheet addresses availability, warranty, changes, use in safety-critical applications, intellectual property matters and other important disclaimers. PRODUCTION DATA.

## 1.2 Applications

- LVDS or ethernet surround view
  - 3D surround view
  - Rear object detection
  - Parking assist
  - Pedestrian detection
  - Lane tracking
  - Drive recording
- Sensor Fusion – vision, radar, ultrasonic, lidar sensors
  - Object data fusion
  - Raw data fusion

## 1.3 Description

TI's new TDA2Ex System-on-Chip (SoC) is a highly optimized and scalable family of devices designed to meet the requirements of leading Advanced Driver Assistance Systems (ADAS). The TDA2Ex family enables broad ADAS applications in today's automobile by integrating an optimal mix of performance, low power, and ADAS vision analytics processing that aims to facilitate a more autonomous and collision-free driving experience.

The TDA2Ex SoC enables sophisticated embedded vision technology in today's automobile by enabling a broad range of ADAS applications including park assist, surround view and sensor fusion on a single architecture.

The TDA2Ex SoC incorporates a heterogeneous, scalable architecture that includes a mix of TI's fixed and floating-point TMS320C66x digital signal processor (DSP) generation core, Arm Cortex-A15 MPCore™ and dual-Cortex-M4 processors. The integration of a video accelerator for decoding multiple video streams over an Ethernet AVB network, along with graphics accelerator for rendering virtual views, enable a 3D viewing experience. The TDA2Ex SoC also integrates a host of peripherals including multicamera interfaces (both parallel and serial, including CSI-2) to enable Ethernet or LVDS-based surround view systems, displays and GigB Ethernet AVB.

Additionally, TI provides a complete set of development tools for the Arm and DSP, including C compilers, a DSP assembly optimizer to simplify programming and scheduling, and a debugging interface for visibility into source code execution.

Cryptographic acceleration is available in all devices. All other supported security features, including support for secure boot, debug security and support for trusted execution environment are available on High-Security (HS) devices. For more information about HS devices, contact your TI representative.

The TDA2Ex ADAS processor is qualified according to the AEC-Q100 standard.

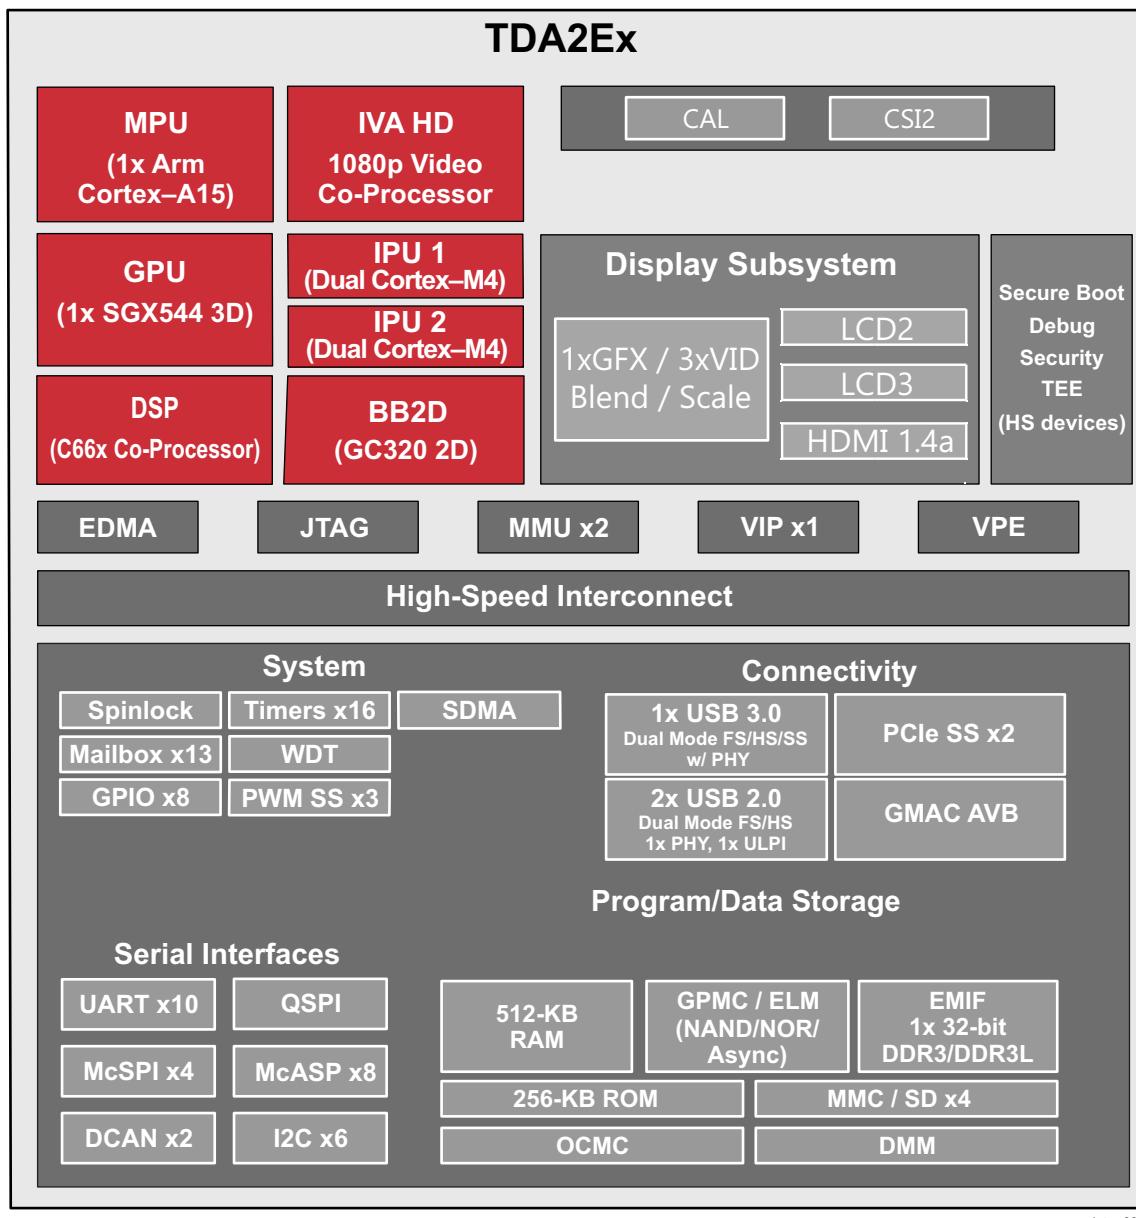

**Device Information<sup>(1)</sup>**

PART NUMBER	PACKAGE	BODY SIZE
TDA2EG-17CBD	FCBGA (538)	17.0 mm x 17.0 mm

## 2 Revision History

---

Changes from May 16, 2019 to November 15, 2019 (from F Revision (May 2019) to G Revision)	Page
• Added reminders to disable unused pulls and RX pads in <a href="#">Section 4.2, Pin Attributes</a> .....	<a href="#">9</a>

### 3 Device Comparison

Table 3-1 shows a comparison between devices, highlighting the differences.

**Table 3-1. Device Comparison<sup>(3)</sup>**

FEATURES		DEVICE
		TDA2EGx
<b>Features</b>		
CTRL_WKUP_STD_FUSE_DIE_ID_2 [31:24] Base PN register bitfield value <sup>(2)(3)</sup>		20 (0x14)
<b>Processors/Accelerators</b>		
Speed Grades		H, D
Arm Single Cortex-A15 Microprocessor (MPU) Subsystem	MPU core 0	Yes
C66x VLIW DSP	DSP1	Yes
BitBLT 2D Hardware Acceleration Engine (BB2D)	BB2D	Yes
Display Subsystem	VOUT1	No
	VOUT2	Yes
	VOUT3	Yes
	HDMI	Yes
Dual Arm Cortex-M4 Image Processing Unit (IPU)	IPU1	Yes
	IPU2 <sup>(1)</sup>	Yes
Image Video Accelerator (IVA)	IVA	Yes
SGX544 Single-Core 3D Graphics Processing Unit (GPU)	GPU	Yes
Video Input Port (VIP)	VIP1	
	vin1a	Yes
	vin1b	Yes
	vin2a	Yes
	vin2b	Yes
Video Processing Engine (VPE)	VPE	Yes
<b>Program/Data Storage</b>		
On-Chip Shared Memory (RAM)	OCMC_RAM1	512KB
General-Purpose Memory Controller (GPMC)	GPMC	Yes
DDR3/DDR3L Memory Controller	EMIF1	up to 2GB
	SECDED/ECC	No
Dynamic Memory Manager (DMM)	DMM	Yes
<b>Peripherals</b>		
Controller Area Network (DCAN) Interface	DCAN1	Yes
	DCAN2	Yes
Enhanced DMA (EDMA)	EDMA	Yes
System DMA (DMA_SYSTEM)	DMA_SYSTEM	Yes
Ethernet Subsystem (Ethernet SS)	GMAC_SW[0]	MII, RMII, or RGMII
	GMAC_SW[1]	MII, RMII, or RGMII
General-Purpose I/O (GPIO)	GPIO	Up to 186
Inter-Integrated Circuit Interface (I <sup>2</sup> C)	I2C	6
System Mailbox Module	MAILBOX	13
Camera Adaptation Layer (CAL) Camera Serial Interface 2 (CSI2)	CSI2_0	1 CLK + 2 Data
	CSI2_1	No

**Table 3-1. Device Comparison<sup>(3)</sup> (continued)**

FEATURES	DEVICE	
	TDA2EGx	
Multichannel Audio Serial Port (McASP)	McASP1	16 serializers
	McASP2	16 serializers
	McASP3	4 serializers
	McASP4	4 serializers
	McASP5	4 serializers
	McASP6	4 serializers
	McASP7	4 serializers
	McASP8	2 serializers
MultiMedia Card/Secure Digital/Secure Digital Input Output Interface (MMC/SD/SDIO)	MMC1	1x UHSI 4b
	MMC2	1x eMMC™ 8b
	MMC3	1x SDIO 8b
	MMC4	1x SDIO 4b
PCI Express 3.0 Port with Integrated PHY	PCIe_SS1	Up to two lanes (second lane shared with PCIe_SS2 and USB1)
	PCIe_SS2	Single lane (shared with PCIe_SS1 and USB1)
Serial Advanced Technology Attachment (SATA)	SATA	No
Real-Time Clock Subsystem (RTCSS)	RTCSS	No
Multichannel Serial Peripheral Interface (McSPI)	McSPI	4
Quad SPI (QSPI)	QSPI	Yes
Spinlock Module	SPINLOCK	Yes
Timers, General-Purpose	TIMERS GP	16
Timer, Watchdog	WD TIMER	Yes
Pulse-Width Modulation Subsystem (PWMSS)	PWMSS1	Yes
	PWMSS2	Yes
	PWMSS3	Yes
Universal Asynchronous Receiver/Transmitter (UART)	UART	10
Universal Serial Bus (USB3.0)	USB1 (Super-Speed, Dual-Role-Device [DRD])	Yes
Universal Serial Bus (USB2.0)	USB2 (High-Speed, Dual-Role-Device [DRD], with embedded HS PHY)	Yes
	USB3 (High-Speed, OTG2.0, with ULPI)	Yes
	USB4 (High-Speed, OTG2.0, with ULPI)	No

(1) IPU2 subsystem is dedicated to IVA support and is not available for other processing.

(2) For more details about the CTRL\_WKUP\_STD\_FUSE\_DIE\_ID\_2 register and Base PN bitfield, see the device TRM.

(3) X777 base part number with X speed grade indicator is the part number for the superset device. Software should constrain the features and speed used to match the intended production device. The Base PN register bitfield value is 0x4F.

### 3.1 Related Products

#### Automotive Processors

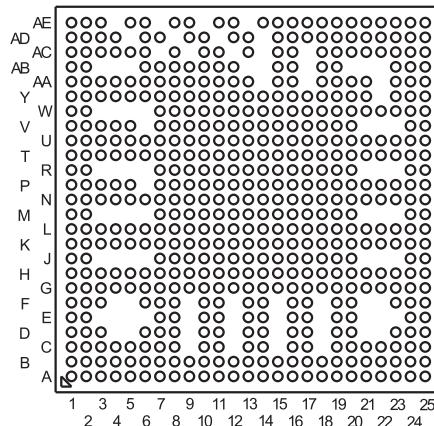

**TDAx ADAS SoCs** TI's TDAx Driver Assistance System-on-Chip (SoC) family offers scalable and open solutions and a common hardware and software architecture for Advanced Driver Assistance Systems (ADAS) applications including camera-based front (mono and stereo), rear, surround view and night vision systems, and mid- and long-range radar and sensor fusion systems.

**Companion Products for TDA2** Review products that are frequently purchased or used in conjunction with this product.

## 4 Terminal Configuration and Functions

### 4.1 Pin Diagram

Figure 4-1 shows the ball locations for the 538 plastic ball grid array (PBGA) package and is used in conjunction with Table 4-1 through Table 4-26 to locate signal names and ball grid numbers.

**Figure 4-1. CBD S-PBGA-N538 Package (Bottom View)**

#### NOTE

The following bottom balls are not pinned out: AE4 / AE7 / AE10 / AE13 / AD5 / AD8 / AD11 / AD14 / AC7 / AC9 / AC12 / AC14 / AC17 / AB3 / AB4 / AB5 / AB13 / AB14 / AB17 / AB20 / AB21 / AB22 / AA14 / AA17 / AA22 / Y22 / W3 / W4 / W5 / W6 / V6 / V21 / V22 / V23 / R3 / R4 / R5 / R6 / R21 / R22 / R23 / P6 / M3 / M4 / M5 / M6 / M21 / M22 / M23 / J3 / J4 / J5 / J6 / J21 / J22 / J23 / F4 / F5 / F9 / F12 / F15 / F18 / F21 / F22 / E3 / E4 / E5 / E6 / E9 / E12 / E15 / E18 / E21 / E22 / E23 / D4 / D5 / D9 / D12 / D15 / D18 / D21 / D22 / C9 / C12 / C15 / C18.

These balls do not exist on the package.

### 4.2 Pin Attributes

Table 4-1 describes the terminal characteristics and the signals multiplexed on each ball. The following list describes the table column headers:

1. **BALL NUMBER:** This column lists ball numbers on the bottom side associated with each signal on the bottom.
2. **BALL NAME:** This column lists mechanical name from package device (name is taken from muxmode 0).
3. **SIGNAL NAME:** This column lists names of signals multiplexed on each ball (also notice that the name of the ball is the signal name in muxmode 0).

#### NOTE

Table 4-1 does not take into account the subsystem multiplexing signals. Subsystem multiplexing signals are described in [Section 4.3, Signal Descriptions](#).

#### NOTE

In driver off mode, the buffer is configured in high-impedance.

**NOTE**

In some cases [Table 4-1](#) may present more than one signal name per muxmode for the same ball. First signal in the list is the dominant function as selected via `CTRL_CORE_PAD_*` register.

All other signals are virtual functions that present alternate multiplexing options. This virtual functions are controlled via `CTRL_CORE_ALT_SELECT_MUX` or `CTRL_CORE_VIP_MUX_SELECT` register. For more information on how to use this options, please refer to Device TRM, Chapter *Control Module*, Section *Pad Configuration Registers*.

**4. MUXMODE:** Multiplexing mode number:

- a. MUXMODE 0 is the primary mode; this means that when `MUXMODE=0` is set, the function mapped on the pin corresponds to the name of the pin. The primary muxmode is not necessarily the default muxmode.

**NOTE**

The default mode is the mode at the release of the reset; also see the `RESET REL.` `MUXMODE` column.

- b. MUXMODE 1 through 15 are possible muxmodes for alternate functions. On each pin, some muxmodes are effectively used for alternate functions, while some muxmodes are not used. Only MUXMODE values which correspond to defined functions should be used.
- c. An empty box means Not Applicable.

**5. TYPE:** Signal type and direction:

- I = Input
- O = Output
- IO = Input or Output
- D = Open drain
- DS = Differential Signaling
- A = Analog
- PWR = Power
- GND = Ground
- CAP = LDO Capacitor

**NOTE**

The RX buffer within the pad logic should be disabled on all pins that are not being used as an input. For more information, see the *Control Module / Control Module Functional Description / PAD Functional Multiplexing and Configuration* section in the device TRM.

**6. BALL RESET STATE:** The state of the terminal at power-on reset:

- drive 0 (OFF): The buffer drives  $V_{OL}$  (pulldown or pullup resistor not activated)
- drive 1 (OFF): The buffer drives  $V_{OH}$  (pulldown or pullup resistor not activated)
- OFF: High-impedance
- PD: High-impedance with an active pulldown resistor
- PU: High-impedance with an active pullup resistor
- An empty box means Not Applicable

**NOTE**

Designs that contain pullup or pulldown resistors, either on the board or in attached devices that oppose internal pullup or pulldown resistors, that are active while the device is held in reset, must not remain in reset for long periods of time.

**7. BALL RESET REL. STATE:** The state of the terminal at the deactivation of the `rstoutn` signal (also

mapped to the PRCM SYS\_WARM\_OUT\_RST signal)

- drive 0 (OFF): The buffer drives V<sub>OL</sub> (pulldown or pullup resistor not activated)
- drive clk (OFF): The buffer drives a toggling clock (pulldown or pullup resistor not activated)
- drive 1 (OFF): The buffer drives V<sub>OH</sub> (pulldown or pullup resistor not activated)
- OFF: High-impedance
- PD: High-impedance with an active pulldown resistor
- PU: High-impedance with an active pullup resistor
- An empty box means Not Applicable

#### NOTE

For more information on the CORE\_PWRON\_RET\_RST reset signal and its reset sources, see the Power, Reset, and Clock Management / PRCM Reset Management Functional Description section of the Device TRM.

8. **BALL RESET REL. MUXMODE:** This muxmode is automatically configured at the release of the rstoutn signal (also mapped to the PRCM SYS\_WARM\_OUT\_RST signal).

An empty box means Not Applicable.

9. **IO VOLTAGE VALUE:** This column describes the IO voltage value (the corresponding power supply). An empty box means Not Applicable.

10. **POWER:** The voltage supply that powers the terminal IO buffers.

An empty box means Not Applicable.

11. **HYS:** Indicates if the input buffer is with hysteresis:

- Yes: With hysteresis
- No: Without hysteresis
- An empty box: Not Applicable

#### NOTE

For more information, see the hysteresis values in [Section 5.7, Electrical Characteristics](#).

12. **BUFFER TYPE:** Drive strength of the associated output buffer.

An empty box means Not Applicable.

#### NOTE

For programmable buffer strength:

- The default value is given in [Table 4-1](#).
- A note describes all possible values according to the selected muxmode.

13. **PULLUP / PULLDOWN TYPE:** Denotes the presence of an internal pullup or pulldown resistor.

Pullup and pulldown resistors can be enabled or disabled via software.

- PU: Internal pullup
- PD: Internal pulldown
- PU/PD: Internal pullup and pulldown
- PUx/PDy: Programmable internal pullup and pulldown
- PDy: Programmable internal pulldown
- An empty box means No pull

#### NOTE

Internal pullup or pulldown resistors must be disabled when opposed by an external pullup or pulldown resistor on the board or within an attached device.

14. **DSIS:** The deselected input state (DSIS) indicates the state driven on the peripheral input (logic "0" or logic "1") when the peripheral pin function is not selected by any of the PINCNTLx registers.

- 0: Logic 0 driven on the peripheral's input signal port.
  - 1: Logic 1 driven on the peripheral's input signal port.
  - blank: Pin state driven on the peripheral's input signal port.
- 

**NOTE**

Configuring two pins to the same input signal is not supported as it can yield unexpected results. This can be easily prevented with the proper software configuration (Hi-Z mode is not an input signal).

---

---

**NOTE**

When a pad is set into a multiplexing mode which is not defined by pin multiplexing, that pad's behavior is undefined. This should be avoided.

---

---

**NOTE**

Some of the EMIF1 signals have an additional state change at the release of porz. The state that the signals change to at the release of porz is as follows:

drive 0 (OFF) for: ddr1\_ck, ddr1\_odt[0], ddr1\_rst.

drive 1 (OFF) for: ddr1\_casn, ddr1\_rasn, ddr1\_wen, ddr1\_nck, ddr1\_ba[2:0], ddr1\_a[15:0],  
ddr1\_csn[0], ddr1\_cke, ddr1\_dqm[3:0]

---

---

**NOTE**

Dual rank support is not available on this device, but signal names are retained for consistency with the TDA2xx family of devices

.

- (1) NA in this table stands for Not Applicable.
- (2) For more information on recommended operating conditions, see [Section 5.4, Recommended Operating Conditions](#).
- (3) The pullup or pulldown block strength is equal to: minimum = 50  $\mu$ A, typical = 100  $\mu$ A, maximum = 250  $\mu$ A.
- (4) The output impedance settings of this IO cell are programmable; by default, the value is DS[1:0] = 10, this means 40  $\Omega$ . For more information on DS[1:0] register configuration, see the Device TRM.
- (5) IO drive strength for usb1\_dp, usb1\_dm, usb2\_dp and usb2\_dm: minimum 18.3 mA, maximum 89 mA (for a power supply vdda33v\_usb1 and vdda33v\_usb2 = 3.46 V).
- (6) Minimum PU = 900  $\Omega$ , maximum PU = 3.090 k $\Omega$  and minimum PD = 14.25 k $\Omega$ , maximum PD = 24.8 k $\Omega$ .  
For more information, see chapter 7 of the USB2.0 specification, in particular section Signaling / Device Speed Identification.
- (7) This function will not be supported on some pin-compatible roadmap devices. Pin compatibility can be maintained in the future by not using these GPIO signals.
- (8) In PUx / PDy, x and y = 60 to 200  $\mu$ A.  
The output impedance settings (or drive strengths) of this IO are programmable (34  $\Omega$ , 40  $\Omega$ , 48  $\Omega$ , 60  $\Omega$ , 80  $\Omega$ ) depending on the values of the I[2:0] registers.
- (9) The internal pull resistors for balls A4, E7, D6, C5, D7, C6, A5, B6 are permanently disabled when sysboot15 is set to 0 as described in the section Sysboot Configuration of the Device TRM. If internal pull-up/down resistors are desired on these balls then sysboot15 should be set to 1. If gpmc boot mode is used with SYSBOOT15=0 (not recommended) then external pull-downs should be implemented to keep the address bus at logic-1 value during boot since the gpmc ms-address bits are high-z during boot.
- (10) This signal is valid only for High-Security devices. For more details, see [Section 5.8 VPP Specification for One-Time Programmable \(OTP\) eFUSES](#). For General Purpose devices do not connect any signal, test point, or board trace to this signal.

## 4.3 Signal Descriptions

Many signals are available on multiple pins, according to the software configuration of the pin multiplexing options.

1. **SIGNAL NAME:** The name of the signal passing through the pin.

---

### NOTE

The subsystem multiplexing signals are not described in [Table 4-1](#) and [Table 4-27](#).

2. **DESCRIPTION:** Description of the signal

3. **TYPE:** Signal direction and type:

- I = Input
- O = Output
- IO = Input or output
- D = Open Drain
- DS = Differential
- A = Analog
- PWR = Power
- GND = Ground

4. **BALL:** Associated ball(s) bottom
- 

### NOTE

For more information, see the Control Module / Control Module Register Manual section of the device TRM.

### 4.3.1 VIP

---

### NOTE

For more information, see the Video Input Port (VIP) section of the device TRM.

**Table 4-2. VIP Signal Descriptions**

SIGNAL NAME	DESCRIPTION	TYPE	BALL
<b>Video Input 1</b>			
vin1a_clk0	Video Input 1 Port A Clock input. Input clock for 8-bit 16-bit or 24-bit Port A video capture. Input data is sampled on the CLK0 edge.	I	G3, J24, Y5
vin1a_d0	Video Input 1 Port A Data input	I	AA1, B23, F1, J25
vin1a_d1	Video Input 1 Port A Data input	I	B22, E2, Y3

vin2b_d0	Video Input 2 Port B Data input	I	AA1, D13, A4
vin2b_d1	Video Input 2 Port B Data input	I	C13, Y3, E7
vin2b_d2	Video Input 2 Port B Data input	I	E13, W2, D6
vin2b_d3	Video Input 2 Port B Data input	I	AA3, B13, C5
vin2b_d4	Video Input 2 Port B Data input	I	AA2, F11, B5
vin2b_d5	Video Input 2 Port B Data input	I	E11, Y4, D7
vin2b_d6	Video Input 2 Port B Data input	I	A13, Y1, C6
vin2b_d7	Video Input 2 Port B Data input	I	A12, Y2, A5
vin2b_de1	Video Input 2 Port B Field ID input	I	AA4, B7, H2
vin2b_fld1	Video Input 2 Port B Field ID input	I	B7, H6
vin2b_hsync1	Video Input 2 Port B Horizontal Sync input	I	E8, Y5, B6
vin2b_vsync1	Video Input 2 Port B Vertical Sync input	I	B8, Y6, A6

### 4.3.2 DSS

**Table 4-3. DSS Signal Descriptions**

SIGNAL NAME	DESCRIPTION	TYPE	BALL
<b>DPI Video Output 2</b>			
vout2_clk	Video Output 2 Clock output	O	C7
vout2_d0	Video Output 2 Data output	O	D13
vout2_d1	Video Output 2 Data output	O	C13
vout2_d2	Video Output 2 Data output	O	E13
vout2_d3	Video Output 2 Data output	O	B13
vout2_d4	Video Output 2 Data output	O	F11
vout2_d5	Video Output 2 Data output	O	E11
vout2_d6	Video Output 2 Data output	O	A13
vout2_d7	Video Output 2 Data output	O	A12
vout2_d8	Video Output 2 Data output	O	B12
vout2_d9	Video Output 2 Data output	O	C11
vout2_d10	Video Output 2 Data output	O	D11
vout2_d11	Video Output 2 Data output	O	B11
vout2_d12	Video Output 2 Data output	O	C10
vout2_d13	Video Output 2 Data output	O	D10
vout2_d14	Video Output 2 Data output	O	E10
vout2_d15	Video Output 2 Data output	O	B10
vout2_d16	Video Output 2 Data output	O	A10
vout2_d17	Video Output 2 Data output	O	F10
vout2_d18	Video Output 2 Data output	O	A11
vout2_d19	Video Output 2 Data output	O	A8
vout2_d20	Video Output 2 Data output	O	A9
vout2_d21	Video Output 2 Data output	O	A7
vout2_d22	Video Output 2 Data output	O	B9
vout2_d23	Video Output 2 Data output	O	C8
vout2_de	Video Output 2 Data Enable output	O	B7
vout2_fld	Video Output 2 Field ID output. This signal is not used for embedded sync modes.	O	D8
vout2_hsync	Video Output 2 Horizontal Sync output. This signal is not used for embedded sync modes.	O	E8
vout2_vsync	Video Output 2 Vertical Sync output. This signal is not used for embedded sync modes.	O	B8
<b>DPI Video Output 3</b>			
vout3_clk	Video Output 3 Clock output	O	G3
vout3_d0	Video Output 3 Data output	O	F1
vout3_d1	Video Output 3 Data output	O	E2
vout3_d2	Video Output 3 Data output	O	E1
vout3_d3	Video Output 3 Data output	O	C1
vout3_d4	Video Output 3 Data output	O	D1
vout3_d5	Video Output 3 Data output	O	D2
vout3_d6	Video Output 3 Data output	O	B1
vout3_d7	Video Output 3 Data output	O	B2
vout3_d8	Video Output 3 Data output	O	C2
vout3_d9	Video Output 3 Data output	O	D3
vout3_d10	Video Output 3 Data output	O	A2
vout3_d11	Video Output 3 Data output	O	B3

**Table 4-3. DSS Signal Descriptions (continued)**

SIGNAL NAME	DESCRIPTION	TYPE	BALL
vout3_d12	Video Output 3 Data output	O	C3
vout3_d13	Video Output 3 Data output	O	C4
vout3_d14	Video Output 3 Data output	O	A3
vout3_d15	Video Output 3 Data output	O	B4
vout3_d16	Video Output 3 Data output	O	M1
vout3_d17	Video Output 3 Data output	O	M2
vout3_d18	Video Output 3 Data output	O	L2
vout3_d19	Video Output 3 Data output	O	L1
vout3_d20	Video Output 3 Data output	O	K3
vout3_d21	Video Output 3 Data output	O	K2
vout3_d22	Video Output 3 Data output	O	J1
vout3_d23	Video Output 3 Data output	O	K1
vout3_de	Video Output 3 Data Enable output	O	J2
vout3_fld	Video Output 3 Field ID output. This signal is not used for embedded sync modes.	O	L3
vout3_hsync	Video Output 3 Horizontal Sync output. This signal is not used for embedded sync modes.	O	K4
vout3_vsync	Video Output 3 Vertical Sync output. This signal is not used for embedded sync modes.	O	H1

#### 4.3.3 HDMI

---

**NOTE**

For more information, see the Display Subsystem / Display Subsystem Overview of the device TRM.

---

**Table 4-4. HDMI Signal Descriptions**

SIGNAL NAME	DESCRIPTION	TYPE	BALL
hdmi1_cec	HDMI consumer electronic control	IOD	E25, H23
hdmi1_hpd	HDMI display hot plug detect	IO	E24, H22
hdmi1_ddc_scl	HDMI display data channel clock	IOD	F23
hdmi1_ddc_sda	HDMI display data channel data	IOD	G21
hdmi1_clockx	HDMI clock differential positive or negative	ODS	AE9
hdmi1_clocky	HDMI clock differential positive or negative	ODS	AD10
hdmi1_data2x	HDMI data 2 differential positive or negative	ODS	AE14
hdmi1_data2y	HDMI data 2 differential positive or negative	ODS	AD15
hdmi1_data1x	HDMI data 1 differential positive or negative	ODS	AE12
hdmi1_data1y	HDMI data 1 differential positive or negative	ODS	AD13
hdmi1_data0x	HDMI data 0 differential positive or negative	ODS	AE11
hdmi1_data0y	HDMI data 0 differential positive or negative	ODS	AD12

#### 4.3.4 CSI2

---

**NOTE**

For more information, see the CAL Subsystem / CAL Subsystem Overview of the device TRM.

---

**Table 4-5. CSI 2 Signal Descriptions**

SIGNAL NAME	DESCRIPTION	TYPE	BALL
csi2_0_dx0	Serial data/clock input - line 0 (position 1)	I	AC1
csi2_0_dy0	Serial data/clock input - line 0 (position 1)	I	AB2
csi2_0_dx1	Serial data/clock input - line 1 (position 2)	I	AD1
csi2_0_dy1	Serial data/clock input - line 1 (position 2)	I	AC2
csi2_0_dx2	Serial data/clock input - line 2 (position 3)	I	AE2
csi2_0_dy2	Serial data/clock input - line 2 (position 3)	I	AD2

**4.3.5 EMIF****NOTE**

For more information, see the Memory Subsystem / EMIF Controller section of the device TRM.

**NOTE**

The index number 1 which is part of the EMIF1 signal prefixes (ddr1\_\*) listed in [Table 4-6, EMIF Signal Descriptions](#), column "SIGNAL NAME" not to be confused with DDR1 type of SDRAM memories.

**Table 4-6. EMIF Signal Descriptions**

SIGNAL NAME	DESCRIPTION	TYPE	BALL
ddr1_csn0	EMIF1 Chip Select 0	O	AC19
ddr1_cke	EMIF1 Clock Enable	O	AB18
ddr1_ck	EMIF1 Clock	O	AD21
ddr1_nck	EMIF1 Negative Clock	O	AE21
ddr1_odt0	EMIF1 On-Die Termination for Chip Select 0	O	AD18
ddr1_casn	EMIF1 Column Address Strobe	O	AD16
ddr1_rasn	EMIF1 Row Address Strobe	O	AD17
ddr1_wen	EMIF1 Write Enable	O	AE18
ddr1_RST	EMIF1 Reset output (DDR3-SDRAM only)	O	AE17
ddr1_ba0	EMIF1 Bank Address	O	AE16
ddr1_ba1	EMIF1 Bank Address	O	AA16
ddr1_ba2	EMIF1 Bank Address	O	AB16
ddr1_a0	EMIF1 Address Bus	O	AC18
ddr1_a1	EMIF1 Address Bus	O	AE19
ddr1_a2	EMIF1 Address Bus	O	AD19
ddr1_a3	EMIF1 Address Bus	O	AB19
ddr1_a4	EMIF1 Address Bus	O	AD20
ddr1_a5	EMIF1 Address Bus	O	AE20
ddr1_a6	EMIF1 Address Bus	O	AA18
ddr1_a7	EMIF1 Address Bus	O	AA20
ddr1_a8	EMIF1 Address Bus	O	Y21
ddr1_a9	EMIF1 Address Bus	O	AC20
ddr1_a10	EMIF1 Address Bus	O	AA21
ddr1_a11	EMIF1 Address Bus	O	AC21
ddr1_a12	EMIF1 Address Bus	O	AC22
ddr1_a13	EMIF1 Address Bus	O	AC15

**Table 4-6. EMIF Signal Descriptions (continued)**

SIGNAL NAME	DESCRIPTION	TYPE	BALL
ddr1_a14	EMIF1 Address Bus	O	AB15
ddr1_a15	EMIF1 Address Bus	O	AC16
ddr1_d0	EMIF1 Data Bus	IO	AA23
ddr1_d1	EMIF1 Data Bus	IO	AC24
ddr1_d2	EMIF1 Data Bus	IO	AB24
ddr1_d3	EMIF1 Data Bus	IO	AD24
ddr1_d4	EMIF1 Data Bus	IO	AB23
ddr1_d5	EMIF1 Data Bus	IO	AC23
ddr1_d6	EMIF1 Data Bus	IO	AD23
ddr1_d7	EMIF1 Data Bus	IO	AE24
ddr1_d8	EMIF1 Data Bus	IO	AA24
ddr1_d9	EMIF1 Data Bus	IO	W25
ddr1_d10	EMIF1 Data Bus	IO	Y23
ddr1_d11	EMIF1 Data Bus	IO	AD25
ddr1_d12	EMIF1 Data Bus	IO	AC25
ddr1_d13	EMIF1 Data Bus	IO	AB25
ddr1_d14	EMIF1 Data Bus	IO	AA25
ddr1_d15	EMIF1 Data Bus	IO	W24
ddr1_d16	EMIF1 Data Bus	IO	W23
ddr1_d17	EMIF1 Data Bus	IO	U25
ddr1_d18	EMIF1 Data Bus	IO	U24
ddr1_d19	EMIF1 Data Bus	IO	W21
ddr1_d20	EMIF1 Data Bus	IO	T22
ddr1_d21	EMIF1 Data Bus	IO	U22
ddr1_d22	EMIF1 Data Bus	IO	U23
ddr1_d23	EMIF1 Data Bus	IO	T21
ddr1_d24	EMIF1 Data Bus	IO	T23
ddr1_d25	EMIF1 Data Bus	IO	T25
ddr1_d26	EMIF1 Data Bus	IO	T24
ddr1_d27	EMIF1 Data Bus	IO	P21
ddr1_d28	EMIF1 Data Bus	IO	N21
ddr1_d29	EMIF1 Data Bus	IO	P22
ddr1_d30	EMIF1 Data Bus	IO	P23
ddr1_d31	EMIF1 Data Bus	IO	P24
ddr1_dqm0	EMIF1 Data Mask	O	AE23
ddr1_dqm1	EMIF1 Data Mask	O	W22
ddr1_dqm2	EMIF1 Data Mask	O	U21
ddr1_dqm3	EMIF1 Data Mask	O	P25
ddr1_dqs0	Data strobe 0 input/output for byte 0 of the 32-bit data bus. This signal is output to the EMIF1 memory when writing and input when reading.	IO	AD22
ddr1_dqsn0	Data strobe 0 invert	IO	AE22
ddr1_dqs1	Data strobe 1 input/output for byte 1 of the 32-bit data bus. This signal is output to the EMIF1 memory when writing and input when reading.	IO	Y24
ddr1_dqsn1	Data strobe 1 invert	IO	Y25
ddr1_dqs2	Data strobe 2 input/output for byte 2 of the 32-bit data bus. This signal is output to the EMIF1 memory when writing and input when reading.	IO	V24
ddr1_dqsn2	Data strobe 2 invert	IO	V25

**Table 4-6. EMIF Signal Descriptions (continued)**

SIGNAL NAME	DESCRIPTION	TYPE	BALL
ddr1_dqs3	Data strobe 3 input/output for byte 3 of the 32-bit data bus. This signal is output to the EMIF1 memory when writing and input when reading.	IO	R24
ddr1_dqsn3	Data strobe 3 invert	IO	R25
ddr1_vref0	Reference Power Supply EMIF1	A	Y20

**4.3.6 GPMC****NOTE**

For more information, see the Memory Subsystem / General-Purpose Memory Controller section of the device TRM.

**Table 4-7. GPMC Signal Descriptions**

SIGNAL NAME	DESCRIPTION	TYPE	BALL
gpmc_ad0	GPMC Data 0 in A/D nonmultiplexed mode and additionally Address 1 in A/D multiplexed mode	IO	F1
gpmc_ad1	GPMC Data 1 in A/D nonmultiplexed mode and additionally Address 2 in A/D multiplexed mode	IO	E2
gpmc_ad2	GPMC Data 2 in A/D nonmultiplexed mode and additionally Address 3 in A/D multiplexed mode	IO	E1
gpmc_ad3	GPMC Data 3 in A/D nonmultiplexed mode and additionally Address 4 in A/D multiplexed mode	IO	C1
gpmc_ad4	GPMC Data 4 in A/D nonmultiplexed mode and additionally Address 5 in A/D multiplexed mode	IO	D1
gpmc_ad5	GPMC Data 5 in A/D nonmultiplexed mode and additionally Address 6 in A/D multiplexed mode	IO	D2
gpmc_ad6	GPMC Data 6 in A/D nonmultiplexed mode and additionally Address 7 in A/D multiplexed mode	IO	B1
gpmc_ad7	GPMC Data 7 in A/D nonmultiplexed mode and additionally Address 8 in A/D multiplexed mode	IO	B2
gpmc_ad8	GPMC Data 8 in A/D nonmultiplexed mode and additionally Address 9 in A/D multiplexed mode	IO	C2
gpmc_ad9	GPMC Data 9 in A/D nonmultiplexed mode and additionally Address 10 in A/D multiplexed mode	IO	D3
gpmc_ad10	GPMC Data 10 in A/D nonmultiplexed mode and additionally Address 11 in A/D multiplexed mode	IO	A2
gpmc_ad11	GPMC Data 11 in A/D nonmultiplexed mode and additionally Address 12 in A/D multiplexed mode	IO	B3
gpmc_ad12	GPMC Data 12 in A/D nonmultiplexed mode and additionally Address 13 in A/D multiplexed mode	IO	C3
gpmc_ad13	GPMC Data 13 in A/D nonmultiplexed mode and additionally Address 14 in A/D multiplexed mode	IO	C4
gpmc_ad14	GPMC Data 14 in A/D nonmultiplexed mode and additionally Address 15 in A/D multiplexed mode	IO	A3
gpmc_ad15	GPMC Data 15 in A/D nonmultiplexed mode and additionally Address 16 in A/D multiplexed mode	IO	B4
gpmc_a0	GPMC Address 0. Only used to effectively address 8-bit data nonmultiplexed memories	O	G1, M1
gpmc_a1	GPMC address 1 in A/D nonmultiplexed mode and Address 17 in A/D multiplexed mode	O	G3, M2
gpmc_a2	GPMC address 2 in A/D nonmultiplexed mode and Address 18 in A/D multiplexed mode	O	H5, L2
gpmc_a3	GPMC address 3 in A/D nonmultiplexed mode and Address 19 in A/D multiplexed mode	O	H6, L1

**Table 4-7. GPMC Signal Descriptions (continued)**

SIGNAL NAME	DESCRIPTION	TYPE	BALL
gpmc_a4	GPMC address 4 in A/D nonmultiplexed mode and Address 20 in A/D multiplexed mode	O	K3
gpmc_a5	GPMC address 5 in A/D nonmultiplexed mode and Address 21 in A/D multiplexed mode	O	K2
gpmc_a6	GPMC address 6 in A/D nonmultiplexed mode and Address 22 in A/D multiplexed mode	O	J1
gpmc_a7	GPMC address 7 in A/D nonmultiplexed mode and Address 23 in A/D multiplexed mode	O	K1
gpmc_a8	GPMC address 8 in A/D nonmultiplexed mode and Address 24 in A/D multiplexed mode	O	K4
gpmc_a9	GPMC address 9 in A/D nonmultiplexed mode and Address 25 in A/D multiplexed mode	O	H1
gpmc_a10	GPMC address 10 in A/D nonmultiplexed mode and Address 26 in A/D multiplexed mode	O	J2
gpmc_a11	GPMC address 11 in A/D nonmultiplexed mode and unused in A/D multiplexed mode	O	L3
gpmc_a12	GPMC address 12 in A/D nonmultiplexed mode and unused in A/D multiplexed mode	O	G1
gpmc_a13	GPMC address 13 in A/D nonmultiplexed mode and unused in A/D multiplexed mode	O	A4, H3, G4
gpmc_a14	GPMC address 14 in A/D nonmultiplexed mode and unused in A/D multiplexed mode	O	E7, H4, G3
gpmc_a15	GPMC address 15 in A/D nonmultiplexed mode and unused in A/D multiplexed mode	O	D6, K6, F6
gpmc_a16	GPMC address 16 in A/D nonmultiplexed mode and unused in A/D multiplexed mode	O	C5, K5, M1
gpmc_a17	GPMC address 17 in A/D nonmultiplexed mode and unused in A/D multiplexed mode	O	B5, G2, D8
gpmc_a18	GPMC address 18 in A/D nonmultiplexed mode and unused in A/D multiplexed mode	O	D7, F2, C7
gpmc_a19	GPMC address 19 in A/D nonmultiplexed mode and unused in A/D multiplexed mode	O	A4 <sup>(3)</sup> , C6, H5
gpmc_a20	GPMC address 20 in A/D nonmultiplexed mode and unused in A/D multiplexed mode	O	A5, E7 <sup>(3)</sup> , L4
gpmc_a21	GPMC address 21 in A/D nonmultiplexed mode and unused in A/D multiplexed mode	O	B6, D6 <sup>(3)</sup> , H2
gpmc_a22	GPMC address 22 in A/D nonmultiplexed mode and unused in A/D multiplexed mode	O	A6, C5 <sup>(3)</sup> , H6
gpmc_a23	GPMC address 23 in A/D nonmultiplexed mode and unused in A/D multiplexed mode	O	B5, H5, C10, G4
gpmc_a24	GPMC address 24 in A/D nonmultiplexed mode and unused in A/D multiplexed mode	O	D7 <sup>(3)</sup> , D10, G3
gpmc_a25	GPMC address 25 in A/D nonmultiplexed mode and unused in A/D multiplexed mode	O	C6 <sup>(3)</sup> , F6, E10
gpmc_a26	GPMC address 26 in A/D nonmultiplexed mode and unused in A/D multiplexed mode	O	A5 <sup>(3)</sup> , M1, B10
gpmc_a27	GPMC address 27 in A/D nonmultiplexed mode and Address 27 in A/D multiplexed mode	O	B6 <sup>(3)</sup> , D8, C7, E8
gpmc_cs0	GPMC Chip Select 0 (active low)	O	F3
gpmc_cs1	GPMC Chip Select 1 (active low)	O	A6
gpmc_cs2	GPMC Chip Select 2 (active low)	O	G4
gpmc_cs3	GPMC Chip Select 3 (active low)	O	G3
gpmc_cs4	GPMC Chip Select 4 (active low)	O	H2
gpmc_cs5	GPMC Chip Select 5 (active low)	O	H6
gpmc_cs6	GPMC Chip Select 6 (active low)	O	H5

**Table 4-7. GPMC Signal Descriptions (continued)**

SIGNAL NAME	DESCRIPTION	TYPE	BALL
gpmc_cs7	GPMC Chip Select 7 (active low)	O	L4
gpmc_clk <sup>(1)(2)</sup>	GPMC Clock output	IO	L4
gpmc_advn_ale	GPMC address valid active low or address latch enable	O	H5
gpmc_oen_ren	GPMC output enable active low or read enable	O	G5
gpmc_wen	GPMC write enable active low	O	G6
gpmc_beno	GPMC lower-byte enable active low	O	H2
gpmc_ben1	GPMC upper-byte enable active low	O	H6
gpmc_wait0	GPMC external indication of wait 0	I	F6
gpmc_wait1	GPMC external indication of wait 1	I	H5, L4

- (1) This clock signal is implemented as 'pad loopback' inside the device - the output signal is looped back through the input buffer to serve as the internal reference signal. Series termination is recommended (as close to device pin as possible) to improve signal integrity of the clock input. Any nonmonotonicity in voltage that occurs at the pad loopback clock pin between  $V_{IH}$  and  $V_{IL}$  must be less than  $V_{HYS}$ .
- (2) The gpio6\_16.clkout1 signal can be used as an "always-on" alternative to gpmc\_clk provided that the external device can support the associated timing. See [Table 5-47 GPMC/NOR Flash Interface Switching Characteristics - Synchronous Mode - Default](#) and [Table 5-49 GPMC/NOR Flash Interface Switching Characteristics - Synchronous Mode - Alternate](#) for timing information.
- (3) The internal pull resistors for balls A4, E7, D6, C5, D7, C6, A5, B6 are permanently disabled when sysboot15 is set to 0 as described in the section Sysboot Configuration of the Device TRM. If internal pull-up/down resistors are desired on these balls then sysboot15 should be set to 1. If gpmc boot mode is used with SYSBOOT15=0 (not recommended) then external pull-downs should be implemented to keep the address bus at logic-1 value during boot since the gpmc ms-address bits are high-z during boot.

#### 4.3.7 Timers

---

**NOTE**

For more information, see the Timers section of the device TRM.

---

**Table 4-8. Timers Signal Descriptions**

SIGNAL NAME	DESCRIPTION	TYPE	BALL
timer1	PWM output/event trigger input	IO	H21, H6
timer2	PWM output/event trigger input	IO	H2, K22
timer3	PWM output/event trigger input	IO	H5, K23
timer4	PWM output/event trigger input	IO	A16, L4
timer5	PWM output/event trigger input	IO	A18, K6
timer6	PWM output/event trigger input	IO	B17, H4
timer7	PWM output/event trigger input	IO	B16, H3
timer8	PWM output/event trigger input	IO	B18, G1
timer9	PWM output/event trigger input	IO	A19, L3
timer10	PWM output/event trigger input	IO	E17, J2
timer11	PWM output/event trigger input	IO	E16, H1
timer12	PWM output/event trigger input	IO	F16, K4
timer13	PWM output/event trigger input	IO	J25
timer14	PWM output/event trigger input	IO	J24
timer15	PWM output/event trigger input	IO	AA6, H24
timer16	PWM output/event trigger input	IO	AD3, H25

### 4.3.8 I<sup>2</sup>C

---

#### NOTE

For more information, see the Serial Communication Interface / Multimaster High-Speed I<sup>2</sup>C Controller / HS I<sup>2</sup>C Environment / HS I<sup>2</sup>C in I<sup>2</sup>C Mode section of the device TRM.

---

#### NOTE

I<sup>2</sup>C1 and I<sup>2</sup>C2 do NOT support HS-mode.

---

**Table 4-9. I<sup>2</sup>C Signal Descriptions**

SIGNAL NAME	DESCRIPTION	TYPE	BALL
<b>Inter-Integrated Circuit Interface 1 (I<sup>2</sup>C1)</b>			
i2c1_scl	I <sup>2</sup> C1 Clock	IOD	G22
i2c1_sda	I <sup>2</sup> C1 Data	IOD	G23
<b>Inter-Integrated Circuit Interface 2 (I<sup>2</sup>C2)</b>			
i2c2_scl	I <sup>2</sup> C2 Clock	IOD	G21
i2c2_sda	I <sup>2</sup> C2 Data	IOD	F23
<b>Inter-Integrated Circuit Interface 3 (I<sup>2</sup>C3)</b>			
i2c3_scl	I <sup>2</sup> C3 Clock	IOD	C17, K22, L4, Y6

i2c4_sda	I <sup>2</sup> C4 Data	IOD	C23, D16, M2, U5
<b>Inter-Integrated Circuit Interface 5 (I<sup>2</sup>C5)</b>			
i2c5_scl	I <sup>2</sup> C5 Clock	IOD	B14, K3, U6
i2c5_sda	I <sup>2</sup> C5 Data	IOD	AC3, D14, K2
<b>Inter-Integrated Circuit Interface 6 (I<sup>2</sup>C6)</b>			
i2c6_scl	I <sup>2</sup> C6 Clock	IOD	A24
i2c6_sda	I <sup>2</sup> C6 Data	IOD	D23

### 4.3.9 UART

---

#### NOTE

For more information about UART booting, see the Initialization / Device Initialization by ROM Code / Peripheral Booting / Initialization Phase for UART Boot section of the device TRM.

---

**Table 4-10. UART Signal Descriptions**

SIGNAL NAME	DESCRIPTION	TYPE	BALL
<b>Universal Asynchronous Receiver/Transmitter 1 (UART1)</b>			
uart1_dcdn	UART1 Data Carrier Detect active low	I	N23
uart1_dsrn	UART1 Data Set Ready Active Low	I	N25
uart1_dtrn	UART1 Data Terminal Ready Active Low	O	N22
uart1_rin	UART1 Ring Indicator	I	N24
uart1_rxd	UART1 Receive Data	I	L25
uart1_txd	UART1 Transmit Data	O	M25
uart1_ctsn	UART1 clear to send active low	I	L20
uart1_rtsn	UART1 request to send active low	O	M24

**Table 4-10. UART Signal Descriptions (continued)**

SIGNAL NAME	DESCRIPTION	TYPE	BALL
<b>Universal Asynchronous Receiver/Transmitter 2 (UART2)</b>			
uart2_rxd	UART2 Receive Data	I	N23
uart2_txd	UART2 Transmit Data	O	N25
uart2_ctsn	UART2 clear to send active low	I	N22
uart2_rtsn	UART2 request to send active low	O	N24
<b>Universal Asynchronous Receiver/Transmitter 3 (UART3)/IrDA</b>			
uart3_rxd	UART3 Receive Data	I	AA5, G25, N22, N5
uart3_txd	UART3 Transmit Data	O	AC4, F25, N24, N6
uart3_ctsn	UART3 clear to send active low	I	G24, L6, N23, T4
uart3_rtsn	UART3 request to send active low	O	F24, L5, N25, T5
uart3_rctx	Remote control data	O	N23
uart3_sd	Infrared transceiver configure/shutdown	O	N25
uart3_irtx	Infrared data output	O	N24
<b>Universal Asynchronous Receiver/Transmitter 4 (UART4)</b>			
uart4_rxd	UART4 Receive Data	I	A24, E24, P4
uart4_txd	UART4 Transmit Data	O	D23, E25, P3
uart4_ctsn	UART4 clear to send active low	I	R2
uart4_rtsn	UART4 request to send active low	O	R1
<b>Universal Asynchronous Receiver/Transmitter 5 (UART5)</b>			
uart5_rxd	UART5 Receive Data	I	B22, G24, M1, Y4
uart5_txd	UART5 Transmit Data	O	AA2, B23, F24, M2
uart5_ctsn	UART5 clear to send active low	I	AA3, L2
uart5_rtsn	UART5 request to send active low	O	L1, W2
<b>Universal Asynchronous Receiver/Transmitter 6 (UART6)</b>			
uart6_rxd	UART6 Receive Data	I	D14, K3, U5
uart6_txd	UART6 Transmit Data	O	B14, K2, V5
uart6_ctsn	UART6 clear to send active low	I	C14, J1
uart6_rtsn	UART6 request to send active low	O	B15, K1
<b>Universal Asynchronous Receiver/Transmitter 7 (UART7)</b>			
uart7_rxd	UART7 Receive Data	I	A22, L2
uart7_txd	UART7 Transmit Data	O	A23, L1
uart7_ctsn	UART7 clear to send active low	I	B22
uart7_rtsn	UART7 request to send active low	O	B23
<b>Universal Asynchronous Receiver/Transmitter 8 (UART8)</b>			
uart8_rxd	UART8 Receive Data	I	C23, H22, J1
uart8_txd	UART8 Transmit Data	O	B25, H23, K1
uart8_ctsn	UART8 clear to send active low	I	A24
uart8_rtsn	UART8 request to send active low	O	D23
<b>Universal Asynchronous Receiver/Transmitter 9 (UART9)</b>			
uart9_rxd	UART9 Receive Data	I	AC3, E8, L20
uart9_txd	UART9 Transmit Data	O	B8, M24, U6
uart9_ctsn	UART9 clear to send active low	I	AA5, C8
uart9_rtsn	UART9 request to send active low	O	AC4, B9
<b>Universal Asynchronous Receiver/Transmitter 10 (UART10)</b>			
uart10_rxd	UART10 Receive Data	I	A7, H21, N22, Y3
uart10_txd	UART10 Transmit Data	O	A9, AA1, K22, N24
uart10_ctsn	UART10 clear to send active low	I	A8, AA4

**Table 4-10. UART Signal Descriptions (continued)**

SIGNAL NAME	DESCRIPTION	TYPE	BALL
uart10_rtsn	UART10 request to send active low	O	A11, AB1

#### 4.3.10 McSPI

**NOTE**

For more information, see the Serial Communication Interface / Multichannel Serial Peripheral Interface (McSPI) section of the device TRM.

**Table 4-11. SPI Signal Descriptions**

SIGNAL NAME	DESCRIPTION	TYPE	BALL
<b>Serial Peripheral Interface 1</b>			
spi1_sclk <sup>(1)</sup>	SPI1 Clock	IO	C24
spi1_d1	SPI1 Data. Can be configured as either MISO or MOSI.	IO	D24
spi1_d0	SPI1 Data. Can be configured as either MISO or MOSI.	IO	D25
spi1_cs0	SPI1 Chip Select	IO	B24
spi1_cs1	SPI1 Chip Select	IO	C25
spi1_cs2	SPI1 Chip Select	IO	E24
spi1_cs3	SPI1 Chip Select	IO	E25
<b>Serial Peripheral Interface 2</b>			
spi2_sclk <sup>(1)</sup>	SPI2 Clock	IO	G25
spi2_d1	SPI2 Data. Can be configured as either MISO or MOSI.	IO	F25
spi2_d0	SPI2 Data. Can be configured as either MISO or MOSI.	IO	G24
spi2_cs0	SPI2 Chip Select	IO	F24
spi2_cs1	SPI2 Chip Select	IO	C25
spi2_cs2	SPI2 Chip Select	IO	E24
spi2_cs3	SPI2 Chip Select	IO	E25
<b>Serial Peripheral Interface 3</b>			
spi3_sclk <sup>(1)</sup>	SPI3 Clock	IO	A18, C23, N5, Y1
spi3_d1	SPI3 Data. Can be configured as either MISO or MOSI.	IO	B17, B25, N6, Y4
spi3_d0	SPI3 Data. Can be configured as either MISO or MOSI.	IO	A24, AA2, B16, T4
spi3_cs0	SPI3 Chip Select	IO	AA3, B18, D23, T5
spi3_cs1	SPI3 Chip Select	IO	A19, W2
<b>Serial Peripheral Interface 4</b>			
spi4_sclk <sup>(1)</sup>	SPI4 Clock	IO	AC3, E8, K4, P4, Y3
spi4_d1	SPI4 Data. Can be configured as either MISO or MOSI.	IO	AA1, B8, H1, P3, U6
spi4_d0	SPI4 Data. Can be configured as either MISO or MOSI.	IO	AA4, AA5, C8, J2, R2
spi4_cs0	SPI4 Chip Select	IO	AB1, AC4, B9, L3, R1
spi4_cs1	SPI4 Chip Select	IO	G1, N6
spi4_cs2	SPI4 Chip Select	IO	H3, T4
spi4_cs3	SPI4 Chip Select	IO	H4, T5

- (1) This clock signal is implemented as 'pad loopback' inside the device - the output signal is looped back through the input buffer to serve as the internal reference signal. Series termination is recommended (as close to device pin as possible) to improve signal integrity of the clock input. Any nonmonotonicity in voltage that occurs at the pad loopback clock pin between  $V_{IH}$  and  $V_{IL}$  must be less than  $V_{HYS}$ .

#### 4.3.11 QSPI

---

##### NOTE

For more information about UART booting, see the Initialization / Device Initialization by ROM Code / Memory Booting / SPI/QSPI Flash Devices section of the device TRM.

---

**Table 4-12. QSPI Signal Descriptions**

SIGNAL NAME	DESCRIPTION	TYPE	BALL
qspi1_sclk	QSPI1 Serial Clock	IO	F2
qspi1_rtclk	QSPI1 Return Clock Input. Must be connected from QSPI1_SCLK on PCB. Refer to PCB Guidelines for QSPI1	I	H3
qspi1_d0	QSPI1 Data[0]. This pin is output data for all commands/writes and for dual read and quad read modes it becomes input data pin during read phase.	IO	K5
qspi1_d1	QSPI1 Data[1]. Input read data in all modes.	IO	G2
qspi1_d2	QSPI1 Data[2]. This pin is used only in quad read mode as input data pin during read phase	IO	K6
qspi1_d3	QSPI1 Data[3]. This pin is used only in quad read mode as input data pin during read phase	IO	H4
qspi1_cs0	QSPI1 Chip Select[0]. This pin is Used for QSPI1 boot modes.	IO	G4
qspi1_cs1	QSPI1 Chip Select[1]	O	G3
qspi1_cs2	QSPI1 Chip Select[2]	O	L1
qspi1_cs3	QSPI1 Chip Select[3]	O	K3

#### 4.3.12 McASP

---

##### NOTE

For more information, see the Serial Communication Interface / Multichannel Audio Serial Port (McASP) section of the device TRM.

---

**Table 4-13. McASP Signal Descriptions**

SIGNAL NAME	DESCRIPTION	TYPE	BALL
<b>Multichannel Audio Serial Port 1</b>			
mcasp1_axr0	McASP1 Transmit/Receive Data	IO	D14

mmc4_dat3	MMC4 data bit 3	IO	N24

- (1) By default, this clock signal is implemented as 'pad loopback' inside the device - the output signal is looped back through the input buffer to serve as the internal reference signal. mmc1\_clk and mmc2\_clk have an optional software programmable setting to use an 'internal loopback clock' instead of the default 'pad loopback clock'. If the 'pad loopback clock' is used, series termination is recommended (as close to device pin as possible) to improve signal integrity of the clock input. Any nonmonotonicity in voltage that occurs at the pad loopback clock pin between  $V_{IH}$  and  $V_{IL}$  must be less than  $V_{HYS}$ .

#### 4.3.18 GPIO

---

##### NOTE

For more information, see the General-Purpose Interface section of the device TRM.

gpio7_27	General-Purpose Input/Output	IO	N25
gpio7_28	General-Purpose Input/Output	IO	A2
gpio7_29	General-Purpose Input/Output	IO	B3
gpio7_30	General-Purpose Input/Output	IO	C17
gpio7_31	General-Purpose Input/Output	IO	C16
<b>GPIO 8</b>			
gpio8_27	General-Purpose Input	I	L23
gpio8_28	General-Purpose Input/Output	IO	J20
gpio8_29	General-Purpose Input/Output	IO	K25
gpio8_30 <sup>(1)</sup>	General-Purpose Input/Output	IO	C21
gpio8_31 <sup>(1)</sup>	General-Purpose Input/Output	IO	C22

(1) gpio8\_30 is multiplexed with EMU0 and gpio8\_31 is multiplexed with EMU1. These pins will be sampled at reset release by the test and emulation logic. Therefore, if they are used as GPIO pins, they must return to the high state whenever the device enters reset. This can be controlled by logic driven from rstoutn. After the device exits reset (indicated by rstoutn rising), these can return to GPIO mode.

#### 4.3.19 PWM

##### NOTE

For more information, see the Pulse-Width Modulation (PWM) SS section of the device TRM.

**Table 4-20. PWM Signal Descriptions**

SIGNAL NAME	DESCRIPTION	TYPE	BALL
<b>PWMSS1</b>			
eCAP1_in_PWM1_out	ECAP1 Capture Input / PWM Output	IO	A7

eQEP3B_in	EQEP3 Quadrature Input B	I	AA2, C11

#### 4.3.20 Emulation and Debug Subsystem

**NOTE**

For more information, see the On-Chip Debug Support / Debug Ports section of the device TRM.

**Table 4-21. Debug Signal Descriptions**

SIGNAL NAME	DESCRIPTION	TYPE	BALL
tms	JTAG test port mode select. An external pullup resistor should be used on this ball.	IO	L21
tdi	JTAG test data	I	L23
tdo	JTAG test port data	O	J20
tclk	JTAG test clock	I	K21
trstn	JTAG test reset	I	L22
rtck	JTAG return clock	O	K25
emu0 <sup>(1)</sup>	Emulator pin 0	IO	C21
emu1 <sup>(1)</sup>	Emulator pin 1	IO	C22
emu2	Emulator pin 2	IO	E14
emu3	Emulator pin 3	IO	F14
emu4	Emulator pin 4	IO	F13
emu5	Emulator pin 5	O	D8
emu6	Emulator pin 6	O	B7

**Table 4-21. Debug Signal Descriptions (continued)**

SIGNAL NAME	DESCRIPTION	TYPE	BALL
emu7	Emulator pin 7	O	C7
emu8	Emulator pin 8	O	E8
emu9	Emulator pin 9	O	B8
emu10	Emulator pin 10	O	C8
emu11	Emulator pin 11	O	B9
emu12	Emulator pin 12	O	A7
emu13	Emulator pin 13	O	A9
emu14	Emulator pin 14	O	A8
emu15	Emulator pin 15	O	A11
emu16	Emulator pin 16	O	F10
emu17	Emulator pin 17	O	A10
emu18	Emulator pin 18	O	B10
emu19	Emulator pin 19	O	E10

(1) EMU0 and EMU1 are multiplexed with GPIO. These pins will be sampled at reset release by the test and emulation logic. Therefore, if they are used as GPIO pins, they must return to the high state whenever the device enters reset. This can be controlled by logic driven from rstoutn. After the device exits reset (indicated by rstoutn rising), these can return to GPIO mode.

#### 4.3.21 System and Miscellaneous

##### 4.3.21.1 Sysboot

---

**NOTE**

For more information, see the Initialization (ROM Code) section of the device TRM.

---

**Table 4-22. Sysboot Signal Descriptions**

SIGNAL NAME	DESCRIPTION	TYPE	BALL
sysboot0	Boot Mode Configuration 0. The value latched on this pin upon porz reset release will determine the boot mode configuration of the device.	I	F1
sysboot1	Boot Mode Configuration 1. The value latched on this pin upon porz reset release will determine the boot mode configuration of the device.	I	E2
sysboot2	Boot Mode Configuration 2. The value latched on this pin upon porz reset release will determine the boot mode configuration of the device.	I	E1
sysboot3	Boot Mode Configuration 3. The value latched on this pin upon porz reset release will determine the boot mode configuration of the device.	I	C1
sysboot4	Boot Mode Configuration 4. The value latched on this pin upon porz reset release will determine the boot mode configuration of the device.	I	D1
sysboot5	Boot Mode Configuration 5. The value latched on this pin upon porz reset release will determine the boot mode configuration of the device.	I	D2
sysboot6	Boot Mode Configuration 6. The value latched on this pin upon porz reset release will determine the boot mode configuration of the device.	I	B1
sysboot7	Boot Mode Configuration 7. The value latched on this pin upon porz reset release will determine the boot mode configuration of the device.	I	B2
sysboot8	Boot Mode Configuration 8. The value latched on this pin upon porz reset release will determine the boot mode configuration of the device.	I	C2
sysboot9	Boot Mode Configuration 9. The value latched on this pin upon porz reset release will determine the boot mode configuration of the device.	I	D3
sysboot10	Boot Mode Configuration 10. The value latched on this pin upon porz reset release will determine the boot mode configuration of the device.	I	A2
sysboot11	Boot Mode Configuration 11. The value latched on this pin upon porz reset release will determine the boot mode configuration of the device.	I	B3
sysboot12	Boot Mode Configuration 12. The value latched on this pin upon porz reset release will determine the boot mode configuration of the device.	I	C3

**Table 4-22. Sysboot Signal Descriptions (continued)**

SIGNAL NAME	DESCRIPTION	TYPE	BALL
sysboot13	Boot Mode Configuration 13. The value latched on this pin upon porz reset release will determine the boot mode configuration of the device.	I	C4
sysboot14	Boot Mode Configuration 14. The value latched on this pin upon porz reset release will determine the boot mode configuration of the device.	I	A3
sysboot15	Boot Mode Configuration 15. The value latched on this pin upon porz reset release will determine the boot mode configuration of the device.	I	B4

#### 4.3.21.2 Power, Reset, and Clock Management (PRCM)

**NOTE**

For more information, see PRCM section of the device TRM.

**Table 4-23. PRCM Signal Descriptions**

SIGNAL NAME	DESCRIPTION	TYPE	BALL
clkout1	Device Clock output 1. Can be used externally for devices with non-critical timing requirements, or for debug, or as a reference clock on GPMC as described in <a href="#">Table 5-47 GPMC/NOR Flash Interface Switching Characteristics - Synchronous Mode - Default</a> and <a href="#">Table 5-49 GPMC/NOR Flash Interface Switching Characteristics - Synchronous Mode - Alternate</a> .	O	K23, L4
clkout2	Device Clock output 2. Can be used externally for devices with non-critical timing requirements, or for debug.	O	H5, J25
clkout3	Device Clock output 3. Can be used externally for devices with non-critical timing requirements, or for debug.	O	H25
porz	Power on Reset (active low) input must be asserted low during a device power up sequence or cold reset state when all supplies are disabled. Typically, an external PMIC is the source and sets porz high after all supplies reach valid operating levels. Asserting porz low puts the entire device in a safe reset state.	I	F19
resetn	Reset (active low) input's falling edge can trigger a device warm reset state from an external component. This signal should be high prior to or simultaneous with, porz rising. If the signal is not used in the system, resetn should be pulled high with an external pull-up resistor to vddshv3.	I	K24
rstoutn	Reset out (Active low) output is asserted low whenever any global reset condition exists. After a brief delay, it will be set high upon removal of the internal global reset condition (i.e. porz, warm reset). It is only functional after its output buffer's reference voltage (vddshv3) is valid. If it is used as a reset for device peripheral components, then it should be AND gated with porz to avoid the possibility of reset signal glitches during a power up sequence. <sup>(2)</sup>	O	E20
xi_osc0	System Oscillator OSC0 Crystal input / LVC MOS clock input. Functions as the input connection to a crystal when the internal oscillator OSC0 is used. Functions as an LVC MOS-compatible input clock when an external oscillator is used.	I	Y12
xi_osc1	Auxiliary Oscillator OSC1 Crystal input / LVC MOS clock input. Functions as the input connection to a crystal when the internal oscillator OSC1 is used. Functions as an LVC MOS-compatible input clock when an external oscillator is used	I	AC11
xo_osc0	System Oscillator OSC0 Crystal output	O	AB12
xo_osc1	Auxiliary Oscillator OSC1 Crystal output	O	AA11
xref_clk0	External Reference Clock 0. For Audio and other Peripherals.	I	J25
xref_clk1	External Reference Clock 1. For Audio and other Peripherals.	I	J24
xref_clk2	External Reference Clock 2. For Audio and other Peripherals.	I	H24
xref_clk3	External Reference Clock 3. For Audio and other Peripherals.	I	H25

**Table 4-23. PRCM Signal Descriptions (continued)**

SIGNAL NAME	DESCRIPTION	TYPE	BALL
RMII_MHZ_50_CLK <sup>(1)</sup>	RMII Reference Clock (50MHz). This pin is an input when external reference is used or output when internal reference is used.	IO	P5

- (1) This clock signal is implemented as 'pad loopback' inside the device - the output signal is looped back through the input buffer to serve as the internal reference signal. Series termination is recommended (as close to device pin as possible) to improve signal integrity of the clock input. Any nonmonotonicity in voltage that occurs at the pad loopback clock pin between  $V_{IH}$  and  $V_{IL}$  must be less than  $V_{HYS}$ .
- (2) Note that rstoutn is only valid after vddshv3 is valid. If the rstoutn signal will be used as a reset into other devices attached to the SOC, it must be AND'ed with porz. This will prevent glitches occurring during supply ramping being propagated.

#### 4.3.21.3 System Direct Memory Access (SDMA)

**NOTE**

For more information, see the DMA Controllers / System DMA section of the device TRM.

**Table 4-24. SDMA Signal Descriptions**

SIGNAL NAME	DESCRIPTION	TYPE	BALL
dma_evt1	System DMA Event Input 1	I	G1, L4
dma_evt2	System DMA Event Input 2	I	H3, H5
dma_evt3	System DMA Event Input 3	I	H2
dma_evt4	System DMA Event Input 4	I	H6

#### 4.3.21.4 Interrupt Controllers (INTC)

**NOTE**

For more information, see the Interrupt Controllers section of the device TRM.

**Table 4-25. INTC Signal Descriptions**

SIGNAL NAME	DESCRIPTION	TYPE	BALL
nmin_dsp	Non maskable interrupt input, active-low. This pin can be optionally routed to the DSP NMI input or as generic input to the Arm cores. Note that by default this pin has an internal pulldown resistor enabled. This internal pulldown should be disabled or countered by a stronger external pullup resistor before routing to the DSP or Arm processors.	I	L24
sys_nirq2	External interrupt event to any device INTC	I	AC10
sys_nirq1	External interrupt event to any device INTC	I	AB10

#### 4.3.22 Power Supplies

**NOTE**

For more information, see Power, Reset, and Clock Management / PRCM Subsystem Environment / External Voltage Inputs section of the device TRM.

**Table 4-26. Power Supply Signal Descriptions**

SIGNAL NAME	DESCRIPTION	TYPE	BALL
vdd	Core voltage domain supply	PWR	J15, J16, J18, K12, K18, L12, L17, M11, M13, M15, M17, N11, N13, N15, N18, P10, P12, P14, P16, P18, R10, R12, R14, R16, R17, T11, T13, T15, T17, T9, U11, U13, U15, U18, U9, V10, V12, V14, V16, V18, W10, W12, W14, W16

cap_vddram_mpu <sup>(1)</sup>	External capacitor connection for the MPU SRAM array ldo output	CAP	G18
vdda33v_usb1	HS USB1 3p3 supply	PWR	AA10
vdda33v_usb2	HS USB1 3p3 supply	PWR	Y10
vdda_core_gmac	DPLL_CORE and CORE HSDIVIDER analog power supply	PWR	L9
vdda_csi	CSI Interface 1.8v Supply	PWR	T6
vdda_dsp_iva	DSP PLL and IVA PLL analog power supply	PWR	K10, L10
vdda_mpu_abe	MPU_ABE PLL analog power supply	PWR	K16, L16
vdda_per	DPLL_ABE, DPLL_PER, and PER HSDIVIDER analog power supply	PWR	M10
vdda_usb2	HS USB2 1.8V analog power supply	PWR	Y8
vdds_mlbp	MLBP IO power supply	PWR	P7, R7
vdd_dsp	DSP voltage domain supply	PWR	H11, H13, H9, J11, J13, J9
vdda_ddr	DDR PLL and DDR HSDIVIDER analog power supply	PWR	R20

**Table 4-26. Power Supply Signal Descriptions (continued)**

SIGNAL NAME	DESCRIPTION	TYPE	BALL
vdda_debug	Debug PLL inside IOSC PLL supply	PWR	N10
vdda_gpu	GPU (SGX) PLL analog power supply	PWR	N9
vdda_hdmi	HDMI PLL and HDMI analog power supply	PWR	W15, Y15
vdda_osc	HFOSC - 1.8v vdds supply	PWR	W13, Y13
vdda_PCIE	PCIe PLL analog power supply	PWR	W11, Y11
vdda_usb1	USB2 PLL analog power supply	PWR	W8
vdda_usb3	USB3 PLL analog power supply	PWR	Y9
vdda_video	VIDEO1 and VIDEO2 PLL analog power supply	PWR	K14, L14
vdds18v	1.8V bump added for atestv esd supply	PWR	G11, H20, W7, Y18
vdds18v_ddr1	DDR2 - 1.8v bias supply	PWR	AA19, P20, Y19
vddshv1	VIN2 domain - 1.8/3.3 mode voltage Power cell - secondary power supply	PWR	G10, G9
vddshv3	GENERAL Domain - 1.8/3.3 mode voltage Power cell - secondary power supply	PWR	G15, G17, H15, H17, J19, K19
vddshv4	MMC4 Domain (UART4) - 1.8/3.3 mode voltage Power cell - secondary power supply	PWR	M19, N19
vddshv7	WIFI Power Group (MMC3/McASP5) - 1.8/3.3 mode voltage Power cell - secondary power supply	PWR	U7, U8
vddshv8	Dual Voltage (1.8V or 3.3V) power supply for the MMC1 Power Group pins	PWR	N8, P8
vddshv9	RGMII - 1.8/3.3 mode voltage Power cell - secondary power supply	PWR	M7, N7
vddshv10	GPMC - 1.8/3.3 mode voltage Power cell - secondary power supply	PWR	J7, J8, K8
vddshv11	MMC2 - 1.8/3.3 mode voltage Power cell - secondary power supply	PWR	F7, G7, H7
vdds_ddr1	DDR2 - vdds2 can be 1.8 (ddr2)/1.5(ddr3) - secondary power supply	PWR	T19, T20, V20, W17, W18, W20
vssa_osc0	OSC0 Analog ground	GND	AA12
vssa_osc1	OSC1 Analog ground	GND	AB11

(1) This pin must always be connected via a 1- $\mu$ F capacitor to vss.

(2) This signal is valid only for High-Security devices. For more details, see [Section 5.8 VPP Specification for One-Time Programmable \(OTP\) eFUSES](#). For General Purpose devices do not connect any signal, test point, or board trace to this signal.

## 4.4 Pin Multiplexing

Table 4-27 describes the device pin multiplexing (no characteristics are provided in this table).

---

### NOTE

Table 4-27, *Pin Multiplexing* doesn't take into account subsystem multiplexing signals. Subsystem multiplexing signals are described in Section 4.3, *Signal Descriptions*.

---

---

### NOTE

For more information, see the Control Module / Control Module Functional Description / PAD Functional Multiplexing and Configuration section of the Device TRM.

---

---

### NOTE

Configuring two pins to the same input signal is not supported as it can yield unexpected results. This can be easily prevented with the proper software configuration (Hi-Z mode is not an input signal).

---

---

### NOTE

When a pad is set into a pin multiplexing mode which is not defined, that pad's behavior is undefined. This should be avoided.

---

---

### NOTE

In some cases Table 4-27 may present more than one signal per muxmode for the same ball. First signal in the list is the dominant function as selected via CTRL\_CORE\_PAD\_\* register.

All other signals are virtual functions that present alternate multiplexing options. These virtual functions are controlled via CTRL\_CORE\_ALT\_SELECT\_MUX or CTRL\_CORE\_VIP\_MUX\_SELECT register. For more information on how to use these options, please refer to Device TRM, Chapter *Control Module*, Section *Pad Configuration Registers*.

---

---

### NOTE

Dual rank support is not available on this device, but signal names are retained for consistency with the TDA2xx family of devices.

---

## 4.5 Connections for Unused Pins

This section describes the connection requirements of the unused and reserved balls.

---

### NOTE

The following balls are reserved: K20, L19, G20, T1, T2, U4, T3, U1, U2

These balls must be left unconnected.

---

### NOTE

All unused power supply balls must be supplied with the voltages specified in the [Section 5.4, Recommended Operating Conditions](#), unless alternative tie-off options are included in [Section 4.3, Signal Descriptions](#).

---

**Table 4-28. Unused Balls Specific Connection Requirements**

BALLS	CONNECTION REQUIREMENTS
Y12 / AC11 / L22 / AC10 / AB10 / AD22 / Y24 / V24 / R24	These balls must be connected to GND through an external pull resistor if unused.
K21 / L24 / K24 / G22 / G23 / L21 / G21 / F23 / AE22 / Y25 / V25 / R25	These balls must be connect to the corresponding power supply through an external pull resistor if unused.
F20 (vpp)	This ball must be left unconnected if unused

---

### NOTE

All other unused signal balls with a Pad Configuration register can be left unconnected with their internal pullup or pulldown resistor enabled.

---

### NOTE

All other unused signal balls without a Pad Configuration register can be left unconnected.

---

## 5 Specifications

---

**NOTE**

For more information, see Power, Reset, and Clock Management / PRCM Subsystem Environment / External Voltage Inputs or Initialization / Preinitialization / Power Requirements section of the Device TRM.

---

---

**NOTE**

The index number 1 which is part of the EMIF1 signal prefixes (ddr1\_\*) listed in [Table 4-6, EMIF Signal Descriptions](#), column "SIGNAL NAME" not to be confused with DDR1 type of SDRAM memories.

---

---

**NOTE**

Audio Back End (ABE) module is not supported for this family of devices, but "ABE" name is still present in some clock or DPLL names.

---

---

**CAUTION**

All IO Cells are NOT Fail-safe compliant and should not be externally driven in absence of their IO supply.

## 5.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted) <sup>(1)</sup>

PARAMETER <sup>(1)</sup>			MIN	MAX	UNIT
$V_{SUPPLY}$ (Steady-State)	Supply Voltage Ranges (Steady-State)	Core (vdd, vdd_dsp)	-0.3	1.5	V
		Analog (vdda_usb1, vdda_usb2, vdda_per, vdda_ddr, vdda_debug, vdda_mpu_abe, vdda_usb3, vdda_csi, vdda_core_gmac, vdda_gpu, dda_hdmi, vdda_pcie, vdda_video, vdda_osc)	-0.3	2.0	V
		Analog 3.3V (vdda33v_usb1, vdda33v_usb2)	-0.3	3.8	V
		vdds18v, vdds18v_ddr1, vdds_mlbp, vdds_ddr1	-0.3	2.1	V
		vddshv1, vddshv3, vddshv4, vddshv7-11 (1.8V mode)	-0.3	2.1	V
		vddshv1, vddshv3, vddshv4, vddshv7, vddshv9-11 (3.3V mode)	-0.3	3.8	V
$V_{IO}$ (Steady-State)	Input and Output Voltage Ranges (Steady-State)	vddshv8 (3.3V mode)	-0.3	3.6	V
		Core I/Os	-0.3	1.5	V
		Analog I/Os (except HDMI)	-0.3	2.0	V
		HDMI I/Os	-0.3	3.5	V
		I/O 1.35V	-0.3	1.65	V
		I/O 1.5V	-0.3	1.8	V
		1.8V I/Os	-0.3	2.1	V
		3.3V I/Os (except those powered by vddshv8)	-0.3	3.8	V
		3.3V I/Os (powered by vddshv8)	-0.3	3.6	V
SR	Maximum slew rate, all supplies			$10^5$	V/s
$V_{IO}$ (Transient Overshoot / Undershoot)	Input and Output Voltage Ranges (Transient Overshoot/Undershoot) Note: valid for up to 20% of the signal period. See <a href="#">Figure 5-1, I/O transient voltage ranges</a> .			$0.2 \times VDD$ <sup>(4)</sup>	V
$T_J$	Operating junction temperature range	Automotive	-40	+125	°C
$T_{STG}$	Storage temperature range after soldered onto PC Board		-55	+150	°C
Latch-up I-Test	I-test <sup>(5)</sup> , All I/Os (if different levels then one line per level)		-100	100	mA
Latch-up OV-Test	Over-voltage Test <sup>(6)</sup> , All supplies (if different levels then one line per level)		N/A	$1.5 \times V_{supply\ max}$	V

(1) Stresses beyond those listed as absolute maximum ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those listed under [Section 5.4, Recommended Operating Conditions](#), is not implied. Exposure to absolute maximum rated conditions for extended periods may affect device reliability.

(2) All voltage values are with respect to VSS, unless otherwise noted.

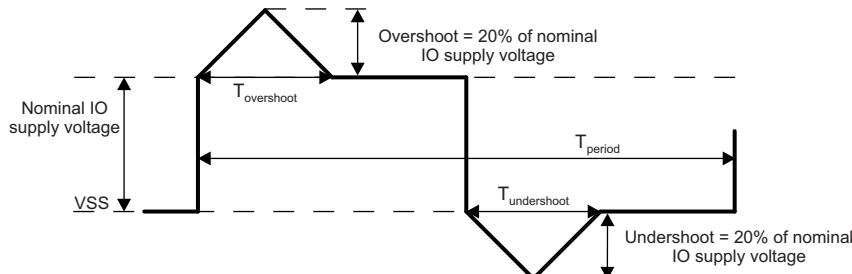

(3) See I/Os supplied by this power pin in [Table 4-1 Pin Attributes](#)

(4) VDD is the voltage on the corresponding power-supply pin(s) for the IO.

(5) Per JEDEC JESD78 at 125°C with specified I/O pin injection current and clamp voltage of 1.5 times maximum recommended I/O voltage and negative 0.5 times maximum recommended I/O voltage.

(6) Per JEDEC JESD78 at 125°C.

(7) The maximum valid input voltage on an IO pin cannot exceed 0.3 volts when the supply powering the IO is turned off. This requirement applies to all the IO pins which are not fail-safe and for all values of IO supply voltage. Special attention should be applied anytime peripheral devices are not powered from the same power sources used to power the respective IO supply. It is important the attached peripheral never sources a voltage outside the valid input voltage range, including power supply ramp-up and ramp-down sequences.

osus\_sprs851

- (1)  $T_{\text{overshoot}} + T_{\text{undershoot}} < 20\% \text{ of } T_{\text{period}}$

**Figure 5-1. IO transient voltage ranges**

## 5.2 ESD Ratings

			VALUE	UNIT	
$V_{\text{ESD}}$ Electrostatic discharge	Human-Body model (HBM), per AEC Q100-002 <sup>(1)</sup>			V	
	Charged-device model (CDM), per AEC Q100-011				
	All pins	All pins	$\pm 250$		
	Corner pins (A1, A25, AE1, AE25)	Corner pins (A1, A25, AE1, AE25)	$\pm 750$		

(1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

## 5.3 Power on Hour (POH) Limits

IP	DUTY CYCLE	VOLTAGE DOMAIN	VOLTAGE (V) (MAX)	FREQUENCY (MHz) (MAX)	T <sub>j</sub> (°C)	POH
All	100%	All	All Supported OPPs	Automotive Profile <sup>(4)</sup>		20000

- (1) The information in this section is provided solely for your convenience and does not extend or modify the warranty provided under TI's standard terms and conditions for TI semiconductor products.
- (2) POH is a functional of voltage, temperature and time. Usage at higher voltages and temperatures will result in a reduction in POH to achieve the same reliability performance. For assessment of alternate use cases, contact your local TI representative.
- (3) Unless specified in the table above, all voltage domains and operating conditions are supported in the device at the noted temperatures.
- (4) Automotive profile is defined as 20000 power on hours with junction temperature as follows: 5%@-40°C, 65%@70°C, 20%@110°C, 10%@125°C.

## 5.4 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

PARAMETER	DESCRIPTION	MIN <sup>(2)</sup>	NOM	MAX DC <sup>(3)</sup>	MAX <sup>(2)</sup>	UNIT
<b>Input Power Supply Voltage Range</b>						
vdd	Core voltage domain supply		See Section 5.5			V
vdd_dsp	DSP voltage domain supply		See Section 5.5			V
vdda_usb1	DPLL_USB and HS USB1 1.8V analog power supply	1.71	1.80	1.836	1.89	V
	Maximum noise (peak-peak)		50			mV <sub>PPmax</sub>
vdda_usb2	HS USB2 1.8V analog power supply	1.71	1.80	1.836	1.89	V
	Maximum noise (peak-peak)		50			mV <sub>PPmax</sub>
vdda33v_usb1 <sup>(5)</sup>	HS USB1 3.3V analog power supply	3.135	3.3	3.366	3.465	V
	Maximum noise (peak-peak)		50			mV <sub>PPmax</sub>
vdda33v_usb2 <sup>(5)</sup>	HS USB2 3.3V analog power supply	3.135	3.3	3.366	3.465	V
	Maximum noise (peak-peak)		50			mV <sub>PPmax</sub>
vdda_per	PER PLL and PER HSDIVIDER analog power supply	1.71	1.80	1.836	1.89	V
	Maximum noise (peak-peak)		50			mV <sub>PPmax</sub>

## Recommended Operating Conditions (*continued*)

over operating free-air temperature range (unless otherwise noted)

PARAMETER	DESCRIPTION	MIN <sup>(2)</sup>	NOM	MAX DC <sup>(3)</sup>	MAX <sup>(2)</sup>	UNIT

		3.3-V Mode					
vss	Ground supply			0			V
vssa_osc0	OSC0 analog ground			0			V
vssa_osc1	OSC1 analog ground			0			V
T <sub>J</sub> <sup>(1)</sup>	Operating junction temperature range	Automotive	-40		+125 <sup>(6)</sup>		°C
ddr1_vref0	Reference Power Supply EMIF1		0.5 × vdds_ddr1				V

(1) Refer to Power on Hours table for limitations.

(2) The voltage at the device ball should never be below the MIN voltage or above the MAX voltage for any amount of time. This requirement includes dynamic voltage events such as AC ripple, voltage transients, voltage dips, etc.

(3) The DC voltage at the device ball should never be above the MAX DC voltage to avoid impact on device reliability and lifetime POH (Power-On-Hours). The MAX DC voltage is defined as the highest allowed DC regulated voltage, without transients, seen at the ball.

(4) Logic functions and parameter values are not assured out of the range specified in the recommended operating conditions.

## Recommended Operating Conditions (*continued*)

over operating free-air temperature range (unless otherwise noted)

- (5) USB Analog supply also powers digital IO buffers. This supply cannot be tied to VSS if USB is unused since digital IO buffers must be powered during device operation.
- (6) The TSHUT feature of the SoC resets the device by default when one of the on-die temp sensors reports 123 °C. This is intended to protect the device from exceeding 125 °C. Though not recommended, the TSHUT temperature threshold can be modified in software if other mechanisms are in place to avoid exceeding 125 °C. Refer to the device TRM for details on the TSHUT feature.

## 5.5 Operating Performance Points

This section describes the operating conditions of the device. This section also contains the description of each OPP (operating performance point) for processor clocks and device core clocks.

[Table 5-1](#) describes the maximum supported frequency per speed grade for TDA2Ex devices.

**Table 5-1. Speed Grade Maximum Frequency**

DEVICE SPEED	MAXIMUM FREQUENCY (MHz)						
	MPU	DSP	IVA	GPU	IPU	L3	DDR3/DDR3L
TDA2ExxH	800	750	532	425.6	212.8	266	667 (DDR-1333)
TDA2ExxD	500	500	430	425.6	212.8	266	667 (DDR-1333)

(1) N/A stands for Not Applicable.

### 5.5.1 AVS and ABB Requirements

Adaptive Voltage Scaling (AVS) and Adaptive Body Biasing (ABB) are required on most of the vdd\_\* supplies as defined in [Table 5-2](#).

**Table 5-2. AVS and ABB Requirements per vdd\_\* Supply**

SUPPLY	VOLTAGE DOMAIN	AVS REQUIRED?		ABB REQUIRED?	
		Yes, for all OPPs	No	Yes, for all OPPs	Yes, for all OPPs
vdd	VD_CORE	Yes, for all OPPs	No	Yes, for all OPPs	Yes, for all OPPs
	VD_SGX	Yes, for all OPPs			
	VD_MPUMPU	Yes, for all OPPs			
vdd_dsp	VD_DSP	Yes, for all OPPs			
	VD_IVA	Yes, for all OPPs			

### 5.5.2 Voltage And Core Clock Specifications

[Table 5-3](#) shows the recommended OPP per voltage domain.

**Table 5-3. Voltage Domains Operating Performance Points**

DOMAIN	CONDITION	OPP_NOM			OPP_HIGH			
		MIN <sup>(2)</sup>	NOM <sup>(1)</sup>	MAX <sup>(2)</sup>	MIN <sup>(2)</sup>	NOM <sup>(1)</sup>	MAX DC <sup>(3)</sup>	MAX <sup>(2)</sup>
VD_CORE (V) <sup>(7)</sup>	BOOT (Before AVS is enabled) <sup>(4)</sup>	1.11	1.15	1.2	Not Applicable			
	After AVS is enabled <sup>(4)</sup>	AVS Voltage <sup>(5)</sup> – 3.5%	AVS Voltage <sup>(5)</sup>	1.2	Not Applicable			
VD_DSP (V) <sup>(8)</sup>	BOOT (Before AVS is enabled) <sup>(4)</sup>	1.02	1.06	1.16	Not Applicable			
	After AVS is enabled <sup>(4)</sup>	AVS Voltage <sup>(5)</sup> – 3.5%	AVS Voltage <sup>(5)</sup>	1.2	AVS Voltage <sup>(5)</sup> – 3.5%	AVS Voltage <sup>(5)</sup>	AVS Voltage <sup>(5)</sup> +2%	AVS Voltage <sup>(5)</sup> + 5%

- (1) In a typical implementation, the power supply should target the NOM voltage.
- (2) The voltage at the device ball should never be below the MIN voltage or above the MAX voltage for any amount of time. This requirement includes dynamic voltage events such as AC ripple, voltage transients, voltage dips, etc.
- (3) The DC voltage at the device ball should never be above the MAX DC voltage to avoid impact on device reliability and lifetime POH (Power-On-Hours). The MAX DC voltage is defined as the highest allowed DC regulated voltage, without transients, seen at the ball.
- (4) For all OPPs, AVS must be enabled to avoid impact on device reliability, lifetime POH (Power-On-Hours), and device power.
- (5) The AVS voltages are device-dependent, voltage domain-dependent, and OPP-dependent. They must be read from the STD\_FUSE OPP Registers. For information about STD\_FUSE OPP Registers address, please refer to Control Module Section of the TRM. The power supply should be adjustable over the following ranges for each required OPP:
  - OPP\_NOM for DSP: 0.85 V – 1.15 V
  - OPP\_NOM for CORE: 0.85 V - 1.15 V
  - OPP\_HIGH: 1.01 V - 1.25 V
 The AVS voltages will be within the above specified ranges.
- (6) The power supply must be programmed with the AVS voltages for the CORE voltage domain, either just after the ROM boot or at the earliest possible time in the secondary boot loader before there is significant activity seen on these domains.
- (7) The package routes VD\_CORE (vdd) to the VD\_MPU, VD\_SGX, VD\_CORE and VD\_RTC domains on the die.
- (8) The package routes VD\_DSP (vdd\_dsp) to the VD\_DSPEVE and VD\_IVA domains on the die.

Table 5-4 describes the standard processor clocks speed characteristics vs OPP of the device.

**Table 5-4. Supported OPP vs Max Frequency <sup>(2)</sup>**

DESCRIPTION	OPP_NOM	OPP_HIGH
	MAXIMUM FREQUENCY (MHz)	
<b>VD_CORE</b>		
MPU_CLK	800	N/A
GPU_CLK	425.6	N/A
CORE_IPUX_CLK	212.8	N/A
L3_CLK	266	N/A
DDR3 / DDR3L	667 (DDR-1333)	N/A
<b>VD_DSP</b>		
IVA_GCLK	388.3	532
DSP_CLK	600	750

(1) N/A stands for Not Applicable.

(2) Maximum supported frequency is limited according to the Device Speed Grade (see Table 5-1).

### 5.5.3 Maximum Supported Frequency

Device modules either receive their clock directly from an external clock input, directly from a PLL, or from a PRCM. Table 5-5 lists the clock source options for each module on this device, along with the maximum frequency that module can accept. To ensure proper module functionality, the device PLLs and dividers must be programmed not to exceed the maximum frequencies listed in this table.

**Table 5-5. Maximum Supported Frequency**

MODULE				CLOCK SOURCES

## 5.6 Power Consumption Summary

### NOTE

Maximum power consumption for this SoC depends on the specific use conditions for the end system. Contact your TI representative for assistance in estimating maximum power consumption for the end system use case.

## 5.7 Electrical Characteristics

### NOTE

The interfaces or signals described in [Section 5.7](#) through [Section 5.7.3](#) correspond to the interfaces or signals available in multiplexing mode 0 (Function 1).

All interfaces or signals multiplexed on the balls described in these tables have the same DC electrical characteristics, unless multiplexing involves a PHY/GPIO combination in which case different DC electrical characteristics are specified for the different multiplexing modes (Functions).

<b>MIPI D-PHY Mode Ultralow Power Receiver (ULP-RX)</b>					
$V_{IL}$	Input low-level voltage			300	mV
$V_{ITL}$	Input low-level threshold <sup>(4)</sup>		300		mV
$V_{HYS}$	Input hysteresis <sup>(3)</sup>		25		mV
<b>MIPI D-PHY Mode High-Speed Receiver (HS-RX)</b>					
$V_{IDTH}$	Differential input high-level threshold		70		mV

**Table 5-10. LVC MOS CSI2 DC Electrical Characteristics (continued)**

over operating free-air temperature range (unless otherwise noted)

PARAMETER		MIN	NOM	MAX	UNIT
$V_{IDTL}$	Differential input low-level threshold			-70	mV
$V_{IDMAX}$	Maximum differential input voltage <sup>(7)</sup>			270	mV
$V_{IHHS}$	Single-ended input high voltage <sup>(5)</sup>			460	mV
$V_{ILHS}$	Single-ended input low voltage <sup>(5)</sup>	-40			mV
$V_{CMRXDC}$	Differential input common-mode voltage <sup>(5)(6)</sup>	70		330	mV
$Z_{ID}$	Differential input impedance	80	100	125	$\Omega$

(1)  $V_{ITH}$  is the voltage at which the receiver is required to detect a high state in the input signal.(2)  $V_{ITL}$  is the voltage at which the receiver is required to detect a low state in the input signal.  $V_{ITL}$  is larger than the maximum single-ended line high voltage during HS transmission. Therefore, both low-power (LP) receivers will detect low during HS signaling.(3) To reduce noise sensitivity on the received signal, the LP receiver is required to incorporate a hysteresis,  $V_{HYST}$ .  $V_{HYST}$  is the difference between the  $V_{ITH}$  threshold and the  $V_{ITL}$  threshold.(4)  $V_{ITL}$  is the voltage at which the receiver is required to detect a low state in the input signal. Specification is relaxed for detecting 0 during ultralow power (ULP) state. The LP receiver is not required to detect HS single-ended voltage as 0 in this state.(5) Excluding possible additional RF interference of 200 mV<sub>PP</sub> beyond 450 MHz.

(6) This value includes a ground difference of 50 mV between the transmitter and the receiver, the static common-mode level tolerance and variations below 450 MHz.

(7) This number corresponds to the  $VOD_{MAX}$  transmitter.(8) Common mode is defined as the average voltage level of X and Y:  $V_{CMRX} = (V_X + V_Y) / 2$ .(9) Common mode ripple may be due to  $t_R$  or  $t_F$  and transmission line impairments in the PCB.(10) For more information regarding the pin name (or ball name) and corresponding signal name, see [Table 4-5 CSI 2 Signal Descriptions](#).**Table 5-11. $I_{OZ}$	$I_{OZ}(I_{PAD})$ Current for BIDI cell. This current is contributed by the tristated driver leakage + input current of the Rx + weak pullup/pulldown leakage. PAD is swept from 0 to VDDS and the Max( $I_{(PAD)}$ ) is measured and is reported as $I_{OZ}$			65	$\mu A$
$I_{IN}$ with pulldown enabled	Input current at each I/O pin with weak pulldown enabled measured when PAD = VDDS	40	100	200	$\mu A$
$I_{IN}$ with pullup enabled	Input current at each I/O pin with weak pullup enabled measured when PAD = 0	10	100	290	$\mu A$
$C_{PAD}$	Pad capacitance (including package capacitance)			4	pF
$Z_O$	Output impedance (drive strength)		40		$\Omega$

(1) VDDS stands for corresponding power supply. For more information on the power supply name and the corresponding ball, see [Table 4-1, POWER \[10\]](#) column.

### 5.7.1 USBPHY DC Electrical Characteristics

#### NOTE

USB1 instance is compliant with the USB3.0 SuperSpeed Transmitter and Receiver Normative Electrical Parameters as defined in the USB3.0 Specification Rev 1.0 dated Jun 6, 2011.

#### NOTE

USB1 and USB2 Electrical Characteristics are compliant with USB2.0 Specification Rev 2.0 dated April 27, 2000 including ECNs and Errata as applicable.

### 5.7.2 HDMIPHY DC Electrical Characteristics

#### NOTE

The HDMIPHY DC Electrical Characteristics are compliant with the HDMI 1.4a specification and are not reproduced here.

### 5.7.3 PCIEPHY DC Electrical Characteristics

#### NOTE

The PCIe interfaces are compliant with the electrical parameters specified in PCI Express® Base Specification Revision 3.0.

## 5.8 VPP Specifications for One-Time Programmable (OTP) eFuses

This section specifies the operating conditions required for programming the OTP eFuses and is applicable only for High-Security Devices.

**Table 5-13. Recommended Operating Conditions for OTP eFuse Programming**

over operating free-air temperature range (unless otherwise noted)

PARAMETER	DESCRIPTION	MIN	NOM	MAX	UNIT
vdd	Supply voltage range for the core domain during OTP operation	1.11	1.15	1.2	V
vpp	Supply voltage range for the eFuse ROM domain during normal operation	NC		V	
	Supply voltage range for the eFuse ROM domain during OTP programming <sup>(1)(2)</sup>	1.8		V	
I(vpp)			100		mA
T <sub>j</sub>	Temperature (junction)	0	25	85	°C

(1) Supply voltage range includes DC errors and peak-to-peak noise. TI power management solutions [TLV70018-Q1](#) from the TLV700xx family meet the supply voltage range needed for vpp.

(2) During normal operation, no voltage should be applied to vpp. This can be typically achieved by disabling the regulator attached to the vpp terminal. For more details, see [TLV700xx-Q1 300-mA, Low-I<sub>Q</sub>, Low-Dropout Regulator](#).

### 5.8.1 Hardware Requirements

The following hardware requirements must be met when programming keys in the OTP eFuses:

- The vpp power supply must be disabled when not programming OTP registers.
- The vpp power supply must be ramped up after the proper device power-up sequence (for more details, see [Section 5.10.3](#)).

### 5.8.2 Programming Sequence

Programming sequence for OTP eFuses:

1. Power on the board per the power-up sequencing. No voltage should be applied on the vpp terminal during power up and normal operation.
2. Load the OTP write software required to program the eFuse (contact your local TI representative for the OTP software package).
3. Apply the voltage on the vpp terminal according to the specification in [Table 5-13](#).
4. Run the software that programs the OTP registers.
5. After validating the content of the OTP registers, remove the voltage from the vpp terminal.

### 5.8.3 Impact to Your Hardware Warranty

You accept that e-Fusing the TI Devices with security keys permanently alters them. You acknowledge that the e-Fuse can fail, for example, due to incorrect or aborted program sequence or if you omit a sequence step. Further the TI Device may fail to secure boot if the error code correction check fails for the Production Keys or if the image is not signed and optionally encrypted with the current active Production Keys. These types of situations will render the TI Device inoperable and TI will be unable to confirm whether the TI Devices conformed to their specifications prior to the attempted e-Fuse. CONSEQUENTLY, TI WILL HAVE NO LIABILITY (WARRANTY OR OTHERWISE) FOR ANY TI DEVICES THAT HAVE BEEN e-FUSED WITH SECURITY KEYS.

## 5.9 Thermal Resistance Characteristics for CBD Package

For reliability and operability concerns, the maximum junction temperature of the Device has to be at or below the T<sub>j</sub> value identified in [Section 5.4, Recommended Operating Conditions](#).

A BCI compact thermal model for this Device is available and recommended for use when modeling thermal performance in a system.

Therefore, it is recommended to perform thermal simulations at the system level with the worst case device power consumption.

### 5.9.1 Package Thermal Characteristics

Table 5-14 provides the thermal resistance characteristics for the package used on this device.

#### NOTE

Power dissipation of 3.0 W and an ambient temperature of 85°C is assumed for CBD package.

**Table 5-14. Thermal Resistance Characteristics**

NO.	PARAMETER	DESCRIPTION	°C/W <sup>(1)</sup>	AIR FLOW (m/s) <sup>(2)</sup>
T1	$R\Theta_{JC}$	Junction-to-case	0.23	N/A
T2	$R\Theta_{JB}$	Junction-to-board	3.65	N/A
T3	$R\Theta_{JA}$	Junction-to-free air	12.8	0
T4			10.4	0.5
T5		Junction-to-moving air	9.6	1
T6			8.8	2
T7			8.3	3
T8			0.1	0
T9	$\Psi_{JT}$	Junction-to-package top	0.1	0.5
T10			0.1	1
T11			0.1	2
T12			0.1	3
T13	$\Psi_{JB}$		3.7	0
T14			3.7	0.5
T15		Junction-to-board	3.6	1
T16			3.6	2
T17			3.5	3

(1) These measurements were conducted in a JEDEC defined 2S2P system (with the exception of the Theta JC [ $R\Theta_{JC}$ ] measurement, which was conducted in a JEDEC defined 1S0P system) and will change based on environment as well as application. For more information, see these EIA/JEDEC standards:

- JESD51-2, *Integrated Circuits Thermal Test Method Environment Conditions - Natural Convection (Still Air)*
- JESD51-3, *Low Effective Thermal Conductivity Test Board for Leaded Surface Mount Packages*
- JESD51-7, *High Effective Thermal Conductivity Test Board for Leaded Surface Mount Packages*
- JESD51-9, *Test Boards for Area Array Surface Mount Packages*

(2) m/s = meters per second

## 5.10 Timing Requirements and Switching Characteristics

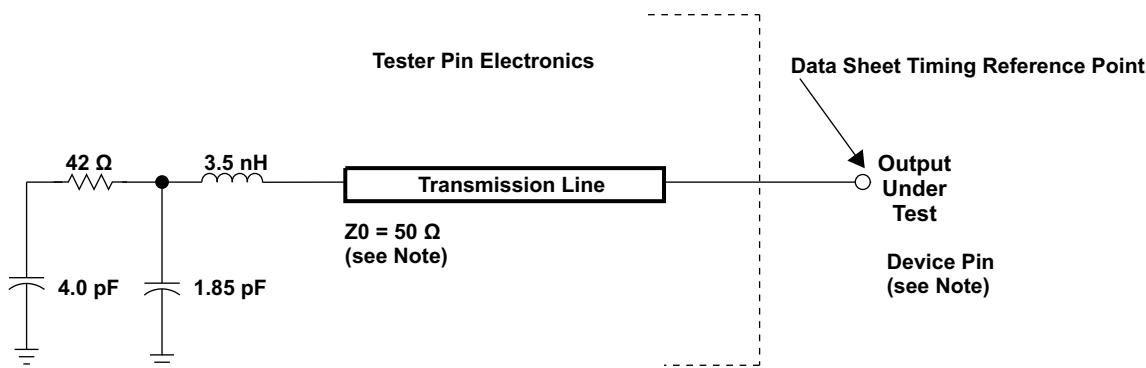

### 5.10.1 Timing Parameters and Information

The timing parameter symbols used in the timing requirement and switching characteristic tables are created in accordance with JEDEC Standard 100. To shorten the symbols, some of pin names and other related terminologies have been abbreviated as follows:

**Table 5-15. Timing Parameters**

<b>SUBSCRIPTS</b>	
<b>SYMBOL</b>	<b>PARAMETER</b>
c	Cycle time (period)
d	Delay time
dis	Disable time
en	Enable time
h	Hold time
su	Setup time
START	Start bit
t	Transition time
v	Valid time
w	Pulse duration (width)
X	Unknown, changing, or don't care level
F	Fall time
H	High
L	Low
R	Rise time
V	Valid
IV	Invalid
AE	Active Edge
FE	First Edge
LE	Last Edge
Z	High impedance

### 5.10.1.1 Parameter Information

NOTE: The data sheet provides timing at the device pin. For output timing analysis, the tester pin electronics and its transmission line effects must be taken into account. A transmission line with a delay of 2 ns can be used to produce the desired transmission line effect. The transmission line is intended as a load only. It is not necessary to add or subtract the transmission line delay (2 ns) from the data sheet timings.

Input requirements in this data sheet are tested with an input slew rate of < 4 Volts per nanosecond (4 V/ns) at the device pin.

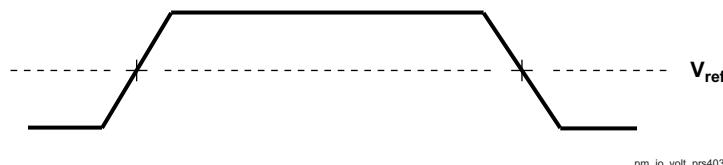

pm\_tstcirc\_prs403

**Figure 5-2. Test Load Circuit for AC Timing Measurements**

The load capacitance value stated is only for characterization and measurement of AC timing signals. This load capacitance value does not indicate the maximum load the device is capable of driving.

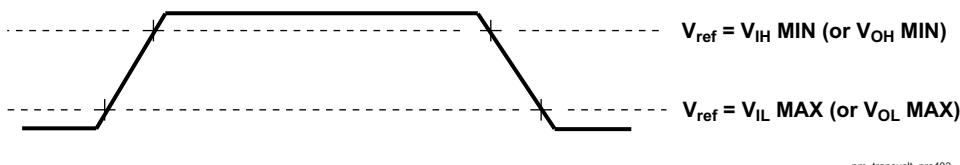

#### 5.10.1.1.1 1.8 V and 3.3 V Signal Transition Levels

All input and output timing parameters are referenced to  $V_{ref}$  for both "0" and "1" logic levels.  $V_{ref} = (V_{DD}/I/O)/2$ .

**Figure 5-3. Input and Output Voltage Reference Levels for AC Timing Measurements**

All rise and fall transition timing parameters are referenced to  $V_{IL\ MAX}$  and  $V_{IH\ MIN}$  for input clocks,  $V_{OL\ MAX}$  and  $V_{OH\ MIN}$  for output clocks.

**Figure 5-4. Rise and Fall Transition Time Voltage Reference Levels**

#### 5.10.1.1.2 1.8 V and 3.3 V Signal Transition Rates

The default SLEWCONTROL settings in each pad configuration register must be used to ensure timings, unless specific instructions otherwise are given in the individual timing subsections of the datasheet.

All timings are tested with an input edge rate of 4 volts per nanosecond (4 V/ns).

### 5.10.1.1.3 Timing Parameters and Board Routing Analysis

The timing parameter values specified in this data manual do not include delays by board routes. As a good board design practice, such delays must *always* be taken into account. Timing values may be adjusted by increasing/decreasing such delays. TI recommends using the available I/O buffer information specification (IBIS) models to analyze the timing characteristics correctly. To properly use IBIS models to attain accurate timing analysis for a given system, see the [Using IBIS Models for timing Analysis](#) application report. If needed, external logic hardware such as buffers may be used to compensate any timing differences.

## 5.10.2 Interface Clock Specifications

### 5.10.2.1 Interface Clock Terminology

The interface clock is used at the system level to sequence the data and/or to control transfers accordingly with the interface protocol.

### 5.10.2.2 Interface Clock Frequency

The two interface clock characteristics are:

- The maximum clock frequency
- The maximum operating frequency

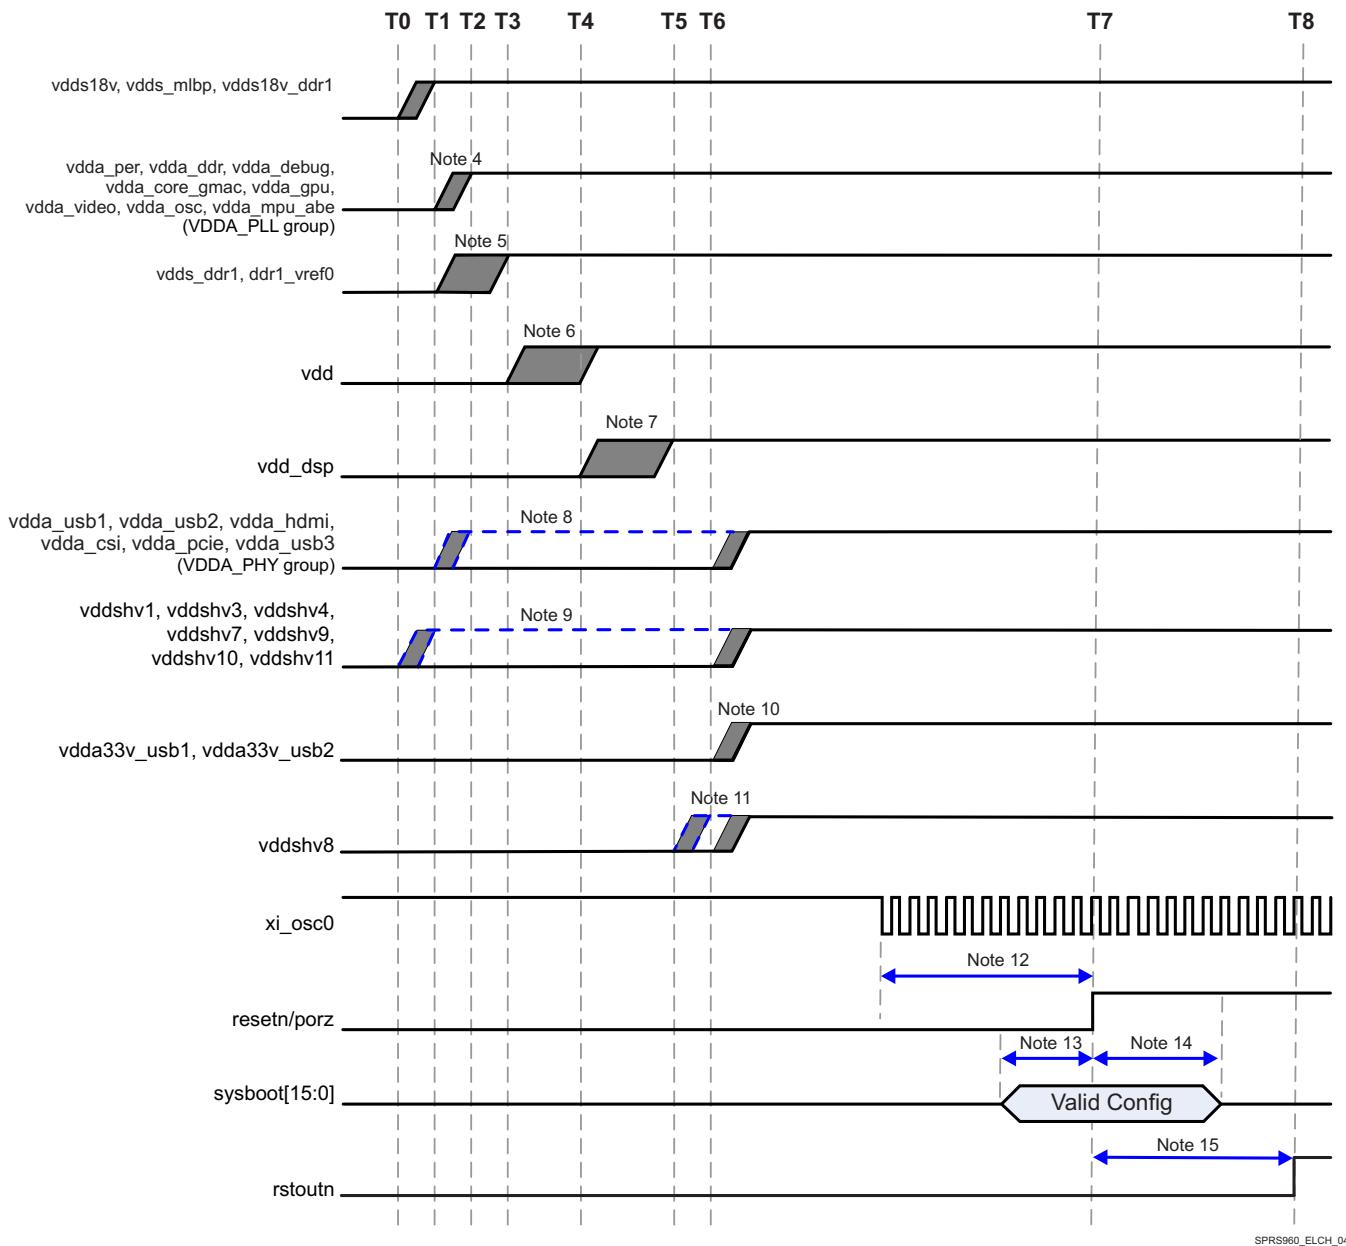

The interface clock frequency documented in this document is the maximum clock frequency, which corresponds to the maximum frequency programmable on this output clock. This frequency defines the maximum limit supported by the Device IC and does not take into account any system consideration (PCB, peripherals).

The system designer will have to consider these system considerations and the Device IC timing characteristics as well to define properly the maximum operating frequency that corresponds to the maximum frequency supported to transfer the data on this interface.

### 5.10.3 Power Supply Sequences

This section describes the power-up and power-down sequence required to ensure proper device operation. The power supply names described in this section comprise a superset of a family of compatible devices. Some members of this family will not include a subset of these power supplies and their associated device modules. Refer to the [Section 4.2, Pin Attributes](#) of the [Section 4, Terminal Configuration and Functions](#) to determine which power supplies are applicable.

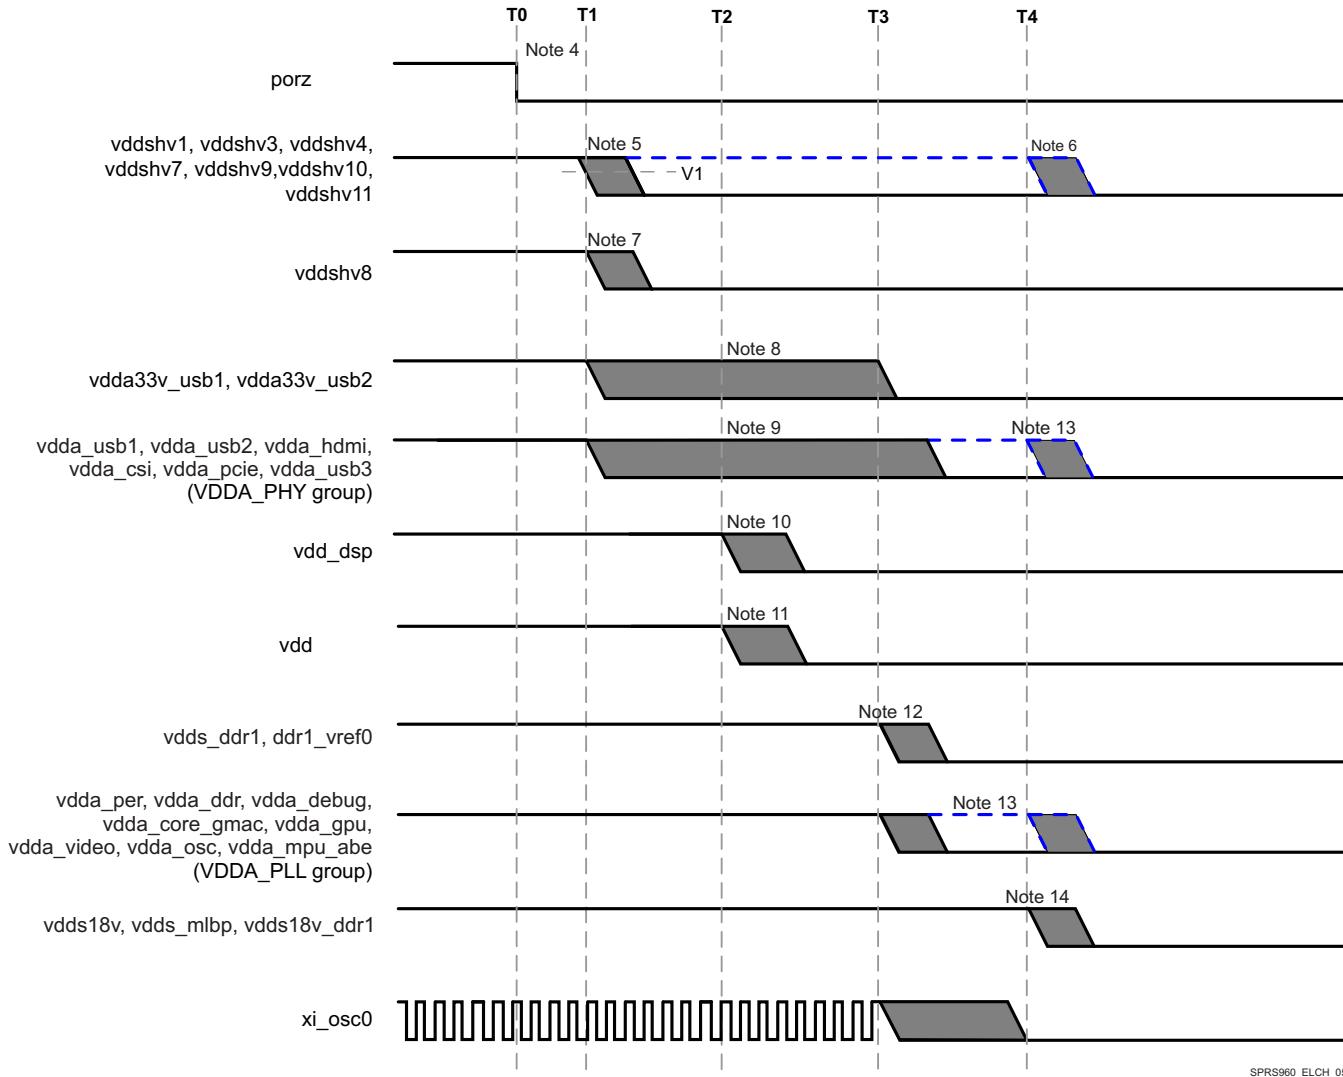

Figure 5-5 through Figure 5-9 and associated notes described the device Recommended Power Sequencing.

**Figure 5-5. Recommended Power-Up Sequencing**

- (1)  $T_0 = 0\text{ms}$ ,  $T_1 = 0.55\text{ms}$ ,  $T_2 = 1.1\text{ms}$ ,  $T_3 = 1.65\text{ms}$ ,  $T_4 = 2.2\text{ms}$ ,  $T_5 = 2.75\text{ms}$ ,  $T_6 = 3.3\text{ms}$ ,  $T_7 = 6.9\text{ms}$ ,  $T_8 \approx 9\text{ms}$ . All “ $T_n$ ” markers show total elapsed time from  $T_0$ .
- (2) Terminology:
  - $V_{OPR\ MIN}$  = Minimum Operational Voltage level that ensures device functionality and specified performance per [Section 5.4, Recommended Operating Conditions](#).
  - Ramp Up = transition time from  $V_{OFF}$  to  $V_{OPR\ MIN}$
- (3) General timing diagram items:
  - Grey shaded areas show valid transition times for supplies between  $V_{OPR\ MIN}$  and  $V_{OFF}$ .
  - Dashed horizontal lines are not valid ramp times but show alternate transition times based upon common sources and clarified in associated note.
  - Dashed vertical lines show approximate elapse times based upon TI recommended PMIC power sequencer circuit performance.
- (4)  $vdda_{\ast}$  rails should not be combined with  $vdds18v_{\ast}$  for best performance to avoid transient switching noise impacts on analog domains.  $vdda_{\ast}$  should not ramp-up before  $vdds18v_{\ast}$  but could ramp concurrently if design ensures final operational voltage will not be reached.

- until after vdds18v. The preferred sequence has vdda\_\* following vdds18v\_\* to ensure circuit components and PCB design do not cause an inadvertent violation.
- (5) vdds\_ddr1 should not ramp-up before vdds18v\_\*. The preferred sequence has vdds\_ddr1 following vdds18v\_\* to ensure circuit components and PCB design do not cause an inadvertent violation. vdds\_ddr1 can ramp-up before, concurrently or after vdda\_\*, there are no dependencies between vdds\_ddr1 and vdda\_\* domains.
- For DDR2 mode of operation (1.8V), vdds\_ddr1 supplies can be combined with all vdds18v\_\* supplies and ramped up together for simplified PDN and power sequencing.
  - If vdds\_ddr1 is combined with vdds18v\_ddr1 but kept separate from vdds18v on board, then this combined 1.8V DDR supply can come up together or after the vdds18v supply. The 1.8V DDR supply should never ramp up before the vdds18v.
- (6) vdd should not ramp-up before vdds18v\_\* or vdds\_ddr1 domains have reached  $V_{OPR\ MIN}$ .
- (7) vdd\_dsp could ramp concurrently with vdd if design ensures:
- Final vdd\_dsp operational voltage will not be reached until after vdd.
  - vdd\_dsp maintains a voltage level at least 150mV less than vdd during entire ramp time. The preferred sequence has vdd\_dsp following vdd to ensure circuit components and PCB design do not cause an inadvertent violation.
- (8) VDDA\_PHY group:
- should ramp up concurrently or after vdda33v\_usb[1-2] to avoid unintended current path between vdda\_PCIE to vdda33v\_usb1 during power sequencing.
  - could ramp up concurrently with VDDA\_PLL group only if the vdda33v\_usb1 power resource has an “off impedance” greater than  $100\Omega$ .
- (9) vddshv[1, 3-4, 7, 9-11] domains:
- If 1.8V I/O signaling is needed, then 1.8V must be sourced from common vdds18v supply and ramp up concurrently with vdds18v.
  - If any 3.3V I/O signaling is needed, then the desired 3.3V vddshv[1, 3-4, 7, 9-11] rails must ramp up after vdd\_dsp.
- (10) vdda33v\_usb[1-2] domain should:
- ramp up before or concurrently with VDDA\_PHY group if USB signaling is needed and to avoid unintended current path between vdda\_PCIE to vdda33v\_usb[1-2] during power sequencing.
  - connect to 3.3V vddshv[1, 3-4, 7, 9-11] common supply if USB signaling is not needed since USB analog power ball also supplies digital IO buffers that must be powered during operation.
- (11) vddshv8 shows two ramp up options for 1.8V I/O or 3.3V I/O or SD Card operation:
- If 1.8V I/O signaling is needed, then vddshv8 must ramp up after vdd and before or concurrently with 3.3V vddshv\* rails.
  - If 3.3V I/O signaling is needed, then vddshv8 must be combined with other 3.3V vddshv\* rails.
  - If SD Card operation is needed, then vddshv8 must be sourced from a dual voltage (3.3/1.8V) power source per SDIO specifications and ramp up concurrently with 3.3V vddshv\* rails.
- (12) porz must remain asserted low until both of the following conditions are met:
- Minimum of  $12 * P$ , where  $P = 1 / (\text{SYS\_CLK1}/610)$ , units in ns.
  - All device supply rails reach stable operational levels.
- (13) Setup time: sysboot[15:0] pins must be valid  $2P^{(12)}$  before porz is de-asserted high.
- (14) Hold time: sysboot[15:0] pins must be valid  $15P^{(12)}$  after porz is de-asserted high.
- (15) rstoutn will be set high after global reset, due to porz, is de-asserted following an internal 2ms delay. rstoutn is only valid after vddshv3 reaches an operational level. If used as a peripheral component reset, it should be AND gated with porz to avoid possible reset glitches during power up.

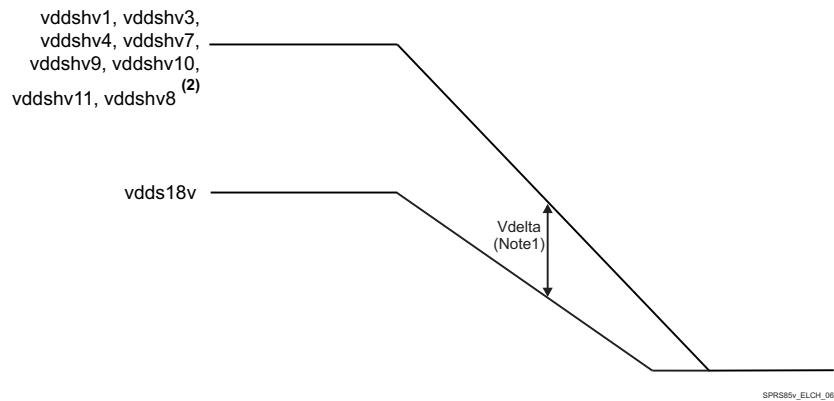

SPRS960\_ELCHE\_05

**Figure 5-6. Recommended Power-Down Sequencing**

- (1)  $T1 \geq 100 \mu s$ ;  $T2 = 500 \mu s$ ;  $T3 = 1.0 \text{ ms}$ ;  $T4 = 1.5 \text{ ms}$ ;  $V1 = 2.7 \text{ V}$ . All "Tn" markers are intended to show total elapsed time, not interval times.
- (2) Terminology:
  - $V_{OPR\ MIN}$  = Minimum Operational Voltage level that ensures device functionality and specified performance in [Section 5.4, Recommended Operating Conditions](#).
  - $V_{OFF}$  = OFF Voltage level is defined to be less than 0.6 V where any current draw has no impact to POH.
  - Ramp Down = transition time from  $V_{OPR\ MIN}$  to  $V_{OFF}$  and is slew rate independent.
- (3) General timing diagram items:
  - Grey shaded areas show valid transition times for supplies between  $V_{OPR\ MIN}$  and  $V_{OFF}$ .
  - Blue dashed lines are not valid windows but show alternate ramp possibilities based on the associated note.
  - Dashed vertical lines show approximate elapse times based upon TI recommended PMIC power-down sequencer circuit performance.
- (4) PORz must be asserted low for 100  $\mu s$  min to ensure SoC is set to a safe functional state before any voltage begins to ramp down.
- (5) vddshv[1, 3-4, 7, 9-11] domains supplied by 3.3 V:
  - must remain greater than 2.7 V to enable Dual Voltage GPIO selector circuit operation for 100  $\mu s$  min after PORz is asserted low.
  - must be in first group of supplies ramping down after PORz has been asserted low for 100  $\mu s$  min.
  - must not exceed vdds18v by more than 2 V during ramp down, see [Figure 5-7, "vdds18v versus vddshv\[1, 3-4, 7, 9-11\] Discharge Relationship"](#).
- (6) vddshv[1, 3-4, 7, 9-11] domains supplied by 1.8 V must ramp down concurrently with vdds18v and be sourced from common vdds18v supply.
- (7) vddshv8 supporting SD Card:

- must be sourced from independent power resource that can provide dual voltage (3.3 / 1.8 V) operation as required to be compliant to SDIO specification
  - must be in first group of supplies to ramp down after PORz has been asserted low for 100  $\mu$ s min.
  - if SDIO operation is not needed, must be grouped and ramped down with other vddshv[1, 3-4, 7, 9-11] domains as noted above.
- (8) vdda33v\_usb[1-2] domains:
- can start ramping down 100  $\mu$ s after low assertion of PORz
  - can ramp down concurrently or before VDDA\_PHY group
- (9) VDDA\_PHY domain group must ramp down concurrently or after vdda33v\_usb[1-2].
- (10) vdd\_dsp domain can ramp down before or concurrently with vdd.
- (11) vdd must ramp down after or concurrently with vdd\_dsp.
- (12) vdds\_ddr1 domain:
- should ramp down after vdd begins ramping down.
  - If DDR2 memory is used (requiring 1.8V supply),
    - then vdds\_ddr1 can be combined with vdds18v and vdds18v\_ddr1 domains and sourced from a common supply. Accordingly, all domains can ramp down concurrently with vdds18v.
    - if vdds\_ddr1 and vdds18v\_ddr1 are combined but kept separate from vdds18v, then the combined 1.8V DDR supply can ramp down before or concurrently with vdds18v.
- (13) vdda\_\* domains:
- can ramp down before, concurrently or after vdds\_ddr1, there is no dependency between these supplies.
  - can ramp down before or concurrently with vdds18v.
  - must satisfy the vdds18v versus vdda\_\* discharge relationship (see [Figure 5-9](#)) if any of the vdda\_\* disable point is later or discharge rate is slower than vdds18v.
- (14) vdds18v domain:
- should maintain  $V_{OPR\ MIN}$  ( $V_{NOM} - 5\% = 1.71\ V$ ) until all other supplies start to ramp down.
  - must satisfy the vdds18v versus vddshv[1, 3-4, 7, 9-11] discharge relationship (see [Figure 5-7](#)) if any of the vddshv[1, 3-4, 7, 9-11] is operating at 3.3 V.
  - must satisfy the vdds18v versus vdds\_ddr1 discharge relationship (see [Figure 5-8](#)) if vdds\_ddr1 discharge rate is slower than vdds18v.

[Figure 5-7](#) describes vddshv[1, 3-4, 7, 9-11] Supplies Falling Before vdds18v Supplies Delta.

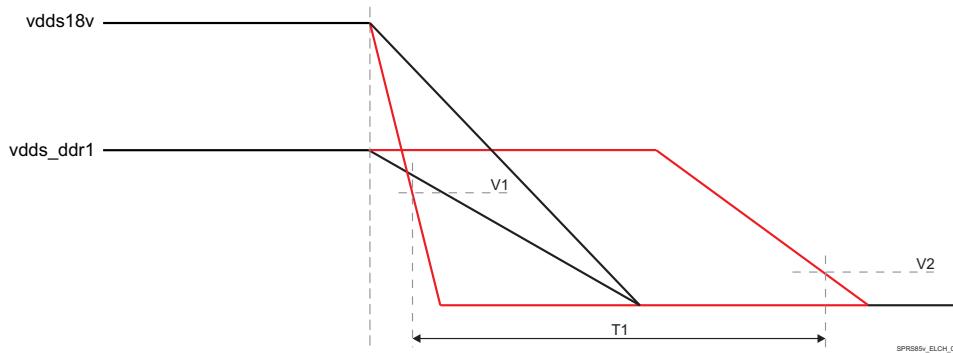

**Figure 5-7. vdds18v versus vddshv[1, 3-4, 7, 9-11] Discharge Relationship**

(1)  $V_{\Delta}$  MAX = 2V.

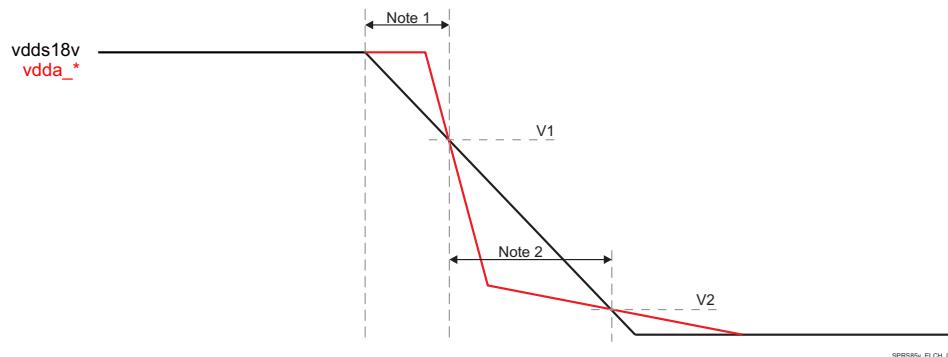

(2) If vddshv8 is powered by the same supply source as the other vddshv[1, 3-4, 7, 9-11] rails.

If vdds18v and vdds\_ddr1 are disabled at the same time due to a loss of input power event or if vdds\_ddr1 discharges more slowly than vdds18v, analysis has shown no reliability impacts when the elapsed time period beginning with vdds18v dropping below 1.0 V and ending with vdds\_ddr1 dropping below 0.6 V is less than 10 ms ([Figure 5-8](#)).

**Figure 5-8. vdds18v and vdds\_ddr1 Discharge Relationship<sup>(1)</sup>**

- (1)  $V1 > 1.0 \text{ V}$ ;  $V2 < 0.6 \text{ V}$ ;  $T1 < 10\text{ms}$ .

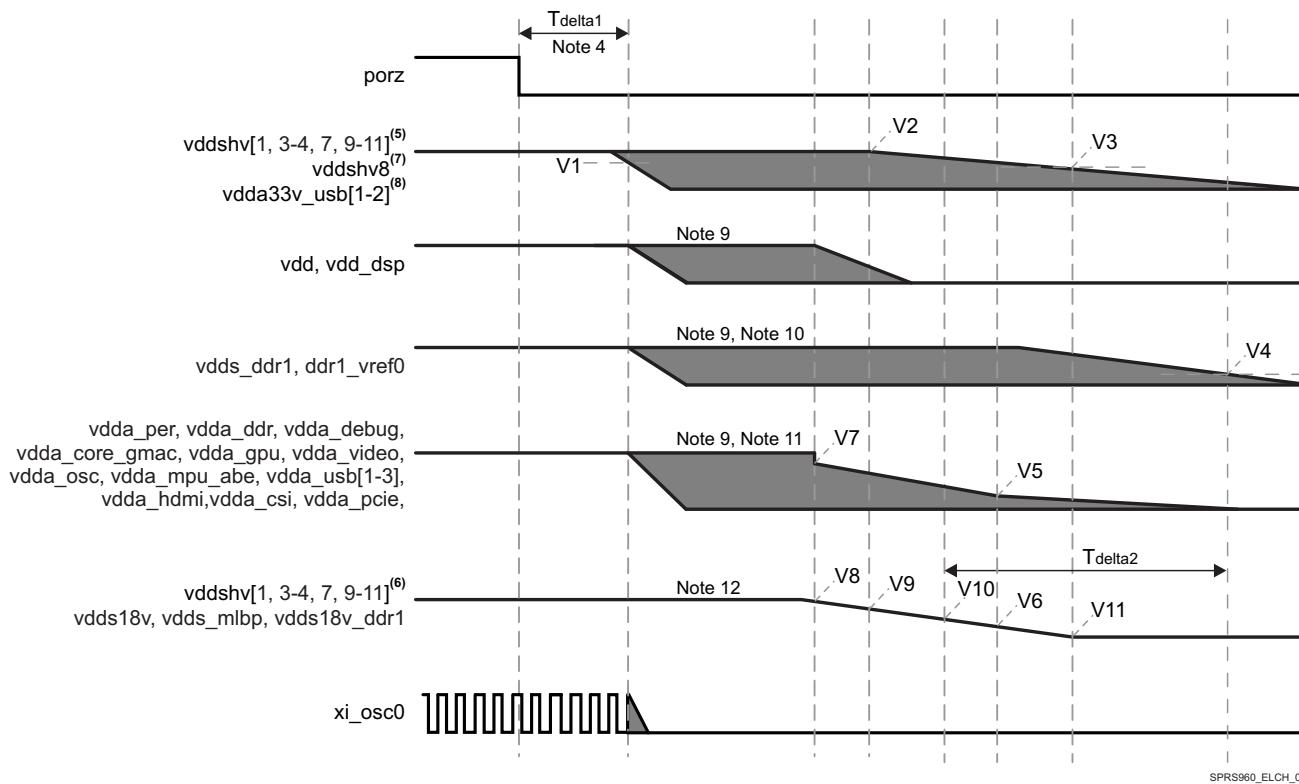

**Figure 5-9. vdds18v and vdda\_\* Discharge Relationship<sup>(3)</sup>**

- (1)  $vdda_*$  can be  $\geq vdds18v$ , until  $vdds18v$  drops below 1.62 V.
- (2)  $vdds18v$  must be  $\geq vdda_*$ , until  $vdds18v$  reaches 0.6 V.
- (3)  $V1 = 1.62 \text{ V}$ ;  $V2 < 0.6 \text{ V}$ .

Figure 5-7 through Figure 5-10 and associated notes described the device Abrupt Power Down Sequence.

A "loss of input power event" occurs when the system's input power is unexpectedly removed. Normally, the recommended power-down sequence should be followed and can be accomplished within 1.5-2 ms of elapsed time. This is the typical range of elapsed time available following a loss of power event, see [Section 7.3.7](#) for design recommendations. If sufficient elapse time is not provided, then an "abrupt" power-down sequence can be supported without impacting POH reliability if all of the following conditions are met ([Figure 5-10](#)).

**Figure 5-10. Abrupt Power-Down Sequencing<sup>(1)</sup>**

(1)  $V1 = 2.7\text{ V}; V2 = 3.3\text{ V}; V3 = 2.0\text{ V}; V4 = V5 = V6 = 0.6\text{ V}; V7 = V8 = 1.62\text{ V}; V9 = 1.3\text{ V}; V10 = 1.0\text{ V}; V11 = 0.0\text{ V}; T_{delta1} > 100\text{ }\mu\text{s}; T_{delta2} < 10\text{ ms}.$

(2) Terminology:

- $V_{OPR\ MIN}$  = Minimum Operational Voltage level that ensures device functionality and specified performance in [Section 5.4, Recommended Operating Conditions](#).
- $V_{OFF}$  = OFF Voltage level is defined to be less than 0.6 V, where any current draw has no impact to POH.
- Ramp Down = transition time from  $V_{OPR\ MIN}$  to  $V_{OFF}$  and is slew rate independent.

(3) General timing diagram items:

- Grey shaded areas show valid transition times for supplies between  $V_{OPR\ MIN}$  and  $V_{OFF}$ .
- Dashed vertical lines show approximate elapse times based upon TI recommended PMIC power-down sequencer circuit performance.

(4) PORZ must be asserted low for 100  $\mu$ s min to ensure SoC is set to a safe functional state before any voltage begins to ramp down.

(5) vddshv[1, 3-4, 7, 9-11] domains supplied by 3.3 V:

- must remain greater than 2.7 V to enable Dual Voltage GPIO selector circuit operation for 100  $\mu$ s min, after PORZ is asserted low.
- must not exceed vdds18v voltage level by more than 2V during ramp down, until vdds18v drops below  $V_{OFF}$  (0.6 V).

(6) vddshv[1, 3-4, 7, 9-11] domains supplied by 1.8 V must ramp down concurrently with vdds18v and be sourced from common vdds18v supply.

(7) vddshv8 supporting SD Card:

- must be in first group of supplies to ramp down after PORZ has been asserted low for 100  $\mu$ s min.
- must be sourced from independent power resource that can provide dual voltage (3.3 / 1.8 V) operation as required to be compliant to SDIO specification.
- if SDIO operation is not needed, must be grouped with other vddshv[1, 3-4, 7, 9-11] domains.

- (8) vdda33v\_usb[1-2] domains must be in first group of supplies to ramp down after PORz has been asserted low for 100  $\mu$ s min.
- (9) vdd\_dsp, vdd, vdds\_ddr1, vdda\_\* domains can all start to ramp down in any order after 100  $\mu$ s low assertion of PORz.
- (10) vdds\_ddr1 domain:
  - can remain at  $V_{OPR\ MIN}$  or a level greater than vdds18v during ramp down.
  - elapsed time from vdds18v dropping below 1.0 V to vdds\_ddr1 dropping below 0.6 V must not exceed 10 ms.
- (11) vdda\_\* domains:
  - can start to ramp down before or concurrently with vdds18v.
  - must not exceed vdds18v voltage level after vdds18v drops below 1.62 V until vdds18v drops below  $V_{OFF}$  (0.6 V).
- (12) vdds18v domain should maintain a minimum level of 1.62 V ( $V_{NOM} - 10\%$ ) until vdd\_dsp and vdd start to ramp down.

#### 5.10.4 Clock Specifications

---

##### NOTE

For more information, see Power Reset and Clock Management / PRCM Environment / External Clock Signal and Power Reset / PRCM Functional Description / PRCM Clock Manager Functional Description section of the Device TRM.

---

---

##### NOTE

Audio Back End (ABE) module is not supported for this family of devices, but “ABE” name is still present in some clock or DPLL names.

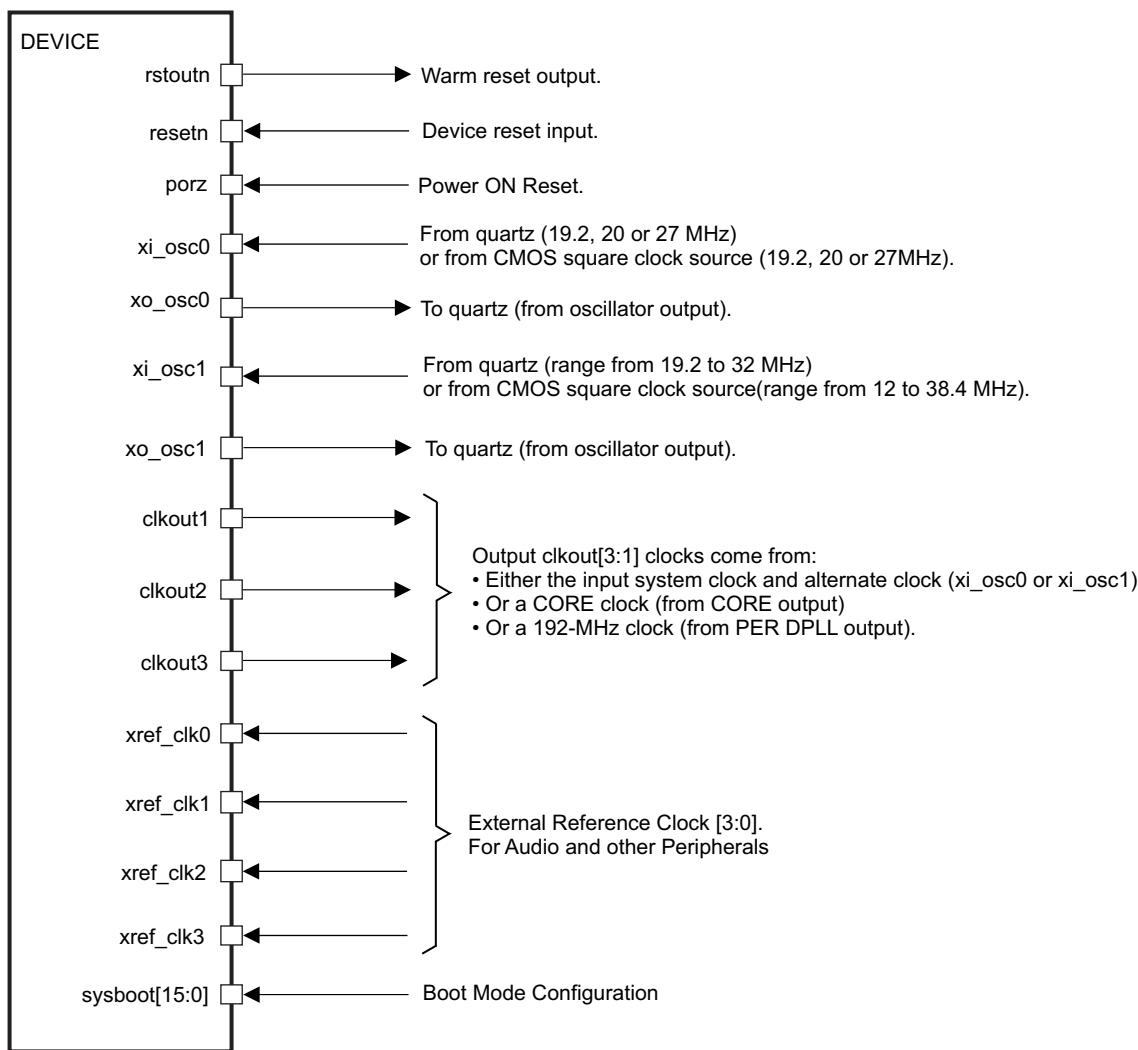

---

The device operation requires the following clocks:

- The system clocks, SYS\_CLK1 (Mandatory) and SYS\_CLK2 (Optional) are the main clock sources of the device. They supply the reference clock to the DPLLs as well as functional clock to several modules.

The Device also embeds an internal free-running 32-kHz oscillator that is always active as long as the wake-up (WKUP) domain is supplied.

Figure 5-11 shows the external input clock sources and the output clocks to peripherals.

**Figure 5-11. Clock Interface**

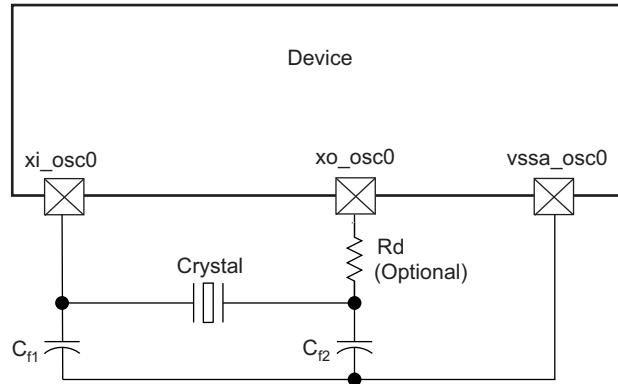

#### 5.10.4.1 Input Clocks / Oscillators

- The source of the internal system clock (SYS\_CLK1) could be either:
  - A CMOS clock that enters on the xi\_osc0 ball (with xo\_osc0 left unconnected on the CMOS clock case).
  - A crystal oscillator clock managed by xi\_osc0 and xo\_osc0.
- The source of the internal system clock (SYS\_CLK2) could be either:
  - A CMOS clock that enters on the xi\_osc1 ball (with xo\_osc1 left unconnected on the CMOS clock case).
  - A crystal oscillator clock managed by xi\_osc1 and xo\_osc1.

SYS\_CLK1 is received directly from oscillator OSC0. For more information about SYS\_CLK1 see Device TRM, Chapter: *Power, Reset, and Clock Management*.

##### 5.10.4.1.1 OSC0 External Crystal

An external crystal is connected to the device pins. [Figure 5-12](#) describes the crystal implementation.

**Figure 5-12. OSC0 Crystal Implementation****NOTE**

The load capacitors,  $C_{f1}$  and  $C_{f2}$  in Figure 5-12, should be chosen such that the below equation is satisfied.  $C_L$  in the equation is the load specified by the crystal manufacturer. All discrete components used to implement the oscillator circuit should be placed as close as possible to the associated oscillator  $xi\_osc0$ ,  $xo\_osc0$ , and  $vssa\_osc0$  pins.

$$C_L = \frac{C_{f1} C_{f2}}{(C_{f1} + C_{f2})}$$

**Figure 5-13. Load Capacitance Equation**

The crystal must be in the fundamental mode of operation and parallel resonant. Table 5-16 summarizes the required electrical constraints. and Table 5-20

**Table 5-16. OSC0 Crystal Electrical Characteristics**

NAME	DESCRIPTION		MIN	TYP	MAX	UNIT
$f_p$	Parallel resonance crystal frequency		19.2, 20, 27			MHz
$C_{f1}$	$C_{f1}$ load capacitance for crystal parallel resonance with $C_{f1} = C_{f2}$		12	24		pF
$C_{f2}$	$C_{f2}$ load capacitance for crystal parallel resonance with $C_{f1} = C_{f2}$		12	24		pF
ESR( $C_{f1}, C_{f2}$ ) (1)	Crystal ESR			100		$\Omega$
$C_0$	Crystal shunt capacitance	ESR = 30 $\Omega$ ESR = 40 $\Omega$	19.2 MHz, 20 MHz, 27 MHz		7	pF
		ESR = 50 $\Omega$	19.2 MHz, 20 MHz 27 MHz		7	pF
		ESR = 60 $\Omega$	19.2 MHz, 20 MHz 27 MHz		7	pF
		ESR = 80 $\Omega$	19.2 MHz, 20 MHz 27 MHz		5	pF
		ESR = 100 $\Omega$	19.2 MHz, 20 MHz 27 MHz		Not Supported	-
					3	pF
$L_M$	Crystal motional inductance for $f_p = 20$ MHz			10.16		mH
$C_M$	Crystal motional capacitance			3.42		fF

**Table 5-16. OSC0 Crystal Electrical Characteristics (continued)**

NAME	DESCRIPTION	MIN	TYP	MAX	UNIT
$t_{j(xiosc0)}$	Frequency accuracy <sup>(1)</sup> , xi_osc0	Ethernet and MLB not used		$\pm 200$	ppm
		Ethernet RGMII and RMII using derived clock		$\pm 50$	
		Ethernet MII using derived clock		$\pm 100$	
		MLB using derived clock		$\pm 50$	

(1) Crystal characteristics should account for tolerance+stability+aging.

When selecting a crystal, the system design must consider the temperature and aging characteristics of a based on the worst case environment and expected life expectancy of the system.

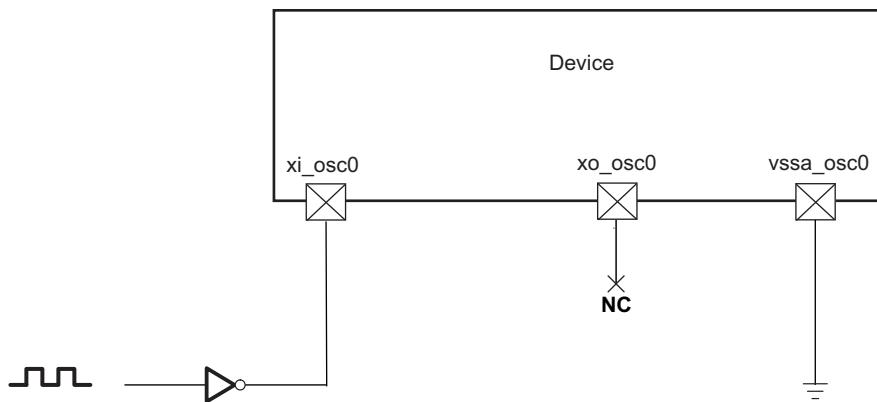

**Table 5-17** details the switching characteristics of the oscillator and the requirements of the input clock.

**Table 5-17. Oscillator Switching Characteristics—Crystal Mode**

NAME	DESCRIPTION	MIN	TYP	MAX	UNIT
$f_p$	Oscillation frequency		19.2, 20, 27 MHz		MHz
$t_{sx}$	Start-up time			4	ms

#### 5.10.4.1.2 OSC0 Input Clock

A 1.8-V LVCMS-Compatible Clock Input can be used instead of the internal oscillator to provide the SYS\_CLK1 clock input to the system. The external connections to support this are shown in [Figure 5-14](#). The xi\_osc0 pin is connected to the 1.8-V LVCMS-Compatible clock source. The xi\_osc0 pin is left unconnected. The vssa\_osc0 pin is connected to board ground (VSS).

SPRS906\_CLK\_04

**Figure 5-14. 1.8-V LVCMS-Compatible Clock Input**

**Table 5-18** summarizes the OSC0 input clock electrical characteristics.

**Table 5-18. OSC0 Input Clock Electrical Characteristics—Bypass Mode**

NAME	DESCRIPTION	MIN	TYP	MAX	UNIT
$f$	Frequency		19.2, 20, 27		MHz
$C_{IN}$	Input capacitance	2.184	2.384	2.584	pF
$I_{IN}$	Input current (3.3V mode)	4	6	10	$\mu A$

Table 5-19 details the OSC0 input clock timing requirements.

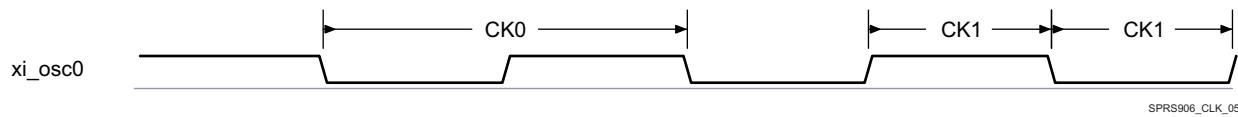

**Table 5-19. OSC0 Input Clock Timing Requirements**

NAME	DESCRIPTION		MIN	TYP	MAX	UNIT
CK0	$1 / t_{c(xi\_osc0)}$		Frequency, $xi\_osc0$		19.2, 20, 27	MHz
CK1	$t_w(xi\_osc0)$	Pulse duration, $xi\_osc0$ low or high		$0.45 \times t_{c(xi\_osc0)}$	$0.55 \times t_{c(xi\_osc0)}$	ns
	$t_j(xi\_osc0)$	Period jitter <sup>(1)</sup> , $xi\_osc0$			$0.01 \times t_{c(xi\_osc0)}$	ns
	$t_R(xi\_osc0)$	Rise time, $xi\_osc0$			5	ns
	$t_F(xi\_osc0)$	Fall time, $xi\_osc0$			5	ns
$t_j(xi\_osc0)$	Frequency accuracy <sup>(2)</sup> , $xi\_osc0$	Ethernet and MLB not used			$\pm 200$	ppm
		Ethernet RGMII and RMII using derived clock			$\pm 50$	
		Ethernet MII using derived clock			$\pm 100$	
		MLB using derived clock			$\pm 50$	

(1) Period jitter is meant here as follows:

- The maximum value is the difference between the longest measured clock period and the expected clock period
- The minimum value is the difference between the shortest measured clock period and the expected clock period

(2) Crystal characteristics should account for tolerance+stability+aging.

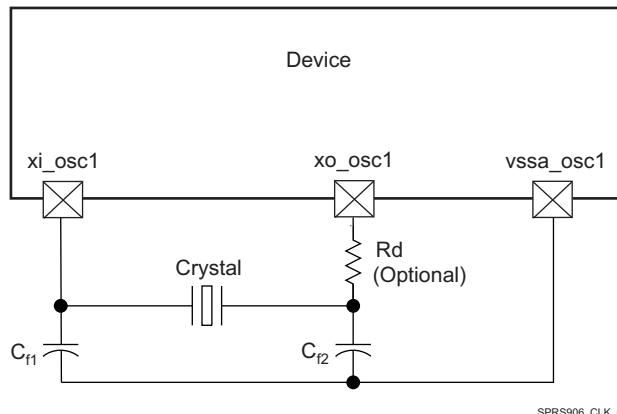

**Figure 5-15. xi\_osc0 Input Clock**

#### 5.10.4.1.3 Auxiliary Oscillator OSC1 Input Clock

SYS\_CLK2 is received directly from oscillator OSC1. For more information about SYS\_CLK2 see Device TRM, Chapter: *Power, Reset, and Clock Management*.

##### 5.10.4.1.3.1 OSC1 External Crystal

An external crystal is connected to the device pins. Figure 5-16 describes the crystal implementation.

**Figure 5-16. Crystal Implementation**

**NOTE**

The load capacitors,  $C_{f1}$  and  $C_{f2}$  in [Figure 5-16](#), should be chosen such that the below equation is satisfied.  $C_L$  in the equation is the load specified by the crystal manufacturer. All discrete components used to implement the oscillator circuit should be placed as close as possible to the associated oscillator xi\_osc1, xo\_osc1, and vssa\_osc1 pins.

$$C_L = \frac{C_{f1} C_{f2}}{(C_{f1} + C_{f2})}$$

**Figure 5-17. Load Capacitance Equation**

The crystal must be in the fundamental mode of operation and parallel resonant. [Table 5-20](#) summarizes the required electrical constraints.

**Table 5-20. OSC1 Crystal Electrical Characteristics**

NAME	DESCRIPTION			MIN	TYP	MAX	UNIT	
$f_p$	Parallel resonance crystal frequency			Range from 19.2 to 32			MHz	
$C_{f1}$	$C_{f1}$ load capacitance for crystal parallel resonance with $C_{f1} = C_{f2}$			12	24	24	pF	
$C_{f2}$	$C_{f2}$ load capacitance for crystal parallel resonance with $C_{f1} = C_{f2}$			12	24	24	pF	
ESR( $C_{f1}, C_{f2}$ )	Crystal ESR			100			$\Omega$	
$C_O$	Crystal shunt capacitance	ESR = 30 $\Omega$	19.2 MHz $\leq f_p \leq$ 32 MHz	7			pF	
		ESR = 40 $\Omega$	19.2 MHz $\leq f_p \leq$ 32 MHz	5			pF	
		ESR = 50 $\Omega$	19.2 MHz $\leq f_p \leq$ 25 MHz	7			pF	
			25 MHz $< f_p \leq$ 27 MHz	5			pF	
			27 MHz $< f_p \leq$ 32 MHz	Not Supported			-	
		ESR = 60 $\Omega$	19.2 MHz $\leq f_p \leq$ 23 MHz	7			pF	
			23 MHz $< f_p \leq$ 25 MHz	5			pF	
			25 MHz $< f_p \leq$ 32 MHz	Not Supported			-	
		ESR = 80 $\Omega$	19.2 MHz $\leq f_p \leq$ 23 MHz	5			pF	
			23 MHz $\leq f_p \leq$ 25 MHz	3			pF	
			25 MHz $< f_p \leq$ 32 MHz	Not Supported			-	
		ESR = 100 $\Omega$	19.2 MHz $\leq f_p \leq$ 20 MHz	3			pF	
			20 MHz $< f_p \leq$ 32 MHz	Not Supported			-	
$L_M$	Crystal motional inductance for $f_p = 20$ MHz			10.16			mH	
$C_M$	Crystal motional capacitance			3.42			fF	
$t_{j(xiosc1)}$	Frequency accuracy <sup>(1)</sup> , xi_osc1		Ethernet and MLB not used	$\pm 200$			ppm	
			Ethernet RGMII and RMII using derived clock	$\pm 50$				
			Ethernet MII using derived clock	$\pm 100$				
			MLB using derived clock	$\pm 50$				

(1) Crystal characteristics should account for tolerance+stability+aging.

When selecting a crystal, the system design must take into account the temperature and aging characteristics of a crystal versus the user environment and expected lifetime of the system.

[Table 5-21](#) details the switching characteristics of the oscillator and the requirements of the input clock.

**Table 5-21. Oscillator Switching Characteristics—Crystal Mode**

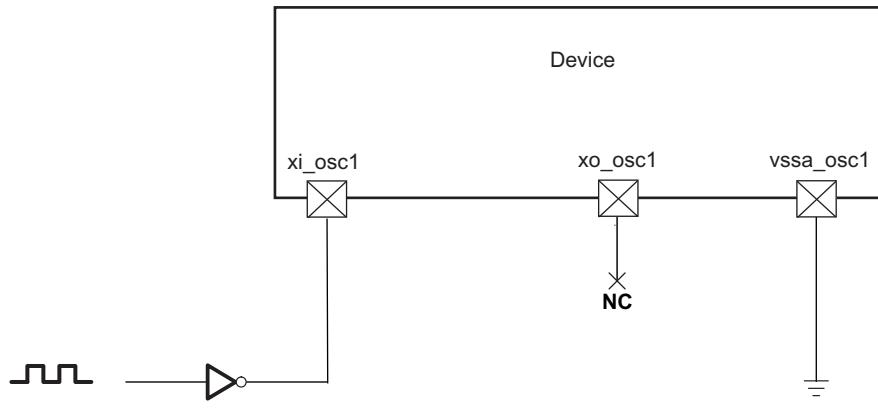

NAME	DESCRIPTION	MIN	TYP	MAX	UNIT
$f_p$	Oscillation frequency	Range from 19.2 to 32			MHz

**Table 5-21. Oscillator Switching Characteristics—Crystal Mode (continued)**

NAME	DESCRIPTION	MIN	TYP	MAX	UNIT
$t_{sx}$	Start-up time			4	ms

#### 5.10.4.1.3.2 OSC1 Input Clock

A 1.8-V LVCMS-Compatible Clock Input can be used instead of the internal oscillator to provide the SYS\_CLK2 clock input to the system. The external connections to support this are shown in, [Figure 5-18](#). The xi\_osc1 pin is connected to the 1.8-V LVCMS-Compatible clock sources. The xo\_osc1 pin is left unconnected. The vssa\_osc1 pin is connected to board ground (vss).

SPRS96\_CLK\_07

**Figure 5-18. 1.8-V LVCMS-Compatible Clock Input**

[Table 5-22](#) summarizes the OSC1 input clock electrical characteristics.

**Table 5-22. OSC1 Input Clock Electrical Characteristics—Bypass Mode**

NAME	DESCRIPTION	MIN	TYP	MAX	UNIT
f	Frequency		Range from 12 to 38.4		MHz
$C_{IN}$	Input capacitance	2.819	3.019	3.219	pF
$I_{IN}$	Input current (3.3V mode)	4	6	10	$\mu$ A
$t_{sx}$	Start-up time <sup>(1)</sup>		See <sup>(2)</sup>		ms

- (1) To switch from bypass mode to crystal or from crystal mode to bypass mode, there is a waiting time about 100  $\mu$ s; however, if the chip comes from bypass mode to crystal mode the crystal will start-up after time mentioned in [Table 5-21](#),  $t_{sx}$  parameter.
- (2) Before the processor boots up and the oscillator is set to bypass mode, there is a waiting time when the internal oscillator is in application mode and receives a wave. The switching time in this case is about 100  $\mu$ s.

[Table 5-23](#) details the OSC1 input clock timing requirements.

**Table 5-23. OSC1 Input Clock Timing Requirements**

NAME	DESCRIPTION	MIN	TYP	MAX	UNIT
CK0	$1 / t_{c(xiosc1)}$ Frequency, xi_osc1		Range from 12 to 38.4		MHz
CK1	$t_w(xiosc1)$ Pulse duration, xi_osc1 low or high		$0.45 \times t_{c(xiosc1)}$	$0.55 \times t_{c(xiosc1)}$	ns
	$t_j(xiosc1)$ Period jitter <sup>(1)</sup> , xi_osc1			$0.01 \times t_{c(xiosc1)}$ <sup>(3)</sup>	ns
	$t_R(xiosc1)$ Rise time, xi_osc1			5	ns
	$t_F(xiosc1)$ Fall time, xi_osc1			5	ns

**Table 5-23. OSC1 Input Clock Timing Requirements (continued)**

NAME	DESCRIPTION		MIN	TYP	MAX	UNIT
t <sub>j(xiosc1)</sub>	Frequency accuracy <sup>(2)</sup> , xi_osc1	Ethernet and MLB not used			±200	ppm
		Ethernet RGMII and RMII using derived clock			±50	
		Ethernet MII using derived clock			±100	
		MLB using derived clock			±50	

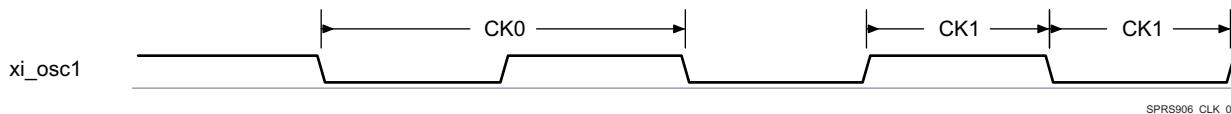

(1) Period jitter is meant here as follows:

- The maximum value is the difference between the longest measured clock period and the expected clock period
- The minimum value is the difference between the shortest measured clock period and the expected clock period

(2) Crystal characteristics should account for tolerance+stability+aging.

(3) The Period jitter requirement for osc1 can be relaxed to  $0.02 \times t_c(xiosc1)$  under the following constraints:

- The osc1/SYS\_CLK2 clock bypasses all device PLLs
- The osc1/SYS\_CLK2 clock is only used to source the DSS pixel clock outputs

SPRS906\_CLK\_08

**Figure 5-19. xi\_osc1 Input Clock**

#### 5.10.4.1.4 RC On-die Oscillator Clock

##### NOTE

The OSC\_32K\_CLK clock, provided by the On-die 32K RC oscillator, inside of the SoC, is not accurate 32kHz clock.

The frequency may significantly vary with temperature and silicon characteristics.

For more information about OSC\_32K\_CLK see the Device TRM, Chapter: *Power, Reset, and Clock Management*.

#### 5.10.4.2 Output Clocks

The device provides three output clocks. Summary of these output clocks are as follows:

- clkout1 - Device Clock output 1. Can be used as a system clock for other devices. The source of the clkout1 could be either:
  - The input system clock and alternate clock (xi\_osc0 or xi\_osc1)
  - CORE clock (from CORE output)
  - 192-MHz clock (from PER DPLL output)
- clkout2 - Device Clock output 2. Can be used as a system clock for other devices. The source of the clkout2 could be either:
  - The input system clock and alternate clock (xi\_osc0 or xi\_osc1)
  - CORE clock (from CORE output)
  - 192-MHz clock (from PER DPLL output)
- clkout3 - Device Clock output 3. Can be used as a system clock for other devices. The source of the clkout3 could be either:
  - The input system clock and alternate clock (xi\_osc0 or xi\_osc1)
  - CORE clock (from CORE output)
  - 192-MHz clock (from PER DPLL output)

For more information about Output Clocks see Device TRM, Chapter: *Power, Reset, and Clock Management*.

### 5.10.4.3 DPLLs, DLLs

---

#### NOTE

For more information, see:

- Power, Reset, and Clock Management / Clock Management Functional / Internal Clock Sources / Generators / Generic DPLL Overview Section  
and
  - Display Subsystem / Display Subsystem Overview section of the Device TRM.
- 

To generate high-frequency clocks, the device supports multiple on-chip DPLLs controlled directly by the PRCM module. They are of two types: type A and type B DPLLs.

- They have their own independent power domain (each one embeds its own switch and can be controlled as an independent functional power domain)
- They are fed with ALWAYS ON system clock, with independent control per DPLL.

The different DPLLs managed by the PRCM are listed below:

- DPLL\_MPU: It supplies the MPU subsystem clocking internally.
  - DPLL\_IVA: It feeds the IVA subsystem clocking.
  - DPLL\_CORE: It supplies all interface clocks and also few module functional clocks.
  - DPLL\_PER: It supplies several clock sources: a 192-MHz clock for the display functional clock, a 96-MHz functional clock to subsystems and peripherals.
  - DPLL\_ABE: It provides clocks to various modules within the device.
  - DPLL\_USB: It provides 960M clock for USB modules (USB1/2/3/4).
  - DPLL\_GMAC: It supplies several clocks for the Gigabit Ethernet Switch (GMAC\_SW).
  - DPLL\_DSP: It feeds the DSP Subsystem clocking.
  - DPLL\_GPU: It supplies clock for the GPU Subsystem.
  - DPLL\_DDR: It generates clocks for the two External Memory Interface (EMIF) controllers and their associated EMIF PHYs.
  - DPLL\_PCIE\_REF: It provides reference clock for the APLL\_PCIE in PCIE Subsystem.
  - APLL\_PCIE: It feeds clocks for the device Peripheral Component Interconnect Express (PCIe) controllers.
- 

#### NOTE

The following DPLLs are controlled by the clock manager located in the always-on Core power domain (CM\_CORE\_AON):

- DPLL\_MPU, DPLL\_IVA, DPLL\_CORE, DPLL\_ABE, DPLL\_DDR, DPLL\_GMAC, DPLL\_PCIE\_REF, DPLL\_PER, DPLL\_USB, DPLL\_DSP, DPLL\_GPU, APLL\_PCIE\_REF.
- 

For more information on CM\_CORE\_AON and CM\_CORE or PRCM DPLLs, see the Power, Reset, and Clock Management (PRCM) chapter of the Device TRM.

The following DPLLs are not managed by the PRCM:

- DPLL\_VIDEO1; (It is controlled from DSS)
  - DPLL\_HDMI; (It is controlled from DSS)
  - DPLL\_DEBUG; (It is controlled from DEBUGSS)
  - DPLL\_USB\_OTG\_SS; (It is controlled from OCP2SCP1)
- 

#### NOTE

For more information for not controlled from PRCM DPLL's see the related chapters in TRM.

---

### 5.10.4.3.1 DPLL Characteristics

The DPLL has three relevant input clocks. One of them is the reference clock (CLKINP) used to generate the synthesized clock but can also be used as the bypass clock whenever the DPLL enters a bypass mode. It is therefore mandatory. The second one is a fast bypass clock (CLKINPULOW) used when selected as the bypass clock and is optional. The third clock (CLKINPHIF) is explained in the next paragraph.

The DPLL has three output clocks (namely CLKOUT, CLKOUTX2, and CLKOUTHIF). CLKOUT and CLKOUTX2 run at the bypass frequency whenever the DPLL enters a bypass mode. Both of them are generated from the lock frequency divided by a post-divider (namely M2 post-divider). The third clock, CLKOUTHIF, has no automatic bypass capability. It is an output of a post-divider (M3 post-divider) with the input clock selectable between the internal lock clock ( $F_{DPLL}$ ) and CLKINPHIF input of the PLL through an asynchronous multiplexing.

For more information, see the Power Reset Controller Management chapter of the Device TRM.

**Table 5-24** summarizes DPLL type described in [Section 5.10.4.3, DPLLs, DLLs Specifications](#) introduction.

**Table 5-24. DPLL Control Type**

DPLL NAME	TYPE	CONTROLLED BY PRCM
DPLL_ABE	<a href="#">Table 5-25</a> (Type A)	Yes <sup>(1)</sup>
DPLL_CORE	<a href="#">Table 5-25</a> (Type A)	Yes <sup>(1)</sup>
DPLL_DEBUGSS	<a href="#">Table 5-25</a> (Type A)	No <sup>(2)</sup>
DPLL_DSP	<a href="#">Table 5-25</a> (Type A)	Yes <sup>(1)</sup>
DPLL_GMAC	<a href="#">Table 5-25</a> (Type A)	Yes <sup>(1)</sup>
DPLL_HDMI	<a href="#">Table 5-26</a> (Type B)	No <sup>(2)</sup>
DPLL_IVA	<a href="#">Table 5-25</a> (Type A)	Yes <sup>(1)</sup>
DPLL_MPU	<a href="#">Table 5-25</a> (Type A)	Yes <sup>(1)</sup>
DPLL_PER	<a href="#">Table 5-25</a> (Type A)	Yes <sup>(1)</sup>
APLL_PCIE	<a href="#">Table 5-25</a> (Type A)	Yes <sup>(1)</sup>
DPLL_PCIE_REF	<a href="#">Table 5-26</a> (Type B)	Yes <sup>(1)</sup>
DPLL_USB	<a href="#">Table 5-26</a> (Type B)	Yes <sup>(1)</sup>
DPLL_USB_OTG_SS	<a href="#">Table 5-26</a> (Type B)	No <sup>(2)</sup>
DPLL_VIDEO1	<a href="#">Table 5-25</a> (Type A)	No <sup>(2)</sup>
DPLL_DDR	<a href="#">Table 5-25</a> (Type A)	Yes <sup>(1)</sup>
DPLL_GPU	<a href="#">Table 5-25</a> (Type A)	Yes <sup>(1)</sup>

(1) DPLL is in the always-on domain.

(2) DPLL is not controlled by the PRCM.

[Table 5-25](#) and [Table 5-26](#) summarize the DPLL characteristics and assume testing over recommended operating conditions.

**Table 5-25. DPLL Type A Characteristics**

NAME	DESCRIPTION	MIN	TYP	MAX	UNIT	COMMENTS
$f_{input}$	CLKINP input frequency	0.032		52	MHz	$F_{INP}$
$f_{internal}$	Internal reference frequency	0.15		52	MHz	REFCLK
$f_{CLKINPHIF}$	CLKINPHIF input frequency	10		1400	MHz	$F_{INPHIF}$
$f_{CLKINPULOW}$	CLKINPULOW input frequency	0.001		600	MHz	Bypass mode: $f_{CLKOUT} = f_{CLKINPULOW} / (M1 + 1)$ if $ulowclken = 1$ <sup>(6)</sup>
$f_{CLKOUT}$	CLKOUT output frequency	20 <sup>(1)</sup>		1800 <sup>(2)</sup>	MHz	$[M / (N + 1)] \times F_{INP} \times [1 / M2]$ (in locked condition)

**Table 5-25. DPLL Type A Characteristics (continued)**

NAME	DESCRIPTION	MIN	TYP	MAX	UNIT	COMMENTS
$f_{CLKOUTx2}$	CLKOUTx2 output frequency	40 <sup>(1)</sup>		2200 <sup>(2)</sup>	MHz	$2 \times [M / (N + 1)] \times F_{INP} \times [1 / M2]$ (in locked condition)
$f_{CLKOUTHIF}$	CLKOUTHIF output frequency	20 <sup>(3)</sup>		1400 <sup>(4)</sup>	MHz	$F_{INPHIF} / M3$ if $clkinphifsel = 1$
		40 <sup>(3)</sup>		2200 <sup>(4)</sup>	MHz	$2 \times [M / (N + 1)] \times F_{INP} \times [1 / M3]$ if $clkinphifsel = 0$
$f_{CLKDCOLDO}$	DCOCLKLDO output frequency	40		2800	MHz	$2 \times [M / (N + 1)] \times F_{INP}$ (in locked condition)
$t_{lock}$	Frequency lock time			$6 + 350 \times REFCLK$	μs	
$\tau_{lock}$	Phase lock time			$6 + 500 \times REFCLK$	μs	
$t_{relock-L}$	Relock time—Frequency lock <sup>(5)</sup> (LP relock time from bypass)			$6 + 70 \times REFCLK$	μs	DPLL in LP relock time: $lowcurrstdby = 1$
$\tau_{relock-L}$	Relock time—Phase lock <sup>(5)</sup> (LP relock time from bypass)			$6 + 120 \times REFCLK$	μs	DPLL in LP relock time: $lowcurrstdby = 1$
$t_{relock-F}$	Relock time—Frequency lock <sup>(5)</sup> (fast relock time from bypass)			$3.55 + 70 \times REFCLK$	μs	DPLL in fast relock time: $lowcurrstdby = 0$
$\tau_{relock-F}$	Relock time—Phase lock <sup>(5)</sup> (fast relock time from bypass)			$3.55 + 120 \times REFCLK$	μs	DPLL in fast relock time: $lowcurrstdby = 0$

(1) The minimum frequencies on CLKOUT and CLKOUTX2 are assuming M2 = 1.

For M2 > 1, the minimum frequency on these clocks will further scale down by factor of M2.

(2) The maximum frequencies on CLKOUT and CLKOUTX2 are assuming M2 = 1.

(3) The minimum frequency on CLKOUTHIF is assuming M3 = 1. For M3 > 1, the minimum frequency on this clock will further scale down by factor of M3.

(4) The maximum frequency on CLKOUTHIF is assuming M3 = 1.

(5) Relock time assumes typical operating conditions, 10°C maximum temperature drift.

(6) Bypass mode:  $f_{CLKOUT} = F_{INP}$  if  $ulowclken = 0$ . For more information, see the Device TRM.

**Table 5-26. DPLL Type B Characteristics**

NAME	DESCRIPTION	MIN	TYP	MAX	UNIT	COMMENTS
$f_{input}$	CLKINP input clock frequency	0.62		60	MHz	$F_{INP}$
$f_{internal}$	REFCLK internal reference clock frequency	0.62		2.5	MHz	$[1 / (N + 1)] \times F_{INP}$
$f_{CLKINPULOW}$	CLKINPULOW bypass input clock frequency	0.001		600	MHz	Bypass mode: $f_{CLKOUT} = f_{CLKINPULOW} / (M1 + 1)$ If $ulowclken = 1$ <sup>(4)</sup>
$f_{CLKDOOUT}$	CLKOUTLDO output clock frequency	20 <sup>(1)(5)</sup>		2500 <sup>(2)(5)</sup>	MHz	$M / (N + 1) \times F_{INP} \times [1 / M2]$ (in locked condition)
$f_{CLKOUT}$	CLKOUT output clock frequency	20 <sup>(1)(5)</sup>		1450 <sup>(2)(5)</sup>	MHz	$[M / (N + 1)] \times F_{INP} \times [1 / M2]$ (in locked condition)
$f_{CLKDCOLDO}$	Internal oscillator (DCO) output clock frequency	750 <sup>(6)</sup>		1500 <sup>(6)</sup>	MHz	$[M / (N + 1)] \times F_{INP}$ (in locked condition)
		1250 <sup>(6)</sup>		2500 <sup>(5)</sup>	MHz	
$t_j$	CLKOUTLDO period jitter	–2.5%	2.5%			The period jitter at the output clocks is $\pm 2.5\%$ peak to peak
	CLKOUT period jitter					
	CLKDCOLDO period jitter					
$t_{lock}$	Frequency lock time			$350 \times REFCLKs$	μs	
$\tau_{lock}$	Phase lock time			$500 \times REFCLKs$	μs	
$t_{relock-L}$	Relock time—Frequency lock <sup>(3)</sup> (LP relock time from bypass)			$9 + 30 \times REFCLKs$	μs	

**Table 5-26. DPLL Type B Characteristics (continued)**

NAME	DESCRIPTION	MIN	TYP	MAX	UNIT	COMMENTS
$t_{\text{Prelock-L}}$	Relock time—Phase lock <sup>(3)</sup> (LP relock time from bypass)			$9 + 125 \times \text{REFCLKs}$	μs	

(1) The minimum frequency on CLKOUT is assuming M2 = 1.

For M2 > 1, the minimum frequency on this clock will further scale down by factor of M2.

(2) The maximum frequency on CLKOUT is assuming M2 = 1.

(3) Relock time assumes typical operating conditions, 10°C maximum temperature drift.

(4) Bypass mode:  $f_{\text{CLKOUT}} = F_{\text{INP}}$  if ULOWCLKEN = 0. For more information, see the Device TRM.

(5) For output clocks, there are two frequency ranges according to the SELFREQDCO setting. For more information, see the Device TRM.

#### 5.10.4.3.2 DLL Characteristics

Table 5-27 summarizes the DLL characteristics and assumes testing over recommended operating conditions.

**Table 5-27. DLL Characteristics**

NAME	DESCRIPTION	MIN	TYP	MAX	UNIT
$f_{\text{input}}$	Input clock frequency (EMIF_DLL_FCLK)			333	MHz
$t_{\text{lock}}$	Lock time			50k	cycles
$t_{\text{relock}}$	Relock time (a change of the DLL frequency implies that DLL must relock)			50k	cycles

#### 5.10.4.3.3 DPLL and DLL Noise Isolation

##### NOTE

For more information on DPLL and DLL decoupling capacitor requirements, see the External Capacitors / Voltage Decoupling Capacitors / I/O and Analog Voltage Decoupling / VDDA Power Domain section.

#### 5.10.5 Recommended Clock and Control Signal Transition Behavior

All clocks and control signals **must** transition between  $V_{IH}$  and  $V_{IL}$  (or between  $V_{IL}$  and  $V_{IH}$ ) in a monotonic manner. Monotonic transitions are more easily ensured with faster switching signals. Slower input transitions are more susceptible to glitches due to noise and special care should be taken for slow input clocks.

#### 5.10.6 Peripherals

##### 5.10.6.1 Timing Test Conditions

All timing requirements and switching characteristics are valid over the recommended operating conditions unless otherwise specified.

##### 5.10.6.2 Virtual and Manual I/O Timing Modes

Some of the timings described in the following sections require the use of Virtual or Manual I/O Timing Modes. Table 5-28 provides a summary of the Virtual and Manual I/O Timing Modes across all device interfaces. The individual interface timing sections found later in this document provide the full description of each applicable Virtual and Manual I/O Timing Mode. Refer to the "Pad Configuration" section of the TRM for the procedure on implementing the Virtual and Manual Timing Modes in a system.

**Table 5-28. Modes Summary**

Virtual or Manual IO Mode Name	Data Manual Timing Mode
DPI Video Output

### 5.10.6.3 VIP

The Device includes 1 Video Input Port (VIP).

Table 5-29, Figure 5-20 and Figure 5-21 present timings and switching characteristics of the VIP.

**CAUTION**

The I/O timings provided in this section are valid only for VIN1 and VIN2 if signals within a single IOSET are used. The IOSETS are defined in Table 5-30.

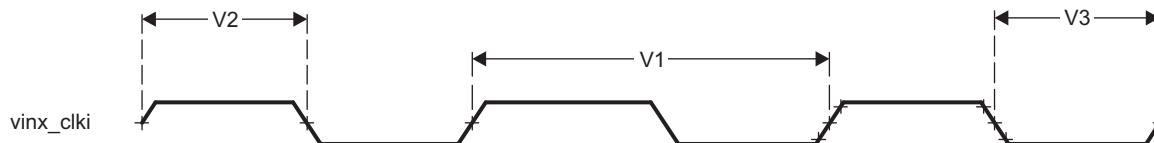

**Table 5-29. Timing Requirements for VIP (3)(4)(5)**

NO.	PARAMETER	DESCRIPTION	MIN	MAX	UNIT
V1	$t_c(CLK)$	Cycle time, $vinx_{clk_i}$ (3) (5)	6.06 (2)		ns
V2	$t_w(CLKH)$	Pulse duration, $vinx_{clk_i}$ high (3) (5)	$0.45 \times P_{(2)}$		ns
V3	$t_w(CLKL)$	Pulse duration, $vinx_{clk_i}$ low (3) (5)	$0.45 \times P_{(2)}$		ns
V4	$t_{su}(CTL/DATA-CLK)$	Input setup time, Control ( $vinx_{dei}$ , $vinx_{vsynci}$ , $vinx_{fldi}$ , $vinx_{hsynci}$ ) and Data ( $vinx_{dn}$ ) valid to $vinx_{clk_i}$ transition (3) (4) (5)	3.11 (2)		ns

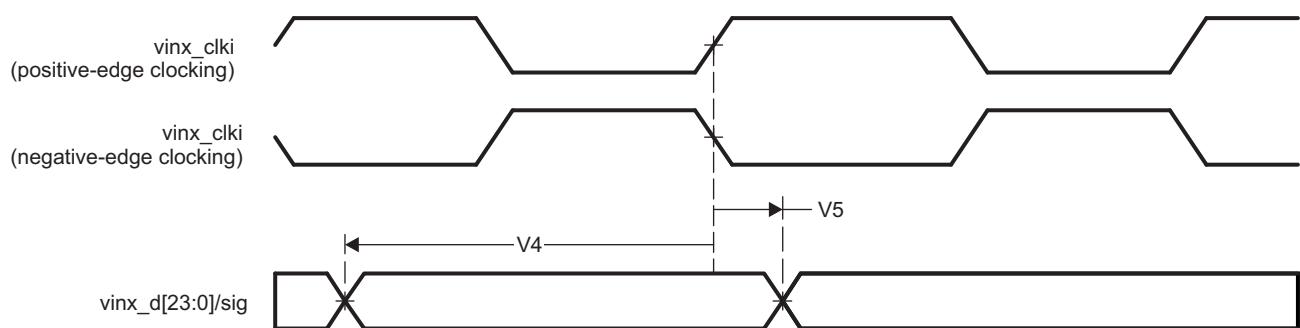

**Table 5-29. Timing Requirements for VIP (3)(4)(5) (continued)**

NO.	PARAMETER	DESCRIPTION	MIN	MAX	UNIT
V6	$t_h(\text{CLK-CTL/DATA})$	Input hold time, Control ( $\text{vinx\_dei}$ , $\text{vinx\_vsynci}$ , $\text{vinx\_fldi}$ , $\text{vinx\_hsynci}$ ) and Data ( $\text{vinx\_dn}$ ) valid from $\text{vinx\_clki}$ transition (3)(4)(5)	-0.05 (2)		ns

(1) For maximum frequency of 165 MHz.

(2)  $P = \text{vinx\_clki}$  period.(3)  $x$  in  $\text{vinx} = 1a, 1b, 2a, 2b$ .(4)  $n$  in  $\text{dn} = 0$  to 7 when  $x = 1b, 2b$ .  
 $n = 0$  to 23 when  $x = 1a, 2a$ .(5)  $i$  in  $\text{clk}_i$ ,  $\text{dei}$ ,  $\text{vsync}_i$ ,  $\text{hsync}_i$  and  $\text{fld}_i = 0$  or 1.

SPRS906\_TIMING\_VIP\_01

**Figure 5-20. Video Input Ports clock signal**

SPRS8xx\_VIP\_02

**Figure 5-21. Video Input Ports timings**

In Table 5-30 and Table 5-31 are presented the specific groupings of signals (IOSET) for use with vin1 and vin2.

**Table 5-30. VIN1 IOSETS**

(1) The IOSET under this column is only applicable for pins with alternate functionality which allows either VIN1 or VIN2 signals to be mapped to the pins. These alternate functions are controlled via CTRL\_CORE\_VIP\_MUX\_SELECT register. For more information on how to use these options, please refer to Device TRM, Chapter Control Module, Section Pad Configuration Registers.

#### NOTE

To configure the desired Manual IO Timing Mode the user must follow the steps described in section "Manual IO Timing Modes" of the Device TRM.

The associated registers to configure are listed in the **CFG REGISTER** column. For more information please see the *Control Module Chapter* in the Device TRM.

Manual IO Timings Modes must be used to ensure some IO timings for VIP1. See [Table 5-28 Modes Summary](#) for a list of IO timings requiring the use of Manual IO Timings Modes. See [Table 5-32 Manual Functions Mapping for VIN2A \(IOSET4/5/6\)](#) for a definition of the Manual modes.

[Table 5-32](#) lists the A\_DELAY and G\_DELAY values needed to calculate the correct values to be set in the CFG\_x registers.

### 5.10.6.4 DSS

Two Display Parallel Interfaces (DPI) channels are available in DSS named DPI Video Output 2 and DPI Video Output 3.

#### NOTE

The DPI Video Output  $i$  ( $i = 2, 3$ ) interface is also referred to as VOUT $i$ .

Every VOUT interface consists of:

- 24-bit data bus (data[23:0])
- Horizontal synchronization signal (HSYNC)
- Vertical synchronization signal (VSYNC)
- Data enable (DE)
- Field ID (FID)
- Pixel clock (CLK)

#### NOTE

For more information, see the Display Subsystem chapter of the Device TRM.

#### CAUTION

The I/O Timings provided in this section are valid only if signals within a single IOSET are used. The IOSETs are defined in [Table 5-42](#).

#### CAUTION

The I/O Timings provided in this section are valid only for some DSS usage modes when the corresponding Virtual I/O Timings or Manual I/O Timings are configured as described in the tables found in this section.

#### CAUTION

All pads/balls configured as vout $i$ \_\* signals must be programmed to use slow slew rate by setting the corresponding CTRL\_CORE\_PAD\_\*[SLEWCONTROL] register field to SLOW (0b1).

[Table 5-38](#), [Table 5-39](#) and [Figure 5-22](#) assume testing over the recommended operating conditions and electrical characteristic conditions.

**Table 5-38. DPI Video Output  $i$  ( $i = 2, 3$ ) Default Switching Characteristics<sup>(1)(2)</sup>**

NO.	PARAMETER	DESCRIPTION	MODE	MIN	MAX	UNIT
D1	$t_{C(\text{clk})}$	Cycle time, output pixel clock vout $i$ _clk	DPI2/3	11.76		ns
D2	$t_{w(\text{clkL})}$	Pulse duration, output pixel clock vout $i$ _clk low		$P \times 0.5-$	$1^{(1)}$	ns
D3	$t_{w(\text{clkH})}$	Pulse duration, output pixel clock vout $i$ _clk high		$P \times 0.5-$	$1^{(1)}$	ns

**Table 5-38. DPI Video Output i (i = 2, 3) Default Switching Characteristics<sup>(1)(2)</sup> (continued)**

NO.	PARAMETER	DESCRIPTION	MODE	MIN	MAX	UNIT
D5	$t_{d(\text{clk-ctlV})}$	Delay time, output pixel clock vouti_clk transition to output data vouti_d[23:0] valid	DPI2 (vin2a_fld0 clock reference)	-2.5	2.5	ns
D6	$t_{d(\text{clk-dV})}$	Delay time, output pixel clock vouti_clk transition to output control signals vouti_vsync, vouti_hsync, vouti_de, and vouti_fld valid	DPI2 (vin2a_fld0 clock reference)	-2.5	2.5	ns
D5	$t_{d(\text{clk-ctlV})}$	Delay time, output pixel clock vouti_clk transition to output data vouti_d[23:0] valid	DPI3	-2.5	2.5	ns
D6	$t_{d(\text{clk-dV})}$	Delay time, output pixel clock vouti_clk transition to output control signals vouti_vsync, vouti_hsync, vouti_de, and vouti_fld valid	DPI3	-2.5	2.5	ns

(1) P = output vouti\_clk period in ns.

(2) All pads/balls configured as vouti\_\* signals must be programmed to use slow slew rate by setting the corresponding CTRL\_CORE\_PAD\_\*[SLEWCONTROL] register field to SLOW (0b1).

(3) SERDES transceivers may be sensitive to the jitter profile of vouti\_clk. See Application Note [Optimizing DRA7xx and TDA2xx Processors for Use With Video Display SerDes](#) for additional guidance.**Table 5-39. DPI Video Output i (i = 2, 3) Alternate Switching Characteristics<sup>(2)</sup>**

NO.	PARAMETER	DESCRIPTION	MODE	MIN	MAX	UNIT
D1	$t_{c(\text{clk})}$	Cycle time, output pixel clock vouti_clk	DPI2/3	6.06		ns

D5	$t_{d(\text{clk-ctlV})}$	Delay time, output pixel clock vouti_clk transition to output data vouti_d[23:0] valid	DPI2 (xref_clk2 clock reference)	3.55	6.61	ns
D6	$t_{d(\text{clk-dV})}$	Delay time, output pixel clock vouti_clk transition to output control signals vouti_vsync, vouti_hsync, vouti_de, and vouti_fld valid	DPI2 (xref_clk2 clock reference)	3.55	6.61	ns
D5	$t_{d(\text{clk-ctlV})}$	Delay time, output pixel clock vouti_clk transition to output data vouti_d[23:0] valid	DPI3	3.55	6.61	ns
D6	$t_{d(\text{clk-dV})}$	Delay time, output pixel clock vouti_clk transition to output control signals vouti_vsync, vouti_hsync, vouti_de, and vouti_fld valid	DPI3	3.55	6.61	ns

- (1) P = output vouti\_clk period in ns.
- (2) All pads/balls configured as vouti\_\* signals must be programmed to use slow slew rate by setting the corresponding CTRL\_CORE\_PAD\_\*[SLEWCONTROL] register field to SLOW (0b1).
- (3) SERDES transceivers may be sensitive to the jitter profile of vouti\_clk. See Application Note [Optimizing DRA7xx and TDA2xx Processors for Use With Video Display SerDes](#) for additional guidance.

**Figure 5-22. DPI Video Output<sup>(1)(2)(3)</sup>**

- (1) The configuration of assertion of the data can be programmed on the falling or rising edge of the pixel clock.
- (2) The polarity and the pulse width of vouti\_hsync and vouti\_vsync are programmable, refer to the DSS section of the device TRM.
- (3) The vouti\_clk frequency can be configured, refer to the DSS section of the device TRM.

In [Table 5-42](#) are presented the specific groupings of signals (IOSET) for use with VOUT2.

**Table 5-42. VOUT2 IOSETS**

SIGNALS	IOSET1	
	BALL	MUX
vout2_d23	C8	4
vout2_d22	B9	4
vout2_d21	A7	4
vout2_d20	A9	4
vout2_d19	A8	4
vout2_d18	A11	4
vout2_d17	F10	4
vout2_d16	A10	4
vout2_d15	B10	4
vout2_d14	E10	4
vout2_d13	D10	4
vout2_d12	C10	4
vout2_d11	B11	4

**Table 5-42. VOUT2 IOSETs (continued)**

SIGNALS	IOSET1	
	BALL	MUX
vout2_d10	D11	4
vout2_d9	C11	4
vout2_d8	B12	4
vout2_d7	A12	4
vout2_d6	A13	4
vout2_d5	E11	4
vout2_d4	F11	4
vout2_d3	B13	4
vout2_d2	E13	4
vout2_d1	C13	4
vout2_d0	D13	4
vout2_vsync	B8	4
vout2_hsync	E8	4
vout2_clk	C7	4
vout2_fld	D8	4
vout2_de	B7	4

**NOTE**

To configure the desired virtual mode the user must set MODESELECT bit and DELAYMODE bitfield for each corresponding pad control register.

The pad control registers are presented in [Table 4-27](#) and described in Device TRM, *Control Module Chapter*.

Virtual IO Timings Modes must be used to ensure some IO timings for VOUT3. See [Table 5-28 Modes Summary](#) for a list of IO timings requiring the use of Virtual IO Timings Modes. See [Table 5-43 Virtual Functions Mapping for VOUT3](#) for a definition of the Virtual modes.

[Table 5-43](#) presents the values for DELAYMODE bitfield.

**Table 5-43. Virtual Functions Mapping for DSS VOUT3**

BALL	BALL NAME	Delay Mode Value	MUXMODE
		DSS_VIRTUAL1	3
B4	gpmc_ad15	14	vout3_d15

L3	gpmc_a11	15	vout3_fld
D3	gpmc_ad9	14	vout3_d9

**NOTE**

To configure the desired Manual IO Timing Mode the user must follow the steps described in section "Manual IO Timing Modes" of the Device TRM.

The associated registers to configure are listed in the **CFG REGISTER** column. For more information please see the *Control Module Chapter* in the Device TRM.

Manual IO Timings Modes must be used to ensure some IO timings for VOUT2. See [Table 5-28, Modes Summary](#) for a list of IO timings requiring the use of Manual IO Timings Modes. See [Table 5-44, Manual Functions Mapping for DSS VOUT2 IOSET1](#) for a definition of the Manual modes.

[Table 5-44](#) lists the A\_DELAY and G\_DELAY values needed to calculate the correct values to be set in the CFG\_x registers.

**Table 5-44. Manual Functions Mapping for DSS VOUT2 IOSET1**

### 5.10.6.5 HDMI

The High-Definition Multimedia Interface is provided for transmitting digital television audiovisual signals from DVD players, set-top boxes and other audiovisual sources to television sets, projectors and other video displays. The HDMI interface is aligned with the HDMI TMDS single stream standard v1.4a (720p @60Hz to 1080p @24Hz) and the HDMI v1.3 (1080p @60Hz): 3 data channels, plus 1 clock channel is supported (differential).

In are presented the specific groupings of signals (IOSET) for use with HDMI.

**NOTE**

For more information, see the High-Definition Multimedia Interface chapter of the device TRM

### 5.10.6.6 CSI2

**NOTE**

For more information, see the Camera Serial Interface 2 CAL Bridge chapter of the device TRM

The camera adaptation layer (CAL) deals with the processing of the pixel data coming from an external image sensor, data from memory. The CAL is a key component for the following multimedia applications: camera viewfinder, video record, and still image capture. The CAL has one serial camera interface :

- The primary serial interface (CSI2 Port A) is compliant with MIPI CSI-2 protocol with four data lanes.

#### 5.10.6.6.1 CSI-2 MIPI D-PHY

The CSI-2 port A is compliant with the MIPI D-PHY RX specification v1.00.00 and the MIPI CSI-2 specification v1.00, with 2 data differential lanes plus 1 clock differential lane in synchronous mode, double data rate:

- 1.5 Gbps (750 MHz) @OPP\_NOM for each lane.

### 5.10.6.7 EMIF

The device has a dedicated interface to DDR3 and DDR3L SDRAM. It supports JEDEC standard compliant DDR3 and DDR3L SDRAM devices with the following features:

- 16-bit or 32-bit data path to external SDRAM memory
- Memory device capacity: 128Mb, 256Mb, 512Mb, 1Gb, 2Gb, 4Gb and 8Gb devices
- One interface with associated DDR3/DDR3L PHYs

**NOTE**

For more information, see the EMIF Controller section of the Device TRM.

### 5.10.6.8 GPMC

The GPMC is the unified memory controller that interfaces external memory devices such as:

- Asynchronous SRAM-like memories and ASIC devices
- Asynchronous page mode and synchronous burst NOR flash
- NAND flash

**NOTE**

For more information, see the General-Purpose Memory Controller section of the Device TRM.

#### 5.10.6.8.1 GPMC/NOR Flash Interface Synchronous Timing

**CAUTION**

The I/O Timings provided in this section are valid only for some GPMC usage modes when the corresponding Virtual I/O Timings or Manual I/O Timings are configured as described in the tables found in this section.

Table 5-46 and Table 5-47 assume testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 5-23, Figure 5-24, Figure 5-25, Figure 5-26, Figure 5-27 and Figure 5-28).

**Table 5-46. GPMC/NOR Flash Interface Timing Requirements - Synchronous Mode - Default**

NO.	PARAMETER	DESCRIPTION	MIN	MAX	UNIT
F12	$t_{su(dV-clkH)}$	Setup time, read gpmc_ad[15:0] valid before gpmc_clk high	3		ns
F13	$t_h(clkH-dV)$	Hold time, read gpmc_ad[15:0] valid after gpmc_clk high	1.1		ns
F21	$t_{su(waitV-clkH)}$	Setup time, gpmc_wait[1:0] valid before gpmc_clk high	2.5		ns
F22	$t_h(clkH-waitV)$	Hold Time, gpmc_wait[1:0] valid after gpmc_clk high	1.3		ns

**NOTE**

Wait monitoring support is limited to a WaitMonitoringTime value > 0. For a full description of wait monitoring feature, see the Device TRM.

**Table 5-47. GPMC/NOR Flash Interface Switching Characteristics - Synchronous Mode - Default**

(1) Total GPMC load on any signal at 3.3V must not exceed 10pF.

(2) For single read: A = (CSRdOffTime - CSOnTime) × (TimeParaGranularity + 1) × GPMC\_FCLK period

For burst read: A = (CSRdOffTime - CSOnTime + (n - 1) × PageBurstAccessTime) × (TimeParaGranularity + 1) × GPMC\_FCLK period

For burst write: A = (CSWrOffTime - CSOnTime + (n - 1) × PageBurstAccessTime) × (TimeParaGranularity + 1) × GPMC\_FCLK period with n the page burst access number.

(3) B = ClkActivationTime × GPMC\_FCLK

(4) For single read: C = RdCycleTime × (TimeParaGranularity + 1) × GPMC\_FCLK

For burst read: C = (RdCycleTime + (n - 1) × PageBurstAccessTime) × (TimeParaGranularity + 1) × GPMC\_FCLK

For Burst write: C = (WrCycleTime + (n - 1) × PageBurstAccessTime) × (TimeParaGranularity + 1) × GPMC\_FCLK with n the page burst access number.

(5) For single read: D = (RdCycleTime - AccessTime) × (TimeParaGranularity + 1) × GPMC\_FCLK

For burst read: D = (RdCycleTime - AccessTime) × (TimeParaGranularity + 1) × GPMC\_FCLK

For burst write: D = (WrCycleTime - AccessTime) × (TimeParaGranularity + 1) × GPMC\_FCLK

(6) For single read: E = (CSRdOffTime - AccessTime) × (TimeParaGranularity + 1) × GPMC\_FCLK

For burst read: E = (CSRdOffTime - AccessTime) × (TimeParaGranularity + 1) × GPMC\_FCLK

For burst write: E = (CSWrOffTime - AccessTime) × (TimeParaGranularity + 1) × GPMC\_FCLK

(7) For nCS falling edge (CS activated):

Case GpmcFCLKDivider = 0 :

F = 0.5 × CSEExtraDelay × GPMC\_FCLK Case GpmcFCLKDivider = 1:

F = 0.5 × CSEExtraDelay × GPMC\_FCLK if (ClkActivationTime and CSOnTime are odd) or (ClkActivationTime and CSOnTime are even)

F = (1 + 0.5 × CSEExtraDelay) × GPMC\_FCLK otherwise

Case GpmcFCLKDivider = 2:

F = 0.5 × CSEExtraDelay × GPMC\_FCLK if ((CSOnTime - ClkActivationTime) is a multiple of 3)

F = (1 + 0.5 × CSEExtraDelay) × GPMC\_FCLK if ((CSOnTime - ClkActivationTime - 1) is a multiple of 3)

F = (2 + 0.5 × CSEExtraDelay) × GPMC\_FCLK if ((CSOnTime - ClkActivationTime - 2) is a multiple of 3)

Case GpmcFCLKDivider = 3:

F = 0.5 × CSEExtraDelay × GPMC\_FCLK if ((CSOnTime - ClkActivationTime) is a multiple of 4)

F = (1 + 0.5 × CSEExtraDelay) × GPMC\_FCLK if ((CSOnTime - ClkActivationTime - 1) is a multiple of 4)

F = (2 + 0.5 × CSEExtraDelay) × GPMC\_FCLK if ((CSOnTime - ClkActivationTime - 2) is a multiple of 4)

F = (3 + 0.5 × CSEExtraDelay) × GPMC\_FCLK if ((CSOnTime - ClkActivationTime - 3) is a multiple of 4)

(8) For ADV falling edge (ADV activated):

Case GpmcFCLKDivider = 0 :

G = 0.5 × ADVEExtraDelay × GPMC\_FCLK

Case GpmcFCLKDivider = 1:

G = 0.5 × ADVEExtraDelay × GPMC\_FCLK if (ClkActivationTime and ADVOnTime are odd) or (ClkActivationTime and ADVOnTime are even)

G = (1 + 0.5 × ADVEExtraDelay) × GPMC\_FCLK otherwise

Case GpmcFCLKDivider = 2:

G = 0.5 × ADVEExtraDelay × GPMC\_FCLK if ((ADVOnTime - ClkActivationTime) is a multiple of 3)

G = (1 + 0.5 × ADVEExtraDelay) × GPMC\_FCLK if ((ADVOnTime - ClkActivationTime - 1) is a multiple of 3)

- $G = (2 + 0.5 \times \text{ADVEExtraDelay}) \times \text{GPMC\_FCLK}$  if  $((\text{ADVOnTime} - \text{ClkActivationTime} - 2)$  is a multiple of 3)  
For ADV rising edge (ADV desactivated) in Reading mode:

(10) D = PageBurstAccessTime × (TimeParaGranularity + 1) × GPMC\_FCLK

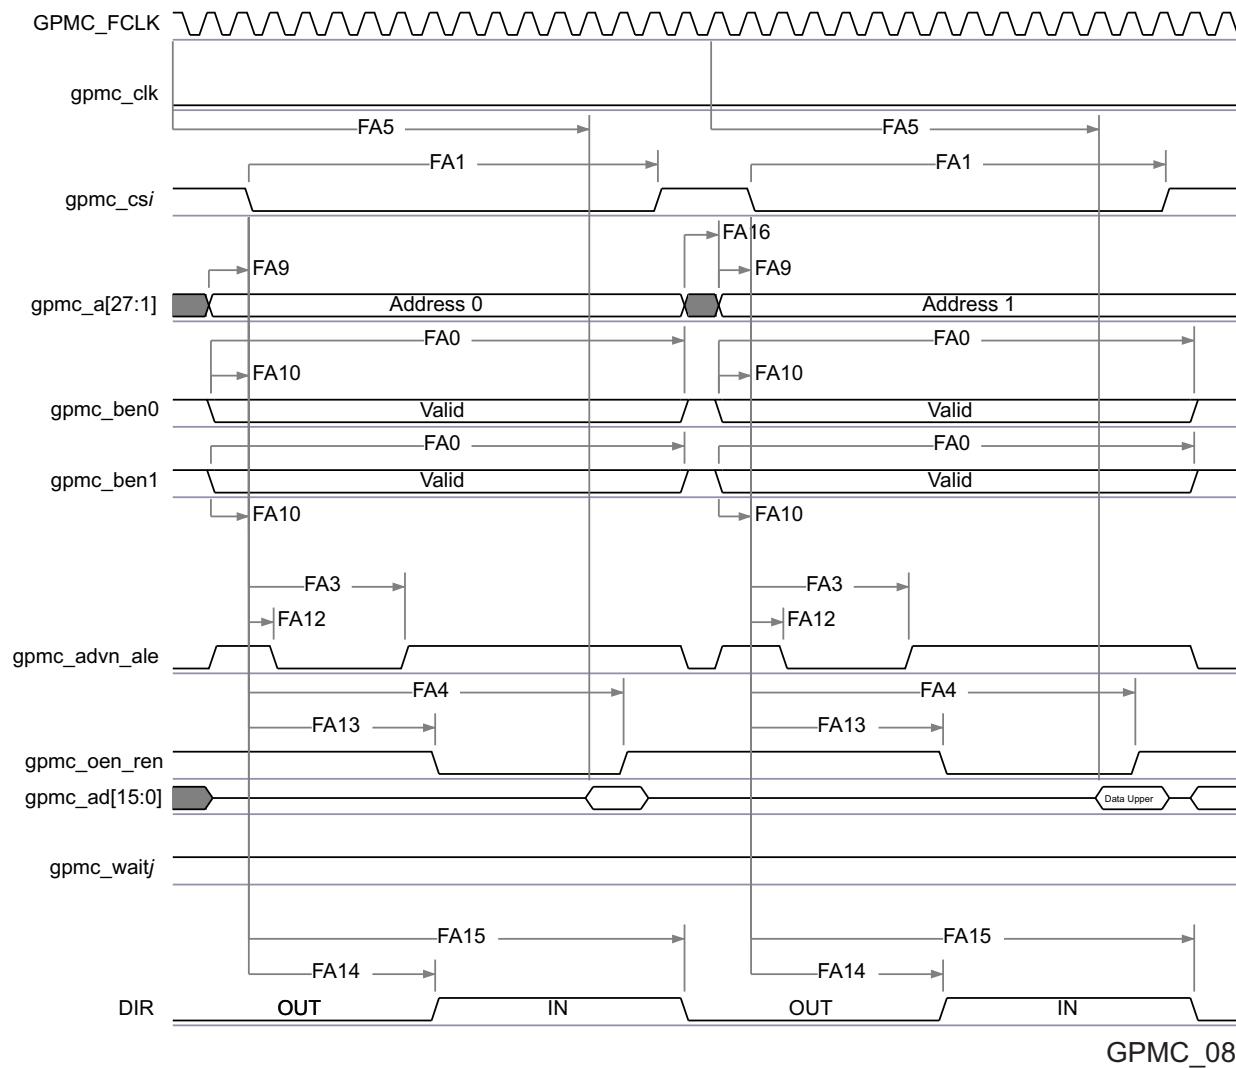

(11) E = ((WEOnTime - CSOnTime) × (TimeParaGranularity + 1) + 0.5 × (WEExtraDelay - CSEExtraDelay)) × GPMC\_FCLK

(12) F = ((WEOffTime - CSOnTime) × (TimeParaGranularity + 1) + 0.5 × (WEExtraDelay - CSEExtraDelay)) × GPMC\_FCLK

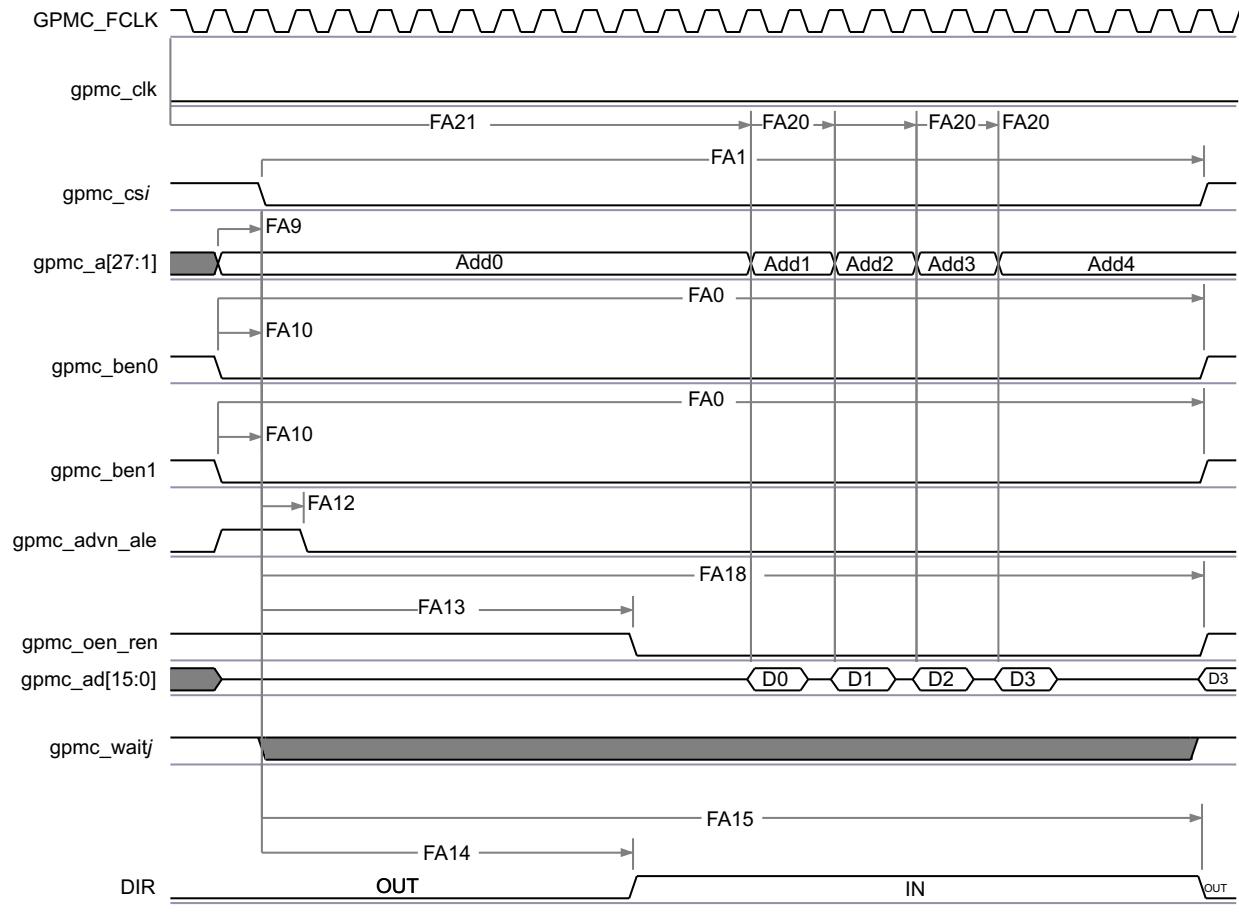

**Figure 5-29. GPMC / NOR Flash - Asynchronous Read - Single Word Timing<sup>(1)(2)(3)</sup>**

- (1) In gpmc\_csi, i = 0 to 7. In gpmc\_waitj, j = 0 to 1.
- (2) FA5 parameter illustrates amount of time required to internally sample input data. It is expressed in number of GPMC functional clock cycles. From start of read cycle and after FA5 functional clock cycles, input Data will be internally sampled by active functional clock edge. FA5 value must be stored inside AccessTime register bits field.
- (3) GPMC\_FCLK is an internal clock (GPMC functional clock) not provided externally.
- (4) The "DIR" (direction control) output signal is NOT pinned out on any of the device pads. It is an internal signal only representing a signal direction on the GPMC data bus.

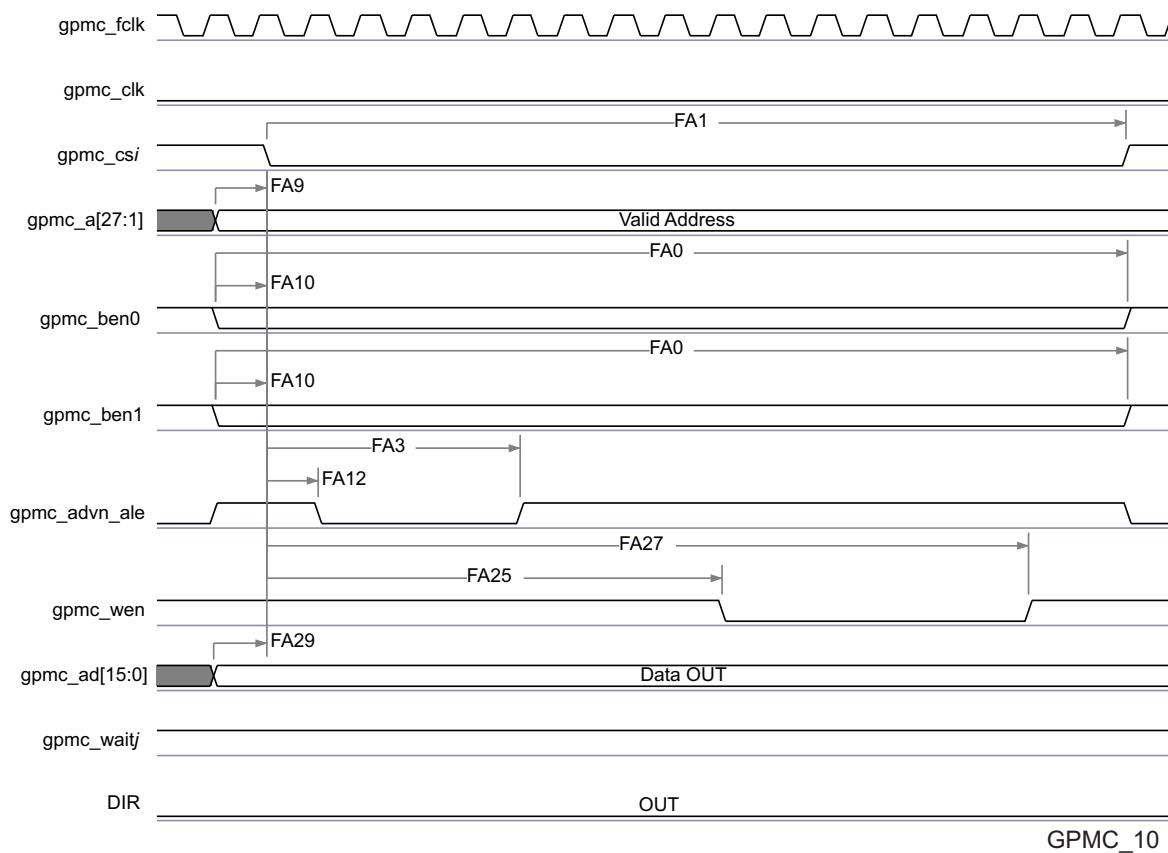

**Figure 5-30. GPMC / NOR Flash - Asynchronous Read - 32-bit Timing<sup>(1)(2)(3)</sup>**

- (1) In “gpmc\_csi”, i = 0 to 7. In “gpmc\_waitj”, j = 0 to 1.
- (2) FA5 parameter illustrates amount of time required to internally sample input Data. It is expressed in number of GPMC functional clock cycles. From start of read cycle and after FA5 functional clock cycles, input Data will be internally sampled by active functional clock edge. FA5 value should be stored inside AccessTime register bits field
- (3) GPMC\_FCLK is an internal clock (GPMC functional clock) not provided externally
- (4) The “DIR” (direction control) output signal is NOT pinned out on any of the device pads. It is an internal signal only representing a signal direction on the GPMC data bus.

**Figure 5-31. GPMC / NOR Flash - Asynchronous Read - Page Mode 4x16-bit Timing** <sup>(1)(2)(3)(4)</sup>

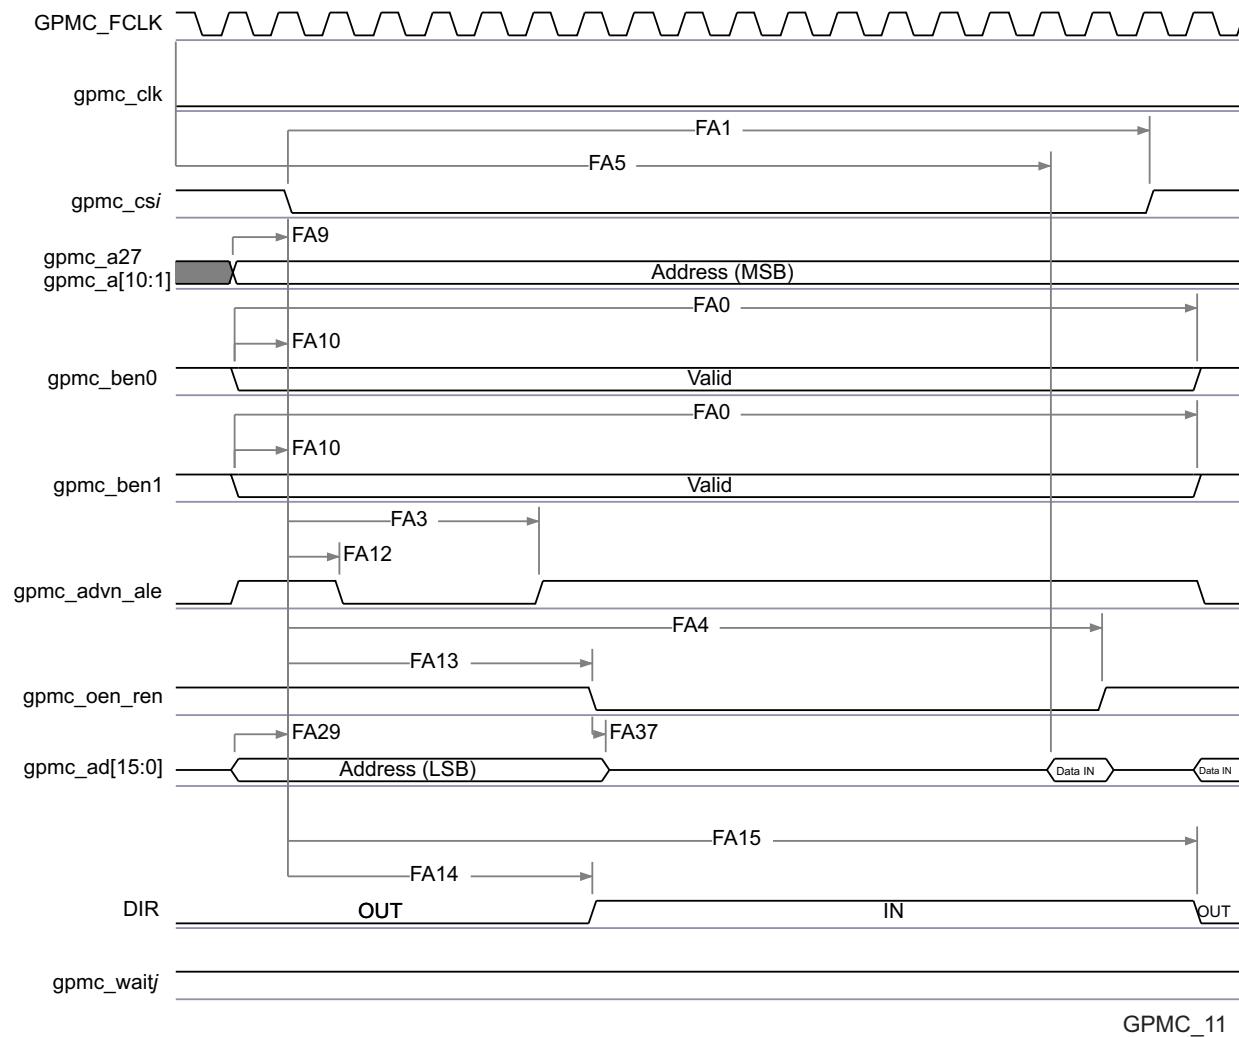

- (1) In "gpmc\_cs<sub>i</sub>", i = 0 to 7. In "gpmc\_wait<sub>j</sub>", j = 0 to 1
- (2) FA21 parameter illustrates amount of time required to internally sample first input Page Data. It is expressed in number of GPMC functional clock cycles. From start of read cycle and after FA21 functional clock cycles, First input Page Data will be internally sampled by active functional clock edge. FA21 calculation is detailed in a separated application note and should be stored inside AccessTime register bits field.
- (3) FA20 parameter illustrates amount of time required to internally sample successive input Page Data. It is expressed in number of GPMC functional clock cycles. After each access to input Page Data, next input Page Data will be internally sampled by active functional clock edge after FA20 functional clock cycles. FA20 is also the duration of address phases for successive input Page Data (excluding first input Page Data). FA20 value should be stored in PageBurstAccessTime register bits field.
- (4) GPMC\_FCLK is an internal clock (GPMC functional clock) not provided externally
- (5) The "DIR" (direction control) output signal is NOT pinned out on any of the device pads. It is an internal signal only representing a signal direction on the GPMC data bus.

**Figure 5-32. GPMC / NOR Flash - Asynchronous Write - Single Word Timing<sup>(1)</sup>**

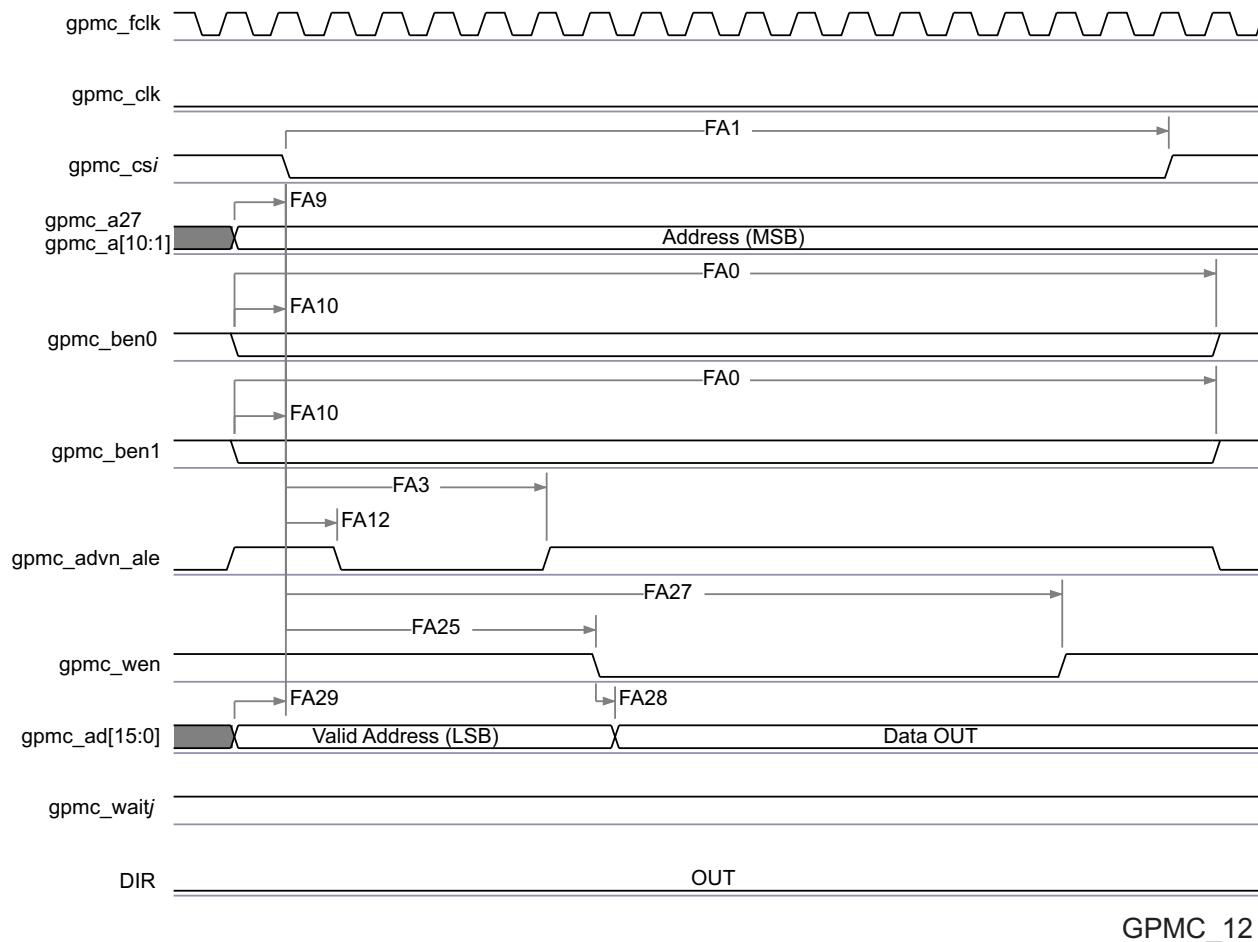

(1) In “gpmc\_csi”, i = 0 to 7. In “gpmc\_waitj”, j = 0 to 1.

(2) The “DIR” (direction control) output signal is NOT pinned out on any of the device pads. It is an internal signal only representing a signal direction on the GPMC data bus.

- (1) GNF12 parameter illustrates amount of time required to internally sample input Data. It is expressed in number of GPMC functional clock cycles. From start of read cycle and after GNF12 functional clock cycles, input data will be internally sampled by active functional clock edge. GNF12 value must be stored inside AccessTime register bits field.
- (2) GPMC\_FCLK is an internal clock (GPMC functional clock) not provided externally.
- (3) In gpmc\_csi, i = 0 to 7. In gpmc\_waitj, j = 0 to 1.

**Figure 5-38. GPMC / NAND Flash - Data Write Cycle Timing<sup>(1)</sup>**

- (1) In gpmc\_csi, i = 0 to 7.

#### NOTE

To configure the desired virtual mode the user must set MODESELECT bit and DELAYMODE bitfield for each corresponding pad control register.

The pad control registers are presented in [Table 4-27](#) and described in Device TRM, Control Module Chapter.

Virtual IO Timings Modes must be used to ensure some IO timings for GPMC. See [Table 5-28 Modes Summary](#) for a list of IO timings requiring the use of Virtual IO Timings Modes. See [Table 5-54 Virtual Functions Mapping for GPMC](#) for a definition of the Virtual modes.

[Table 5-54](#) presents the values for DELAYMODE bitfield.

**Table 5-54. Virtual Functions Mapping for GPMC**

(1) Some signals listed are virtual functions that present alternate multiplexing options. These virtual functions are controlled via CTRL\_CORE\_ALT\_SELECT\_MUX or CTRL\_CORE\_VIP\_MUX\_SELECT registers. For more information on how to use these options, please refer to Device TRM, Chapter Control Module, Section Pad Configuration Registers.

### 5.10.6.9 Timers

The device has 16 general-purpose (GP) timers (TIMER1 - TIMER16), two watchdog timers, and a 32-kHz synchronized timer (COUNTER\_32K) that have the following features:

- Dedicated input trigger for capture mode and dedicated output trigger/pulse width modulation (PWM) signal
- Interrupts generated on overflow, compare, and capture
- Free-running 32-bit upward counter
- Supported modes:
  - Compare and capture modes
  - Auto-reload mode
  - Start-stop mode
- On-the-fly read/write register (while counting)

The device has two system watchdog timer (WD\_TIMER1 and WD\_TIMER2) that have the following features:

- Free-running 32-bit upward counter
- On-the-fly read/write register (while counting)
- Reset upon occurrence of a timer overflow condition

The device includes one instance of the 32-bit watchdog timer: WD\_TIMER2, also called the MPU watchdog timer.

The watchdog timer is used to provide a recovery mechanism for the device in the event of a fault condition, such as a non-exiting code loop.

In are presented the specific groupings of signals (IOSET) for use with TIMERS.

---

**NOTE**

For additional information on the Timer Module, see the Device TRM.

---

### 5.10.6.10 I<sup>2</sup>C

The device includes 6 inter-integrated circuit (I<sup>2</sup>C) modules which provide an interface to other devices compliant with Philips Semiconductors Inter-IC bus (I<sup>2</sup>C-bus<sup>TM</sup>) specification version 2.1. External components attached to this 2-wire serial bus can transmit/receive 8-bit data to/from the device through the I<sup>2</sup>C module.

---

**NOTE**

Note that, on I<sup>2</sup>C1 and I<sup>2</sup>C2, due to characteristics of the open drain IO cells, HS mode is not supported.

---

---

**NOTE**

Inter-integrated circuit i (i=1 to 6) module is also referred to as I<sup>2</sup>Ci.

---

**NOTE**

For more information, see the Multimaster High-Speed I<sup>2</sup>C Controller section of the Device TRM.

**Table 5-55, Table 5-56 and Figure 5-39** assume testing over the recommended operating conditions and electrical characteristic conditions below.

**Table 5-55. Timing Requirements for I<sup>2</sup>C Input Timings<sup>(1)</sup>**

NO.	PARAMETER	DESCRIPTION	STANDARD MODE		FAST MODE		UNIT
			MIN	MAX	MIN	MAX	
1	t <sub>c</sub> (SCL)	Cycle time, SCL	10		2.5		μs
2	t <sub>su</sub> (SCLH-SDAL)	Setup time, SCL high before SDA low (for a repeated START condition)	4.7		0.6		μs
3	t <sub>h</sub> (SDAL-SCLL)	Hold time, SCL low after SDA low (for a START and a repeated START condition)	4		0.6		μs
4	t <sub>w</sub> (SCLL)	Pulse duration, SCL low	4.7		1.3		μs
5	t <sub>w</sub> (SCLH)	Pulse duration, SCL high	4		0.6		μs
6	t <sub>su</sub> (SDAV-SCLH)	Setup time, SDA valid before SCL high	250		100 <sup>(2)</sup>		ns
7	t <sub>h</sub> (SCLL-SDAV)	Hold time, SDA valid after SCL low	0 <sup>(3)</sup>	3.45 <sup>(4)</sup>	0 <sup>(3)</sup>	0.9 <sup>(4)</sup>	μs
8	t <sub>w</sub> (SDAH)	Pulse duration, SDA high between STOP and START conditions	4.7		1.3		μs
9	t <sub>r</sub> (SDA)	Rise time, SDA		1000	20 + 0.1C <sub>b</sub> <sup>(5)</sup>	300 <sup>(3)</sup>	ns
10	t <sub>r</sub> (SCL)	Rise time, SCL		1000	20 + 0.1C <sub>b</sub> <sup>(5)</sup>	300 <sup>(3)</sup>	ns
11	t <sub>f</sub> (SDA)	Fall time, SDA		300	20 + 0.1C <sub>b</sub> <sup>(5)</sup>	300 <sup>(3)</sup>	ns
12	t <sub>f</sub> (SCL)	Fall time, SCL		300	20 + 0.1C <sub>b</sub> <sup>(5)</sup>	300 <sup>(3)</sup>	ns
13	t <sub>su</sub> (SCLH-SDAH)	Setup time, SCL high before SDA high (for STOP condition)	4		0.6		μs
14	t <sub>w</sub> (SP)	Pulse duration, spike (must be suppressed)			0	50	ns
15	C <sub>b</sub> <sup>(5)</sup>	Capacitive load for each bus line		400		400	pF

(1) The I<sup>2</sup>C pins SDA and SCL do not feature fail-safe I/O buffers. These pins could potentially draw current when the device is powered down.

(2) A Fast-mode I<sup>2</sup>C-bus™ device can be used in a Standard-mode I<sup>2</sup>C-bus system, but the requirement t<sub>su</sub>(SDA-SCLH) ≥ 250 ns must then be met. This will automatically be the case if the device does not stretch the LOW period of the SCL signal. If such a device does stretch the LOW period of the SCL signal, it must output the next data bit to the SDA line t<sub>r</sub> max + t<sub>su</sub>(SDA-SCLH) = 1000 + 250 = 1250 ns (according to the Standard-mode I<sup>2</sup>C-Bus Specification) before the SCL line is released.

(3) A device must internally provide a hold time of at least 300 ns for the SDA signal (referred to the V<sub>IHmin</sub> of the SCL signal) to bridge the undefined region of the falling edge of SCL.

(4) The maximum t<sub>h</sub>(SDA-SCLL) has only to be met if the device does not stretch the low period [t<sub>w</sub>(SCLL)] of the SCL signal.

(5) C<sub>b</sub> = total capacitance of one bus line in pF. If mixed with HS-mode devices, faster fall-times are allowed.

**Table 5-56. Timing Requirements for I<sup>2</sup>C HS-Mode (I<sup>2</sup>C3/4/5/6 Only)<sup>(1)</sup>**

NO.	PARAMETER	DESCRIPTION	C <sub>b</sub> = 100 pF MAX		C <sub>b</sub> = 400 pF <sup>(2)</sup>		UNIT
			MIN	MAX	MIN	MAX	
1	t <sub>c</sub> (SCL)	Cycle time, SCL	0.294		0.588		μs
2	t <sub>su</sub> (SCLH-SDAL)	Set-up time, SCL high before SDA low (for a repeated START condition)	160		160		ns
3	t <sub>h</sub> (SDAL-SCLL)	Hold time, SCL low after SDA low (for a repeated START condition)	160		160		ns
4	t <sub>w</sub> (SCLL)	LOW period of the SCLH clock	160		320		ns

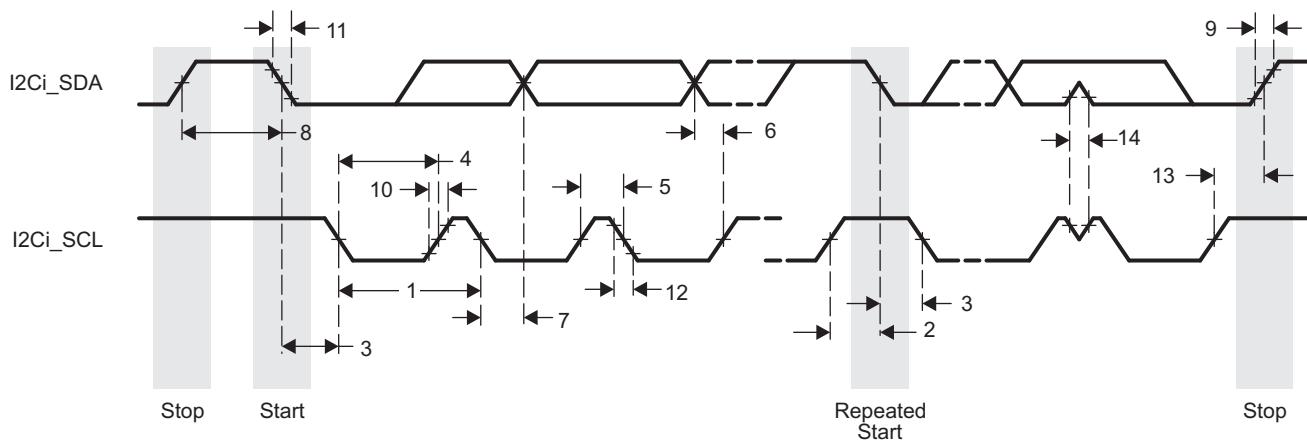

**Table 5-56. Timing Requirements for I<sup>2</sup>C HS-Mode (I<sup>2</sup>C3/4/5/6 Only)<sup>(1)</sup> (continued)**

NO.	PARAMETER	DESCRIPTION	$C_b = 100 \text{ pF MAX}$		$C_b = 400 \text{ pF } ^{(2)}$		UNIT
			MIN	MAX	MIN	MAX	
5	$t_w(\text{SCLH})$	HIGH period of the SCLH clock	60		120		ns
6	$t_{su}(\text{SDAV-SCLH})$	Setup time, SDA valid before SCL high	10		10		ns
7	$t_h(\text{SCLL-SDAV})$	Hold time, SDA valid after SCL low	0 <sup>(3)</sup>	70	0 <sup>(3)</sup>	150	ns
13	$t_{su}(\text{SCLH-SDAH})$	Setup time, SCL high before SDA high (for a STOP condition)	160		160		ns
14	$t_w(\text{SP})$	Pulse duration, spike (must be suppressed)	0	10	0	10	ns
15	$C_b$ <sup>(2)</sup>	Capacitive load for SDAH and SCLH lines		100		400	pF
16	$C_b$	Capacitive load for SDAH + SDA line and SCLH + SCL line		400		400	pF

(1) I<sup>2</sup>C HS-Mode is only supported on I<sup>2</sup>C3/4/5/6. I<sup>2</sup>C HS-Mode is not supported on I<sup>2</sup>C1/2.

(2) For bus line loads  $C_b$  between 100 and 400 pF the timing parameters must be linearly interpolated.

(3) A device must internally provide a Data hold time to bridge the undefined part between  $V_{IH}$  and  $V_{IL}$  of the falling edge of the SCLH signal. An input circuit with a threshold as low as possible for the falling edge of the SCLH signal minimizes this hold time.

SPRS906\_TIMING\_I2C\_01

**Figure 5-39. I<sup>2</sup>C Receive Timing**

Table 5-57 and Figure 5-40 assume testing over the recommended operating conditions and electrical characteristic conditions below.

NO.	PARAMETER	DESCRIPTION	STANDARD MODE		FAST MODE		UNIT
			MIN	MAX	MIN	MAX	
16	$t_c(\text{SCL})$	Cycle time, SCL	10		2.5		μs
17	$t_{su}(\text{SCLH-SDAL})$	Setup time, SCL high before SDA low (for a repeated START condition)	4.7		0.6		μs
18	$t_h(\text{SDAL-SCLL})$	Hold time, SCL low after SDA low (for a START and a repeated START condition)	4		0.6		μs
19	$t_w(\text{SCLL})$	Pulse duration, SCL low	4.7		1.3		μs
20	$t_w(\text{SCLH})$	Pulse duration, SCL high	4		0.6		μs
21	$t_{su}(\text{SDAV-SCLH})$	Setup time, SDA valid before SCL high	250		100		ns
22	$t_h(\text{SCLL-SDAV})$	Hold time, SDA valid after SCL low (for I <sup>2</sup> C bus devices)	0	3.45	0	0.9	μs

**Table 5-57. Switching Characteristics Over Recommended Operating Conditions for I<sub>2</sub>C Output Timings<sup>(2)</sup> (continued)**

NO.	PARAMETER	DESCRIPTION	STANDARD MODE		FAST MODE		UNIT
			MIN	MAX	MIN	MAX	
23	t <sub>w</sub> (SDAH)	Pulse duration, SDA high between STOP and START conditions	4.7		1.3		μs
24	t <sub>r</sub> (SDA)	Rise time, SDA		1000	20 + 0.1C <sub>b</sub> <sup>(1) (3)</sup>	300 <sup>(3)</sup>	ns
25	t <sub>r</sub> (SCL)	Rise time, SCL		1000	20 + 0.1C <sub>b</sub> <sup>(1) (3)</sup>	300 <sup>(3)</sup>	ns
26	t <sub>f</sub> (SDA)	Fall time, SDA		300	20 + 0.1C <sub>b</sub> <sup>(1) (3)</sup>	300 <sup>(3)</sup>	ns
27	t <sub>f</sub> (SCL)	Fall time, SCL		300	20 + 0.1C <sub>b</sub> <sup>(1) (3)</sup>	300 <sup>(3)</sup>	ns
28	t <sub>su</sub> (SCLH-SDAH)	Setup time, SCL high before SDA high (for STOP condition)	4		0.6		μs
29	C <sub>p</sub>	Capacitance for each I <sub>2</sub> C pin		10		10	pF

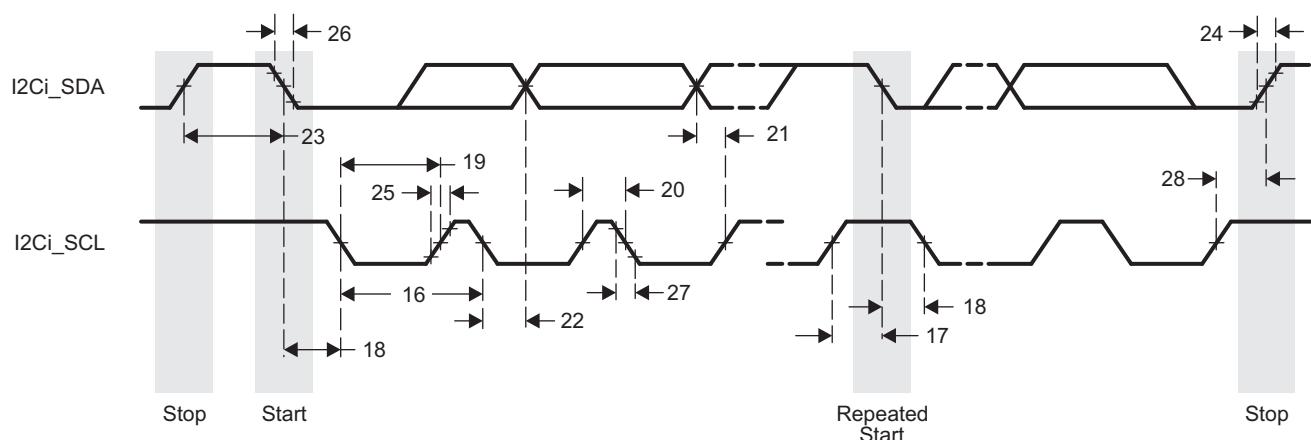

(1) C<sub>b</sub> = total capacitance of one bus line in pF. If mixed with HS-mode devices, faster fall-times are allowed.

(2) Software must properly configure the I<sub>2</sub>C module registers to achieve the timings shown in this table. See the Device TRM for details.

(3) These timings apply only to I<sub>2</sub>C1 and I<sub>2</sub>C2. I<sub>2</sub>C3, I<sub>2</sub>C4, I<sub>2</sub>C5 and I<sub>2</sub>C6 use standard LVCMOS buffers to emulate open-drain buffers and their rise/fall times should be referenced in the device IBIS model.

#### NOTE

I<sub>2</sub>C emulation is achieved by configuring the LVCMOS buffers to output Hi-Z instead of driving high when transmitting logic-1.

SPRS906\_TIMING\_I2C\_02

**Figure 5-40. I<sub>2</sub>C Transmit Timing**

In are presented the specific groupings of signals (IOSET) for use with I<sub>2</sub>C1/2/3/4/5.

#### 5.10.6.11 UART

The UART performs serial-to-parallel conversions on data received from a peripheral device and parallel-to-serial conversion on data received from the CPU. There are 10 UART modules in the device. Only one UART supports IrDA features. Each UART can be used for configuration and data exchange with a number of external peripheral devices or interprocessor communication between devices.

The UART<sub>i</sub> (where i = 1 to 10) include the following features:

- 16C750 compatibility

- 64-byte FIFO buffer for receiver and 64-byte FIFO for transmitter
- Baud generation based on programmable divisors N (where  $N = 1 \dots 16\ 384$ ) operating from a fixed functional clock of 48 MHz or 192 MHz
- Break character detection and generation
- Configurable data format:
  - Data bit: 5, 6, 7, or 8 bits
  - Parity bit: Even, odd, none
  - Stop-bit: 1, 1.5, 2 bit(s)
- Flow control: Hardware (RTS/CTS) or software (XON/XOFF)
- Only UART1 module has extended modem control signals (CD, RI, DTR, DSR)
- Only UART3 supports IrDA

**NOTE**

For more information, see the UART section of the Device TRM.

**Table 5-58, Table 5-59 and Figure 5-41** assume testing over the recommended operating conditions and electrical characteristic conditions below.

**Table 5-58. Timing Requirements for UART**

NO.	PARAMETER	DESCRIPTION	MIN	MAX	UNIT
4	$t_w(RX)$	Pulse width, receive data bit, 15/30/100pF high or low	0.96U <sup>(1)</sup>	1.05U <sup>(1)</sup>	ns
5	$t_w(CTS)$	Pulse width, receive start bit, 15/30/100pF high or low	0.96U <sup>(1)</sup>	1.05U <sup>(1)</sup>	ns
	$t_d(RTS-TX)$	Delay time, transmit start bit to transmit data	P <sup>(2)</sup>		ns
	$t_d(CTS-TX)$	Delay time, receive start bit to transmit data	P <sup>(2)</sup>		ns

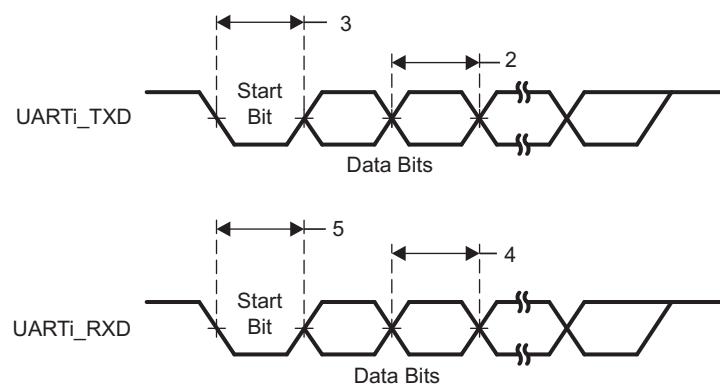

(1) U = UART baud time = 1/programmed baud rate

(2) P = Clock period of the reference clock (FCLK, usually 48 MHz or 192MHz).

**Table 5-59. Switching Characteristics Over Recommended Operating Conditions for UART**

NO.	PARAMETER	DESCRIPTION	MIN	MAX	UNIT
	$f_{(baud)}$	Maximum programmable baud rate	15 pF	12	MHz
			30 pF	0.23	
			100 pF	0.115	
2	$t_w(TX)$	Pulse width, transmit data bit, 15/30/100 pF high or low	U - 2 <sup>(1)</sup>	U + 2 <sup>(1)</sup>	ns
3	$t_w(RTS)$	Pulse width, transmit start bit, 15/30/100 pF high or low	U - 2 <sup>(1)</sup>	U + 2 <sup>(1)</sup>	ns

(1) U = UART baud time = 1/programmed baud rate

SPRS906\_TIMING\_UART\_01

**Figure 5-41. UART Timing**

In are presented the specific groupings of signals (IOSET) for use with UART.

### 5.10.6.12 McSPI

The McSPI is a master/slave synchronous serial bus. There are four separate McSPI modules (SPI1, SPI2, SPI3, and SPI4) in the device. All these four modules support up to four external devices (four chip selects) and are able to work as both master and slave.

The McSPI modules include the following main features:

- Serial clock with programmable frequency, polarity, and phase for each channel
- Wide selection of SPI word lengths, ranging from 4 to 32 bits
- Up to four master channels, or single channel in slave mode
- Master multichannel mode:
  - Full duplex/half duplex
  - Transmit-only/receive-only/transmit-and-receive modes
  - Flexible input/output (I/O) port controls per channel
  - Programmable clock granularity
  - SPI configuration per channel. This means, clock definition, polarity enabling and word width
- Power management through wake-up capabilities
- Programmable timing control between chip select and external clock generation
- Built-in FIFO available for a single channel.
- Each SPI module supports multiple chip select pins spim\_cs[i], where i = 1 to 4.

#### NOTE

For more information, see the Serial Communication Interface section of the device TRM.

#### NOTE

The McSPI<sub>m</sub> module ( $m = 1$  to 4) is also referred to as SPI<sub>m</sub>.

#### CAUTION

The I/O timings provided in this section are applicable for all combinations of signals for SPI1 and SPI2. However, the timings are valid only for SPI3 and SPI4 if signals within a single IOSET are used. The IOSETS are defined in [Table 5-62](#).

[Table 5-60](#), [Figure 5-42](#) and [Figure 5-43](#) present Timing Requirements for McSPI - Master Mode.

**Table 5-60. Timing Requirements for SPI - Master Mode <sup>(1)</sup>**

NO.	PARAMETER	DESCRIPTION	MODE	MIN	MAX	UNIT
SM1	$t_c(\text{SPICLK})$	Cycle time, spi_sclk <sup>(1)</sup> <sup>(2)</sup>	SPI1/2/3/ 4	20.8 <sup>(3)</sup>		ns
SM2	$t_w(\text{SPICLKL})$	Typical Pulse duration, spi_sclk low <sup>(1)</sup>		0.5 × P-1 <sup>(4)</sup>		ns
SM3	$t_w(\text{SPICLKH})$	Typical Pulse duration, spi_sclk high <sup>(1)</sup>		0.5 × P-1 <sup>(4)</sup>		ns
SM4	$t_{su}(\text{MISO-SPICLK})$	Setup time, spi_d[x] valid before spi_sclk active edge <sup>(1)</sup>		3.5		ns
SM5	$t_h(\text{SPICLK-MISO})$	Hold time, spi_d[x] valid after spi_sclk active edge <sup>(1)</sup>		3.7		ns

**Table 5-60. Timing Requirements for SPI - Master Mode <sup>(1)</sup> (continued)**

NO.	PARAMETER	DESCRIPTION	MODE	MIN	MAX	UNIT
SM6	$t_d(\text{SPICLK-SIMO})$	Delay time, spi_sclk active edge to spi_d[x] transition <sup>(1)</sup>	SPI1	-3.57	4.1	ns
			SPI2	-3.9	3.6	ns
			SPI3	-4.9	4.7	ns
			SPI4	-4.3	4.5	ns
SM7	$t_d(\text{CS-SIMO})$	Delay time, spi_cs[x] active edge to spi_d[x] transition			5	ns
SM8	$t_d(\text{CS-SPICLK})$	Delay time, spi_cs[x] active to spi_sclk first edge <sup>(1)</sup>	MASTER _PHA0 <sup>(5)</sup>	B-4.2 <sup>(6)</sup>		ns
			MASTER _PHA1 <sup>(5)</sup>	A-4.2 <sup>(7)</sup>		ns
SM9	$t_d(\text{SPICLK-CS})$	Delay time, spi_sclk last edge to spi_cs[x] inactive <sup>(1)</sup>	MASTER _PHA0 <sup>(5)</sup>	A-4.2 <sup>(7)</sup>		ns
			MASTER _PHA1 <sup>(5)</sup>	B-4.2 <sup>(6)</sup>		ns

(1) This timing applies to all configurations regardless of SPI\_CLK polarity and which clock edges are used to drive output data and capture input data.

(2) Related to the SPI\_CLK maximum frequency.

(3) 20.8ns cycle time = 48MHz

(4) P = SPICLK period.

(5) SPI\_CLK phase is programmable with the PHA bit of the SPI\_CH(i)CONF register.

(6) B = (TCS + 0.5) × TSPICLKREF × Fratio, where TCS is a bit field of the SPI\_CH(i)CONF register and Fratio = Even ≥2.

(7) When P = 20.8 ns, A = (TCS + 1) × TSPICLKREF, where TCS is a bit field of the SPI\_CH(i)CONF register. When P > 20.8 ns, A = (TCS + 0.5) × Fratio × TSPICLKREF, where TCS is a bit field of the SPI\_CH(i)CONF register.

SPRS906\_TIMING\_McSPI\_02

**Figure 5-43. McSPI - Master Mode Receive**

Table 5-61, Figure 5-44 and Figure 5-45 present Timing Requirements for McSPI - Slave Mode.

**Table 5-61. Timing Requirements for SPI - Slave Mode**

NO.	PARAMETER	DESCRIPTION	MODE	MIN	MAX	UNIT
SS1 <sup>(1)</sup>	$t_c(\text{SPICLK})$	Cycle time, spi_sclk		62.5 <sup>(2)</sup> <sup>(3)</sup>		ns
SS2 <sup>(1)</sup>	$t_w(\text{SPICLKL})$	Typical Pulse duration, spi_sclk low		$0.45 \times P$ <sup>(4)</sup>		ns
SS3 <sup>(1)</sup>	$t_w(\text{SPICLKH})$	Typical Pulse duration, spi_sclk high		$0.45 \times P$ <sup>(4)</sup>		ns
SS4 <sup>(1)</sup>	$t_{su}(\text{SIMO-SPICLK})$	Setup time, spi_d[x] valid before spi_sclk active edge		5		ns
SS5 <sup>(1)</sup>	$t_h(\text{SPICLK-SIMO})$	Hold time, spi_d[x] valid after spi_sclk active edge		5		ns
SS6 <sup>(1)</sup>	$t_d(\text{SPICLK-SOMI})$	Delay time, spi_sclk active edge to mcspi_somi transition	SPI1/2/3	2	26.6	ns
			SPI4	2	20.1	ns

**Table 5-61. Timing Requirements for SPI - Slave Mode (continued)**

NO.	PARAMETER	DESCRIPTION	MODE	MIN	MAX	UNIT
SS7 (5)	$t_{d(CS-SOMI)}$	Delay time, spi_cs[x] active edge to mcspi_somi transition			20.95	ns
SS8 (1)	$t_{su(CS-SPCLK)}$	Setup time, spi_cs[x] valid before spi_sclk first edge			5	ns
SS9 (1)	$t_h(SPCLK-CS)$	Hold time, spi_cs[x] valid after spi_sclk last edge	SPI1/2	5		ns
			SPI3	7.5		ns
			SPI4	6		ns

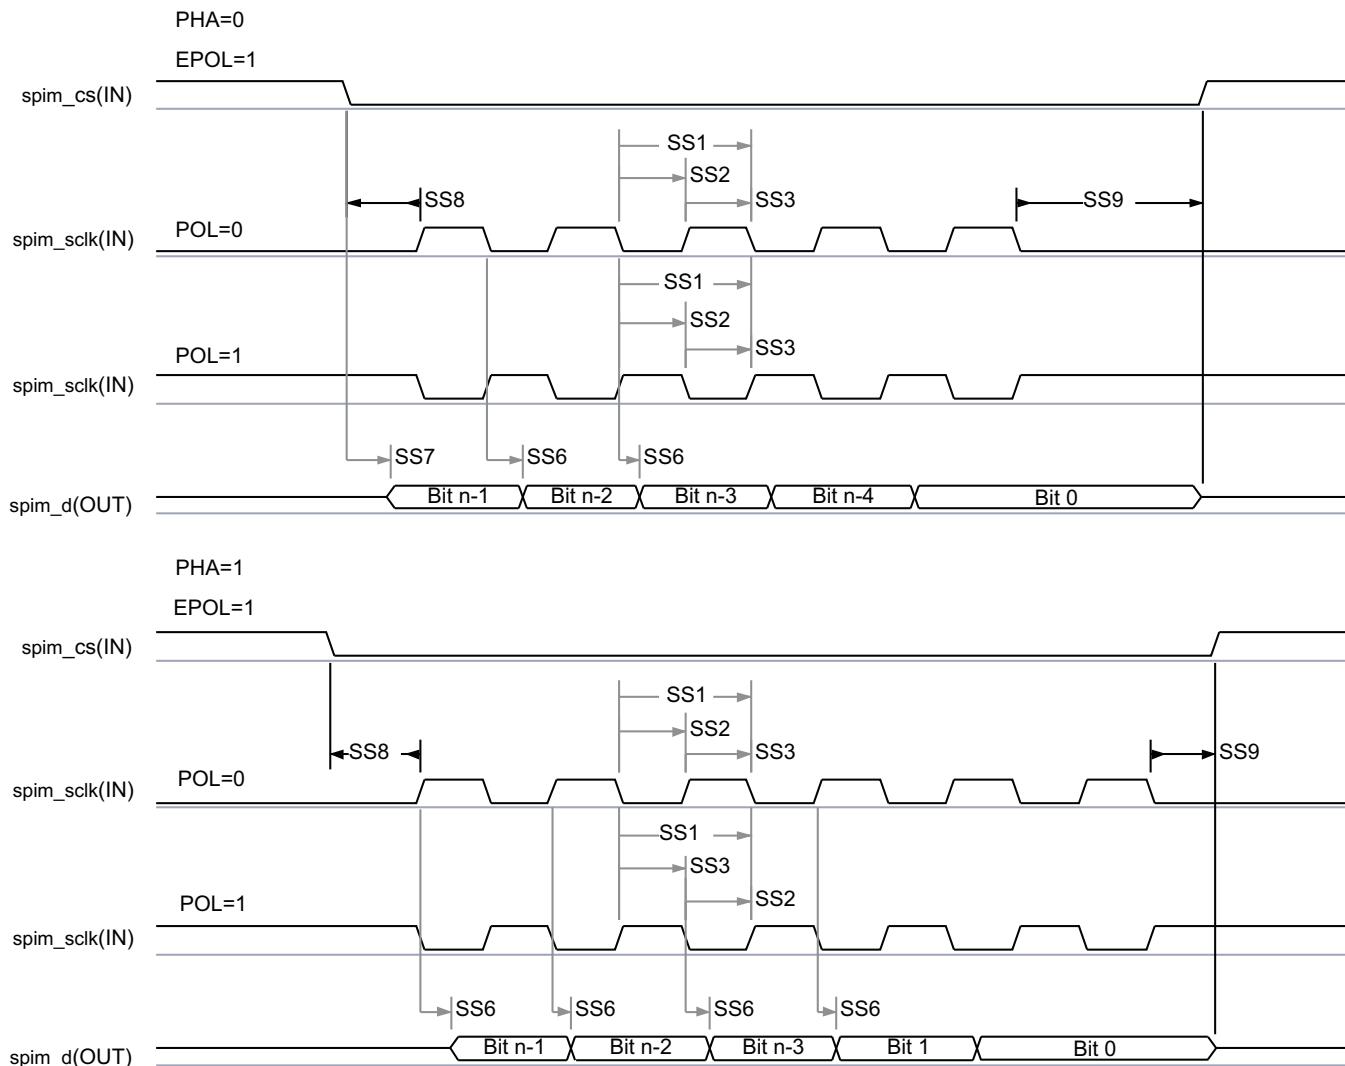

(1) This timing applies to all configurations regardless of SPI\_CLK polarity and which clock edges are used to drive output data and capture input data.

(2) When operating the SPI interface in RX-only mode, the minimum Cycle time is 26ns (38.4MHz)

(3) 62.5ns Cycle time = 16 MHz

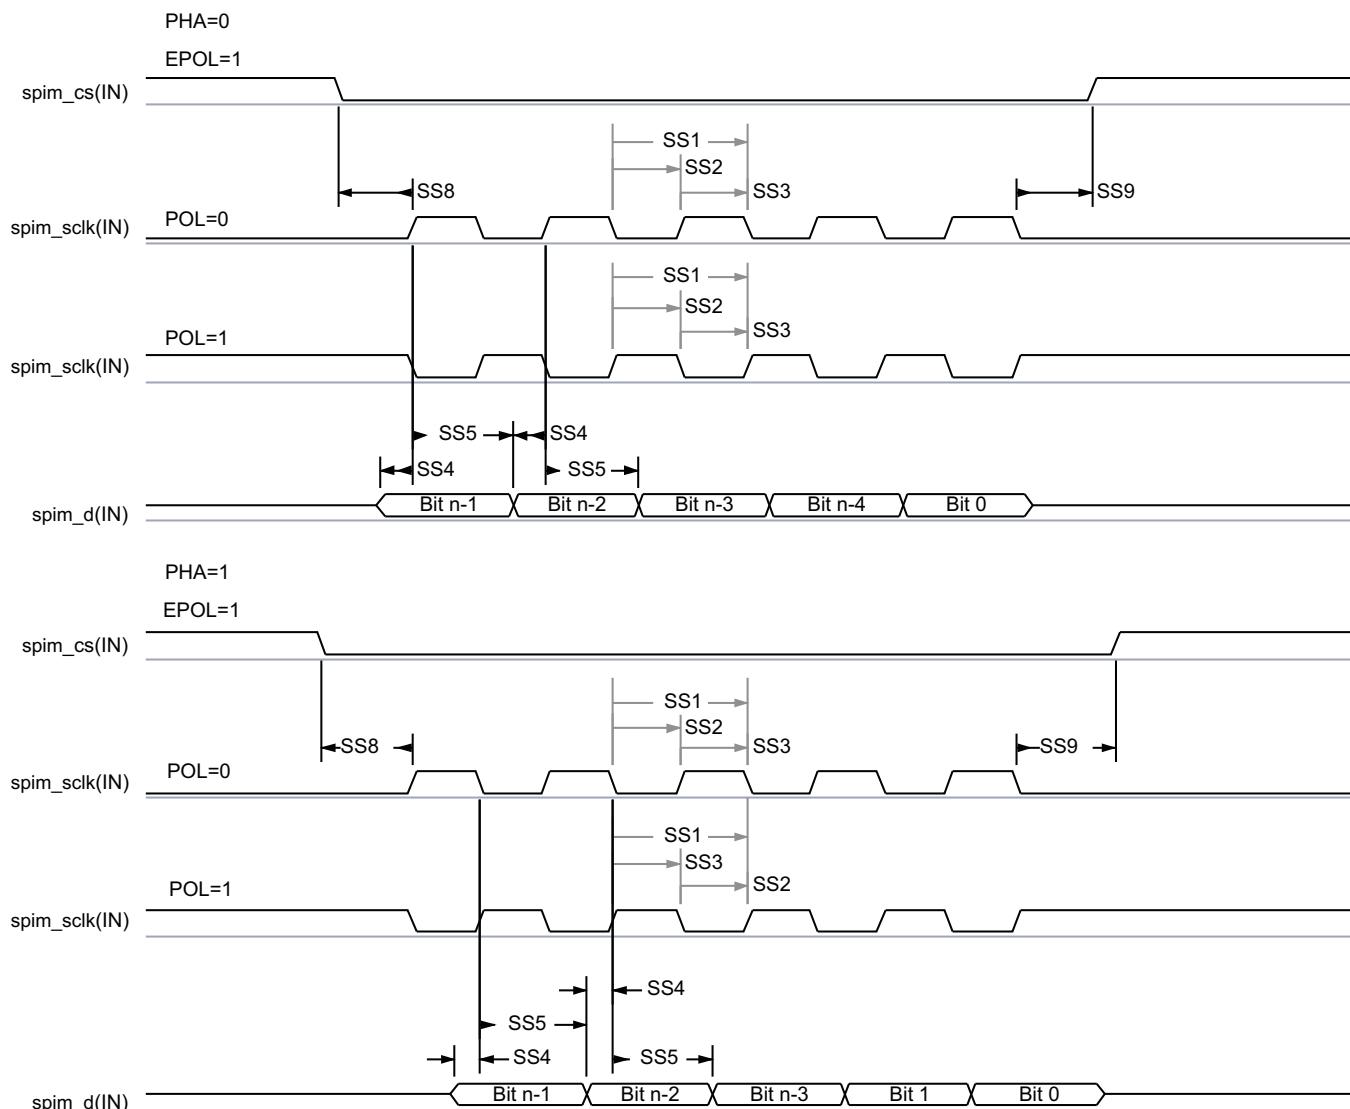

(4) P = SPICLK period.

(5) PHA = 0; SPI\_CLK phase is programmable with the PHA bit of the SPI\_CH(i)CONF register.

### 5.10.6.13 QSPI

The Quad SPI (QSPI) module is a type of SPI module that allows single, dual or quad read access to external SPI devices. This module has a memory mapped register interface, which provides a direct interface for accessing data from external SPI devices and thus simplifying software requirements. It works as a master only. There is one QSPI module in the device and it is primary intended for fast booting from quad-SPI flash memories.

General SPI features:

- Programmable clock divider
- Six pin interface (DCLK, CS\_N, DOUT, DIN, QDIN1, QDIN2)
- 4 external chip select signals
- Support for 3-, 4- or 6-pin SPI interface
- Programmable CS\_N to DOUT delay from 0 to 3 DCLKs
- Programmable signal polarities
- Programmable active clock edge
- Software controllable interface allowing for any type of SPI transfer

#### NOTE

For more information, see the Quad Serial Peripheral Interface section of the Device TRM.

#### CAUTION

The I/O Timings provided in this section are only valid when all QSPI Chip Selects used in a system are configured to use the same Clock Mode (either Clock Mode 0 or Clock Mode 3).

#### CAUTION

The I/O Timings provided in this section are valid only for some QSPI usage modes when the corresponding Virtual I/O Timings or Manual I/O Timings are configured as described in the tables found in this section.

Table 5-63 and Table 5-64 Present Timing and Switching Characteristics for Quad SPI Interface.

**Table 5-63. Switching Characteristics for QSPI**

NO.	PARAMETER	DESCRIPTION	MODE	MIN	MAX	UNIT
Q1	$t_{\text{C}}(\text{SCLK})$	Cycle time, sclk	Default Timing Mode, Clock Mode 0	11.71		ns
			Default Timing Mode, Clock Mode 3	20.8		ns

**Table 5-63. Switching Characteristics for QSPI (continued)**

NO.	PARAMETER	DESCRIPTION	MODE	MIN	MAX	UNIT
Q2	$t_{w(SCLKL)}$	Pulse duration, sclk low		$Y \times P-1$ <sup>(1)</sup>		ns
Q3	$t_{w(SCLKH)}$	Pulse duration, sclk high		$Y \times P-1$ <sup>(1)</sup>		ns
Q4	$t_d(CS-SCLK)$	Delay time, sclk falling edge to cs active edge, CS3:0	Default Timing Mode	$-M \times P-$ 1.6 <sup>(2)</sup> <sup>(3)</sup>	$-M \times$ $P+2.6$ <sup>(2)</sup> <sup>(3)</sup>	ns
Q5	$t_d(SCLK-CS)$	Delay time, sclk falling edge to cs inactive edge, CS3:0	Default Timing Mode	$N \times P-$ 1.6 <sup>(2)</sup> <sup>(3)</sup>	$N \times$ $P+2.6$ <sup>(2)</sup> <sup>(3)</sup>	ns
Q6	$t_d(SCLK-D0)$	Delay time, sclk falling edge to d[0] transition	Default Timing Mode	-1.6	2.6	ns
Q7	$t_{ena(CS-D0LZ)}$	Enable time, cs active edge to d[0] driven (lo-z)		-P-3.5	-P+2.5	ns
Q8	$t_{dis(CS-D0Z)}$	Disable time, cs active edge to d[0] tri-stated (hi-z)		-P-2.5	-P+2.0	ns
Q9	$t_d(SCLK-D0)$	Delay time, sclk first falling edge to first d[0] transition	PHA=0 Only, Default Timing Mode	-1.6- <sup>(2)</sup>	2.6-P <sup>(2)</sup>	ns

(1) The Y parameter is defined as follows:

If DCLK\_DIV is 0 or ODD then, Y equals 0.5.

If DCLK\_DIV is EVEN then, Y equals (DCLK\_DIV/2) / (DCLK\_DIV+1).

For best performance, it is recommended to use a DCLK\_DIV of 0 or ODD to minimize the duty cycle distortion. The HSDIVIDER on CLKOUTX2\_H13 output of DPLL\_PER can be used to achieve the desired clock divider ratio. All required details about clock division factor DCLK\_DIV can be found in the device-specific Technical Reference Manual.

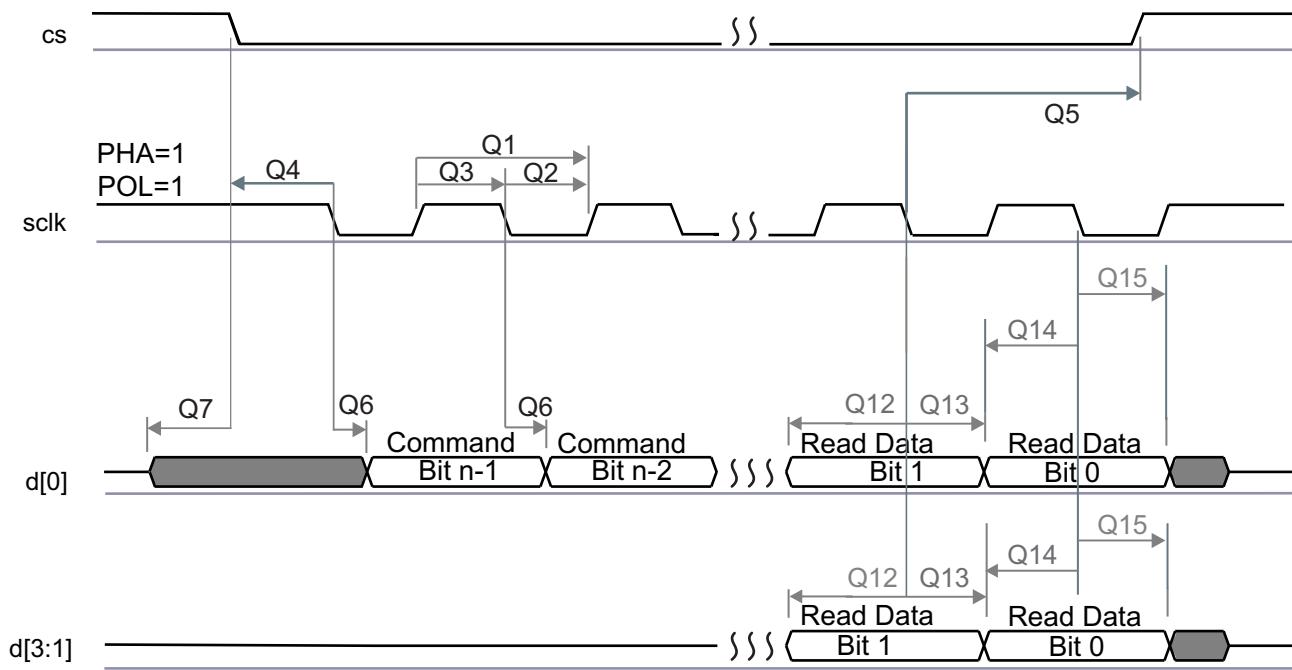

(2) P = SCLK period.

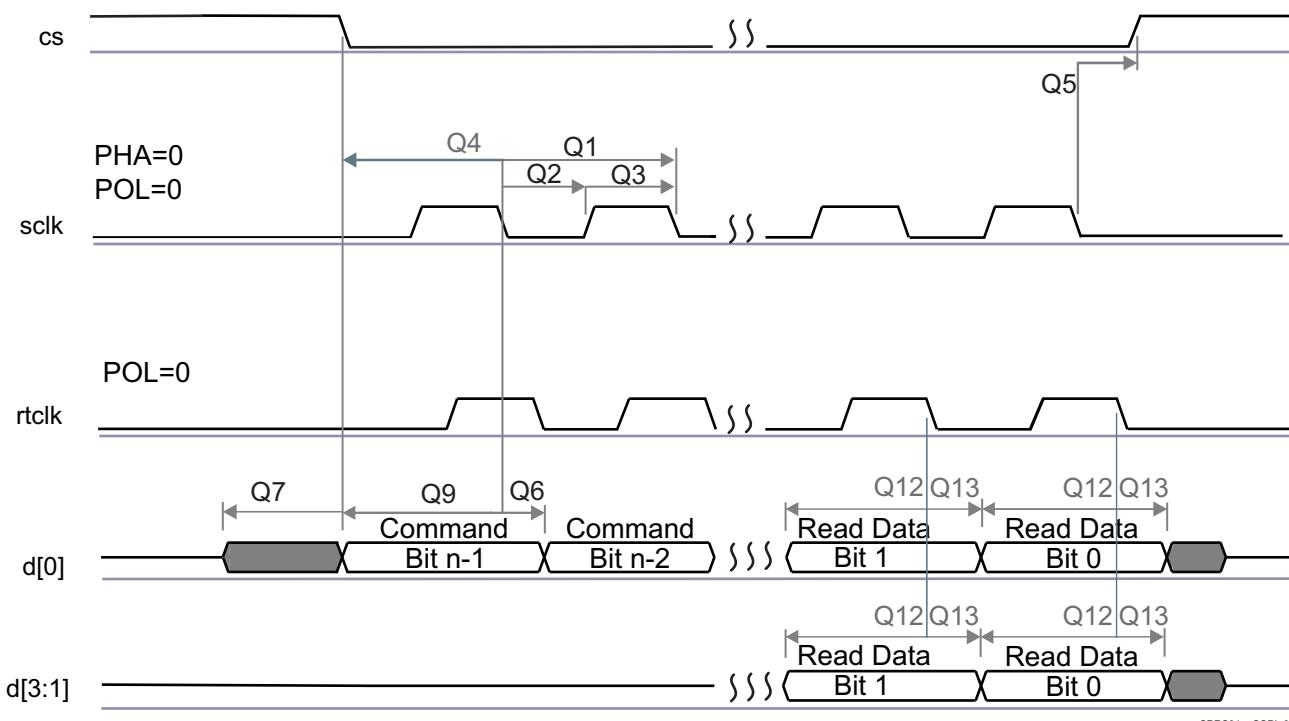

(3) M=QSPI\_SPI\_DC\_REG.DDx + 1 when Clock Mode 0.

M=QSPI\_SPI\_DC\_REG.DDx when Clock Mode 3.

N = 2 when Clock Mode 0.

N = 3 when Clock Mode 3.

**Figure 5-46. QSPI Read (Clock Mode 3)**

SPRS91v\_QSPI\_02

Figure 5-47. QSPI Read (Clock Mode 0)

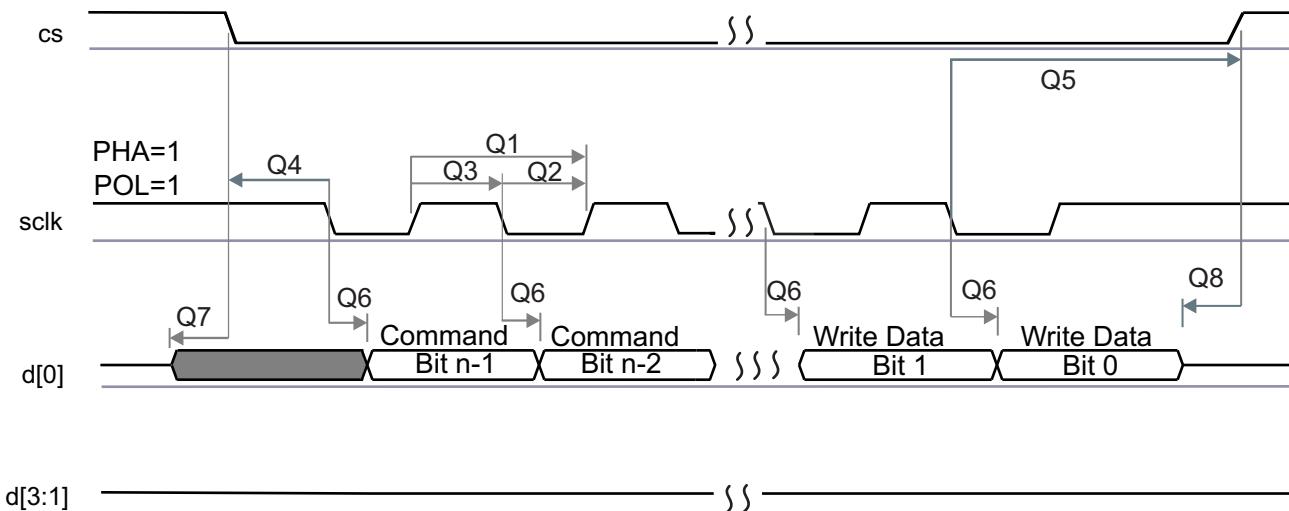

**CAUTION**

The I/O Timings provided in this section are valid only for some QSPI usage modes when the corresponding Virtual I/O Timings or Manual I/O Timings are configured as described in the tables found in this section.

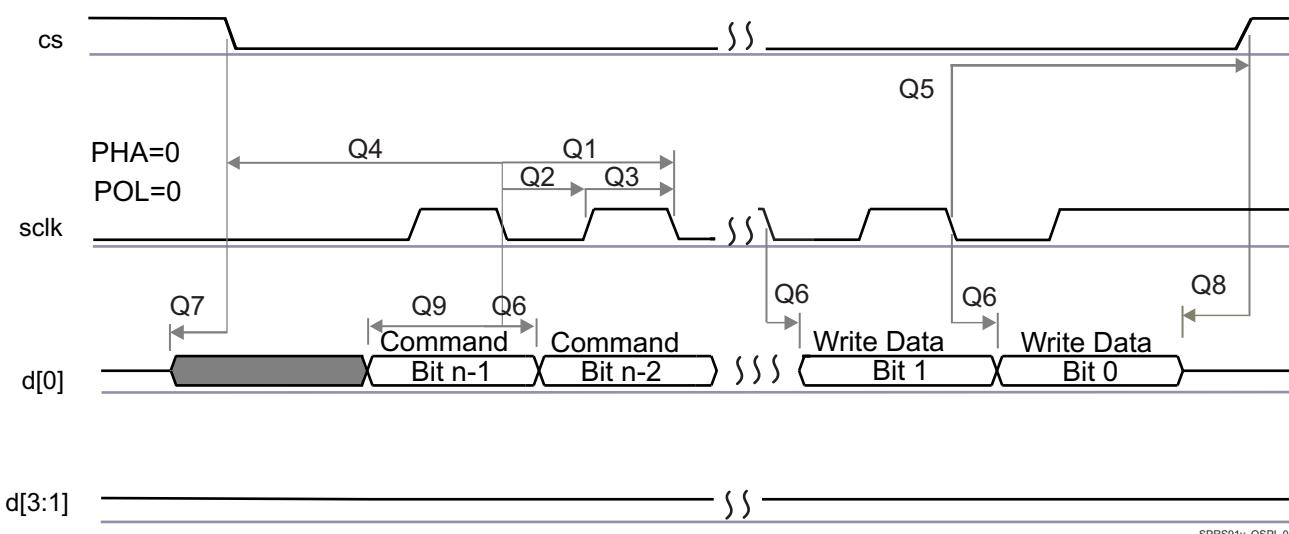

Table 5-64. Timing Requirements for QSPI<sup>(3)(2)</sup>

NO.	PARAMETER	DESCRIPTION	MODE	MIN	MAX	UNIT
Q2	$t_{su}(D-RTCLK)$	Setup time, d[3:0] valid before falling rtclk edge	Default Timing Mode, Clock Mode 0	4.6		ns
	$t_{su}(D-SCLK)$	Setup time, d[3:0] valid before falling sclk edge	Default Timing Mode, Clock Mode 3	12.3		ns
Q13	$t_h(RTCLK-D)$	Hold time, d[3:0] valid after falling rtclk edge	Default Timing Mode, Clock Mode 0	-0.1		ns
	$t_h(SCLK-D)$	Hold time, d[3:0] valid after falling sclk edge	Default Timing Mode, Clock Mode 3	0.1		ns
Q14	$t_{su}(D-SCLK)$	Setup time, final d[3:0] bit valid before final falling sclk edge	Default Timing Mode, Clock Mode 3	12.3-P <sup>(1)</sup>		ns
Q15	$t_h(SCLK-D)$	Hold time, final d[3:0] bit valid after final falling sclk edge	Default Timing Mode, Clock Mode 3	0.1+P <sup>(1)</sup>		ns

- (1) P = SCLK period.
- (2) Clock Modes 1 and 2 are not supported.
- (3) The Device captures data on the falling clock edge in Clock Mode 0 and 3, as opposed to the traditional rising clock edge. Although non-standard, the falling-edge-based setup and hold time timings have been designed to be compatible with standard SPI devices that launch data on the falling edge in Clock Modes 0 and 3.

**Figure 5-48. QSPI Write (Clock Mode 3)**

**Figure 5-49. QSPI Write (Clock Mode 0)**

**CAUTION**

The I/O Timings provided in this section are valid only for some QSPI usage modes when the corresponding Virtual I/O Timings or Manual I/O Timings are configured as described in the tables found in this section.

**NOTE**

To configure the desired Manual IO Timing Mode the user must follow the steps described in section Manual IO Timing Modes of the Device TRM.

The associated registers to configure are listed in the **CFG REGISTER** column. For more information see the Control Module chapter in the Device TRM.

Manual IO Timings Modes must be used to ensure some IO timings for QSPI. See [Table 5-28 Modes Summary](#) for a list of IO timings requiring the use of Manual IO Timings Modes. See [Table 5-65 Manual Functions Mapping for QSPI](#) for a definition of the Manual modes.

[Table 5-65](#) lists the A\_DELAY and G\_DELAY values needed to calculate the correct values to be set in the CFG\_x registers.

**Table 5-65. Manual Functions Mapping for QSPI**

BALL	BALL NAME	QSPI1_MANUAL1		CFG REGISTER	MUXMODE
		A_DELAY (ps)	G_DELAY (ps)		
L1	gpmc_a3	0	0	CFG_GPMC_A3_OUT	qspi1_cs2
K3	gpmc_a4	0	0	CFG_GPMC_A4_OUT	qspi1_cs3

G3	gpmc_cs3	0	0	CFG_GPMC_CS3_OUT	qspi1_cs1

#### 5.10.6.14 McASP

The multichannel audio serial port (McASP) functions as a general-purpose audio serial port optimized for the needs of multichannel audio applications. The McASP is useful for time-division multiplexed (TDM) stream, Inter-Integrated Sound (I2S) protocols, and intercomponent digital audio interface transmission (DIT).

The device have integrated 8 McASP modules (McASP1-McASP8) with:

- McASP1 and McASP2 modules supporting 16 channels with independent TX/RX clock/sync domain
- McASP3 through McASP7 modules supporting 4 channels with independent TX/RX clock/sync domain
- McASP8 module supporting 2 channels with independent TX/RX clock/sync domain

**NOTE**

For more information, see the Serial Communication Interface section of the Device TRM.

**CAUTION**

The I/O Timings provided in this section are valid only for some McASP usage modes when the corresponding Virtual I/O Timings or Manual I/O Timings are configured as described in the tables found in this section.

[Table 5-66](#), [Table 5-67](#), [Table 5-68](#) and [Figure 5-50](#) present Timing Requirements for McASP1 to McASP8

**Table 5-66. Timing Requirements for McASP1<sup>(1)</sup>**

NO.	PARAMETER	DESCRIPTION	MODE	MIN	MAX	UNIT
1	$t_c(\text{AHCLKX})$	Cycle time, AHCLKX		20		ns

3	CIOFIO	CLKR / FSR: Output CLKX / FSX: Input	AXR(Outputs)/CLKX/FSX	MCASP1_VIRTUAL2_ASYNC_RX	See Figure 5-54
			AXR(Inputs)/CLKR/FSR	Default (No Virtual Mode)	
4	CIOFOI	CLKR / FSX: Output CLKX / FSR: Input	AXR(Outputs)/CLKX/FSX	MCASP1_VIRTUAL2_ASYNC_RX	See Figure 5-55
			AXR(Inputs)/CLKR/FSR	Default (No Virtual Mode)	
<b>IP Mode : SYNC (CLKR / FSR internally generated from CLKX / FSX)</b>					
5	CO-FO-	CLKX / FSX: Output	AXR(Outputs)/CLKX/FSX	Default (No Virtual Mode)	See Figure 5-56
			AXR(Inputs)/CLKX/FSX	Default (No Virtual Mode)	
6	CI-FO-	FSX: Output CLKX: Input	AXR(Outputs)/CLKX/FSX	MCASP1_VIRTUAL1_SYNC_RX	See Figure 5-57
			AXR(Inputs)/CLKX/FSX	MCASP1_VIRTUAL1_SYNC_RX	
7	CI-FI-	CLKX / FSX: Input	AXR(Outputs)/CLKX/FSX	MCASP1_VIRTUAL1_SYNC_RX	See Figure 5-58
			AXR(Inputs)/CLKX/FSX	MCASP1_VIRTUAL1_SYNC_RX	
8	CO-FI-	CLKX: Output FSX: Input	AXR(Outputs)/CLKX/FSX	Default (No Virtual Mode)	See Figure 5-59
			AXR(Inputs)/CLKX/FSX	Default (No Virtual Mode)	

**Table 5-73. Virtual Mode Case Details for McASP2**

No.	CASE	CASE Description	Virtual Mode Settings		Notes
			Signals	Virtual Mode Value	
<b>IP Mode : SYNC (CLKR / FSR internally generated from CLKX / FSX)</b>					
5	CO-FO-	CLKX / FSX: Output	AXR(Outputs)/CLKX/FSX	Default (No Virtual Mode)	See Figure 5-56
			AXR(Inputs)/CLKX/FSX	Default (No Virtual Mode)	
6	CI-FO-	FSX: Output CLKX: Input	AXR(Outputs)/CLKX/FSX	MCASP2_VIRTUAL3_SYNC_RX	See Figure 5-57
			AXR(Inputs)/CLKX/FSX	MCASP2_VIRTUAL3_SYNC_RX	
7	CI-FI-	CLKX / FSX: Input	AXR(Outputs)/CLKX/FSX	MCASP2_VIRTUAL3_SYNC_RX <sup>(1)</sup>	See Figure 5-58
			AXR(Inputs)/CLKX/FSX	MCASP2_VIRTUAL3_SYNC_RX <sup>(1)</sup>	
			AXR(Inputs)/CLKX/FSX	MCASP2_VIRTUAL1_SYNC_RX_80M <sup>(2)</sup>	
8	CO-FI-	CLKX: Output FSX: Input	AXR(Outputs)/CLKX/FSX	Default (No Virtual Mode)	See Figure 5-59
			AXR(Inputs)/CLKX/FSX	Default (No Virtual Mode)	

(1) Used up to 50MHz. Should also be used in a CI-FI- mixed case where AXR operate as both inputs and outputs (that is, AXR are bidirectional).

(2) Used in 80MHz input only mode when AXR, CLKX and FSX are all inputs.

### 5.10.6.15 USB

SuperSpeed USB DRD Subsystem has four instances in the device providing the following functions:

- USB1: SuperSpeed (SS) USB 3.0 Dual-Role-Device (DRD) subsystem with integrated SS (USB3.0) PHY and HS/FS (USB2.0) PHY.
- USB2: High-Speed (HS) USB 2.0 Dual-Role-Device (DRD) subsystem with integrated HS/FS PHY.
- USB3: HS USB 2.0 Dual-Role-Device (DRD) subsystem with ULPI (SDR) interface to external HS/FS PHYs.

#### NOTE

For more information, see the SuperSpeed USB DRD section of the Device TRM.

#### 5.10.6.15.1 USB1 DRD PHY

The USB1 DRD interface supports the following applications:

- USB2.0 High-Speed PHY port (1.8 V and 3.3 V): this asynchronous high-speed interface is compliant with the USB2.0 PHY standard with an internal transceiver (USB2.0 standard v2.0), for a maximum data rate of 480 Mbps.
- USB3.0 Super-Speed PHY port (1.8 V): this asynchronous differential super-speed interface is compliant with the USB3.0 RX/TX PHY standard (USB3.0 standard v1.0) for a maximum data bit rate of 5Gbps.

#### 5.10.6.15.2 USB2 PHY

The USB2 interface supports the following applications:

- USB2.0 High-Speed PHY port (1.8 V and 3.3 V): this asynchronous high-speed interface is compliant with the USB2.0 PHY standard with an internal transceiver (USB2.0 standard v2.0), for a maximum data rate of 480 Mbps.

### 5.10.6.16 USB3 DRD ULPI—SDR—Slave Mode—12-pin Mode

The USB3 DRD interfaces support the following application:

- USB ULPI port: this synchronous interface is compliant with the USB2.0 ULPI SDR standard (UTMI+ v1.22), for alternative off-chip USB2.0 PHY interface; that is, with external transceiver with a maximum frequency of 60 MHz (synchronous slave mode, SDR, 12-pin, 8-data-bit).

#### NOTE

The Universal Serial Bus k ULPI modules are also referred as USBk where k = 3, 4.

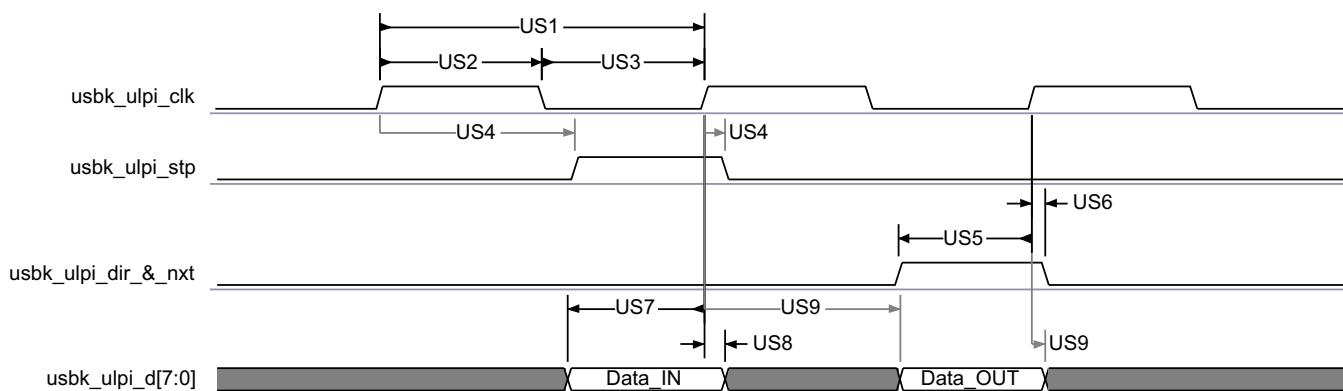

[Table 5-83](#), [Table 5-84](#) and [Figure 5-60](#) assume testing over the recommended operating conditions and electrical characteristic conditions.

**Table 5-83. Timing Requirements for ULPI SDR Slave Mode**

NO.	PARAMETER	DESCRIPTION	MIN	MAX	UNIT
US1	$t_{c(clk)}$	Cycle time, usb_ulpi_clk period	16.66		ns
US5	$t_{su(ctrlV-clkH)}$	Setup time, usb_ulpi_dir/usb_ulpi_nxt valid before usb_ulpi_clk rising edge	6.73		ns
US6	$t_{h(clkH-ctrlV)}$	Hold time, usb_ulpi_dir/usb_ulpi_nxt valid after usb_ulpi_clk rising edge	-0.41		ns
US7	$t_{su(dV-clkH)}$	Setup time, usb_ulpi_d[7:0] valid before usb_ulpi_clk rising edge	6.73		ns
US8	$t_{h(clkH-dV)}$	Hold time, usb_ulpi_d[7:0] valid after usb_ulpi_clk rising edge	-0.41		ns

**Table 5-84. Switching Characteristics for ULPI SDR Slave Mode**

### 5.10.6.17 PCIe3

The device supports connections to PCIe-compliant devices via the integrated PCIe master/slave bus interface. The PCIe module is comprised of a dual-mode PCIe core and a SerDes PHY. Each PCIe subsystem controller has support for PCIe Gen-II mode (5.0 Gbps /lane) and Gen-I mode (2.5 Gbps/lane) (Single Lane and Flexible dual lane configuration).

The device PCIe supports the following features:

- 16-bit operation @250 MHz on PIPE interface (per 16-bit lane)
- Supports 2 ports x 1 lane or 1 port x 2 lanes configuration
- Single virtual channel (VC0), single traffic class (TC0)
- Single function in end-point mode

- Automatic width and speed negotiation
- Max payload: 128 byte outbound, 256 byte inbound
- Automatic credit management
- ECRC generation and checking
- Configurable BAR filtering
- Legacy interrupt reception (RC) and generation (EP)
- MSI generation and reception
- PCI Express Active State Power Management (ASPM) state L0s and L1 (with exceptions)
- All PCI Device Power Management D-states with the exception of D3<sub>cold</sub> / L2 state

The PCIe controller on this device conforms to the PCI Express Base 3.0 Specification, revision 1.0 and the PCI Local Bus Specification, revision 3.0.

---

**NOTE**

For more information, see the PCIe Controller section of the Device TRM.

---

#### 5.10.6.18 DCAN

The device provides two DCAN interfaces for supporting distributed realtime control with a high level of security. The DCAN interfaces implement the following features:

- Supports CAN protocol version 2.0 part A, B
  - Bit rates up to 1 MBit/s
  - 64 message objects
  - Individual identifier mask for each message object
  - Programmable FIFO mode for message objects
  - Programmable loop-back modes for self-test operation
  - Suspend mode for debug support
  - Software module reset
  - Automatic bus on after Bus-Off state by a programmable 32-bit timer
  - Direct access to Message RAM during test mode
  - CAN Rx/Tx pins are configurable as general-purpose IO pins
  - Two interrupt lines (plus additional parity-error interrupts line)
  - RAM initialization
  - DMA support
- 

**NOTE**

For more information, see the DCAN section of the Device TRM.

---

**NOTE**

The Controller Area Network Interface x (x = 1 to 2) is also referred to as DCANx.

---

**NOTE**

Refer to the CAN Specification for calculations necessary to validate timing compliance. Jitter tolerance calculations must be performed to validate the implementation.

---

Table 5-86 and Table 5-87 present timing and switching characteristics for DCANx Interface.

**Table 5-86. Timing Requirements for DCANx Receive**

NO.	PARAMETER	DESCRIPTION	MIN	NOM	MAX	UNIT
-	$f_{(\text{baud})}$	Maximum programmable baud rate			1	Mbps
-	$t_d(\text{DCANRX})$	Delay time, DCANx_RX pin to receive shift register			15	ns

**Table 5-87. Switching Characteristics Over Recommended Operating Conditions for DCANx Transmit**

NO.	PARAMETER	DESCRIPTION	MIN	MAX	UNIT
-	$f_{(\text{baud})}$	Maximum programmable baud rate		1	Mbps
-	$t_d(\text{DCANTX})$	Delay time, Transmit shift register to DCANx_TX pin <sup>(1)</sup>		23	ns

(1) These values do not include rise/fall times of the output buffer.

### 5.10.6.19 GMAC\_SW

The three-port gigabit ethernet switch subsystem (GMAC\_SW) provides ethernet packet communication and can be configured as an ethernet switch. It provides the Gigabit Media Independent Interface (G/MII) in MII mode, Reduced Gigabit Media Independent Interface (RGMI), Reduced Media Independent Interface (RMII), and the Management Data Input/Output (MDIO) for physical layer device (PHY) management.

#### NOTE

For more information, see the Ethernet Subsystem section of the Device TRM.

#### NOTE

The Gigabit, Reduced and Media Independent Interface n (n = 0 to 1) are also referred to as MIIn, RMIIn and RGMIIn.

#### CAUTION

The I/O Timings provided in this section are valid only if signals within a single IOSET are used. The IOSETs are defined in [Table 5-92](#), [Table 5-95](#), [Table 5-100](#) and [Table 5-107](#).

#### CAUTION

The I/O Timings provided in this section are valid only for some GMAC usage modes when the corresponding Virtual I/O Timings or Manual I/O Timings are configured as described in the tables found in this section.

### 5.10.6.19.1 GMAC MII Timings

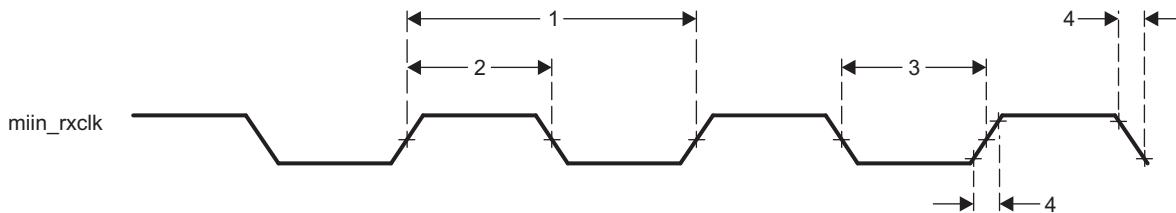

[Table 5-88](#) and [Figure 5-61](#) present timing requirements for MIIn in receive operation.

**Table 5-88. Timing Requirements for miin\_rxclk - MII Operation**

NO.	PARAMETER	DESCRIPTION	SPEED	MIN	MAX	UNIT
1	$t_c(\text{RX_CLK})$	Cycle time, miin_rxclk	10 Mbps	400		ns
			100 Mbps	40		ns

#### 5.10.6.19.3 GMAC RMII Timings

The main reference clock REF\_CLK (RMII\_50MHZ\_CLK) of RMII interface is internally supplied from PRCM. The source of this clock could be either externally sourced from the RMII\_MHZ\_50\_CLK pin of the device or internally generated from DPLL\_GMAC output clock GMAC\_RMII\_HS\_CLK. Please see the PRCM chapter of the device TRM for full details about RMII reference clock.

#### CAUTION

The I/O Timings provided in this section are valid only for some GMAC usage modes when the corresponding Virtual I/O Timings or Manual I/O Timings are configured as described in the tables found in this section.

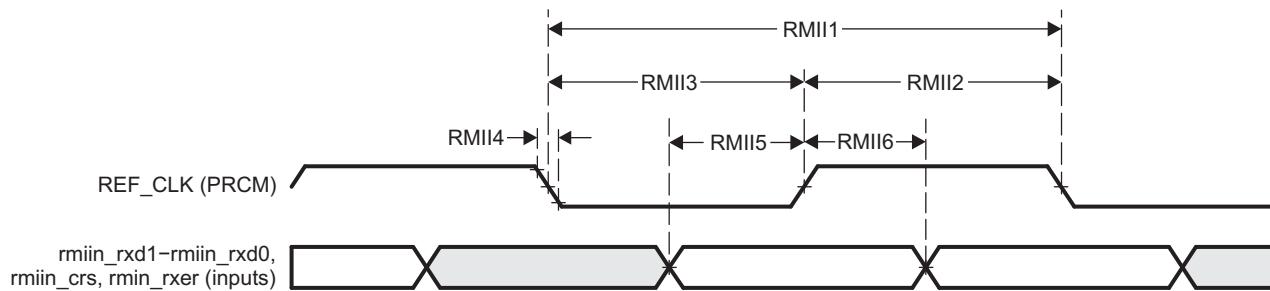

Table 5-96, Table 5-97 and Figure 5-66 present timing requirements for GMAC RMII Receive.

Table 5-96. Timing Requirements for GMAC REF\_CLK - RMII Operation

NO.	PARAMETER	DESCRIPTION	MIN	MAX	UNIT
RMII1	$t_c(\text{REF\_CLK})$	Cycle time, REF_CLK	20		ns
RMII2	$t_w(\text{REF\_CLKH})$	Pulse duration, REF_CLK high	7	13	ns

#### 5.10.6.19.4 GMAC RGMIIn Timings

**CAUTION**

The I/O Timings provided in this section are valid only for some GMAC usage modes when the corresponding Virtual I/O Timings or Manual I/O Timings are configured as described in the tables found in this section.

Table 5-103, Table 5-104 and Figure 5-68 present timing requirements for receive RGMIIn operation.

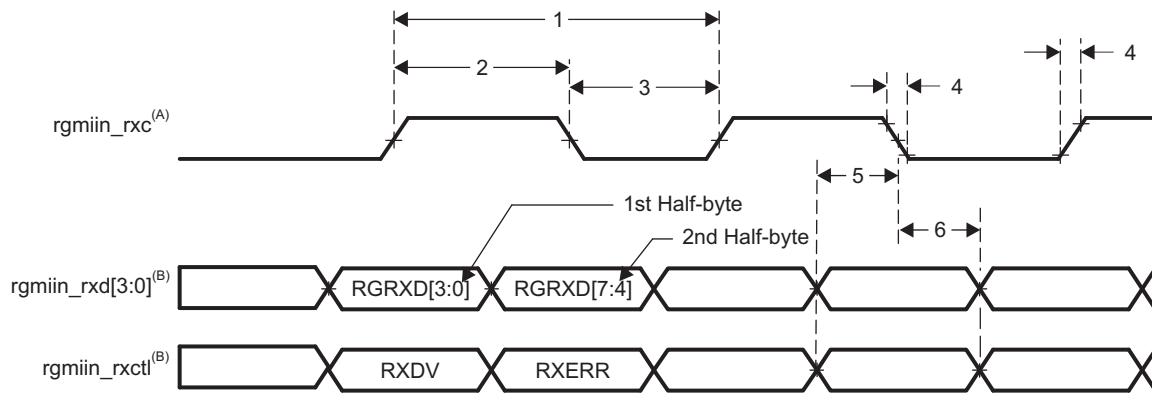

**Table 5-103. Timing Requirements for rgmiin\_rxc - RGMIIn Operation**

NO.	PARAMETER	DESCRIPTION	SPEED	MIN	MAX	UNIT
1	$t_c(RXC)$	Cycle time, rgmiin_rxc	10 Mbps	360	440	ns
			100 Mbps	36	44	ns
			1000 Mbps	7.2	8.8	ns
2	$t_w(RXCH)$	Pulse duration, rgmiin_rxc high	10 Mbps	160	240	ns
			100 Mbps	16	24	ns
			1000 Mbps	3.6	4.4	ns
3	$t_w(RXCL)$	Pulse duration, rgmiin_rxc low	10 Mbps	160	240	ns
			100 Mbps	16	24	ns
			1000 Mbps	3.6	4.4	ns
4	$t_t(RXC)$	Transition time, rgmiin_rxc	10 Mbps		0.75	ns
			100 Mbps		0.75	ns
			1000 Mbps		0.75	ns

**Table 5-104. Timing Requirements for GMAC RGMIIn Input Receive for 10/100/1000 Mbps (1)**

NO.	PARAMETER	DESCRIPTION	MODE	MIN	MAX	UNIT
5	$t_{su}(RXD-RXCH)$	Setup time, receive selected signals valid before rgmiin_rxc high/low	RGMII0/1	1		ns
6	$t_h(RXCH-RXD)$	Hold time, receive selected signals valid after rgmiin_rxc high/low	RGMII0/1	1		ns

- (1) For RGMII, receive selected signals include: rgmiin\_rx[3:0] and rgmiin\_rxctl.

- A. rgmiin\_rxc must be externally delayed relative to the data and control pins.
- B. Data and control information is received using both edges of the clocks. rgmiin\_rx[3:0] carries data bits 3-0 on the rising edge of rgmiin\_rxc and data bits 7-4 on the falling edge of rgmiin\_rxc. Similarly, rgmiin\_rxctl carries RXDV on rising edge of rgmiin\_rxc and RXERR on falling edge of rgmiin\_rxc.

**Figure 5-68. GMAC Receive Interface Timing, RGMIIIn operation**

Table 5-105, Table 5-106 and Figure 5-69 present switching characteristics for transmit - RGMIIIn for 10/100/1000Mbit/s.

**Table 5-105. Switching Characteristics Over Recommended Operating Conditions for rgmiin\_txctl - RGMIIIn Operation for 10/100/1000 Mbit/s**

NO.	PARAMETER	DESCRIPTION	SPEED	MIN	MAX	UNIT
1	$t_c(TXC)$	Cycle time, rgmiin_txc	10 Mbps	360	440	ns
			100 Mbps	36	44	ns
			1000 Mbps	7.2	8.8	ns
2	$t_w(TXCH)$	Pulse duration, rgmiin_txc high	10 Mbps	160	240	ns
			100 Mbps	16	24	ns
			1000 Mbps	3.6	4.4	ns
3	$t_w(TXCL)$	Pulse duration, rgmiin_txc low	10 Mbps	160	240	ns
			100 Mbps	16	24	ns
			1000 Mbps	3.6	4.4	ns
4	$t_t(TXC)$	Transition time, rgmiin_txc	10 Mbps		0.75	ns
			100 Mbps		0.75	ns
			1000 Mbps		0.75	ns

**Table 5-106. Switching Characteristics for GMAC RGMIIIn Output Transmit for 10/100/1000 Mbps (1)**

NO.	PARAMETER	DESCRIPTION	MODE	MIN	MAX	UNIT
5	$t_{osu}(TXD-TXC)$	Output Setup time, transmit selected signals valid to rgmiin_txc high/low	RGMII0, Internal Delay Enabled, 1000 Mbps	1.05 (2)		ns
			RGMII0, Internal Delay Enabled, 10/100 Mbps	1.2		ns
			RGMII1, Internal Delay Enabled, 1000 Mbps	1.05 (3)		ns
			RGMII1, Internal Delay Enabled, 10/100 Mbps	1.2		ns

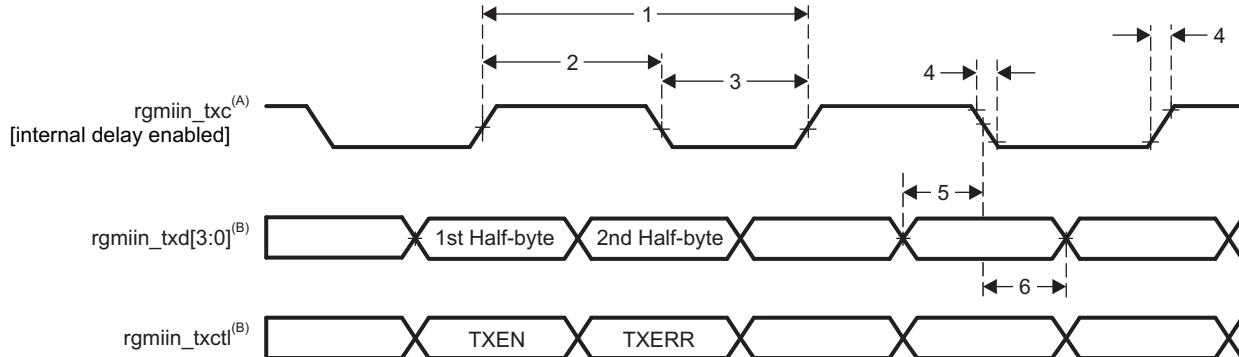

**Table 5-106. Switching Characteristics for GMAC RGMIIn Output Transmit for 10/100/1000 Mbps**  
<sup>(1)</sup> (continued)

NO.	PARAMETER	DESCRIPTION	MODE	MIN	MAX	UNIT
6	$t_{oh}(TXC-TXD)$	Output Hold time, transmit selected signals valid after rgmiin_txc high/low	RGMII0, Internal Delay Enabled, 1000 Mbps	1.05 <sup>(2)</sup>		ns
			RGMII0, Internal Delay Enabled, 10/100 Mbps	1.2		ns
			RGMII1, Internal Delay Enabled, 1000 Mbps	1.05 <sup>(3)</sup>		ns
			RGMII1, Internal Delay Enabled, 10/100 Mbps	1.2		ns

(1) For RGMII, transmit selected signals include: rgmiin\_txd[3:0] and rgmiin\_txctl.

(2) RGMII0 requires that the 4 data pins rgmii0\_txd[3:0] and rgmii0\_txctl have their board propagation delays matched within 50pS of rgmii0\_txc.

(3) RGMII1 requires that the 4 data pins rgmii1\_txd[3:0] and rgmii1\_txctl have their board propagation delays matched within 50pS of rgmii1\_txc.

SPRS969G\_TIMING\_GMAC\_RGMIITX\_09

- A. TXC is delayed internally before being driven to the rgmiin\_txc pin. This internal delay is always enabled.
- B. Data and control information is transmitted using both edges of the clocks. rgmiin\_txd[3:0] carries data bits 3-0 on the rising edge of rgmiin\_txc and data bits 7-4 on the falling edge of rgmiin\_txc. Similarly, rgmiin\_txctl carries TXEN on rising edge of rgmiin\_txc and TXERR on falling edge of rgmiin\_txc.

**Figure 5-69. GMAC Transmit Interface Timing RGMIIn operation**

In Table 5-107 are presented the specific groupings of signals (IOSET) for use with GMAC RGMII signals.

**Table 5-107. GMAC RGMII IOSETS**

SIGNALS	IOSET3		IOSET4	
	BALL	MUX	BALL	MUX
GMAC RGMII1				
rgmii1_txd3	C11	3		
rgmii1_txd2	B12	3		
rgmii1_txd1	A12	3		
rgmii1_txd0	A13	3		
rgmii1_rxd3	B13	3		
rgmii1_rxd2	E13	3		
rgmii1_rxd1	C13	3		
rgmii1_rxd0	D13	3		
rgmii1_rxctl	F11	3		
rgmii1_txc	B11	3		
rgmii1_txctl	D11	3		

**Table 5-107. GMAC RGMII IOSETs (continued)**

SIGNALS	IOSET3		IOSET4	
	BALL	MUX	BALL	MUX
rgmii1_rxc	E11	3		
<b>GMAC RGMII0</b>				
rgmii0_txd3			P4	0
rgmii0_txd2			P3	0
rgmii0_txd1			R2	0
rgmii0_txd0			R1	0
rgmii0_rxd3			N1	0
rgmii0_rxd2			P1	0
rgmii0_rxd1			N3	0
rgmii0_rxd0			N4	0
rgmii0_txc			T4	0
rgmii0_rxctl			P2	0
rgmii0_rxc			N2	0
rgmii0_txctl			T5	0

**NOTE**

To configure the desired Manual IO Timing Mode the user must follow the steps described in section "Manual IO Timing Modes" of the Device TRM.

The associated registers to configure are listed in the **CFG REGISTER** column. For more information please see the *Control Module Chapter* in the Device TRM.

Manual IO Timings Modes must be used to ensure some IO timings for GMAC. See [Table 5-28 Modes Summary](#) for a list of IO timings requiring the use of Manual IO Timings Modes. See [Table 5-108 Manual Functions Mapping for GMAC RGMII0](#) for a definition of the Manual modes.

[Table 5-108](#) lists the A\_DELAY and G\_DELAY values needed to calculate the correct values to be set in the CFG\_x registers.

**Table 5-108. Manual Functions Mapping for GMAC RGMII0**

BALL	BALL NAME	GMAC_RGMII0_MANUAL1		CFG REGISTER	MUXMODE
		A_DELAY (ps)	G_DELAY (ps)		
N2	rgmii0_rxci	413	0	CFG_RGMII0_RXC_IN	rgmii0_rxci
P2	rgmii0_rxctl	27	2296	CFG_RGMII0_RXCTL_IN	rgmii0_rxctl

### 5.10.6.20 eMMC/SD/SDIO

The Device includes the following external memory interfaces 4 MultiMedia Card/Secure Digital/Secure Digital Input Output Interface (MMC/SD/SDIO)

---

**NOTE**

The eMMC/SD/SDIO $i$  ( $i = 1$  to 4) controller is also referred to as MMC $i$ .

---

#### 5.10.6.20.1 MMC1—SD Card Interface

MMC1 interface is compliant with the SD Standard v3.01 and it supports the following SD Card applications:

- Default speed, 4-bit data, SDR, half-cycle
  - High speed, 4-bit data, SDR, half-cycle
  - SDR12, 4-bit data, half-cycle
  - SDR25, 4-bit data, half-cycle
  - UHS-I SDR50, 4-bit data, half-cycle
  - UHS-I SDR104, 4-bit data, half-cycle
  - UHS-I DDR50, 4-bit data
- 

**NOTE**

For more information, see the eMMC/SD/SDIO chapter of the Device TRM.

---

##### 5.10.6.20.1.1 Default speed, 4-bit data, SDR, half-cycle

[Table 5-110](#) and [Table 5-111](#) present Timing requirements and Switching characteristics for MMC1 - Default Speed in receiver and transmitter mode (see [Figure 5-70](#) and [Figure 5-71](#)).

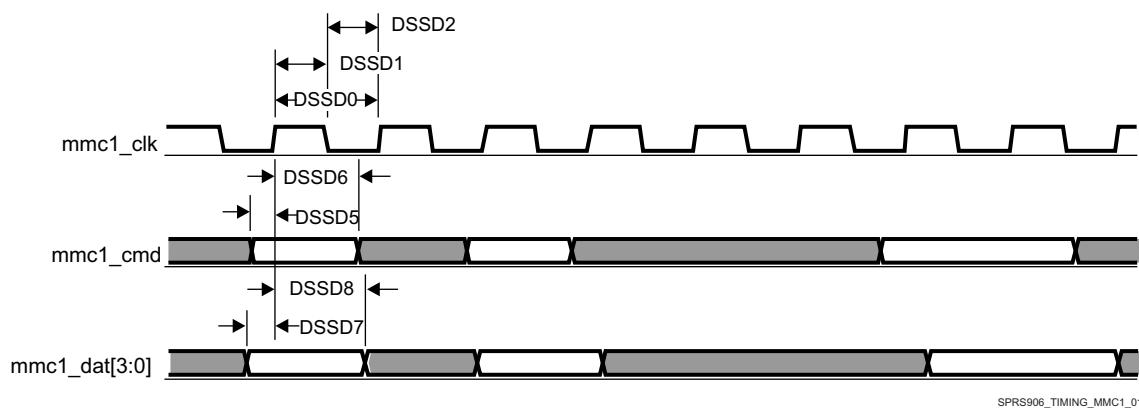

**Table 5-110. Timing Requirements for MMC1 - SD Card Default Speed Mode**

NO.	PARAMETER	DESCRIPTION	MIN	MAX	UNIT
DSSD5	$t_{su(cmdV-clkH)}$	Setup time, mmc1_cmd valid before mmc1_clk rising clock edge	5.11		ns
DSSD6	$t_h(clkH-cmdV)$	Hold time, mmc1_cmd valid after mmc1_clk rising clock edge	20.46		ns
DSSD7	$t_{su(dV-clkH)}$	Setup time, mmc1_dat[3:0] valid before mmc1_clk rising clock edge	5.11		ns
DSSD8	$t_h(clkH-dV)$	Hold time, mmc1_dat[3:0] valid after mmc1_clk rising clock edge	20.46		ns

**Table 5-111. Switching Characteristics for MMC1 - SD Card Default Speed Mode**

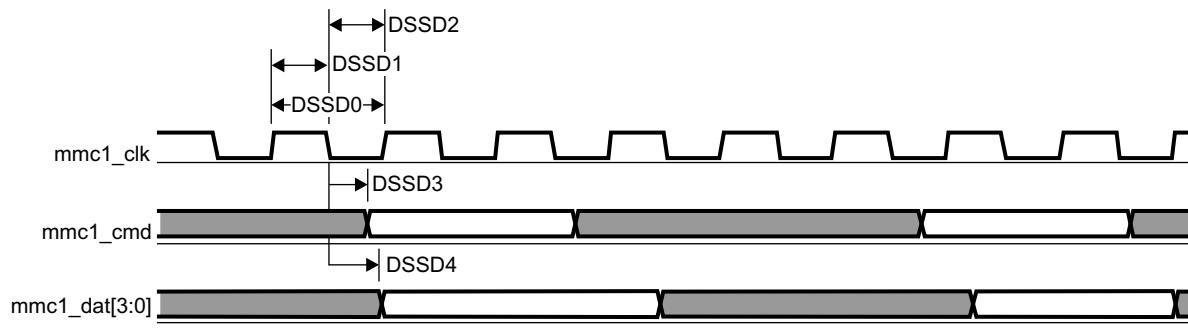

NO.	PARAMETER	DESCRIPTION	MIN	MAX	UNIT
DSSD0	$f_{op(clk)}$	Operating frequency, mmc1_clk		24	MHz
DSSD1	$t_w(clkH)$	Pulse duration, mmc1_clk high	0.5 × P- 0.185 <sup>(1)</sup>		ns
DSSD2	$t_w(clkL)$	Pulse duration, mmc1_clk low	0.5 × P- 0.185 <sup>(1)</sup>		ns
DSSD3	$t_d(clkL-cmdV)$	Delay time, mmc1_clk falling clock edge to mmc1_cmd transition	-14.93	14.93	ns
DSSD4	$t_d(clkL-dV)$	Delay time, mmc1_clk falling clock edge to mmc1_dat[3:0] transition	-14.93	14.93	ns

(1) P = output mmc1\_clk period in ns

SPRS906\_TIMING\_MMC1\_01

**Figure 5-70. MMC/SD/SDIO in - Default Speed - Receiver Mode**

SPRS906\_TIMING\_MMC1\_02

**Figure 5-71. MMC/SD/SDIO in - Default Speed - Transmitter Mode**

#### 5.10.6.20.1.2 High speed, 4-bit data, SDR, half-cycle

Table 5-112 and Table 5-113 present Timing requirements and Switching characteristics for MMC1 - High Speed in receiver and transmitter mode (see Figure 5-72 and Figure 5-73).

**Table 5-112. Timing Requirements for MMC1 - SD Card High Speed**

NO.	PARAMETER	DESCRIPTION	MIN	MAX	UNIT
HSSD3	$t_{su(cmdV-clkH)}$	Setup time, mmc1_cmd valid before mmc1_clk rising clock edge	5.3		ns
HSSD4	$t_h(clkH-cmdV)$	Hold time, mmc1_cmd valid after mmc1_clk rising clock edge	2.6		ns
HSSD7	$t_{su(dV-clkH)}$	Setup time, mmc1_dat[3:0] valid before mmc1_clk rising clock edge	5.3		ns
HSSD8	$t_h(clkH-dV)$	Hold time, mmc1_dat[3:0] valid after mmc1_clk rising clock edge	2.6		ns

**Table 5-113. Switching Characteristics for MMC1 - SD Card High Speed**

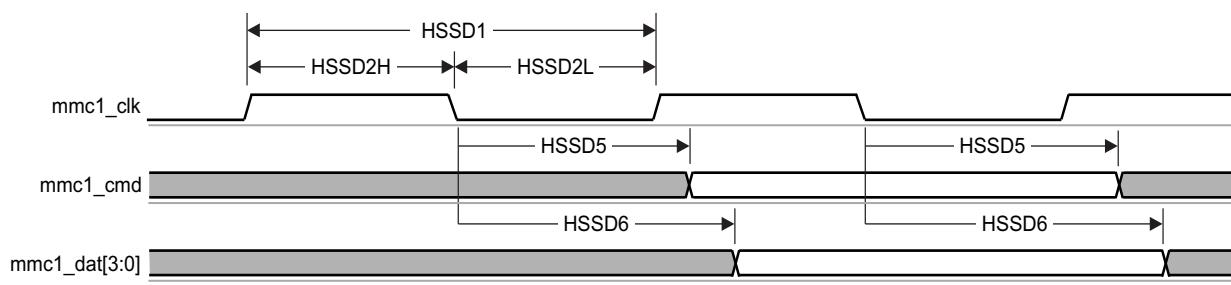

NO.	PARAMETER	DESCRIPTION	MIN	MAX	UNIT
HSSD1	$f_{op(clk)}$	Operating frequency, mmc1_clk		48	MHz
HSSD2H	$t_w(clkH)$	Pulse duration, mmc1_clk high	$0.5 \times P - 0.185$ (1)		ns
HSSD2L	$t_w(clkL)$	Pulse duration, mmc1_clk low	$0.5 \times P - 0.185$ (1)		ns
HSSD5	$t_d(clkL-cmdV)$	Delay time, mmc1_clk falling clock edge to mmc1_cmd transition	-7.6	3.6	ns
HSSD6	$t_d(clkL-dV)$	Delay time, mmc1_clk falling clock edge to mmc1_dat[3:0] transition	-7.6	3.6	ns

(1) P = output mmc1\_clk period in ns

SDR255	$t_d(clkL-cmdV)$	Delay time, mmc1_clk falling clock edge to mmc1_cmd transition	-8.8	6.6	ns

**Table 5-117. Switching Characteristics for MMC1 - SD Card SDR25 Mode (continued)**

NO.	PARAMETER	DESCRIPTION	MIN	MAX	UNIT
SDR256	$t_{d(\text{clkL-dV})}$	Delay time, mmc1_clk falling clock edge to mmc1_dat[3:0] transition	-8.8	6.6	ns

(1) P = output mmc1\_clk period in ns

**Figure 5-76. MMC/SD/SDIO in - High Speed SDR25 - Receiver Mode****Figure 5-77. MMC/SD/SDIO in - High Speed SDR25 - Transmitter Mode**

#### 5.10.6.20.1.5 UHS-I SDR50, 4-bit data, half-cycle

Table 5-118 and Table 5-119 present Timing requirements and Switching characteristics for MMC1 - SDR50 in receiver and transmitter mode (see Figure 5-78 and Figure 5-79).

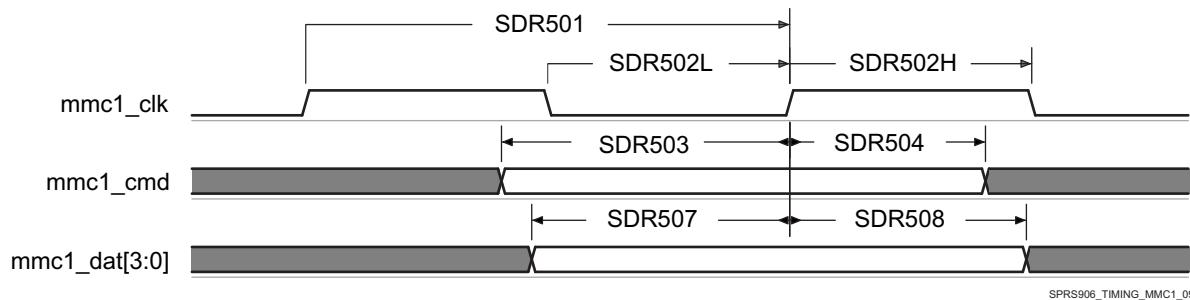

**Table 5-118. Timing Requirements for MMC1 - SD Card SDR50 Mode**

NO.	PARAMETER	DESCRIPTION	MODE	MIN	MAX	UNIT
SDR50_3	$t_{su(\text{cmdV}-\text{clkH})}$	Setup time, mmc1_cmd valid before mmc1_clk rising clock edge		1.48		ns
SDR50_4	$t_h(\text{clkH}-\text{cmdV})$	Hold time, mmc1_cmd valid after mmc1_clk rising clock edge		1.7		ns
SDR50_7	$t_{su(\text{dV}-\text{clkH})}$	Setup time, mmc1_dat[3:0] valid before mmc1_clk rising clock edge		1.48		ns
SDR50_8	$t_h(\text{clkH}-\text{dV})$	Hold time, mmc1_dat[3:0] valid after mmc1_clk rising clock edge	Pad Loopback Clock	1.7		ns
			Internal Loopback Clock	1.6		ns

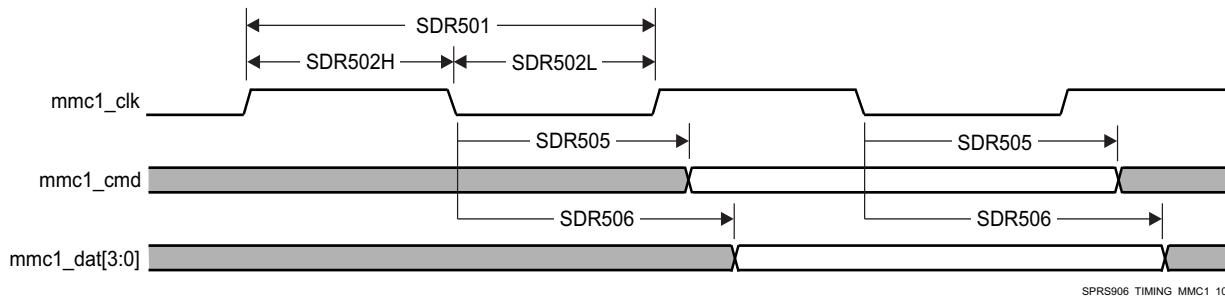

**Table 5-119. Switching Characteristics for MMC1 - SD Card SDR50 Mode**

NO.	PARAMETER	DESCRIPTION	MIN	MAX	UNIT
SDR501	fop(clk)	Operating frequency, mmc1_clk	96		MHz
SDR502_H	$t_w(\text{clkH})$	Pulse duration, mmc1_clk high	$0.5 \times P - 0.185$ (1)		ns
SDR502L	$t_w(\text{clkL})$	Pulse duration, mmc1_clk low	$0.5 \times P - 0.185$ (1)		ns
SDR505	$t_d(\text{clkL}-\text{cmdV})$	Delay time, mmc1_clk falling clock edge to mmc1_cmd transition	-8.8	6.6	ns
SDR506	$t_{d(\text{clkL}-\text{dV})}$	Delay time, mmc1_clk falling clock edge to mmc1_dat[3:0] transition	-3.66	1.46	ns

(1) P = output mmc1\_clk period in ns

**Figure 5-78. MMC/SD/SDIO in - High Speed SDR50 - Receiver Mode**

**Figure 5-79. MMC/SD/SDIO in - High Speed SDR50 - Transmitter Mode**

#### 5.10.6.20.1.6 UHS-I SDR104, 4-bit data, half-cycle

Table 5-120 presents Timing requirements and Switching characteristics for MMC1 - SDR104 in receiver and transmitter mode (see Figure 5-80 and Figure 5-81).

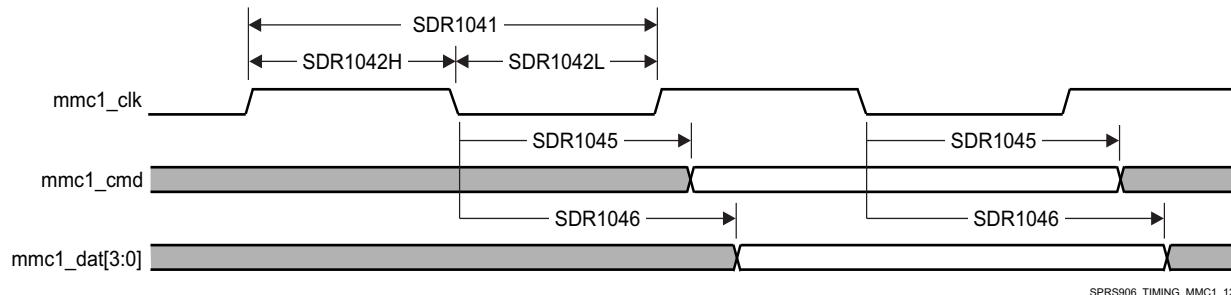

**Table 5-120. Switching Characteristics for MMC1 - SD Card SDR104 Mode**

NO.	PARAMETER	DESCRIPTION	MIN	MAX	UNIT
SDR1041	fop(clk)	Operating frequency, mmc1_clk		192	MHz
SDR1042 H	t <sub>w(clkH)</sub>	Pulse duration, mmc1_clk high	0.5 × P- 0.185 (1)		ns
SDR1042 L	t <sub>w(clkL)</sub>	Pulse duration, mmc1_clk low	0.5 × P- 0.185 (1)		ns
SDR1045	t <sub>d(clkL-cmdV)</sub>	Delay time, mmc1_clk falling clock edge to mmc1_cmd transition	-1.09	0.49	ns
SDR1046	t <sub>d(clkL-dV)</sub>	Delay time, mmc1_clk falling clock edge to mmc1_dat[3:0] transition	-1.09	0.49	ns

(1) P = output mmc1\_clk period in ns

**Figure 5-80. MMC/SD/SDIO in - High Speed SDR104 - Receiver Mode**

**Figure 5-81. MMC/SD/SDIO in - High Speed SDR104 - Transmitter Mode**

#### 5.10.6.20.1.7 UHS-I DDR50, 4-bit data

Table 5-121 and Table 5-122 present Timing requirements and Switching characteristics for MMC1 - DDR50 in receiver and transmitter mode (see Figure 5-82 and Figure 5-83).

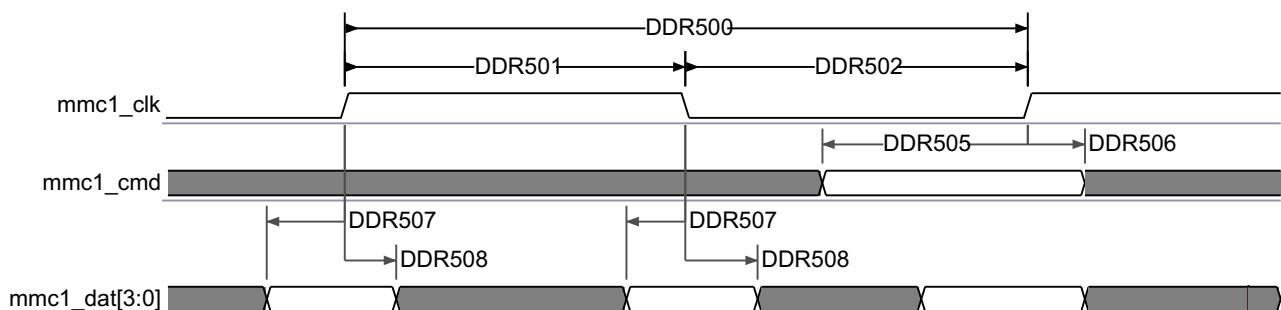

**Table 5-121. Timing Requirements for MMC1 - SD Card DDR50 Mode**

NO.	PARAMETER	DESCRIPTION	MODE	MIN	MAX	UNIT
DDR50_5	$t_{su(cmdV-clk)}$	Setup time, mmc1_cmd valid before mmc1_clk transition		1.79		ns
DDR50_6	$t_h(clk-cmdV)$	Hold time, mmc1_cmd valid after mmc1_clk transition		2		ns
DDR50_7	$t_{su(dV-clk)}$	Setup time, mmc1_dat[3:0] valid before mmc1_clk transition	Pad Loopback	1.79		ns
			Internal Loopback	1.79		ns
DDR50_8	$t_h(clk-dV)$	Hold time, mmc1_dat[3:0] valid after mmc1_clk transition	Pad Loopback	2		ns
			Internal Loopback	1.6		ns

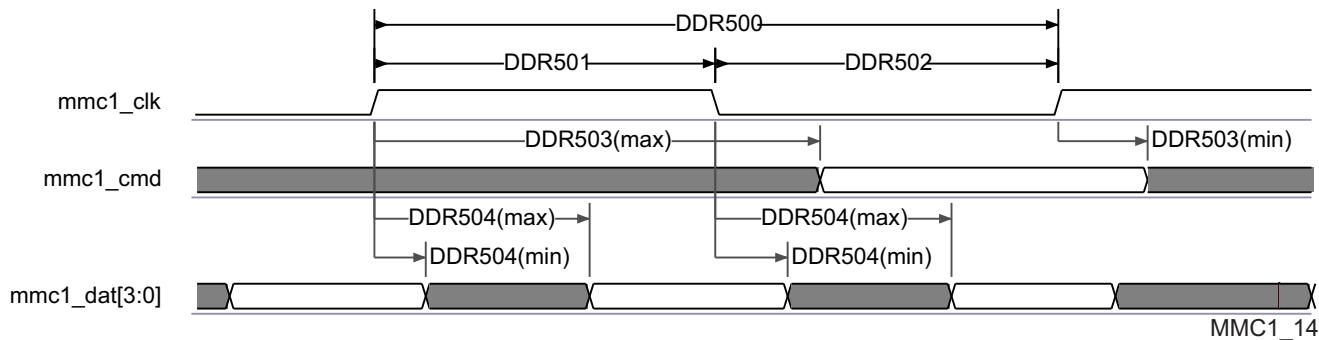

**Table 5-122. Switching Characteristics for MMC1 - SD Card DDR50 Mode**

NO.	PARAMETER	DESCRIPTION	MIN	MAX	UNIT
DDR500	fop(clk)	Operating frequency, mmc1_clk		48	MHz
DDR501	$t_w(clkH)$	Pulse duration, mmc1_clk high	0.5 × P- (1)	0.185	ns
DDR502	$t_w(clkL)$	Pulse duration, mmc1_clk low	0.5 × P- (1)	0.185	ns
DDR503	$t_d(clk-cmdV)$	Delay time, mmc1_clk transition to mmc1_cmd transition	1.225	6.6	ns
DDR504	$t_d(clk-dV)$	Delay time, mmc1_clk transition to mmc1_dat[3:0] transition	1.225	6.6	ns

(1) P = output mmc1\_clk period in ns

**Figure 5-82. SDMMC - High Speed SD - DDR - Data/Command Receive**

**Figure 5-83. SDMMC - High Speed SD - DDR - Data/Command Transmit****NOTE**

To configure the desired virtual mode the user must set MODESELECT bit and DELAYMODE bitfield for each corresponding pad control register.

The pad control registers are presented in [Table 4-27](#) and described in Device TRM, *Control Module Chapter*.

Virtual IO Timings Modes must be used to ensure some IO timings for MMC1. See [Table 5-28 Modes Summary](#) for a list of IO timings requiring the use of Virtual IO Timings Modes. See [Table 5-123 Virtual Functions Mapping for MMC1](#) for a definition of the Virtual modes.

[Table 5-123](#) presents the values for DELAYMODE bitfield.

**Table 5-123. Virtual Functions Mapping for MMC1**

BALL	BALL NAME	Delay Mode Value				MUXMODE
		MMC1_VIRTUAL1	MMC1_VIRTUAL4	MMC1_VIRTUAL5	MMC1_VIRTUAL6	
U3	mmc1_clk	15	12	11	10	mmc1_clk
V4	mmc1_cmd	15	12	11	10	mmc1_cmd
V3	mmc1_dat0	15	12	11	10	mmc1_dat0
V2	mmc1_dat1	15	12	11	10	mmc1_dat1
W1	mmc1_dat2	15	12	11	10	mmc1_dat2
V1	mmc1_dat3	15	12	11	10	mmc1_dat3

**NOTE**

To configure the desired Manual IO Timing Mode the user must follow the steps described in section Manual IO Timing Modes of the Device TRM.

The associated registers to configure are listed in the **CFG REGISTER** column. For more information see the Control Module chapter in the Device TRM.

Manual IO Timings Modes must be used to ensure some IO timings for MMC1. See [Table 5-28 Modes Summary](#) for a list of IO timings requiring the use of Manual IO Timings Modes. See [Table 5-124 Manual Functions Mapping for MMC1](#) for a definition of the Manual modes.

[Table 5-124](#) lists the A\_DELAY and G\_DELAY values needed to calculate the correct values to be set in the CFG\_x registers.

**Table 5-124. Manual Functions Mapping for MMC1**

BALL	BALL NAME	MMC1_MANUAL1		MMC1_MANUAL2		CFG REGISTER	MUXMODE
		A_DELAY (ps)	G_DELAY (ps)	A_DELAY (ps)	G_DELAY (ps)

### 5.10.6.20.2 MMC2 — eMMC

MMC2 interface is compliant with the JC64 eMMC Standard v4.5 and it supports the following eMMC applications:

- Standard JC64 SDR, 8-bit data, half cycle
- High-speed JC64 SDR, 8-bit data, half cycle
- High-speed HS200 JEDES84, 8-bit data, half cycle
- High-speed JC64 DDR, 8-bit data

**NOTE**

For more information, see the eMMC/SD/SDIO chapter of the Device TRM.

### 5.10.6.20.2.1 Standard JC64 SDR, 8-bit data, half cycle

Table 5-125 and Table 5-126 present Timing requirements and Switching characteristics for MMC2 - Standart SDR in receiver and transmitter mode (see Figure 5-84 and Figure 5-85).

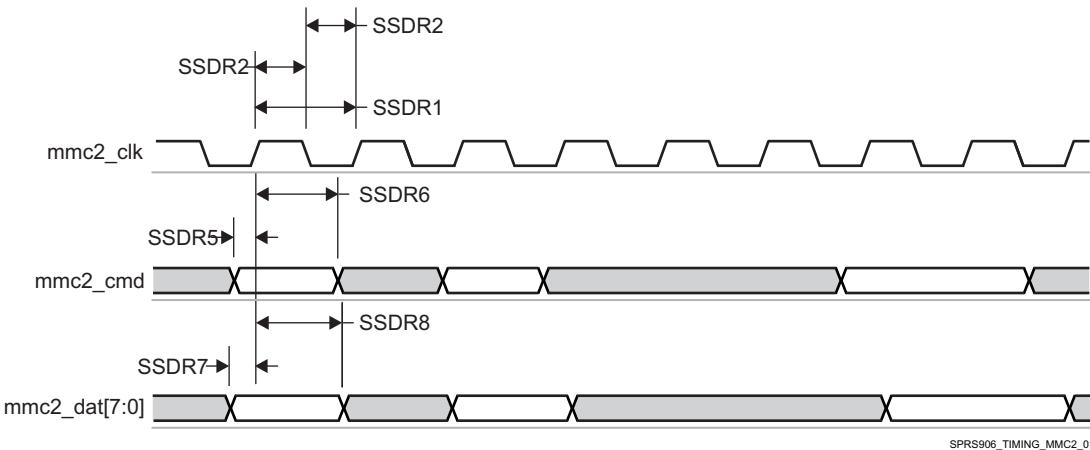

**Table 5-125. Timing Requirements for MMC2 - JC64 Standard SDR Mode**

NO.	PARAMETER	DESCRIPTION	MIN	MAX	UNIT
SSDR5	$t_{su(cmdV-clkH)}$	Setup time, mmc2_cmd valid before mmc2_clk rising clock edge	13.19		ns
SSDR6	$t_h(clkH-cmdV)$	Hold time, mmc2_cmd valid after mmc2_clk rising clock edge	8.4		ns
SSDR7	$t_{su(dV-clkH)}$	Setup time, mmc2_dat[7:0] valid before mmc2_clk rising clock edge	13.19		ns
SSDR8	$t_h(clkH-dV)$	Hold time, mmc2_dat[7:0] valid after mmc2_clk rising clock edge	8.4		ns

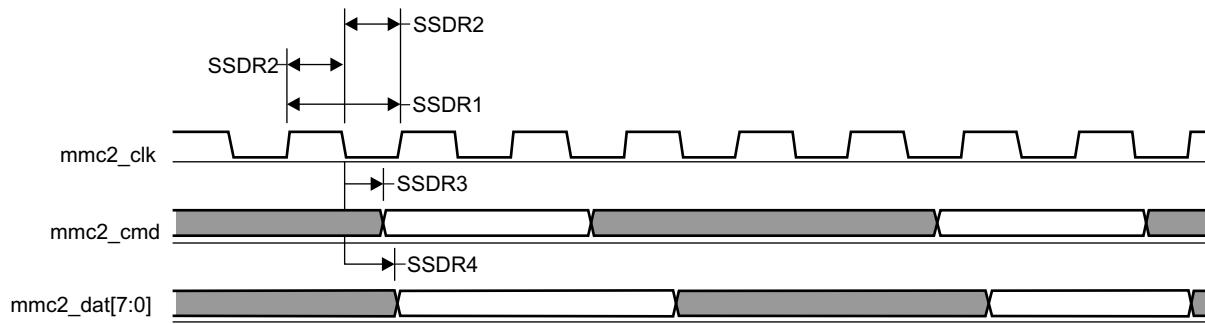

**Table 5-126. Switching Characteristics for MMC2 - JC64 Standard SDR Mode**

NO.	PARAMETER	DESCRIPTION	MIN	MAX	UNIT
SSDR1	fop(clk)	Operating frequency, mmc2_clk		24	MHz
SSDR2H	t <sub>w(clkH)</sub>	Pulse duration, mmc2_clk high	0.5 × P- 0.172 (1)		ns
SSDR2L	t <sub>w(clkL)</sub>	Pulse duration, mmc2_clk low	0.5 × P- 0.172 (1)		ns
SSDR3	t <sub>d(clkL-cmdV)</sub>	Delay time, mmc2_clk falling clock edge to mmc2_cmd transition	-16.96	16.96	ns
SSDR4	t <sub>d(clkL-dV)</sub>	Delay time, mmc2_clk falling clock edge to mmc2_dat[7:0] transition	-16.96	16.96	ns

(1) P = output mmc2\_clk period in ns

### 5.10.6.20.2.3 High-speed HS200 JEDS84 SDR, 8-bit data, half cycle

Table 5-129 presents Switching characteristics for MMC2 - HS200 in transmitter mode (see [Figure 5-88](#)).

**Table 5-129. Switching Characteristics for MMC2 - JEDEC HS200 Mode**

NO.	PARAMETER	DESCRIPTION	MIN	MAX	UNIT
HS2001	fop(clk)	Operating frequency, mmc2_clk		192	MHz
HS2002H	t <sub>w(clkH)</sub>	Pulse duration, mmc2_clk high	0.5 × P- 0.172 <sup>(1)</sup>		ns
HS2002L	t <sub>w(clkL)</sub>	Pulse duration, mmc2_clk low	0.5 × P- 0.172 <sup>(1)</sup>		ns
HS2005	t <sub>d(clkL-cmdV)</sub>	Delay time, mmc2_clk falling clock edge to mmc2_cmd transition	-1.136	0.536	ns
HS2006	t <sub>d(clkL-dV)</sub>	Delay time, mmc2_clk falling clock edge to mmc2_dat[7:0] transition	-1.136	0.536	ns

(1) P = output mmc2\_clk period in ns

**Figure 5-88. eMMC in - HS200 SDR - Transmitter Mode**

#### 5.10.6.20.2.4 High-speed JC64 DDR, 8-bit data

Table 5-130 and Table 5-131 present Timing requirements and Switching characteristics for MMC2 - High speed DDR in receiver and transmitter mode (see Figure 5-89 and Figure 5-90).

**Table 5-130. Timing Requirements for MMC2 - JC64 High Speed DDR Mode**

NO.	PARAMETER	DESCRIPTION	MODE	MIN	MAX	UNIT
DDR3	t <sub>su(cmdV-clk)</sub>	Setup time, mmc2_cmd valid before mmc2_clk transition		1.8		ns
DDR4	t <sub>h(clk-cmdV)</sub>	Hold time, mmc2_cmd valid after mmc2_clk transition		1.6		ns
DDR7	t <sub>su(dV-clk)</sub>	Setup time, mmc2_dat[7:0] valid before mmc2_clk transition		1.8		ns
DDR8	t <sub>h(clk-dV)</sub>	Hold time, mmc2_dat[7:0] valid after mmc2_clk transition	Pad Loopback (1.8V and 3.3V), Boot	1.6		ns
			Internal Loopback (1.8V with MMC2_VIRTUAL2)	1.86		ns
			Internal Loopback (3.3V with MMC2_VIRTUAL2)	1.95		ns
			Internal Loopback (1.8V with MMC2_MANUAL2)			ns
			Internal Loopback (3.3V with MMC2_MANUAL2)	1.6		ns

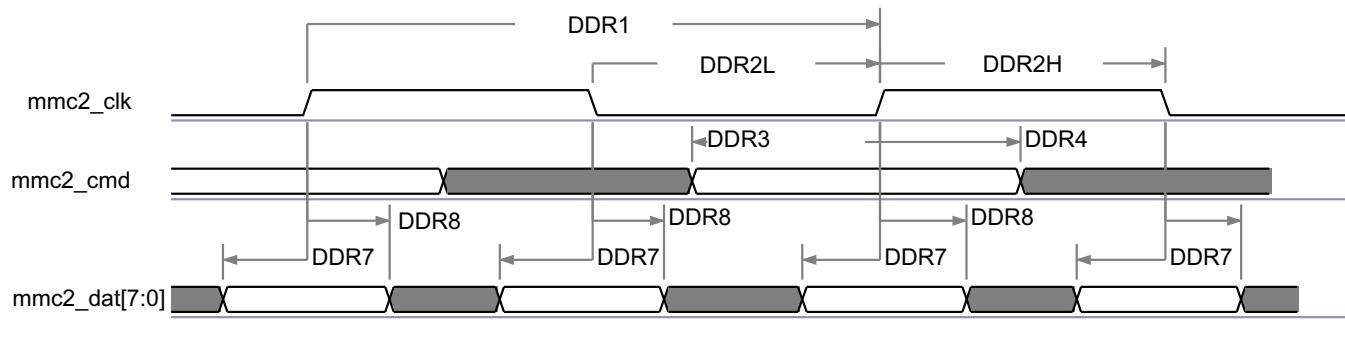

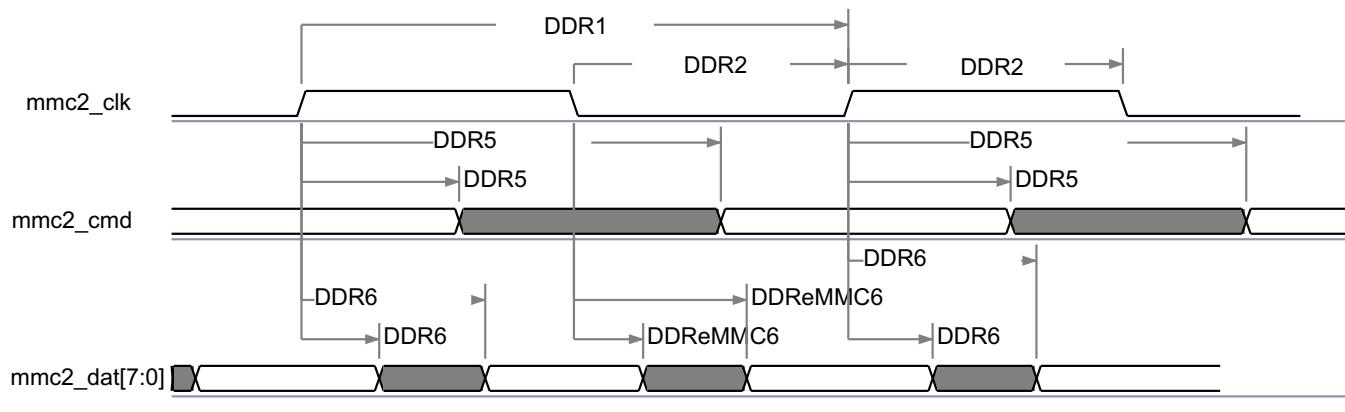

**Table 5-131. Switching Characteristics for MMC2 - JC64 High Speed DDR Mode**

NO.	PARAMETER	DESCRIPTION	MIN	MAX	UNIT
DDR1	fop(clk)	Operating frequency, mmc2_clk		48	MHz
DDR2H	t <sub>w(clkH)</sub>	Pulse duration, mmc2_clk high	0.5 × P- 0.172 <sup>(1)</sup>		ns
DDR2L	t <sub>w(clkL)</sub>	Pulse duration, mmc2_clk low	0.5 × P- 0.172 <sup>(1)</sup>		ns

**Table 5-131. Switching Characteristics for MMC2 - JC64 High Speed DDR Mode (continued)**

NO.	PARAMETER	DESCRIPTION	MIN	MAX	UNIT
DDR5	$t_{d(\text{clk-cmd}V)}$	Delay time, mmc2_clk transition to mmc2_cmd transition	2.9	7.14	ns
DDR6	$t_{d(\text{clk-d}V)}$	Delay time, mmc2_clk transition to mmc2_dat[7:0] transition	2.9	7.14	ns

(1) P = output mmc2\_clk period in ns

**Figure 5-89. MMC/SD/SDIO in - High Speed DDR JC64 - Receiver Mode****Figure 5-90. MMC/SD/SDIO in - High Speed DDR JC64 - Transmitter Mode****NOTE**

To configure the desired virtual mode the user must set MODESELECT bit and DELAYMODE bitfield for each corresponding pad control register.

The pad control registers are presented in [Table 4-27](#) and described in Device TRM, Control Module Chapter.

Virtual IO Timings Modes must be used to ensure some IO timings for MMC2. See [Table 5-28 Modes Summary](#) for a list of IO timings requiring the use of Virtual IO Timings Modes. See [Table 5-132 Virtual Functions Mapping for MMC2](#) for a definition of the Virtual modes.

[Table 5-132](#) presents the values for DELAYMODE bitfield.

**Table 5-132. Virtual Functions Mapping for MMC2**

BALL	BALL NAME	Delay Mode Value	MUXMODE
		MMC2_VIRTUAL2	1
A6	gpmc_cs1	13	mmc2_cmd
A4	gpmc_a19	13	mmc2_dat4

**Table 5-132. Virtual Functions Mapping for MMC2 (continued)**

BALL	BALL NAME	Delay Mode Value	MUXMODE
		MMC2_VIRTUAL2	1
E7	gpmc_a20	13	mmc2_dat5
D6	gpmc_a21	13	mmc2_dat6
C5	gpmc_a22	13	mmc2_dat7
B5	gpmc_a23	13	mmc2_clk
D7	gpmc_a24	13	mmc2_dat0
C6	gpmc_a25	13	mmc2_dat1
A5	gpmc_a26	13	mmc2_dat2
B6	gpmc_a27	13	mmc2_dat3

**NOTE**

To configure the desired Manual IO Timing Mode the user must follow the steps described in section Manual IO Timing Modes of the Device TRM.

The associated registers to configure are listed in the **CFG REGISTER** column. For more information see the Control Module chapter in the Device TRM.

Manual IO Timings Modes must be used to ensure some IO timings for MMC2. See [Table 5-28 Modes Summary](#) for a list of IO timings requiring the use of Manual IO Timings Modes. See [Table 5-133 Manual Functions Mapping for MMC2](#) for a definition of the Manual modes.

[Table 5-133](#) lists the A\_DELAY and G\_DELAY values needed to calculate the correct values to be set in the CFG\_X registers.

**Table 5-133. Manual Functions Mapping for MMC2**

### 5.10.6.20.3 MMC3 and MMC4—SDIO/SD

MMC3 and MMC4 interfaces are compliant with the SDIO3.0 standard v1.0, SD Part E1 and for generic SDIO devices, it supports the following applications:

- MMC3 8-bit data and MMC4 4-bit data, SD Default speed, SDR
- MMC3 8-bit data and MMC4 4-bit data, SD High speed, SDR
- MMC3 8-bit data and MMC4 4-bit data, UHS-1 SDR12 (SD Standard v3.01), 4-bit data, SDR, half cycle
- MMC3 8-bit data and MMC4 4-bit data, UHS-I SDR25 (SD Standard v3.01), 4-bit data, SDR, half cycle
- MMC3 8-bit data, UHS-I SDR50

#### NOTE

The eMMC/SD/SDIOj ( $j = 3$  to 4) controller is also referred to as MMCj.

#### NOTE

For more information, see the MMC/SDIO chapter of the Device TRM.

### 5.10.6.20.3.1 MMC3 and MMC4, SD Default Speed

Figure 5-91, Figure 5-92, and Table 5-134 through Table 5-137 present Timing requirements and Switching characteristics for MMC3 and MMC4 - SD Default speed in receiver and transmitter mode.

**Table 5-134. Timing Requirements for MMC3 - Default Speed Mode <sup>(1)</sup>**

NO.	PARAMETER	DESCRIPTION	MIN	MAX	UNIT
DS5	$t_{su(cmdV-clkH)}$	Setup time, mmc3_cmd valid before mmc3_clk rising clock edge	5.11		ns
DS6	$t_h(clkH-cmdV)$	Hold time, mmc3_cmd valid after mmc3_clk rising clock edge	20.46		ns
DS7	$t_{su(dV-clkH)}$	Setup time, mmc3_dat[i:0] valid before mmc3_clk rising clock edge	5.11		ns
DS8	$t_h(clkH-dv)$	Hold time, mmc3_dat[i:0] valid after mmc3_clk rising clock edge	20.46		ns

(1) i in [i:0] = 7

**Table 5-135. Switching Characteristics for MMC3 - SD/SDIO Default Speed Mode <sup>(2)</sup>**

NO.	PARAMETER	DESCRIPTION	MIN	MAX	UNIT
DS0	$f_{op(clk)}$	Operating frequency, mmc3_clk		24	MHz
DS1	$t_w(clkH)$	Pulse duration, mmc3_clk high	$0.5 \times P - 0.270$ <sup>(1)</sup>		ns

**Table 5-135. Switching Characteristics for MMC3 - SD/SDIO Default Speed Mode (2) (continued)**

NO.	PARAMETER	DESCRIPTION	MIN	MAX	UNIT
DS2	$t_{w(\text{clkL})}$	Pulse duration, mmc3_clk low	$0.5 \times P - 0.270$ (1)		ns
DS3	$t_{d(\text{clkL-cmdV})}$	Delay time, mmc3_clk falling clock edge to mmc3_cmd transition	-14.93	14.93	ns
DS4	$t_{d(\text{clkL-dV})}$	Delay time, mmc3_clk falling clock edge to mmc3_dat[i:0] transition	-14.93	14.93	ns

(1) P = output mmc3\_clk period in ns

(2) i in [i:0] = 7

**Table 5-136. Timing Requirements for MMC4 - Default Speed Mode (1)**

NO.	PARAMETER	DESCRIPTION	MIN	MAX	UNIT
DS5	$t_{su(\text{cmdV-clkH})}$	Setup time, mmc4_cmd valid before mmc4_clk rising clock edge	5.11		ns
DS6	$t_{h(\text{clkH-cmdV})}$	Hold time, mmc4_cmd valid after mmc4_clk rising clock edge	20.46		ns
DS7	$t_{su(\text{dV-clkH})}$	Setup time, mmc4_dat[i:0] valid before mmc4_clk rising clock edge	5.11		ns
DS8	$t_{h(\text{clkH-dV})}$	Hold time, mmc4_dat[i:0] valid after mmc4_clk rising clock edge	20.46		ns

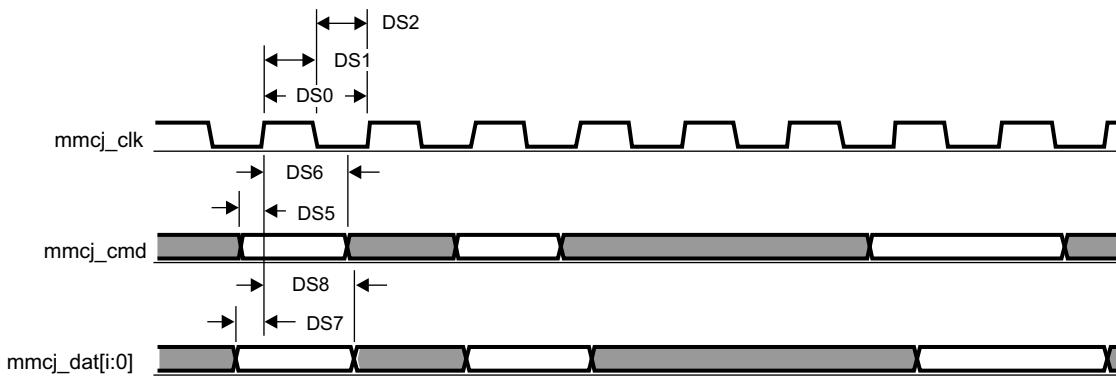

(1) i in [i:0] = 3

**Table 5-137. Switching Characteristics for MMC4 - Default Speed Mode (2)**

NO.	PARAMETER	DESCRIPTION	MIN	MAX	UNIT
DS0	fop(clk)	Operating frequency, mmc4_clk		24	MHz
DS1	$t_{w(\text{clkH})}$	Pulse duration, mmc4_clk high	$0.5 \times P - 0.270$ (1)		ns
DS2	$t_{w(\text{clkL})}$	Pulse duration, mmc4_clk low	$0.5 \times P - 0.270$ (1)		ns
DS3	$t_{d(\text{clkL-cmdV})}$	Delay time, mmc4_clk falling clock edge to mmc4_cmd transition	-14.93	14.93	ns
DS4	$t_{d(\text{clkL-dV})}$	Delay time, mmc4_clk falling clock edge to mmc4_dat[i:0] transition	-14.93	14.93	ns

#### NOTE

To configure the desired Manual IO Timing Mode the user must follow the steps described in section Manual IO Timing Modes of the Device TRM.

The associated registers to configure are listed in the **CFG REGISTER** column. For more information see the Control Module chapter in the Device TRM.

Manual IO Timings Modes must be used to ensure some IO timings for MMC3. See [Table 5-28 Modes Summary](#) for a list of IO timings requiring the use of Manual IO Timings Modes. See [Table 5-152 Manual Functions Mapping for MMC3](#) for a definition of the Manual modes.

[Table 5-152](#) lists the A\_DELAY and G\_DELAY values needed to calculate the correct values to be set in the CFG\_X registers.

**Table 5-152. Manual Functions Mapping for MMC3**

BALL	BALL NAME	MMC3_MANUAL1		CFG REGISTER	MUXMODE

### 5.10.6.21 GPIO

The general-purpose interface combines eight general-purpose input/output (GPIO) banks. Each GPIO module provides up to 32 dedicated general-purpose pins with input and output capabilities; thus, the general-purpose interface supports up to 186 pins.

These pins can be configured for the following applications:

- Data input (capture)/output (drive)
- Keyboard interface with a debounce cell
- Interrupt generation in active mode upon the detection of external events. Detected events are processed by two parallel independent interrupt-generation submodules to support biprocessor operations
- Wake-up request generation in idle mode upon the detection of external events

#### NOTE

For more information, see the General-Purpose Interface chapter of the Device TRM.

#### NOTE

The general-purpose input/output i ( $i = 1$  to 8) bank is also referred to as GPIO*i*.

### 5.10.6.22 System and Miscellaneous interfaces

The Device includes the following System and Miscellaneous interfaces:

- Sysboot Interface
- System DMA Interface
- Interrupt Controllers (INTC) Interface

### **5.10.7 Emulation and Debug Subsystem**

The Device includes the following Test interfaces:

- IEEE 1149.1 Standard-Test-Access Port (JTAG)
- Trace Port Interface Unit (TPIU)

#### **5.10.7.1 IEEE 1149.1 Standard-Test-Access Port (JTAG)**

The JTAG (IEEE Standard 1149.1-1990 Standard-Test-Access Port and Boundary Scan Architecture) interface is used for BSDL testing and emulation of the device. The trstn pin only needs to be released when it is necessary to use a JTAG controller to debug the device or exercise the device's boundary scan functionality. For maximum reliability, the device includes an internal Pulldown (IPD) on the trstn pin to ensure that trstn is always asserted upon power up and the device's internal emulation logic is always properly initialized. JTAG controllers from Texas Instruments actively drive trstn high. However, some third-party JTAG controllers may not drive trstn high but expect the use of a Pullup resistor on trstn. When using this type of JTAG controller, assert trstn to initialize the device after powerup and externally drive trstn high before attempting any emulation or boundary-scan operations.

The main JTAG features include:

- 32KB embedded trace buffer (ETB)
- 5-pin system trace interface for debug
- Supports Advanced Event Triggering (AET)
- All processors can be emulated via JTAG ports
- All functions on EMU pins of the device:
  - EMU[1:0] - cross-triggering, boot mode (WIR), STM trace
  - EMU[4:2] - STM trace only (single direction)

##### **5.10.7.1.1 JTAG Electrical Data/Timing**

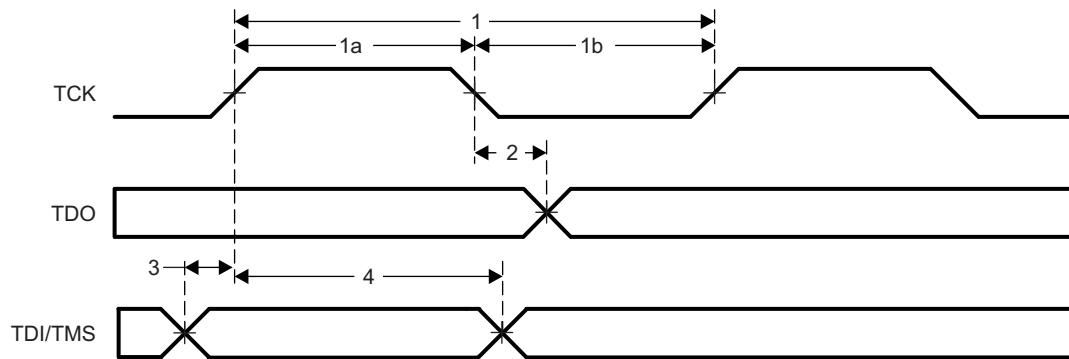

[Table 5-153](#), [Table 5-154](#) and [Figure 5-101](#) assume testing over the recommended operating conditions and electrical characteristic conditions below.

## 6 Detailed Description

### 6.1 Description

TI's new TDA2Ex System-on-Chip (SoC) is a highly optimized and scalable family of devices designed to meet the requirements of leading Advanced Driver Assistance Systems (ADAS). The TDA2Ex family enables broad ADAS applications in today's automobile by integrating an optimal mix of performance, low power, and ADAS vision analytics processing that aims to facilitate a more autonomous and collision-free driving experience.

The TDA2Ex SoC enables sophisticated embedded vision technology in today's automobile by enabling a board range of ADAS applications including park assist, surround view and sensor fusion on a single architecture.

The TDA2Ex SoC incorporates a heterogeneous, scalable architecture that includes a mix of TI's fixed and floating-point TMS320C66x digital signal processor (DSP) generation core, Arm Cortex-A15 MPCore and dual-Cortex-M4 processors. The integration of a video accelerator for decoding multiple video streams over an Ethernet AVB network, along with graphics accelerator for rendering virtual views, enable a 3D viewing experience. The TDA2Ex SoC also integrates a host of peripherals including multicamera interfaces (both parallel and serial, including CSI-2) to enable Ethernet or LVDS-based surround view systems, displays and GigB Ethernet AVB.

Additionally, TI provides a complete set of development tools for the Arm and DSP, including C compilers, a DSP assembly optimizer to simplify programming and scheduling, and a debugging interface for visibility into source code execution.

Cryptographic acceleration is available in all devices. All other supported security features, including support for secure boot, debug security and support for trusted execution environment are available on High-Security (HS) devices. For more information about HS devices, contact your TI representative.

The TDA2Ex ADAS processor is qualified according to the AEC-Q100 standard.

### 6.2 Functional Block Diagram

[Figure 6-1](#) is functional block diagram for the device.

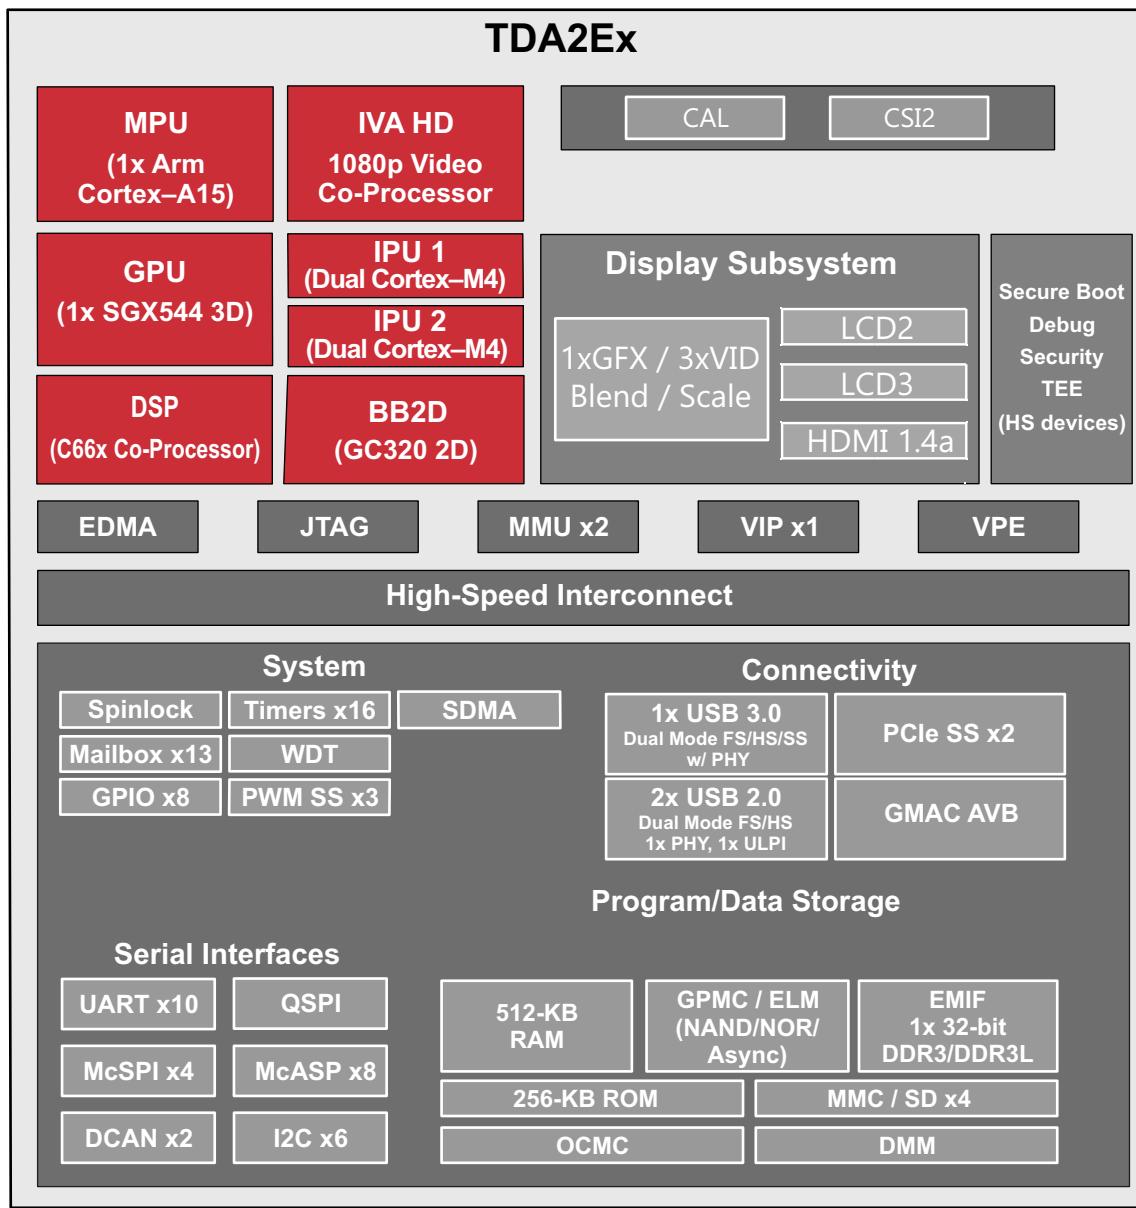

Figure 6-1. TDA2Ex Block Diagram

## 6.3 MPU

The Cortex®-A15 microprocessor unit (MPU) subsystem serves the applications processing role by running the high-level operating system (HLOS) and application code.

The MPU subsystem incorporates one Cortex-A15 MPU core (MPU\_C0), individual level 1 (L1) caches, level 2 (L2) cache (MPU\_L2CACHE) shared between them, and various other shared peripherals. To aid software development, the processor core can be kept cache-coherent with the L2 cache.

The MPU subsystem provides a high-performance computing platform with high peak-computing performance and low memory latency.

The Arm subsystem supports the following key features:

- Arm® Cortex-A15 MP Core (MPU\_CLUSTER)
  - One Cortex-A15 MPU core (revision r2p2) which has the following features:
    - Superscalar, dynamic multi-issue technology
      - Out-of-order (OoO) instruction dispatch and completion
      - Dynamic branch prediction with branch target buffer (BTB), global history buffer (GHB), and 48-entry return stack
      - Continuous fetch and decoding of three instructions per clock cycle
      - Dispatch of up to four instructions and completion of eight instructions per clock cycle
      - Provides optimal performance from binaries compiled for previous Arm processors
      - Five execution units handle simple instructions, branch instructions, Neon and floating point instructions, multiply instructions, and load and store instructions.
      - Simple instructions take two cycles from dispatch, while complex instructions take up to 11 cycles.
      - Can issue two simple instructions in a cycle
      - Can issue a load and a store instruction in the same cycle
    - Integrated Neon processing engine to include the Arm Neon Advanced SIMD (single instruction, multiple data) support for accelerated media and signal processing computation
    - Includes VFPv4-compatible hardware to support single- and double-precision add, subtract, divide, multiply and accumulate, and square root operations
    - Extensive support to accelerate virtualization using a hypervisor
    - 32-KiB L1 instruction (L1I) and 32-KiB L1 data (L1D) cache:
      - 64-byte line size
      - 2-way set associative
    - Memory management unit (MMU):
      - Two-level translation lookaside buffer (TLB) organization
        - First level is an 32-entry, fully associative micro-TLB implemented for each of instruction fetch, load, and store.
        - Second level is a unified, 4-way associative, 512-entry main TLB
      - Supports hardware TLB table-walk for backward-compatible and new 64-bit entry page table formats
      - New page table format can produce 40-bit physical addresses
      - Two-stage translation where first stage is HLOS-controlled and the second level may be controlled by a hypervisor. Second stage always uses the new page table format
    - Integrated L2 cache (MPU\_L2CACHE) and snoop control unit (SCU):
      - 1-MiB of unified (instructions and data) cache organized as 16 ways of 1024 sets of 64-byte lines
      - Redundant L1 data (cache) tags to perform snoop filtering (L1 instruction cache tags are not duplicated)
      - Operates at Cortex-A15 MPU core clock rate
      - Integrated L2 cache controller (MPU\_L2CACHE\_CTRL):
        - Sixteen 64-byte line buffers that handle evictions, line fills and snoop transfers
        - One 128-bit AMBA4 Coherent Bus (AXI4-ACE) port
        - Auto-prefetch buffer for up to 16 streams and detecting forward and backward strides
    - Generalized interrupt controller (GIC, also referred to as MPU\_INTC): An interrupt controller supplied by Arm. The single GIC in the MPU\_CLUSTER routes interrupts to the MPU core. The GIC supports:
      - Number of shared peripheral interrupts (SPI): 160
      - Number of software generated interrupts (SGI): 16
      - Number of CPU interfaces: 1

- Virtual CPU interface for virtualization support. This allows the majority of guest operating system (OS) interactions with the GIC to be handled in hardware, but with physical interrupts still requiring hypervisor intervention to assign them to the appropriate virtual machine.
- Integrated timer counter and one timer block
- Arm CoreSight debug and trace modules. For more information, see chapter *On-Chip Debug Support* of the Device TRM..
- MPU\_AXI2OCP bridge (local interconnect):
  - Connected to Memory Adapter (MPU\_MA), which routes the non-EMIF address space transactions to MPU\_AXI2OCP
  - Single request multiple data (SRMD) protocol on L3\_MAIN port
  - Multiple targets:
    - 64-bit port to the L3\_MAIN interconnect. Interface frequency is 1/4 or 1/8 of core frequency
    - MPU\_ROM
    - Internal MPU subsystem peripheral targets, including Memory Adapter LISA Section Manager (MA\_LSM), wake-up generator (MPU\_WUGEN), watchdog timer (MPU\_WD\_TIMER), and local PRCM module (MPU\_PRCM) configuration
    - Internal AXI target, CoreSight System Trace Module (CS\_STM)
- Memory adapter (MPU\_MA): Helps decrease the latency of accesses between the MPU\_L2CACHE and the external memory interface (EMIF1) by providing a direct path between the MPU subsystem and EMIF1:
  - Connected to 128-bit AMBA4 interface of MPU\_CLUSTER
  - Direct 128-bit interface to EMIF1
  - Interface speed between MPU\_CLUSTER and MPU\_MA is at half-speed of the MPU core frequency
  - Quarter-speed interface to EMIF
  - Uses firewall logic to check access rights of incoming addresses
- Local PRCM (MPU\_PRCM):
  - Handles MPU\_C0 power domain
  - Supports SR3-APG (SmartReflex3 Automatic Power Gating) power management technology inside the MPU\_CLUSTER
  - MPU subsystem has five power domains
- Wake-up generator (MPU\_WUGEN)
  - Responsible for waking up the MPU core
- Standby controller: Handles the power transitions inside the MPU subsystem
- Realtime (master) counter (COUNTER\_REALTIME): Produces the count used by the private timer peripheral in the MPU\_CLUSTER
- Watchdog timer (MPU\_WD\_TIMER): Used to generate a chip-level watchdog reset request to global PRCM
- On-chip boot ROM (MPU\_ROM): The MPU\_ROM size is 48-KiB, and the address range is from 0x4003 8000 to 0x4004 3FFF. For more information about booting from this memory, see chapter *Initialization* of the Device TRM..

- Interfaces:
  - 128-bit interface to EMIF1
  - 64-bit master port to the L3\_MAIN interconnect
  - 32-bit slave port from the L4\_CFG\_EMU interconnect (debug subsystem) for configuration of the MPU subsystem debug modules
  - 32-bit slave port from the L4\_CFG interconnect for memory adapter firewall (MPU\_MA\_NTTP\_FW) configuration
  - 32-bit ATB output for transmitting debug and trace data
  - 160 peripheral interrupt inputs

For more information, see section *Arm Cortex-A15 Subsystem* in chapter *Processors and Accelerators* of the device TRM.

## 6.4 DSP Subsystem

The device includes a single instance (DSP1) of a digital signal processor (DSP) subsystem, based on the TI's standard TMS320C66x DSP CorePac core.

The TMS320C66x DSP core enhances the TMS320C674x™ core, which merges the C674x™ floating point and the C64x+™ fixed-point instruction set architectures. The C66x DSP is object-code compatible with the C64x+/C674x DSPs.

For more information on the TMS320C66x core CPU, see the *TMS320C66x DSP CPU and Instruction Set Reference Guide*, ([SPRUGH7](#)).

The DSP subsystem integrated in the device includes the following components:

- A TMS320C66x CorePac DSP core that encompasses:
  - L1 program-dedicated (L1P) cacheable memory
  - L1 data-dedicated (L1D) cacheable memory
  - L2 (program and data) cacheable memory
  - Extended Memory Controller (XMC)
  - External Memory Controller (EMC)
  - DSP CorePac located interrupt controller (INTC)
  - DSP CorePac located power-down controller (PDC)
- Dedicated enhanced data memory access engine - EDMA, to transfer data from/to memories and peripherals external to the DSP subsystem and to local DSP memory (most commonly L2 SRAM). The external DMA requests are passed through DSP system level (SYS) wakeup logic, and collected from the DSP1 dedicated outputs of the device DMA Events Crossbar for the subsystem.
- A level 2 (L2) interconnect network (DSP NoC) to allow connectivity between different modules of the subsystem or the remainder of the device via the device L3\_MAIN interconnect.
- Two memory management units (on EDMA L2 interconnect and DSP MDMA paths) for accessing the device L3\_MAIN interconnect address space
- Dedicated system control logic (DSP\_SYSTEM) responsible for power management, clock generation, and connection to the device power, reset, and clock management (PRCM) module

The TMS320C66x Instruction Set Architecture (ISA) is the latest for the C6000 family. As with its predecessors (C64x, C64x+ and C674x), the C66x is an advanced VLIW architecture with 8 functional units (two multiplier units and six arithmetic logic units) that operate in parallel. The C66x CPU has a total of 64 general-purpose 32-bit registers.

Some features of the DSP C6000 family devices are:

- Advanced VLIW CPU with eight functional units (two multipliers and six ALUs) which:
  - Executes up to eight instructions per cycle for up to ten times the performance of typical DSPs
  - Allows designers to develop highly effective RISC-like code for fast development time

- Instruction packing
  - Gives code size equivalence for eight instructions executed serially or in parallel
  - Reduces code size, program fetches, and power consumption
- Conditional execution of most instructions
  - Reduces costly branching
  - Increases parallelism for higher sustained performance
- Efficient code execution on independent functional units
  - Industry's most efficient C compiler on DSP benchmark suite
  - Industry's first assembly optimizer for fast development and improved parallelization
- 8-/16-/32-bit/64-bit data support, providing efficient memory support for a variety of applications
- 40-bit arithmetic options which add extra precision for vocoders and other computationally intensive applications
- Saturation and normalization to provide support for key arithmetic operations
- Field manipulation and instruction extract, set, clear, and bit counting support common operation found in control and data manipulation applications.

The C66x CPU has the following additional features:

- Each multiplier can perform two  $16 \times 16$ -bit or four  $8 \times 8$  bit multiplies every clock cycle.
- Quad 8-bit and dual 16-bit instruction set extensions with data flow support
- Support for non-aligned 32-bit (word) and 64-bit (double word) memory accesses
- Special communication-specific instructions have been added to address common operations in error-correcting codes.
- Bit count and rotate hardware extends support for bit-level algorithms.
- Compact instructions: Common instructions (AND, ADD, LD, MPY) have 16-bit versions to reduce code size.
- Protected mode operation: A two-level system of privileged program execution to support higher-capability operating systems and system features such as memory protection.
- Exceptions support for error detection and program redirection to provide robust code execution
- Hardware support for modulo loop operation to reduce code size and allow interrupts during fully-pipelined code
- Each multiplier can perform  $32 \times 32$  bit multiplies
- Additional instructions to support complex multiplies allowing up to eight 16-bit multiply/add/subtracts per clock cycle

The TMS320C66x has the following key improvements to the ISA:

- 4x Multiply Accumulate improvement for both fixed and floating point
- Improvement of the floating point arithmetic
- Enhancement of the vector processing capability for fixed and floating point
- Addition of domain-specific instructions for complex arithmetic and matrix operations

**On the C66x ISA, the vector processing capability is improved by extending the width of the SIMD instructions.** The C674x DSP supports 2-way SIMD operations for 16-bit data and 4-way SIMD operations for 8-bit data. C66x enhances this capabilities with the addition of SIMD instructions for 32-bit data allowing operation on 128-bit vectors. For example the QMPY32 instruction is able to perform the element to element multiplication between two vectors of four 32-bit data each.

C66x ISA includes a set of specific instructions to handle complex arithmetic and matrix operations.

- **TMS320C66x DSP CorePac memory components:**

- A 32-KiB L1 program memory (L1P) configurable as cache and/or SRAM:
  - When configured as a cache, the L1P is a 1-way set-associative cache with a 32-byte cache line
  - The DSP CorePac L1P memory controller provides bandwidth management, memory protection, and power-down functions
  - The L1P is capable of cache block and global coherence operations
  - The L1P controller has an Error Detection (ED) mechanism, including necessary SRAM
  - The L1P memory can be fully configured as a cache or SRAM
  - Page size for L1P memory is 2KB
- A 32-KiB L1 data memory (L1D) configurable as cache and / or SRAM:
  - When configured as a cache, the L1D is a 2-way set-associative cache with a 64-byte cache line
  - The DSP CorePac L1D memory controller provides bandwidth management, memory protection, and power-down functions
  - The L1D memory can be fully configured as a cache or SRAM
  - No support for error correction or detection
  - Page size for L1D memory is 2KB
- A 288-KiB (program and data) L2 memory, only part of which is cacheable:
  - When configured as a cache, the L2 memory is a 4-way set associative cache with a 128-byte cache line
  - Only 256 KiB of L2 memory can be configured as cache or SRAM
  - 32 KiB of the L2 memory is always mapped as SRAM
  - The L2 memory controller has an Error Correction Code (ECC) and ED mechanism, including necessary SRAM
  - The L2 memory controller supports hardware prefetching and also provides bandwidth management, memory protection, and power-down functions.
  - Page size for L2 memory is 16KB
- The **External Memory Controller (EMC)** is a bridge from the C66x CorePac to the rest of the DSP subsystem and device. It has :
  - a 32-bit configuration port (CFG) providing access to local subsystem resources (like DSP\_EDMA, DSP\_SYSTEM, and so forth) or to L3\_MAIN resources accessible via the CFG address range.
  - a 128-bit slave-DMA port (SDMA) which provides accesses of system masters outside the DSP subsystem to resources inside the DSP subsystem or C66x DSP CorePac memories, i.e. when the DSP subsystem is the slave in a transaction.
- The **Extended Memory Controller (XMC)** processes requests from the L2 Cache Controller (which are a result of CPU instruction fetches, load/store commands, cache operations) to device resources via the C66x DSP CorePac 128-bit master DMA (MDMA) port:
  - Memory protection for addresses outside C66x DSP CorePac generated over device L3\_MAIN on the MDMA port
  - Prefetch, multi-in-flight requests
- A DSP local **Interrupt Controller (INTC)** in the DSP C66x CorePac, interfaces the system events to the DSP C66x core CPU interrupt and exceptions inputs. The DSP subsystem C66x CorePac interrupt controller supports up to 128 system events of which 64 interrupts are external to DSP subsystem, collected from the DSP1 dedicated outputs of the device Interrupt Crossbar.

- **Local Enhanced Direct Memory Access (EDMA) controller features:**
  - Channel controller (CC) : 64-channel, 128 PaRAM, 2 Queues
  - 2 x Third-party Transfer Controllers (TPTC0 and TPTC1):
    - Each TC has a 128-bit read port and a 128-bit write port
    - 2KiB FIFOs on each TPTC
  - 1-dimensional/2-dimensional (1D/2D) addressing
  - Chaining capability
- **DSP subsystem integrated MMUs:**
  - Two MMUs are integrated:
    - The MMU0 is located between DSP MDMA master port and the device L3\_MAIN interconnect and can be optionally bypassed
    - The MMU1 is located between the EDMA master port and the device L3\_MAIN interconnect
- A DSP local **Power-Down Controller (PDC)** is responsible to power-down various parts of the DSP C66x CorePac, or the entire DSP C66x CorePac.
- The DSP subsystem **System Control logic** provides:
  - Slave idle and master standby protocols with device PRCM for powerdown
  - OCP Disconnect handshake for init and target busses
  - Asynchronous reset
  - Power-down modes:
    - "Clockstop" mode featuring wake-up on interrupt event. The DMA event wake-up is managed in software.
- The device DSP subsystem is supplied by a PRCM DPLL, but DSP1 **has integrated its own PLL module** outside the C66x CorePac for clock gating and division.
- **The device DSP subsystem has following port instances** to connect to remaining part of the device. See also :
  - A 128-bit initiator (DSP MDMA master) port for MDMA/Cache requests
  - A 128-bit initiator (DSP EDMA master) port for EDMA requests
  - A 32-bit initiator (DSP CFG master) port for configuration requests
  - A 128-bit target (DSP slave) port for requests to DSP memories and various peripherals
- **C66x DSP subsystem (DSPSS) safety aspects:**
  - Above mentioned memory ECC/ED mechanisms
  - MMUs enable mapping of only the necessary application space to the processor
  - Memory Protection Units internal to the DSPSS (in L1P, L1D and L2 memory controllers) and external to DSPSS (firewalls) to help define legal accesses and raise exceptions on illegal accesses
  - Exceptions: Memory errors, various DSP errors, MMU errors and some system errors are detected and cause exceptions. The exceptions could be handled by the DSP or by a designated safety processor at the chip level. Note that it may not be possible for the safety processor to completely handle some exceptions

**Unsupported features on the C66x DSP core for the device are:**

- The Extended Memory Controller MPAX (memory protection and address extension) 36-bit addressing is NOT supported

**Known DSP subsystem powermode restrictions for the device are:**

- "Full logic / RAM retention" mode featuring wake-up on both interrupt or DMA event (logic in "always on" domain). Only OFF mode is supported by DSP subsystem, **requiring full boot**.

For more information about:

- C66x debug/trace support, see chapter *On-Chip Debug* of the device TRM.

## 6.5 IVA

The IVA supports resolutions up to 1080 p/i with full performance of 60 fps (or 120 fields), achievable for encode or decode only (not for simultaneous encode and decode).

The IVA subsystem is composed of:

- A primary sequencer, including its memories and an imaging controller: ICNT1
- A video direct memory access (VDMA) processor, which can be used as a secondary sequencer: ICNT2
- A VDMA engine: DMA\_IVA
- An entropy codec: ECD3
- A motion compensation engine: MC3
- A transform and quantization calculation engine: CALC3
- A loop filter acceleration engine: ILF3
- A motion estimation acceleration engine: IME3
- An intraprediction estimation engine: IPE3
- Shared level 2 (L2) interface and memory
- Local interconnect (L4\_IVA)
- A message interface for communication between SYNCBOXes
- Mailbox
- A debug module for trace event and software instrumentation: SMSET

---

### NOTE

The IVA allows execution of compliant codecs through the software development kit (SDK). Refer to the SDK documentation for details.

---

For more information, see chapter *IVA Subsystem* of the device TRM.

## 6.6 IPU

The device instantiates two dual Cortex®-M4 image processor unit (IPU) subsystems:

- IPU1 subsystem is available for general purpose usage
  - IPU2 subsystem is dedicated to IVA support and is not available for other processing
- 

### NOTE

The two IPU subsystems are identical from functional point of view. Thus, a unified name **IPUx** shall be used throughout the chapter for simplification.

---

Each IPU subsystem contains two Arm® Cortex-M4 processors (IPUx\_C0 and IPUx\_C1) that share a common level 1 (L1) cache (called unicache [IPUx\_UNICACHE]). The two Cortex-M4 cores are completely homogeneous to one another. Any task possible using one Cortex-M4 core is also possible using the other Cortex-M4 core. It is software responsibility to distribute the various tasks between each Cortex-M4 core for optimal performance.

The integrated interrupt handling of the IPUx subsystem allows it to function as an efficient control unit.

Each IPU subsystem integrates the following:

- Two Arm Cortex-M4 microprocessors (IPUx\_C0 and IPUx\_C1):
  - Armv7-M and Thumb®-2 instruction set architecture (ISA)
  - Armv6 SIMD and digital signal processor (DSP) extensions
  - Single-cycle MAC
  - Integrated nested vector interrupt controller (NVIC) (also called IPUx\_Cx\_INTC, where x = 0, 1)
  - Integrated bus matrix
  - Registers:
    - Thirteen general-purpose 32-bit registers
    - Link register (LR)
    - Program counter (PC)
    - Program status register, xPSR
    - Two banked SP registers
  - Integrated power management
  - Extensive debug capabilities
- Unicache interface:
  - Instruction and data interface
  - Supports paralleled accesses
- Level 2 (L2) master interface (MIF) splitter for access to memory or configuration port
- Configuration port: Used for unicache maintenance and unicache memory management unit (IPUx\_UNICACHE\_MMU) configuration
- Unicache:
  - 32 KiB divided into 16 banks
  - 4-way
  - Cache configuration lock/freeze/preload
  - Internal MMU:
    - 16-entry region-based address translation
    - Read/write control and access type control
    - Execute Never (XN) MMU protection policy
    - Little-endian format
  - Subsystem counter timer module (IPUx\_UNICACHE\_SCTM, or just SCTM)
  - On-chip ROM (IPUx\_ROM) and banked RAM (IPUx\_RAM) memory
  - Emulation/debug: Emulation feature embedded in Cortex-M4
  - L2 MMU (IPUx\_MMU): 32 entries with table walking logic
  - Wake-up generator (IPUx\_WUGEN): Generates wake-up request from external interrupts
- Power management:
  - Local power-management control: Configurable through the IPUx\_WUGEN registers.
  - Three sleep modes supported, controlled by the local power-management module.
  - IPUx is clock-gated in all sleep modes.
  - IPUx\_Cx\_INTC interrupt interface stays awake.

For more information, see chapter *Dual Cortex-M4 IPU Subsystem* of the device TRM.

## 6.7 GPU

The 3D graphics processing unit (GPU) accelerates 2-dimensional (2D) and 3-dimensional (3D) graphics and compute applications. It is based on the POWERVR SGX544-MP subsystem from Imagination Technologies.

SGX is a new generation of programmable POWERVR graphics and video processing subsystems. The POWERVR SGX is a scalable architecture which efficiently processes a number of differing multimedia data types concurrently:

- Pixel Data
- Vertex Data
- General Purpose Processing
- API support for industry standards:
  - OpenCL™-EP 1.1
  - Direct3D® Feature Level 9.3
- Single-core GPU architecture:
  - 1 × SGX544 core
  - System level cache of 64 KiB
- Tile-based deferred rendering architecture:
  - Reduces external bandwidth to SDRAM
- Universal Scalable Shader Engine (USSE™):
  - Multithreaded engine incorporating vertex and pixel shader functionality
  - Automatic load balancing of vertex and pixel processing tasks
- Present and texture load accelerator (PTLA):
  - Enables to move, rotate, twiddle, and scale texture surfaces
  - Supports RGB, ARGB, YUV4:2:2, and YUV4:2:0 surface formats
  - Supports bilinear upscale
  - Supports source color key
- Fully virtualized memory addressing for operating system (OS) in a unified memory architecture:
  - Memory management unit (MMU)
  - Up to 4-GiB virtual address space

The 3D-GPU subsystem generates a single (aggregate) interrupt connected to the device Interrupt Crossbar. This allows for this interrupt to be programmatically mapped to multiple device host interrupt controllers.

- Texture support:
  - Cube map
  - Projected textures
  - Non-square textures
- Texture formats:
  - RGBA 8888, 565, 1555, and 1565
  - Monochromatic 8, 16, 16f, 32f, and 32int
  - Dual channel, 8:8, 16:16, and 16f:16f
  - Compressed textures:
    - PVRTC-i 2 bpp
    - PVRTC-i 4 bpp
    - PVRTC-ii 2 bpp
    - PVRTC-ii 4 bpp
    - ETC1
    - DXT 1-5 and BC 4-5
  - Programmable support for YUV formats:
    - Programmable matrix in hardware, coefficients on 12 bits
    - YUV4:2:2, YUV4:2:0, two planes (NV12 or NV21); YUV4:2:0, three planes

- Resolution support:
  - Frame buffer maximum =  $4096 \times 4096$
  - Texture maximum size =  $4096 \times 4096$
- Texture filtering:
  - Bilinear, trilinear
  - Independent minimum and mag control
- Anti-aliasing:
  - 4x multisampling
  - Programmable sample positions

For more information, see chapter *3D Graphics Accelerator* of the device TRM.

## 6.8 BB2D

The 2D graphics accelerator subsystem accelerates 2D graphics applications. The 2D graphics accelerator subsystem is based on the GC320 2D GPU core from Vivante Corporation. The hardware acceleration is brought to numerous 2D applications, including on-screen display and touch screen user interfaces, graphical user interfaces (GUIs) and menu displays, flash animation, and gaming.

- API support:
  - OpenWF™, DirectFB
  - GDI/DirectDraw™
  - Flash
- **BB2D architecture:**
  - BitBlt and StretchBlt
  - DirectFB hardware acceleration
  - ROP2, ROP3, ROP4 full alpha blending and transparency
  - Clipping rectangle support
  - Alpha blending includes Java® 2 Porter-Duff compositing rules
  - 90-, 180-, 270-degree rotation on every primitive
  - YUV-to-RGB color space conversion
  - Programmable display format conversion with 14 source and 7 destination formats
  - High-quality 9-tap, 32-phase filter for image and video scaling at 1080p
  - Monochrome expansion for text rendering
  - 32 K  $\times$  32 K coordinate system
- **Hardware acceleration for DirectFB:**
  - High-speed video scaler
  - ROP2/3/4
  - Rectangle filling and drawing
  - Line drawing
  - Simple blitting
  - Stretch blitting
  - Blending with alpha channel (per-pixel alpha)
  - Blending with alpha factor (alpha modulation)
  - Nine source and destination blending functions
  - Porter-Duff rules support
  - Premultiplied alpha support
  - Colorized blitting (color modulation)
  - Source color keying
  - Destination color keying

The device BB2D generates a single (aggregate) interrupt request connected to the device Interrupt Crossbar. This allows for this interrupt to be programmatically mapped to multiple device host interrupt controllers.

For more information, see chapter *2D Graphics Accelerator* of the device TRM.

## 6.9 Memory Subsystem

### 6.9.1 EMIF

The EMIF module provides connectivity between DDR memory types and manages data bus read/write accesses between external memory and device subsystems which have master access to the L3\_MAIN interconnect and DMA capability.

The EMIF module has the following capabilities:

- Supports JEDEC standard-compliant DDR3/DDR3L-SDRAM memory types
- 2-GiB SDRAM address range over one chip-select. This range is configurable through the dynamic memory manager (DMM) module
- Supports SDRAM devices with one, two, four or eight internal banks
- Supports SDRAM devices with single or dual die packages
- Data bus widths:
  - 128-bit L3\_MAIN (system) interconnect data bus width
  - 128-bit port for direct connection with MPU subsystem
  - 32-bit SDRAM data bus width
  - 16-bit SDRAM data bus width used in narrow mode
- Supported CAS latencies:
  - DDR3: 5, 6, 7, 8, 9, 10 and 11
- Supports 256-, 512-, 1024-, and 2048-word page sizes
- Supported burst length: 8
- Supports sequential burst type
- SDRAM auto initialization from reset or configuration change
- Supports self refresh and power-down modes for low power
- Partial array self-refresh mode for low power.
- Output impedance (ZQ) calibration for DDR3
- Supports on-die termination (ODT) DDR3
- Supports prioritized refresh
- Programmable SDRAM refresh rate and backlog counter
- Programmable SDRAM timing parameters
- Write and read leveling/calibration and data eye training for DDR3.

The EMIF module does not support:

- Burst chop for DDR3
- Interleave burst type
- Auto precharge because of better Bank Interleaving performance
- DLL disabling from EMIF side
- SDRAM devices with more than one die, or topologies which require more than one chip select on a single EMIF channel

For more information, see section *DDR External Memory Interface (EMIF)* in chapter *Memory Subsystem* of the device TRM.

### 6.9.2 GPMC

The General Purpose Memory Controller (GPMC) is an external memory controller of the device. Its data access engine provides a flexible programming model for communication with all standard memories.

The GPMC supports the following various access types:

- Asynchronous read/write access

- Asynchronous read page access (4, 8, and 16 Word16)
- Synchronous read/write access
- Synchronous read/write burst access without wrap capability (4, 8 and 16 Word16)
- Synchronous read/write burst access with wrap capability (4, 8 and 16 Word16)
- Address-data-multiplexed (AD) access
- Address-address-data (AAD) multiplexed access
- Little- and big-endian access

The GPMC can communicate with a wide range of external devices:

- External asynchronous or synchronous 8-bit wide memory or device (non burst device)
- External asynchronous or synchronous 16-bit wide memory or device
- External 16-bit non-multiplexed NOR flash device
- External 16-bit address and data multiplexed NOR Flash device
- External 8-bit and 16-bit NAND flash device
- External 16-bit pseudo-SRAM (pSRAM) device

The main features of the GPMC are:

- 8- or 16-bit-wide data path to external memory device
- Supports up to eight CS regions of programmable size and programmable base addresses in a total address space of 1 GiB
- Supports transactions controlled by a firewall
- On-the-fly error code detection using the Bose-Chaudhuri-Hocquenghem (BCH) ( $t = 4, 8, \text{ or } 16$ ) or Hamming code to improve the reliability of NAND with a minimum effect on software (NAND flash with 512-byte page size or greater)
- Fully pipelined operation for optimal memory bandwidth use
- The clock to the external memory is provided from GPMC functional clock divided by 1, 2, 3, or 4
- Supports programmable autoclock gating when no access is detected
- Independent and programmable control signal timing parameters for setup and hold time on a per-chip basis. Parameters are set according to the memory device timing parameters, with a timing granularity of one GPMC functional clock cycle.
- Flexible internal access time control (WAIT state) and flexible handshake mode using external WAIT pin monitoring
- Support bus keeping
- Support bus turnaround
- Prefetch and write posting engine associated with to achieve full performance from the NAND device with minimum effect on NOR/SRAM concurrent access

For more information, see section *General-Purpose Memory Controller (GPMC)* in chapter *Memory Subsystem* of the device TRM.

### 6.9.3 ELM

In the case of NAND modules with no internal correction capability, sometimes referred to as bare NAND, the correction process can be delegated to the error location module (ELM) used in conjunction with the GPMC.

The ELM supports the following features:

- 4, 8, and 16 bits per 512-byte block error location based on BCH algorithm
- Eight simultaneous processing contexts
- Page-based and continuous modes

- Interrupt generation when error location process completes:
  - When the full page has been processed in page mode
  - For each syndrome polynomial (checksum-like information) in continuous mode

For more information, see section *Error Location Module (ELM)* in chapter *Memory Subsystem* of the device TRM.

#### **6.9.4 OCMC**

There is one on-chip memory controller (OCMC) in the device.

The OCM Controller supports the following features:

- L3\_MAIN data interface:
  - Used for maximum throughput performance
  - 128-bit data bus width
  - Burst supported
- L4 interface (OCMC\_RAM only):
  - Used for access to configuration registers
  - 32-bit data bus width
  - Only single accesses supported
  - The L4 associated OCMC clock is two times lower than the L3 associated OCMC clock
- Error correction and detection:
  - Single error correction and dual error detection
  - 9-bit Hamming error correction code (ECC) calculated on 128-bit data word which is concatenated with memory address bits
  - Hamming distance of 4
  - Enable/Disable mode control through a dedicated register
  - Single bit error correction on a read transaction
  - Exclusion of repeated addresses from correctable error address trace history
  - ECC valid for all write transactions to an enabled region
  - Sub-128-bit writes supported via read modify write
- ECC Error Status Reporting:
  - Trace history buffer (FIFO) with depth of 4 for corrected error address
  - Trace history buffer with depth of 4 for non correctable error address and also including double error detection
  - Interrupt generation for correctable and uncorrectable detected errors
- ECC Diagnostics Configuration:
  - Counters for single error correction (SEC), double error detection (DED) and address error events (AEE)
  - Programmable threshold registers for exceptions associated with SEC, DED and AEE counters
  - Register control for enabling and disabling of diagnostics
  - Configuration registers and ECC status accessible through L4 interconnect
- Circular buffer for sliced based VIP frame transfers:
  - Up to 12 programmable circular buffers mapped with unique virtual frame addresses
  - On the fly (with no additional latency) address translation from virtual to OCMC circular buffer memory space
  - Virtual frame size up to 8 MiB and circular buffer size up to 1 MiB
  - Error handling and reporting of illegal CBUF addressing
  - Underflow and Overflow status reporting and error handling
  - Last access read/write address history

- Two Interrupt outputs configured independently to service either ECC or CBUF interrupt events

The OCM controller does not have a memory protection logic and does not support endianism conversion.

For more information, see section *On-Chip Memory (OCM)* in chapter *Memory Subsystem* of the device TRM.

## 6.10 Interprocessor Communication

### 6.10.1 MailBox

Communication between the on-chip processors of the device uses a queued mailbox-interrupt mechanism.

The queued mailbox-interrupt mechanism allows the software to establish a communication channel between two processors through a set of registers and associated interrupt signals by sending and receiving messages (mailboxes).

The device implements the following mailbox types:

- System mailbox:
  - Number of instances: 13
  - Used for communication between: MPU, DSP1, IPU1, and IPU2 subsystems
  - Reference name: MAILBOX(1..13)
- IVA mailbox:
  - Number of instances: 1
  - Used for communication between: IVA local user (ICONT1, or ICONT2) and three external users (selected among MPU, DSP1, IPU1, and IPU2 subsystems)
  - Reference name: IVA\_MBOX

Each mailbox module supports the following features:

- Parameters configurable at design time
  - Number of users
  - Number of mailbox message queues
  - Number of messages (FIFO depth) for each message queue
- 32-bit message width
- Message reception and queue-not-full notification using interrupts
- Support of 16-/32-bit addressing scheme
- Power management support

For more information, see chapter *MailBox* of the device TRM.

### 6.10.2 Spinlock

The Spinlock module provides hardware assistance for synchronizing the processes running on multiple processors in the device:

- Cortex®-A15 microprocessor unit (MPU) subsystem
- Digital signal processor (DSP) subsystem – DSP1
- Dual Cortex-M4 image processing unit (IPU) subsystems – IPU1 and IPU2

The Spinlock module implements 256 spinlocks (or hardware semaphores), which provide an efficient way to perform a lock operation of a device resource using a single read-access, avoiding the need of a readmodify- write bus transfer that the programmable cores are not capable of.

For more information, see chapter *Spinlock Module* of the device TRM.

## 6.11 Interrupt Controller

The device has a large number of interrupts to service the needs of its many peripherals and subsystems. The MPU, DSP, and IPU (x2) subsystems are capable of servicing these interrupts via their integrated interrupt controllers. In addition, each processor's interrupt controller is preceded by an Interrupt Controller Crossbar (IRQ\_CROSSBAR) that provides flexibility in mapping the device interrupts to processor interrupt inputs. For more information about IRQ crossbar, see chapter *Control Module* of the Device TRM.

### Cortex®-A15 MPU Subsystem Interrupt Controller (MPU\_INTC)

The MPU\_INTC module (also called Generalized Interrupt Controller [GIC]) is a single functional unit that is integrated in the Arm Cortex-A15 multiprocessor core (MPCore) alongside Cortex-A15 processor. It provides:

- 160 hardware interrupt inputs
- Generation of interrupts by software
- Prioritization of interrupts
- Masking of any interrupts
- Distribution of the interrupts to the target Cortex-A15 processor(s)
- Tracking the status of interrupts

The Cortex-A15 processor supports three main groups of interrupt sources, with each interrupt source having a unique ID:

- *Software Generated Interrupts (SGIs)*: SGIs are generated by writing to the Cortex-A15 Software Generated Interrupt Register (GICD\_SGIR). A maximum of 16 SGIs (ID0–ID15) can be generated for the CPU interface. An SGI has edge-triggered properties. The software triggering of the interrupt is equivalent to the edge transition of the interrupt signal on a peripheral input.
- *Private Peripheral Interrupts (PPIs)*: A PPI is an interrupt generated by a peripheral that is specific to the processor. Although interrupts ID16–ID31 are dedicated to PPIs in general, only seven PPIs are actually used for the CPU interface (ID25–ID31). Interrupts ID16–ID24 are reserved (not used).
- *Shared Peripheral Interrupts (SPIs)*: SPIs are triggered by events generated on associated interrupt input lines. In this device, the GIC is configured to support 160 SPIs corresponding to its external IRQS[159:0] signals.

For detailed information about this module and description of SGIs and PPIs, see the Arm *Cortex-A15 MPCore Technical Reference Manual* (available at [infocenter.arm.com/help/index.jsp](http://infocenter.arm.com/help/index.jsp)).

### C66x DSP Subsystem Interrupt Controller (DSP1\_INTC)

The DSP1 subsystem integrates an interrupt controller - DSP1\_INTC, which interfaces the system events to the C66x core interrupt and exceptions inputs. It combines up to 128 interrupts into 12 prioritized interrupts presented to the C66x CPU.

For detailed information about this module, see chapter *DSP Subsystem* of the Device TRM.

### Dual Cortex-M4 IPU Subsystem Interrupt Controller (IPUx\_Cx\_INTC, where x = 1, 2)

There are two Image Processing Unit (IPU) subsystems in the device - IPU1, and IPU2. Each IPU subsystem integrates two Arm Cortex-M4 cores.

A Nested Vectored Interrupt Controller (NVIC) is integrated within each Cortex-M4. The interrupt mapping is the same (per IPU) for the two cores to facilitate parallel processing. The NVIC supports:

- 64 external interrupts (in addition to 16 Cortex-M4 internal interrupts), which are dynamically prioritized with 16 levels of priority defined for each core
- Low-latency exception and interrupt handling
- Prioritization and handling of exceptions
- Control of the local power management
- Debug accesses to the processor core

For detailed information about this module, refer to *Arm Cortex-M4 Technical Reference Manual* (available at [infocenter.arm.com/help/index.jsp](http://infocenter.arm.com/help/index.jsp)).

## 6.12 EDMA

The primary purpose of the Enhanced Direct Memory Access (EDMA) controller is to service user-programmed data transfers between two memory-mapped slave endpoints on the device.

Typical usage of the EDMA controller includes:

- Servicing software-driven paging transfers (for example, data movement between external memory [such as SDRAM] and internal memory [such as DSP L2 SRAM])
- Servicing event-driven peripherals, such as a serial port
- Performing sorting or sub-frame extraction of various data structures
- Offloading data transfers from the main device CPUs, such as the C66x DSP CorePac or the Arm CorePac

The EDMA controller consists of two major principle blocks:

- EDMA Channel Controller
- EDMA Transfer Controller(s)

The EDMA Channel Controller (EDMACC) serves as the user interface for the EDMA controller. The EDMACC includes parameter RAM (PaRAM), channel control registers, and interrupt control registers. The EDMACC serves to prioritize incoming software requests or events from peripherals and submits transfer requests (TR) to the EDMA transfer controller.

The EDMA Transfer Controller (EDMATC) is responsible for data movement. The transfer request packets (TRP) submitted by the EDMACC contain the transfer context, based on which the transfer controller issues read/write commands to the source and destination addresses programmed for a given transfer.

There are two EDMA controllers present on this device:

- EDMA\_0, integrating:
  - 1 Channel Controller, referenced as: EDMACC\_0
  - 2 Transfer Controllers, referenced as: EDMACC\_0\_TC\_0 (or EDMATC\_0) and EDMACC\_0\_TC\_1 (or EDMATC\_1)
- EDMA\_1, integrating:
  - 1 Channel Controller, referenced as: EDMACC\_1
  - 2 Transfer Controllers, referenced as: EDMACC\_1\_TC\_0 (or EDMATC\_2) and EDMACC\_1\_TC\_1 (or EDMATC\_3)

The two EDMA channel controllers (EDMACC\_0 and EDMACC\_1) are functionally identical. For simplification, the unified name EDMACC shall be regularly used throughout this chapter when referring to EDMA Channel Controllers functionality and features.

The four EDMA transfer controllers (EDMACC\_0\_TC\_0, EDMACC\_0\_TC\_1, EDMACC\_1\_TC\_0 and EDMACC\_1\_TC\_1) are functionally identical. For simplification, the unified name EDMATC shall be regularly used throughout this chapter when referring to EDMA Transfer Controllers functionality and features.

Each EDMACC has the following features:

- Fully orthogonal transfer description
  - 3 transfer dimensions:
    - Array (multiple bytes)
    - Frame (multiple arrays)
    - Block (multiple frames)
  - Single event can trigger transfer of array, frame, or entire block
  - Independent indexes on source and destination

- Flexible transfer definition
  - Increment or constant addressing modes
  - Linking mechanism allows automatic PaRAM set update
  - Chaining allows multiple transfers to execute with one event
- 64 DMA channels
  - Channels triggered by either:
    - Event synchronization
    - Manual synchronization (CPU write to event set register)
    - Chain synchronization (completion of one transfer triggers another transfer)
  - Support for programmable DMA Channel to PaRAM mapping
- 8 Quick DMA (QDMA) channels
  - QDMA channels are triggered automatically upon writing to PaRAM set entry
  - Support for programmable QDMA channel to PaRAM mapping
- 512 PaRAM sets
  - Each PaRAM set can be used for a DMA channel, QDMA channel, or link set
- 2 transfer controllers/event queues
  - 16 event entries per event queue
- Interrupt generation based on:
  - Transfer completion
  - Error conditions
- Debug visibility
  - Queue water marking/threshold
  - Error and status recording to facilitate debug
- Memory protection support
  - Proxied memory protection for TR submission
  - Active memory protection for accesses to PaRAM and registers

Each EDMATC has the following features:

- Supports 2-dimensional (2D) transfers with independent indexes on source and destination (EDMACC manages the 3rd dimension)
- Up to 4 in-flight transfer requests (TR)
- Programmable priority levels
- Support for increment or constant addressing mode transfers
- Interrupt and error support
- Supports only little-endian operation in this device
- Memory mapped register (MMR) bit fields are fixed position in 32-bit MMR

For more information chapter *EDMA Controller* of the device TRM.

## 6.13 Peripherals

### 6.13.1 VIP

The VIP module provides video capture functions for the device. VIP incorporates a multi-channel raw video parser, various video processing blocks, and a flexible Video Port Direct Memory Access (VPDMA) engine to store incoming video in various formats. The device uses a single instantiation of the VIP module giving the ability of capturing up to two video streams.

A VIP module includes the following main features:

- Two independently configurable external video input capture slices (Slice 0 and Slice 1) each of which has two video input ports, Port A and Port B, where Port A can be configured as a 24/16/8-bit port, and Port B is a fixed 8-bit port.
- Each video Port A can be operated as a port with clock independent input channels (with interleaved or separated Y/C data input). Embedded sync and external sync modes are supported for all input configurations.
- Support for a single external asynchronous pixel clock, up to 165MHz per port.
- Pixel Clock Input Domain Port A supports up to one 24-bit input data bus, including BT.1120 style embedded sync for 16-bit and 24-bit data.
- Embedded Sync data interface mode supports single or multiplexed sources
- Discrete Sync data interface mode supports only single source input
- 24-bit data input plus discrete syncs can be configured to include:
  - 8-bit YUV422 (Y and U/V time interleaved)
  - 16-bit YUV422 (CbY and CrY time interleaved)
  - 24-bit YUV444
  - 16-bit RGB565
  - 24-bit RGB888
  - 12/16-bit RAW Capture
  - 24-bit RAW capture
- Discrete sync modes include:
  - VSYNC + HSYNC (FID determined by FID signal pin or HSYNC/VSYNC skew)
  - VSYNC + ACTVID + FID
  - VBLANK + ACTVID (ACTVID toggles in VBLANK) + FID
  - VBLANK + ACTVID (no ACTVID toggles in VBLANK) + FID
- Multichannel parser (embedded syncs only)
  - Embedded syncs only
  - Pixel (2x or 4x) or Line multiplexed modes supported
  - Performs demultiplexing and basic error checking
  - Supports maximum of 9 channels in Line Mux (8 normal + 1 split line)
- Ancillary data capture support
  - For 16-bit or 24-bit input, ancillary data may be extracted from any single channel
  - For 8-bit time interleaved input, ancillary data can be chosen from the Luma channel, the Chroma channel, or both channels
  - Horizontal blanking interval data capture only supported when using discrete syncs (VSYNC + HSYNC or VSYNC + HBLANK)
  - Ancillary data extraction supported on multichannel capture as well as single source streams

- Format conversion and scaling
  - Programmable color space conversion
  - YUV422 to YUV444 conversion
  - YUV444 to YUV422 conversion
  - YUV422 to YUV420 conversion
  - YUV444 Source: YUV444 to YUV444, YUV444 to RGB888, YUV444 to YUV422, YUV444 to YUV420
  - RGB888 Source: RGB888 to RGB888, RGB888 to YUV444, RGB888 to YUV422, RGB888 to YUV420
  - YUV422 Source: YUV422 to YUV422, YUV422 to YUV420, YUV422 to YUV444, YUV422 to RGB888
  - Supports RAW to RAW (no processing)
  - Scaling and format conversions do not work for multiplexed input
- Supports up to 2047 pixels wide input - when scaling is engaged
- Supports up to 3840 pixels wide input - when only chroma up/down sampling is engaged, without scaling
- Supports up to 4095 pixels wide input - without scaling and chroma up/down sampling
- The maximum supported input resolution is further limited by:
  - Pixel clock and feature-dependent constraints
  - For RGB24-bit format (RAW data), the maximum frame width is limited to 2730 pixels

For more information, see chapter *Video Input Port* of the device TRM

### **6.13.2 DSS**

Display Port Interfaces (DPI) is available in DSS named DPI Video Output (VOUT).

VOUT interface consists of:

- 24-bit data bus (data[23:0])
- Horizontal synchronization signal (HSYNC)
- Vertical synchronization signal (VSYNC)
- Data enable (DE)
- Field ID (FID)
- Pixel clock (CLK)

For more information, see section *Display Subsystem (DSS)* of the device TRM.

### **6.13.3 Timers**

The device includes several types of timers used by the system software, including 16 general-purpose (GP) timers, one watchdog timer, and a 32-kHz synchronized timer (COUNTER\_32K).

#### **6.13.3.1 General-Purpose Timers**

The device has 16 GP timers: TIMER1 through TIMER16.

- TIMER1(1ms tick): has its event capture pin tied to 32KHz clock and can be used to gauge the system clock input and detects its frequency among 19.2, 20, or 27 MHz. It includes a specific functions to generate accurate tick interrupts to the operating system and it belongs to the PD\_WKUPAON domain
- TIMER2 and TIMER10: (1ms tick timers): they include a specific functions to generate accurate tick interrupts to the operating system, TIMER2 and TIMER10 belong to the PD\_L4PER domain
- TIMER3/4/9/11/13/14/15/16: they belongs to the PD\_L4PER domain
- TIMER12 belongs to the PD\_WKUPAON power domain
- TIMER5 trough TIMER8: belong to the PD\_IPU module

Each timer (except TIMER12) can be clocked from the system clock (19.2, 20, or 27 MHz) or the 32-kHz clock. The selection of clock source is made at the power, reset, and clock management (PRCM) module level. TIMER12 can be clocked only from the internal oscillator (on-die oscillator).

The following are the main features of the GP timer controllers:

- Level 4 (L4) slave interface support:
  - 32-bit data bus width
  - 32-/16-bit access supported
  - 8-bit access not supported
  - 10-bit address bus width
  - Burst mode not supported
  - Write nonposted transaction mode supported
- Interrupts generated on overflow, compare, and capture
- Free-running 32-bit upward counter
- Compare and capture modes
- Autoreload mode
- Start/stop mode
- Programmable divider clock source ( $2^n$ , where  $n = [0:8]$ )
- Dedicated input trigger for capture mode and dedicated output trigger/PWM signal
- Dedicated GP output signal for using the `TIMERi_GPO_CFG` signal
- On-the-fly read/write register (while counting)
- 1-ms tick with 32.768-Hz functional clock generated (only TIMER1, TIMER2, and TIMER10)

For more information, see section *Timers* of the device TRM.

#### 6.13.3.2 32-kHz Synchronized Timer (COUNTER\_32K)

The 32-kHz synchronized timer (COUNTER\_32K) is a 32-bit counter clocked by the falling edge of the 32-kHz system clock.

The main features of the 32-kHz synchronized timer controller are:

- L4 slave interface (OCP) support:
  - 32-bit data bus width
  - 32-/16-bit access supported
  - 8-bit access not supported
  - 16-bit address bus width
  - Burst mode not supported
  - Write nonposted transaction mode not supported
- Only read operations are supported on the module registers; no write operation is supported (no error/no action on write).
- Free-running 32-bit upward counter
- Start and keep counting after power-on reset
- Automatic roll over to 0; highest value reached: 0xFFFF FFFF
- On-the-fly read (while counting)

For more information, see section *Timers* of the device TRM.

#### 6.13.3.3 Watchdog Timer

The device includes one instance of the 32-bit watchdog timer: WD\_TIMER2.

The watchdog timer is an upward counter capable of generating a pulse on the reset pin and an interrupt to the device system modules following an overflow condition. The WD\_TIMER2 timer serves resets to the PRCM module (its interrupt outputs are unused).

WD\_TIMER2 is located in the PD\_WKUPAON power domain, and can run when the device is in lowest power state (all power domains are off except always-on (AON) and WKUP).

The watchdog timer can be accessed, loaded, and cleared by registers through the L4\_WKUP interface. The watchdog timer has the 32-kHz clock for its timer clock input. WD\_TIMER2 directly generates a warm reset condition on overflow.

WD\_TIMER2 connects to a single target agent port on the L4\_WKUP interconnect.

The main features of the watchdog timer controllers are:

- L4 slave interface support:
  - 32-bit data bus width
  - 32-/16-bit access supported
  - 8-bit access not supported
  - 11-bit address bus width
  - Burst mode not supported
  - Write nonposted mode supported
- Free-running 32-bit upward counter
- Programmable divider clock source ( $2^n$  where  $n = [0:7]$ )
- On-the-fly read/write register (while counting)
- Subset programming model of the GP timer
- The watchdog timer is reset either on power on or after a warm reset before it starts counting.
- Reset or interrupt actions when a timer overflow condition occurs
- The watchdog timer generates a reset or an interrupt in its hardware integration.

For more information, see section *Timers* of the device TRM.

#### 6.13.4 I<sup>2</sup>C

The device contains five multimaster high-speed (HS) inter-integrated circuit (I<sup>2</sup>C) controllers (I<sup>2</sup>C<sub>i</sub> modules, where  $i = 1, 2, 3, 4, 5, 6$ ) each of which provides an interface between a local host (LH), such as a digital signal processor (DSP), and any I<sup>2</sup>C-bus-compatible device that connects through the I<sup>2</sup>C serial bus. External components attached to the I<sup>2</sup>C bus can serially transmit and receive up to 8 bits of data to and from the LH device through the 2-wire I<sup>2</sup>C interface.

Each multimaster HS I<sup>2</sup>C controller can be configured to act like a slave or master I<sup>2</sup>C-compatible device.

I<sup>2</sup>C1 and I<sup>2</sup>C2 controllers have dedicated I<sup>2</sup>C compliant open drain buffers, and support Fast mode (up to 400Kbps). I<sup>2</sup>C3, I<sup>2</sup>C4, I<sup>2</sup>C5 and I<sup>2</sup>C6 controllers are multiplexed with standard LVCMOS IO and connected to emulate open drain. I<sup>2</sup>C emulation is achieved by configuring the LVCMOS buffers to output Hi-Z instead of driving high when transmitting logic 1. These controllers support HS mode (up to 3.4Mbps).

For more information, see section *Multimaster High-Speed I<sup>2</sup>C Controller (I<sup>2</sup>C)* in chapter *Serial Communication Interfaces* of the device TRM.

#### 6.13.5 UART

The UART is a simple L4 slave peripheral that utilizes the DMA\_SYSTEM or EDMA for data transfer or IRQ polling via CPU. There are 10 UART modules in the device. Only one UART supports IrDA features. Each UART can be used for configuration and data exchange with a number of external peripheral devices or interprocessor communication between devices.

### 6.13.5.1 UART Features

The UART<sub>i</sub> (where  $i = 1$  to  $10$ ) include the following features:

- 16C750 compatibility
- 64-byte FIFO buffer for receiver and 64-byte FIFO for transmitter
- Programmable interrupt trigger levels for FIFOs
- Baud generation based on programmable divisors N (where  $N = 1 \dots 16,384$ ) operating from a fixed functional clock of 48 MHz or 192 MHz

Oversampling is programmed by software as 16 or 13. Thus, the baud rate computation is one of two options:

- Baud rate = (functional clock / 16) / N
- Baud rate = (functional clock / 13) / N
- This software programming mode enables higher baud rates with the same error amount without changing the clock source
- Break character detection and generation
- Configurable data format:
  - Data bit: 5, 6, 7, or 8 bits
  - Parity bit: Even, odd, none
  - Stop-bit: 1, 1.5, 2 bit(s)
- Flow control: Hardware (RTS/CTS) or software (XON/XOFF)
- The 48 MHz functional clock option allows baud rates up to 3.6Mbps
- The 192 MHz functional clock option allows baud rates up to 12Mbps
- UART1 module has extended modem control signals (DCD, RI, DTR, DSR)
- UART3 supports IrDA

### 6.13.5.2 IrDA Features

UART3 supports the following IrDA key features:

- Support of IrDA 1.4 slow infrared (SIR), medium infrared (MIR), and fast infrared (FIR) communications:
  - Frame formatting: Addition of variable beginning-of-frame (xBOF) characters and end-of-frame (EOF) characters
  - Uplink/downlink cyclic redundancy check (CRC) generation/detection
  - Asynchronous transparency (automatic insertion of break character)
  - Eight-entry status FIFO (with selectable trigger levels) to monitor frame length and frame errors
  - Framing error, CRC error, illegal symbol (FIR), and abort pattern (SIR, MIR) detection

### 6.13.5.3 CIR Features

The CIR mode uses a variable pulse-width modulation (PWM) technique (based on multiples of a programmable  $t$  period) to encompass the various formats of infrared encoding for remote-control applications. The CIR logic transmits data packets based on a user-definable frame structure and packet content.

The CIR (UART3 only) includes the following features to provide CIR support for remote-control applications:

- Transmit mode only (receive mode is not supported)
- Free data format (supports any remote-control private standards)
- Selectable bit rate
- Configurable carrier frequency
- 1/2, 5/12, 1/3, or 1/4 carrier duty cycle

For more information, see section *Universal Asynchronous Receiver/Transmitter (UART)* in chapter *Serial Communication Interfaces* of the device TRM.

### 6.13.6 McSPI

The McSPI is a master/slave synchronous serial bus. There are four separate McSPI modules (McSPI1, McSPI2, McSPI3, and McSPI4) in the device. All these four modules support up to four external devices (four chip selects) and are able to work as both master and slave.

The McSPI modules include the following main features:

- Serial clock with programmable frequency, polarity, and phase for each channel
- Wide selection of McSPI word lengths, ranging from 4 to 32 bits
- Up to four master channels, or single channel in slave mode
- Master multichannel mode:
  - Full duplex/half duplex
  - Transmit-only/receive-only/transmit-and-receive modes
  - Flexible input/output (I/O) port controls per channel
  - Programmable clock granularity
  - McSPI configuration per channel. This means, clock definition, polarity enabling and word width
- Single interrupt line for multiple interrupt source events
- Power management through wake-up capabilities
- Enable the addition of a programmable start-bit for McSPI transfer per channel (start-bit mode)
- Supports start-bit write command
- Supports start-bit pause and break sequence
- Programmable timing control between chip select and external clock generation
- Built-in FIFO available for a single channel

For more information, see section *Serial Peripheral Interface (McSPI)* in chapter *Serial Communication Interfaces* of the device TRM.

### 6.13.7 QSPI

The quad serial peripheral interface (QSPI™) module is a kind of SPI module that allows single, dual, or quad read access to external SPI devices. This module has a memory mapped register interface, which provides a direct interface for accessing data from external SPI devices and thus simplifying software requirements. The QSPI works as a master only.

The QSPI supports the following features:

- General SPI features:
  - Programmable clock divider
  - Six pin interface
  - Programmable length (from 1 to 128 bits) of the words transferred
  - Programmable number (from 1 to 4096) of the words transferred
  - 4 external chip-select signals
  - Support for 3-, 4-, or 6-pin SPI interface
  - Optional interrupt generation on word or frame (number of words) completion
  - Programmable delay between chip select activation and output data from 0 to 3 QSPI clock cycles
  - Programmable signal polarities
  - Programmable active clock edge
  - Software-controllable interface allowing for any type of SPI transfer
  - Control through L3\_MAIN configuration port
- Serial flash interface (SFI) features:
  - Serial flash read/write interface
  - Additional registers for defining read and write commands to the external serial flash device
  - 1 to 4 address bytes
  - Fast read support, where fast read requires dummy bytes after address bytes; 0 to 3 dummy bytes can be configured.
  - Dual read support
  - Quad read support
  - Little-endian support only
  - Linear increment addressing mode only

The QSPI supports only dual and quad reads. Dual or quad writes are not supported. In addition, there is no "pass through" mode supported where the data present on the QSPI input is sent to its output.

For more information, see section *Quad Serial Peripheral Interface (QSPI)* in chapter *Serial Communication Interfaces* of the device TRM.

### 6.13.8 McASP

The McASP functions as a general-purpose audio serial port optimized to the requirements of various audio applications. The McASP module can operate in both transmit and receive modes. The McASP is useful for time-division multiplexed (TDM) stream, Inter-IC Sound (I2S) protocols reception and transmission as well as for an intercomponent digital audio interface transmission (DIT). The McASP has the flexibility to gluelessly connect to a Sony/Philips digital interface (S/PDIF) transmit physical layer component.

Although intercomponent digital audio interface reception (DIR) mode (i.e. S/PDIF stream receiving) is not natively supported by the McASP module, a specific TDM mode implementation for the McASP receivers allows an easy connection to external DIR components (for example, S/PDIF to I2S format converters).

The device have integrated 8 McASP modules (McASP1-McASP8) with:

- McASP1 and McASP2 supporting 16 channels with independent TX/RX clock/sync domain
- McASP3 through McASP8 modules supporting 4 channels with independent TX/RX clock/sync domain

For more information, see section *Multi-channel Audio Serial Port (McASP)* in chapter *Serial Communication Interfaces* of the device TRM.

### 6.13.9 USB

SuperSpeed USB DRD Subsystem has three instances in the device providing the following functions:

- USB1: SuperSpeed (SS) USB 3.0 Dual-Role-Device (DRD) subsystem with integrated SS (USB3.0) PHY and HS/FS (USB2.0) PHY
- USB2: High-Speed (HS) USB 2.0 Dual-Role-Device (DRD) subsystem with integrated HS/FS PHY
- USB3: HS USB 2.0 Dual-Role-Device (DRD) subsystem with ULPI (SDR) interface to external HS/FS PHYs

SuperSpeed USB DRD Subsystem has the following features:

- Dual-role-device (DRD) capability:
  - Supports USB Peripheral (or Device) mode at speeds SS (5Gbps)(USB1 only), HS (480 Mbps), and FS (12 Mbps)
  - Supports USB Host mode at speeds SS (5Gbps)(USB1 only), HS (480 Mbps), FS (12 Mbps), and LS (1.5 Mbps)
  - USB static peripheral operation
  - USB static host operation
  - Flexible stream allocation
  - Stream priority
  - External Buffer Control
- Each instance contains single xHCI controller with the following features:
  - Internal DMA controller
  - Descriptor caching and data prefetching
  - Interrupt moderation and blocking
  - Power management USB3.0 states for U0, U1, U2, and U3
  - Dynamic FIFO memory allocation for all endpoints
  - Supports all modes of transfers (control, bulk, interrupt, and isochronous)
  - Supports high bandwidth ISO mode
- Connects to an external charge pump for VBUS 5 V generation
- USB-HS PHY (USB2PHY1 and USB2PHY2 for USB1 and USB2, respectively): contain the USB functions, drivers, receivers, and pads for correct D+/D– signalling
- USB3PHY. The USB3PHY is embedded in the USB1 subsystem and contains:
  - USB3RX\_PHY deserializer to receive data at SuperSpeed mode
  - USB3TX\_PHY serializer to transmit data at SuperSpeed mode
  - Power sequencer that contains a power control state machine, generating the sequences to power up/down the USB3RX\_PHY/USB3TX\_PHY
  - Dedicated DLL (DPLL\_USB\_OTG\_SS)

For more information, see section *SuperSpeed USB DRD (USB)* in chapter *Serial Communication Interfaces* of the device TRM.

### 6.13.10 PCIe

The Peripheral Component Interconnect Express (PCIe) module is a multi-lane I/O interconnect that provides low pin-count, high reliability, and high-speed data transfer at rates of up to 5.0 Gbps per lane, per direction, for serial links on backplanes and printed wiring boards. It is a 3-rd Generation I/O Interconnect technology succeeding PCI and ISA bus that is designed to be used as a general-purpose serial I/O interconnect. It is also used as a bridge to other interconnects like USB2/3.0, GbE MAC, and so forth.

The PCI Express standard predecessor - PCI, is a parallel bus architecture that is increasingly difficult to scale-up in bandwidth, which is usually performed by increasing the number of data signal lines. The PCIe architecture was developed to help minimize I/O bus bottlenecks within systems and to provide the necessary bandwidth for high-speed, chip-to-chip, and board-to-board communications within a system. It is designed to replace the PCI-based shared, parallel bus signaling technology that is approaching its practical performance limits while simplifying the interface design.

The device instantiates two PCIe subsystems (PCIe\_SS1 and PCIe\_SS2). The PCIe controller is capable to operate either in Root Complex (RC) or in End Point (EP) PCIe mode. The device PCIe\_SS1 controller supports up to two 16-bit data lanes on its PIPE port. The device PCIe\_SS2 controller supports only one 16-bit data lane on its PIPE port.

When the PCIe\_SS1 controller PIPE port is configured to operate in a single-lane mode, it operates on a single pair of PCIe PHY serializer and deserializer - PCIe1\_PHY\_TX/PCIe1\_PHY\_RX. When PCIe\_SS1 PIPE is configured to operate in dual-lane mode, it operates on two pairs of PCIe PHY serializer and deserializer - PCIe1\_PHY\_TX/PCIe1\_PHY\_RX and PCIe2\_PHY\_TX/PCIe2\_PHY\_RX, respectively. The single-lane PCIe\_SS2 controller PIPE port (if enabled) can operate only on the PCIe2\_PHY\_TX/PCIe2\_PHY\_RX pair. Hereby, if PCIe\_SS2 controller is used, the PCIe\_SS1 can operate only in a single-lane mode on the PCIe1\_PHY\_TX/PCIe1\_PHY\_RX. In addition, PCIe PHY subsystem encompasses a PCIe PCS (physical coding sublayer), a PCIe power management logic, APLL, a DPLL reference clock generator and an APLL clock low-jitter buffer.

- The PCIe Controller implements the transport and link layers of the PCIe interface protocol.
- PCIe PCS (a physical coding sublayer component) converts a 8-bit portion of parallel data over a PCIe lane to a 10-bit parallel data to adapt the process of serialization and deserialization in the TX/RX PHYs to various requirements. At the same time it transforms the transmission rate to maintain the PCIe Gen2 bandwidth (5 Gbps) on both sides (PCIe controller and PHY).
- A multiplexer logic which adds flexibility to connect a PCIe controller hardware mapped PCS logic output to a single (for the single-lane PCIe\_SS2 controller) or to a couple (for the 2-lane PCIe\_SS1 controller) of PHY ports at a time
- Physical layer (PHY) serializer/deserializer components with associated power control logic, building the so called PMA (physical media attachment) part of the PCIe\_PHY transceiver, as follows:
  - PCIe physical port 0 associated serializer (TX) - PCIe1\_PHY\_TX and deserializer (RX) - PCIe1\_PHY\_RX
  - PCIe physical port 1 associated serializer (TX) - PCIe2\_PHY\_TX and deserializer (RX) - PCIe2\_PHY\_RX
- DPLL\_PCIE\_REF is a DPLL clock source, controlled from the device PRCM, that provides a 100-MHz clock to the PCIe PHY serializer/deserializer components reference clock inputs.
- Both the PCIe\_SS1 and PCIe\_SS2 share the same APLL (APLLPCIE) which by default multiplies the DPLL\_PCIE\_REF (typically 100 MHz or 20 MHz) clock to 2.5 GHz.
- The APOLLPCIE low-jitter buffer (ACSPCIE) and additional logic takes care to provide the PCIe APLL reference input clock.

PCIe module supports the following features:

- PCI Local Bus Specification revision 3.0
- PCI Express Base 3.0 Specification, revision 1.0.

#### **At system level the device supports PCI express interface in the following configurations:**

- Each PCIe subsystem controller has support for PCIe Gen2 mode (5.0 Gbps per lane) and Gen1 mode (2.5 Gbps per lane).
- One PCIe (PCIe\_SS1) operates as Gen2 2-lanes supporting in either root-complex (RC) or end-point EP.
- Two PCIe (PCIe\_SS1 and PCIe\_SS2) operates Gen2 1-lane supporting either RC or EP with the possibility of one operating in Gen1 and one in Gen2.

- PCIe\_SS1 can be configured to operate in either 2-Lane (dual lane) or 1-Lane (single lane) mode, as follows:
  - Single Lane - lane 0 mapped to the PCIe port 0 of the device
  - Flexible dual lane configuration - lanes 0 and 1 can be swapped on the two PCIe ports
- PCIe\_SS2 can only operate in 1-Lane mode, as follows:
  - Single Lane - lane 0 mapped to the device PCIe port 1

When PCIe\_SS1 is configured to operate in dual-lane mode, PCIe\_SS2 is in-operable as both PCIe1\_PHY\_RX/TX and PCIe2\_PHY\_RX/TX are assigned to PCIe\_SS1, and thereby NOT available to PCIe\_SS2.

**The main features of a device PCIe controller are:**

- 16-bit operation at 250 MHz on PIPE interface (per 16-bit lane)
- One master port on the L3\_MAIN supporting 32-bit address and 64-bit data bus.
- PCIe\_SS1 master port dedicated MMU (device MMU2) on L3\_MAIN path, to which PCIe traffic can be optionally mapped.
- One slave port on the L3\_MAIN supporting 29-bit address and 64-bit data bus.
- Maximum outbound payload size of 64 Bytes (the L3 Interconnect PCIe1/2 target ports split bursts of size >64 Bytes to the into multiple 64 Byte bursts)
- Maximum inbound payload size of 256 Bytes (internally converted to 128 Byte - bursts)
- No remote read request size limit: implicit support for 4 KiB-size and greater
- Support of EP legacy mode
- Support of inbound I/O accesses in EP legacy mode
- PIPE interface features fixed-width (16-bit data per lane) and dynamic frequency to switch between PCIe Gen1 and Gen2.
- Ultra-low transmit and receive latency
- Automatic Lane reversal as specified in the PCI Express Base 3.0 Specification, revision 1.0 (transmit and receive)
- Polarity inversion on receive
- Single Virtual Channel (VC0) and Single Traffic Class (TC0)
- Single Function in End point mode
- Automatic credit management
- ECRC generation and checking
- All PCI Device Power Management D-states with the exception of D3<sub>cold</sub>/L2 state
- PCI Express Active State Power Management (ASPM) state L0s and L1 (with exceptions)
- PCI Express Link Power Management states except for L2 state
- PCI Express Advanced Error Reporting (AER)
- PCI Express messages for both transmit and receive
- Filtering for Posted, Non-Posted, and Completion traffic
- Configurable BAR filtering, I/O filtering, configuration filtering and completion lookup/timeout
- Access to configuration space registers and external application memory mapped registers through ECAM mechanism.
- Legacy PCI Interrupts reception (RC) and generation (EP)
- 2 x hardware interrupts per PCIe\_SS1 and PCIe\_SS2 controller mapped via the device Interrupt Crossbar (IRQ\_CROSSBAR) to multiple device host (MPU, DSP, and so forth) interrupt controllers in the device
- MSIs generation and reception
- PCIe\_PHY Loopback in RC mode

For more information, see section *PCIe Controller* in chapter *Serial Communication Interfaces* of the device TRM.

### 6.13.11 DCAN

The Controller Area Network (CAN) is a serial communications protocol which efficiently supports distributed real-time applications. CAN has high immunity to electrical interference and the ability to self-diagnose and repair data errors. In a CAN network, many short messages are broadcast to the entire network, which provides for data consistency in every node of the system.

The device provides two DCAN interfaces for supporting distributed realtime control with a high level of security. The DCAN interfaces implement the following features:

- Supports CAN protocol version 2.0 part A, B
- Bit rates up to 1 MBit/s
- 64 message objects
- Individual identifier mask for each message object
- Programmable FIFO mode for message objects
- Programmable loop-back modes for self-test operation
- Suspend mode for debug support
- Software module reset
- Automatic bus on after Bus-Off state by a programmable 32-bit timer
- Direct access to Message RAM during test mode
- CAN Rx/Tx pins are configurable as general-purpose IO pins
- Two interrupt lines (plus additional parity-error interrupts line)
- RAM initialization
- DMA support

For more information, see section *Controller Area Network Interface (DCAN)* in chapter *Serial Communication Interfaces* of the device TRM.

### 6.13.12 GMAC\_SW

The three-port gigabit ethernet switch subsystem (GMAC\_SW) provides ethernet packet communication and can be configured as an ethernet switch. It provides the gigabit media independent interface (G/MII) in MII mode, reduced gigabit media independent interface (RGMII), reduced media independent interface (RMII), and the management data input output (MDIO) for physical layer device (PHY) management.

The GMAC\_SW subsystem provides the following features:

- Two Ethernet ports (port 1 and port 2) with selectable RGMII, RMII, and G/MII (in MII mode only) interfaces plus internal Communications Port Programming Interface (CPPI 3.1) on port 0
- Synchronous 10/100/1000 Mbit operation
- Wire rate switching (802.1d)
- Non-blocking switch fabric
- Flexible logical FIFO-based packet buffer structure
- Four priority level Quality Of Service (QOS) support (802.1p)
- CPPI 3.1 compliant DMA controllers
- Support for Audio/Video Bridging (P802.1Qav/D6.0)
- Support for IEEE 1588 Clock Synchronization (2008 Annex D and Annex F)
  - Timing FIFO and time stamping logic embedded in the subsystem
- Device Level Ring (DLR) Support
- Energy Efficient Ethernet (EEE) support (802.3az)
- Flow Control Support (802.3x)

- Address Lookup Engine (ALE)
  - 1024 total address entries plus VLANs
  - Wire rate lookup
  - Host controlled time-based aging
  - Multiple spanning tree support (spanning tree per VLAN)
  - L2 address lock and L2 filtering support
  - MAC authentication (802.1x)
  - Receive-based or destination-based multicast and broadcast rate limits
  - MAC address blocking
  - Source port locking
  - OUI (Vendor ID) host accept/deny feature
  - Remapping of priority level of VLAN or ports
- VLAN support
  - 802.1Q compliant
    - Auto add port VLAN for untagged frames on ingress
    - Auto VLAN removal on egress and auto pad to minimum frame size
- Ethernet Statistics:
  - EtherStats and 802.3Stats Remote network Monitoring (RMON) statistics gathering (shared)
  - Programmable statistics interrupt mask when a statistic is above one half its 32-bit value
- Flow Control Support (802.3x)
- Digital loopback and FIFO loopback modes supported
- Maximum frame size 2016 bytes (2020 with VLAN)
- 8k (2048 × 32) internal CPPI buffer descriptor memory
- Management Data Input/Output (MDIO) module for PHY Management
- Programmable interrupt control with selected interrupt pacing
- Emulation support
- Programmable Transmit Inter Packet Gap (IPG)
- Reset isolation (switch function remains active even in case of all device resets except for POR pin reset and ICEPICK cold reset)
- Full duplex mode supported in 10/100/1000 Mbps. Half-duplex mode supported only in 10/100 Mbps.
- IEEE 802.3 gigabit Ethernet conformant

For more information, see section *Gigabit Ethernet Switch (GMAC\_SW)* in chapter *Serial Communication Interfaces* of the device TRM.

### **6.13.13 eMMC/SD/SDIO**

The eMMC/SD/SDIO host controller provides an interface between a local host (LH) such as a microprocessor unit (MPU) or digital signal processor (DSP) and either eMMC, SD® memory cards, or SDIO cards and handles eMMC/SD/SDIO transactions with minimal LH intervention.

Optionally, the controller is connected to the L3\_MAIN interconnect to have a direct access to system memory. It also supports two direct memory access (DMA) slave channels or a DMA master access (in this case, slave DMA channels are deactivated) depending on its integration.

The eMMC/SD/SDIO host controller deals with eMMC/SD/SDIO protocol at transmission level, data packing, adding cyclic redundancy checks (CRCs), start/end bit, and checking for syntactical correctness.

The application interface can send every eMMC/SD/SDIO command and poll for the status of the adapter or wait for an interrupt request, which is sent back in case of exceptions or to warn of end of operation.

The application interface can read card responses or flag registers. It can also mask individual interrupt sources. All these operations can be performed by reading and writing control registers. The eMMC/SD/SDIO host controller also supports two DMA channels.

There are four eMMC/SD/SDIO host controllers inside the device. gives an overview of the eMMC/SD/SDIO $i$  ( $i = 1$  to 4) controllers.

Each controller has the following data width:

- eMMC/SD/SDIO1 - 4-bit wide data bus
- eMMC/SD/SDIO2 - 8-bit wide data bus
- eMMC/SD/SDIO3 - 4-bit wide data bus
- eMMC/SD/SDIO4 - 4-bit wide data bus

The eMMC/SD/SDIO $i$  controller is also referred to as MMC $i$ .

Compliance with standards:

- Full compliance with MMC/eMMC command/response sets as defined in the JC64 MMC/eMMC standard specification, v4.5.
- Full compliance with SD command/response sets as defined in the SD Physical Layer specification v3.01
- Full compliance with SDIO command/response sets and interrupt/read-wait suspend-resume operations as defined in the SD part E1 specification v3.00
- Full compliance with SD Host Controller Standard Specification sets as defined in the SD card specification Part A2 v3.00

Main features of the eMMC/SD/SDIO host controllers:

- Flexible architecture allowing support for new command structure
- 32-bit wide access bus to maximize bus throughput
- Designed for low power
- Programmable clock generation
- Dedicated DLL to support SDR104 mode (MMC1 only)
- Dedicated DLL to support HS200 mode (MMC2 only)
- Card insertion/removal detection and write protect detection
- L4 slave interface supports:
  - 32-bit data bus width
  - 8/16/32 bit access supported
  - 9-bit address bus width
  - Streaming burst supported only with burst length up to 7
  - WNP supported
- L3 initiator interface Supports:
  - 32-bit data bus width
  - 8/16/32 bit access supported
  - 32-bit address bus width
  - Burst supported
- Built-in 1024-byte buffer for read or write
- Two DMA channels, one interrupt line
- Support JC 64 v4.4.1 boot mode operations
- Support SDA 3.00 Part A2 programming model
- Support SDA 3.00 Part A2 DMA feature (ADMA2)

- Supported data transfer rates:
  - MMCi supports the following SD v3.0 data transfer rates:
    - DS mode (3.3V IOs): up to 12 MBps (24 MHz clock)
    - HS mode (3.3V IOs): up to 24 MBps (48 MHz clock)
    - SDR12 (1.8V IOs): up to 12 MBps (24 MHz clock)
    - SDR25 (1.8V IOs): up to 24 MBps (48 MHz clock)
    - SDR50 (1.8V IOs): up to 48 MBps (96 MHz clock) - MMC1 and MMC3 only
    - DDR50 (1.8V IOs): up to 48 MBps (48 MHz clock) - MMC1 only
    - SDR104 (1.8V IOs) cards can be supported up to 192 MHz clock (96 MBps max) - MMC1 only
  - MMCi supports the Default SD mode 1-bit data transfer up to 24Mbps (3MBps)
  - Only MMC2 supports also the following JC64 v4.5 data transfer rates:
    - Up to 192 MBps in eMMC mode, 8-bit SDR mode (192 MHz clock frequency)
    - Up to 96 MBps in eMMC mode, 8-bit DDR mode (48 MHz clock frequency)
  - All eMMC/SD/SDIO controllers are connected to 1.8V/3.3V compatible I/Os to support 1.8V/3.3V signaling

---

**NOTE**

eMMC functionality is supported fully by MMC2 only. The other MMC modules are capable of eMMC functionality, but are not timing-optimized for eMMC.

---

The differences between the eMMC/SD/SDIO host controllers and a standard SD host controller defined by the *SD Card Specification, Part A2, SD Host Controller Standard Specification*, v3.00 are:

- The clock divider in the eMMC/SD/SDIO host controller supports a wider range of frequency than specified in the *SD Memory Card Specifications*, v3.0. The eMMC/SD/SDIO host controller supports odd and even clock ratio.
  - The eMMC/SD/SDIO host controller supports configurable busy time-out.
  - ADMA2 64-bit mode is not supported.
  - There is no external LED control.
- 

**NOTE**

Only even ratios are supported in DDR mode.

---

For more information, see chapter *eMMC/SD/SDIO* of the device TRM.

### 6.13.14 GPIO

The general-purpose interface combines eight general-purpose input/output (GPIO) banks.

Each GPIO module provides 32 dedicated general-purpose pins with input and output capabilities; thus, the general-purpose interface supports up to 186 pins.

These pins can be configured for the following applications:

- Data input (capture)/output (drive)
- Keyboard interface with a debounce cell
- Interrupt generation in active mode upon the detection of external events. Detected events are processed by two parallel independent interrupt-generation submodules to support biprocessor operations.
- Wake-up request generation in idle mode upon the detection of external events

For more information, see section *General-Purpose Interface (GPIO)* of the device TRM.

### 6.13.15 ePWM

An effective PWM peripheral must be able to generate complex pulse width waveforms with minimal CPU overhead or intervention. It needs to be highly programmable and very flexible while being easy to understand and use. The ePWM unit described here addresses these requirements by allocating all needed timing and control resources on a per PWM channel basis. Cross coupling or sharing of resources has been avoided; instead, the ePWM is built up from smaller single channel modules with separate resources and that can operate together as required to form a system. This modular approach results in an orthogonal architecture and provides a more transparent view of the peripheral structure, helping users to understand its operation quickly.

Each ePWM module supports the following features:

- **Dedicated 16-bit time-base counter with period and frequency control**
- **Two PWM outputs (EPWMxA and EPWMxB) that can be used in the following configurations:**
  - Two independent PWM outputs with single-edge operation
  - Two independent PWM outputs with dual-edge symmetric operation
  - One independent PWM output with dual-edge asymmetric operation
- **Asynchronous override control of PWM signals through software.**
- **Programmable phase-control support for lag or lead operation relative to other ePWM modules.**
- **Hardware-locked (synchronized) phase relationship on a cycle-by-cycle basis.**
- **Dead-band generation with independent rising and falling edge delay control.**
- **Programmable trip zone allocation of both cycle-by-cycle trip and one-shot trip on fault conditions.**
- **A trip condition can force either high, low, or high-impedance state logic levels at PWM outputs.**
- **Programmable event prescaling minimizes CPU overhead on interrupts.**
- **PWM chopping by high-frequency carrier signal, useful for pulse transformer gate drives.**

For more information, see section *Enhanced PWM (ePWM) Module* in chapter *Pulse-Width Modulation Subsystem* of the device TRM.

### 6.13.16 eCAP

Uses for eCAP include:

- Sample rate measurements of audio inputs
- Speed measurements of rotating machinery (for example, toothed sprockets sensed via Hall sensors)
- Elapsed time measurements between position sensor pulses
- 4 stage sequencer (Mod4 counter) which is synchronized to external events (ECAPx pin edges)

- Period and duty cycle measurements of pulse train signals
- Decoding current or voltage amplitude derived from duty cycle encoded current/voltage sensors

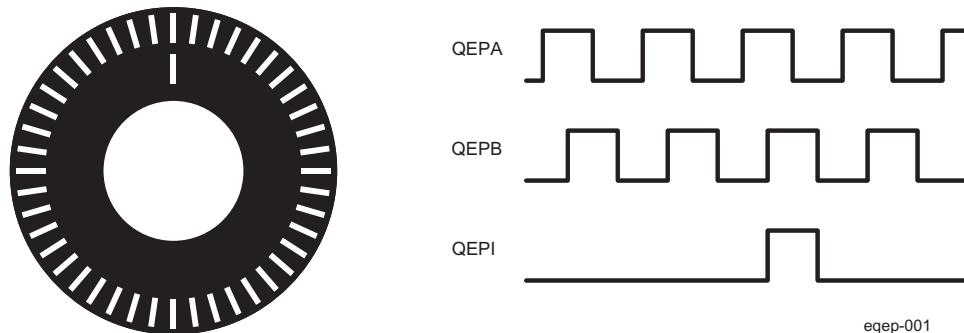

The eCAP module includes the following features:

- 32-bit time base counter
- 4-event time-stamp registers (each 32 bits)
- Edge polarity selection for up to four sequenced time-stamp capture events
- Interrupt on either of the four events
- Single shot capture of up to four event time-stamps
- Continuous mode capture of time-stamps in a four-deep circular buffer
- Absolute time-stamp capture
- Difference (Delta) mode time-stamp capture
- All above resources dedicated to a single input pin
- When not used in capture mode, the ECAP module can be configured as a single channel PWM output

For more information, see section *Enhanced Capture (eCAP) Module* in chapter *Pulse-Width Modulation Subsystem* of the device TRM.

#### 6.13.17 eQEP

A single track of slots patterns the periphery of an incremental encoder disk, as shown in Figure 6-2. These slots create an alternating pattern of dark and light lines. The disk count is defined as the number of dark/light line pairs that occur per revolution (lines per revolution). As a rule, a second track is added to generate a signal that occurs once per revolution (index signal: QEPI), which can be used to indicate an absolute position. Encoder manufacturers identify the index pulse using different terms such as index, marker, home position, and zero reference.

**Figure 6-2. Optical Encoder Disk**

To derive direction information, the lines on the disk are read out by two different photo-elements that "look" at the disk pattern with a mechanical shift of 1/4 the pitch of a line pair between them. This shift is realized with a reticle or mask that restricts the view of the photo-element to the desired part of the disk lines. As the disk rotates, the two photo-elements generate signals that are shifted 90 degrees out of phase from each other. These are commonly called the quadrature QEPA and QEPB signals. The clockwise direction for most encoders is defined as the QEPA channel going positive before the QEPB channel.

The encoder wheel typically makes one revolution for every revolution of the motor or the wheel may be at a geared rotation ratio with respect to the motor. Therefore, the frequency of the digital signal coming from the QEPA and QEPB outputs varies proportionally with the velocity of the motor. For example, a 2000-line encoder directly coupled to a motor running at 5000 revolutions per minute (rpm) results in a frequency of 166.6 KHz, so by measuring the frequency of either the QEPA or QEPB output, the processor can determine the velocity of the motor.

For more information, see section *Enhanced Quadrature Encoder Pulse (eQEP) Module* in chapter *Pulse-Width Modulation Subsystem* of the device TRM.

## 6.14 On-chip Debug

Debugging a system that contains an embedded processor involves an environment that connects high-level debugging software running on a host computer to a low-level debug interface supported by the target device. Between these levels, a debug and trace controller (DTC) facilitates communication between the host debugger and the debug support logic on the target chip.

The DTC is a combination of hardware and software that connects the host debugger to the target system. The DTC uses one or more hardware interfaces and/or protocols to convert actions dictated by the debugger user to JTAG® commands and scans that execute the core hardware.

The debug software and hardware components let the user control multiple central processing unit (CPU) cores embedded in the device in a global or local manner. This environment provides:

- Synchronized global starting and stopping of multiple processors
- Starting and stopping of an individual processor
- Each processor can generate triggers that can be used to alter the execution flow of other processors

System topics include but are not limited to:

- System clocking and power-down issues
- Interconnection of multiple devices
- Trigger channels

For more information, see chapter *On-chip Debug* of the device TRM.

The device deploys Texas Instrument's CTools debug technology for on-chip debug and trace support. It provides the following features:

- External debug interfaces:
  - Primary debug interface - IEEE1149.1 (JTAG) or IEEE1149.7 (complementary superset of JTAG)
    - Used for debugger connection
    - Default mode is IEEE1149.1 but debugger can switch to IEEE1149.7 via an IEEE1149.7 adapter module
    - Controls ICEPick (generic test access port [TAP] for dynamic TAP insertion) to allow the debugger to access several debug resources through its secondary (output) JTAG ports (for more information, see *ICEPick Secondary TAPs* section of the Device TRM).
  - Debug (trace) port
    - Can be used to export processor or system trace off-chip (to an external trace receiver)
    - Can be used for cross-triggering with an external device
    - Configured through debug resources manager (DRM) module instantiated in the debug subsystem
    - For more information about debug (trace) port, see *Debug (Trace) Port* and *Concurrent Debug Modes* sections of the Device TRM.
- JTAG based processor debug on:
  - Cortex-A15 in MPU
  - C66x in DSP1
  - Cortex-M4 (x2) in IPU1, IPU2
  - Arm968 (x2) in IVA
- Dynamic TAP insertion
  - Controlled by ICEPick
  - For more information, see , *Dynamic TAP Insertion*.

- Power and clock management
  - Debugger can get the status of the power domain associated to each TAP.
  - Debugger may prevent the application software switching off the power domain.
  - Application power management behavior can be preserved during debug across power transitions.
  - For more information, see *Power and Clock Management* section of the Device TRM.
- Reset management
  - Debugger can configure ICEPick to assert, block, or extend the reset of a given subsystem.
  - For more information, see *Reset Management* section of the Device TRM.
- Cross-triggering
  - Provides a way to propagate debug (trigger) events from one processor, subsystem, or module to another:
    - Subsystem A can be programmed to generate a debug event, which can then be exported as a global trigger across the device.
    - Subsystem B can be programmed to be sensitive to the trigger line input and to generate an action on trigger detection.
  - Two global trigger lines are implemented
  - Device-level cross-triggering is handled by the XTRIG (TI cross-trigger) module implemented in the debug subsystem
  - Various Arm® CoreSight™ cross-trigger modules implemented to provide support for CoreSight triggers distribution
    - CoreSight Cross-Trigger Interface (CS\_CTI) modules
    - CoreSight Cross-Trigger Matrix (CS\_CTM) modules
  - For more information about cross-triggering, see *Cross-Triggering* section of the Device TRM.
- Suspend
  - Provides a way to stop a closely coupled hardware process running on a peripheral module when the host processor enters debug state
  - For more information about suspend, see *Suspend* section of the Device TRM.
- MPU watchpoint
  - Embedded in MPU subsystem
  - Provides visibility on MPU to EMIF direct paths
  - For more information, see *MPU Memory Adaptor (MPU\_MA) Watchpoint* section of the Device TRM.
- Processor trace
  - Cortex-A15 (MPU) and C66x (DSP) processor trace is supported
  - Program trace only for MPU (no data trace)
  - MPU trace supported by a CoreSight Program Trace Macrocell (CS\_PTM) module
  - Three exclusive trace sinks:
    - CoreSight Trace Port Interface Unit (CS\_TPIU) – trace export to an external trace receiver
    - CTools Trace Buffer Router (CT\_TBR) in system bridge mode – trace export through USB
    - CT\_TBR in buffer mode – trace history store into on-chip trace buffer
  - For more information, see *Processor Trace* section of the Device TRM.

- System instrumentation (trace)
  - Supported by a CTools System Trace Module (CT\_STM), implementing MIPI System Trace Protocol (STP) (rev 2.0)
  - Real-time software trace
    - MPU software instrumentation through CoreSight STM (CS\_STM) (STP2.0)
    - System-on-chip (SoC) software instrumentation through CT\_STM (STP2.0)
  - OCP watchpoint (OCP\_WP\_NOC)
    - OCP target traffic monitoring: OCP\_WP\_NOC can be configured to generate a trigger upon watchpoint match (that is, when target transaction attributes match the user-defined attributes).
    - SoC events trace
    - DMA transfer profiling
  - Statistics collector (performance probes)
    - Computes traffic statistics within a user-defined window and periodically reports to the user through the CT\_STM interface
    - Embedded in the L3\_MAIN interconnect
    - 10 instances:
      - 1 instance dedicated to target (SDRAM) load monitoring
      - 9 instances dedicated to master latency monitoring
- IVA instrumentation (hardware accelerator [HWA] profiling)
  - Supported through a software message and system trace event (SMSET) module embedded in the IVA subsystem
- Power-management events profiling (PM instrumentation [PMI])
  - Monitoring major power-management events. The PM state changes are handled as generic events and encapsulated in STP messages.
- Clock-management events profiling (CM instrumentation [CMI])
  - Monitoring major clock management events. The CM state changes are handled as generic events and encapsulated in STP messages.
  - Two instances, one per CM
    - CM1 Instrumentation (CMI1) module mapped in the PD\_CORE\_AON power domain
    - CM2 Instrumentation (CMI2) module mapped in the PD\_CORE power domain
- For more information, see *System Instrumentation* section of the Device TRM.
- Performance monitoring
  - Supported by subsystem counter timer module (SCTM) for IPU
  - Supported by performance monitoring unit (PMU) for MPU subsystem

For more information, see chapter *On-Chip Debug Support* of the device TRM.

## 7 Applications, Implementation, and Layout

### NOTE

Information in the following Applications section is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 7.1 Introduction

This chapter is intended to communicate, guide and illustrate a PCB design strategy resulting in a PCB that can support TI's latest Application Processor. This Processor is a high-performance processor designed for automotive Infotainment based on enhanced OMAP™ architecture integrated on a 28-nm CMOS process technology.

These guidelines first focus on designing a robust Power Delivery Network (PDN) which is essential to achieve the desirable high performance processing available on Device. The general principles and step-by-step approach for implementing good power integrity (PI) with specific requirements will be described for the key Device power domains.

TI strongly believes that simulating a PCB's proposed PDN is required for first pass PCB design success. Key Device processor high-current power domains need to be evaluated for Power Rail IR Drop, Decoupling Capacitor Loop-Inductance and Power Rail Target Impedance. Only then can a PCB's PDN performance be truly accessed by comparing these model PI parameters vs. TI's recommended values. Ultimately for any high-volume product, TI recommends conducting a "Processor PDN Validation" test on prototype PCBs across processor "split lots" to verify PDN robustness meets desired performance goals for each customer's worst-case scenario. Please contact your TI representative to receive guidance on PDN PI modeling and validation testing.

Likewise, the methodology and requirements needed to route Device high-speed, differential interfaces (i.e. USB2.0, USB3.0, HDMI, PCI), single-ended interfaces (i.e. DDR3, QSPI) and general purpose interfaces using LVCMOS drivers that meet timing requirements while minimizing signal integrity (SI) distortions on the PCB's signaling traces. Signal trace lengths and flight times are aligned with FR-4 standard specification for PCBs.

Several different PCB layout stack-up examples have been presented to illustrate a typical number of layers, signal assignments and controlled impedance requirements. Different Device interface signals demand more or less complexity for routing and controlled impedance stack-ups. Optimizing the PCB's PDN stack-up needs with all of these different types of signal interfaces will ultimately determine the final layer count and layer assignments in each customer's PCB design.

This guideline must be used as a supplement in complement to TI's Application Processor, Power Management IC (PMIC) and Audio Companion components along with other TI component technical documentation (i.e. Technical Reference Manual, Data Manual, Data Sheets, Silicon Errata, Pin-Out Spreadsheet, Application Notes, etc.).

### NOTE

Notwithstanding any provision to the contrary, TI makes no warranty expressed, implied, or statutory, including any implied warranty of merchantability or fitness for a specific purpose, for customer boards. The data described in this appendix are intended as guidelines only.

### NOTE

These PCB guidelines are in a draft maturity and consequently, are subject to change depending on design verification testing conducted during IC development and validation.

### 7.1.1 Initial Requirements and Guidelines

Unless otherwise specified, the characteristic impedance for single-ended interfaces is recommended to be between  $35\ \Omega$  and  $65\ \Omega$  to minimize the overshoot or undershoot on far-end loads.

Characteristic impedance for differential interfaces must be routed as differential traces on the same layer. The trace width and spacing must be chosen to yield the recommended differential impedance. For more information see [Section 7.5.1](#).

The PDN must be optimized for low trace resistance and low trace inductance for all high-current power nets from PMIC to the device.

An external interface using a connector must be protected following the IEC61000-4-2 level 4 system ESD.

## 7.2 Power Optimizations

This section describes the necessary steps for designing a robust Power Distribution Network (PDN):

- [Section 7.2.1, Step 1: PCB Stack-up](#)
- [Section 7.2.2, Step 2: Physical Placement](#)
- [Section 7.2.3, Step 3: Static Analysis](#)
- [Section 7.2.4, Step 4: Frequency Analysis](#)

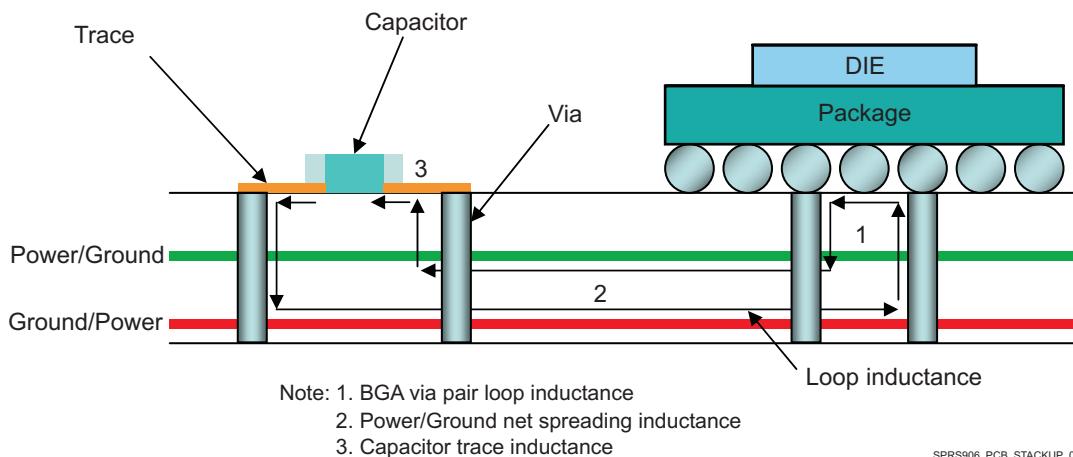

### 7.2.1 Step 1: PCB Stack-up

The PCB stack-up (layer assignment) is an important factor in determining the optimal performance of the power distribution system. An optimized PCB stack-up for higher power integrity performance can be achieved by following these recommendations:

- Power and ground plane pairs must be closely coupled together. The capacitance formed between the planes can decouple the power supply at high frequencies. Whenever possible, the power and ground planes must be solid to provide continuous return path for return current.
- Use a thin dielectric between the power and ground plane pair. Capacitance is inversely proportional to the separation of the plane pair. Minimizing the separation distance (the dielectric thickness) maximizes the capacitance.
- Optimize the power and ground plane pair carrying high current supplies to key component power domains as close as possible to the same surface where these components are placed (see [Figure 7-1](#)). This will help to minimize “loop inductance” encountered between supply decoupling capacitors and component supply inputs and between power and ground plane pairs.

#### NOTE

1-2oz Cu weight for power / ground plane is preferred to enable better PCB heat spreading, helping to reduce Processor junction temperatures. In addition, it is preferable to have the power / ground planes be adjacent to the PCB surface on which the Processor is mounted.

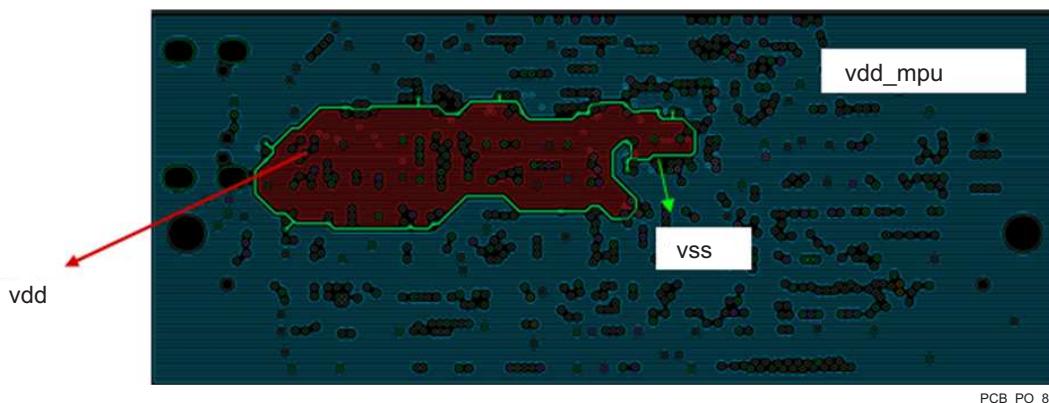

**Figure 7-1. Minimize Loop Inductance With Proper Layer Assignment**

The placement of power and ground planes in the PCB stackup (determined by layer assignment) has a significant impact on the parasitic inductances of power current path as shown in [Figure 7-1](#). For this reason, it is recommended to consider layer order in the early stages of the PCB PDN design cycle, putting high-priority supplies in the top half of the stackup (assuming high load and priority components are mounted on the top-side of PCB) and low-priority supplies in the bottom half of the stackup as shown in the examples below (vias have parasitic inductances which impact the bottom layers more, so it is advised to put the sensitive and high-priority power supplies on the top/same layers).

### 7.2.2 Step 2: Physical Placement

A critical step in designing an optimized PDN is that proper care must be taken to making sure that the initial floor planning of the PCB layout is done with good power integrity design guidelines in mind. The following points are important for optimizing a PCB's PDN:

- Minimizing the physical distance between power sources and key high load components is the first step toward optimization. Placing source and load components on the same side of the PCB is desirable. This will minimize via inductance impact for high current loads and steps.
- External trace routing between components must be as wide as possible. The wider the traces, the lower the DC resistance and consequently the lower the static IR drop.
- Whenever possible for the internal layers (routing and plane), wide traces and copper area fills are preferred for PDN layout. The routing of power nets in plane provide for more interplane capacitance and improved high frequency performance of the PDN.
- Whenever possible, use a via to component pin/pad ratio of 1:1 or better (i.e. especially decoupling capacitors, power inductors and current sensing resistors). Do not share vias among multiple capacitors for connecting power supply and ground planes.
- Placement of vias must be as close as possible or even within a component's solder pad if the PCB technology you are using provides this capability.
- To avoid any “ampacity” issue – maximum current-carrying capacity of each transitional via should be evaluated to determine the appropriate number of vias required to connect components. Adding vias to bring the “via-to-pad” ratio to 1:1 will improve PDN performance.
- For noise sensitive power supplies (i.e. Phase Lock-Loops, analog signals like audio and video), a Gnd shield can be used to isolate coplanar supplies that may have high step currents or high frequency switching transitions from coupling into low-noise supplies.

**Figure 7-2. Coplanar Shielding of Power Net Using Ground Guard-band**

### 7.2.3 Step 3: Static Analysis

Delivering reliable power to circuits is always of critical importance because voltage drops (also known as IR drops) can happen at every level within an electronic system, on-chip, within a package, and across the board. Robust system performance can only be ensured by understanding how the system elements will perform under typical stressful Use Cases. Therefore, it is a good practice to perform a Static or DC Analysis.

Static or DC analysis and design methodology results in a PDN design that minimizes voltage or IR drops across power and ground planes, traces and vias. This ensures the application processor's internal transistors will be operating within their specified voltage ranges for proper functionality. The amount of IR drop that will be encountered is based upon amount power drawn for a desired Use Case and PCB trace (widths, geometry and number of parallel traces) and via (size, type and number) characteristics.

Components that are distant from their power source are particularly susceptible to IR drop. Designs that rely on battery power must minimize voltage drops to avoid unacceptable power loss that can negatively impact system performance. Early assessments of a PDN's static (DC) performance helps to determine basic power distribution parameters such as best system input power point, optimal PCB layer stackup, and copper area needed for load currents.

The resistance  $R_s$  of a plane conductor for a unit length and unit width is called the **surface resistivity** (ohms per square).

$$R_s = \frac{1}{\sigma \cdot t} = \frac{\rho}{t}$$

$$R = R_s \cdot \frac{l}{w}$$

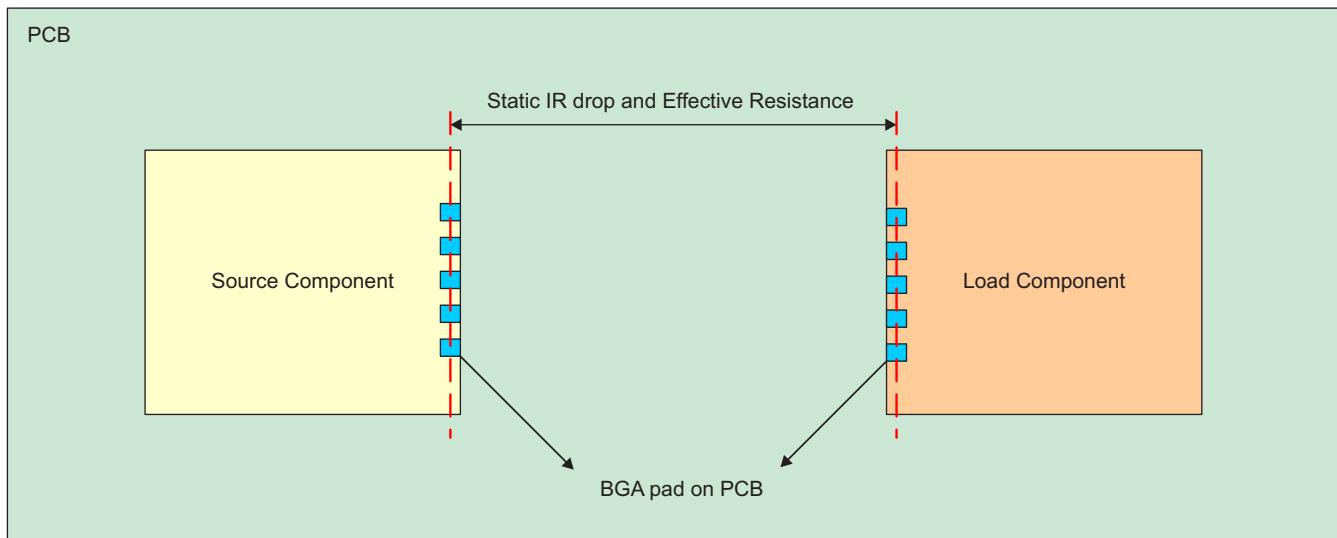

SPRS906\_PCB\_STATIC\_01

**Figure 7-3. Depiction of Sheet Resistivity and Resistance**

Ohm's Law ( $V = I \times R$ ) relates conduction current to voltage drop. At DC, the relation coefficient is a constant and represents the resistance of the conductor. Even current carrying conductors will dissipate power at high currents even though their resistance may be very small. Both voltage drop and power dissipation are proportional to the resistance of the conductor.

Figure 7-4 shows a PCB-level static IR drop budget defined between the power management device (PMIC) pins and the application processor's balls when the PMIC is supplying power.

- It is highly recommended to physically place the PMIC as close as possible to the processor and on the same side. The orientation of the PMIC vs. processor should be aligned to minimize distance for the highest current rail.

SPRS969G\_PCB\_STATIC\_02

**Figure 7-4. Static IR Drop Budget for PCB Only**

The system-level IR drop budget is made up of three portions: on-chip, package, and PCB board. Static IR or DC analysis/design methodology consists of designing the PDN such that the voltage drop (under DC operating conditions) across power and ground pads of the transistors of the application processor device is within a specified value of the nominal voltage for proper functionality of the device.

A PCB system-level voltage drop budget for proper device functionality is typically 1.5% of nominal voltage. For a 1.35-V supply, this would be  $\leq 20$  mV.

To accurately analyze PCB static IR drop, the actual geometry of the PDN must be modeled properly and simulated to accurately characterize long distribution paths, copper weight impacts, electro-migration violations of current-carrying vias, and “Swiss-cheese” effects via placement has on power rails. It is recommended to perform the following analyses:

- Lumped resistance/IR drop analysis
- Distributed resistance/IR drop analysis

**NOTE**

The PMIC companion device supporting this processor has been designed with voltage sensing feedback loop capabilities that enable a remote sense of the SMPS output voltage at the point of use.

The NOTE above means the SMPS feedback signals and returns must be routed across PCB and connected to the Device input power ball for which a particular SMPS is supplying power. This feedback loop provides compensation for some of the voltage drop encountered across the PDN within limits. As such, the effective resistance of the PDN within this loop should be determined in order to optimize voltage compensation loop performance. The resistance of two PDN segments are of interest: one from the power inductor/bulk power filtering capacitor node to the Processor's input power and second is the entire PDN route from SMPS output pin-ball to the Processor input power.

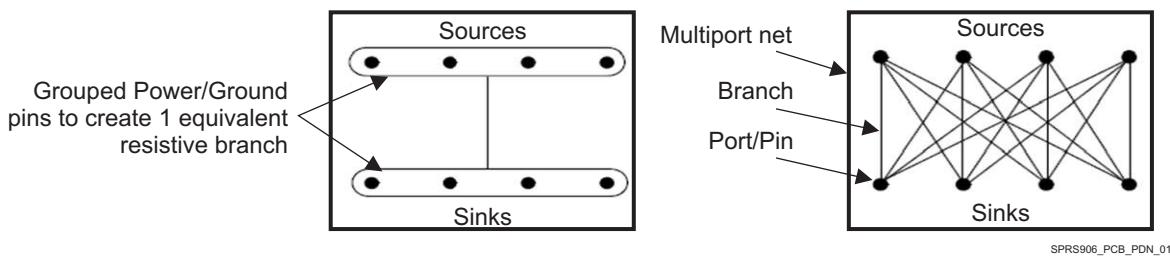

In the following sections each methodology is described in detail and an example has been provided of analysis flow that can be used by the PCB designer to validate compliance to the requirements on their PCB PDN design.

### 7.2.3.1 PDN Resistance and IR Drop

Lumped methodology consists of grouping all of the power pins on both the PMIC (voltage source) and processor (current sink) devices. Then the PMIC source is set to an expected Use Case voltage level and the processor load has its Use Case current sink value set as well. Now the lumped/effective resistance for the power rail trace/plane routes can be determined based upon the actual layout's power rail etch width, shape, length, via count and placement. Figure 7-5 illustrates the pin-grouping/lumped concept.

The lumped methodology consists of importing the PCB layout database (from Cadence Allegro tool or any other layout design tool) into the static IR drop modeling and simulation tool of preference for the PCB designer. This is followed by applying the correct PCB stack-up information (thickness, material properties) of the PCB dielectric and metallization layers. The material properties of dielectric consist of permittivity ( $D_k$ ) and loss tangent ( $D_f$ ).

For the conductor layers, the correct conductivity needs to be programmed into the simulation tool. This is followed by pin-grouping of the power and ground nets, and applying appropriate voltage/current sources. The current and voltage information can be obtained from the power and voltage specifications of the device under different operating conditions / Use Cases.

**Figure 7-5. Pin-grouping concept: Lumped and Distributed Methodologies**

### 7.2.4 Step 4: Frequency Analysis

Delivering low noise voltage sources are very important to allowing a system to operate at the lowest possible Operational Performance Point (OPP) for any one Use Case. An OPP is a combination of the supply voltage level and clocking rate for key internal processor domains. A SCH and PCB designed to provide low noise voltage supplies will then enable the processor to enter optimal OPPs for each Use Case that in turn will minimize power dissipation and junction temperatures on-die. Therefore, it is a good engineering practice to perform a Frequency Analysis over the key power domains.

Frequency analysis and design methodology results in a PDN design that minimizes transient noise voltages at the processor's input power balls. This allows the processor's internal transistors to operate near the minimum specified operating supply voltage levels. To accomplish this one must evaluate how a voltage supply will change due to impedance variations over frequency. This analysis will focus on the decoupling capacitor network (VDD\_xxx and VSS/Gnd rails) at the load. Sufficient capacitance with a distribution of self-resonant points will provide for an overall lower impedance vs frequency response for each power domain.

Decoupling components that are distant from their load's input power are susceptible to encountering spreading loop inductance from the PCB design. Early analysis of each key power domain's frequency response helps to determine basic decoupling capacitor placement, optimal footprint, layer assignment, and types needed for minimizing supply voltage noise/fluctuations due to switching and load current transients.

#### NOTE

Evaluation of loop inductance values for decoupling capacitors placed ~300mils closer to the load's input power balls has shown an 18% reduction in loop inductance due to reduced distance.

- Decoupling capacitors must be carefully placed in order to minimize loop inductance impact on supply voltage transients. A real capacitor has characteristics not only of capacitance but also inductance and resistance.

[Figure 7-6](#) shows the parasitic model of a real capacitor. A real capacitor must be treated as an RLC circuit with effective series resistance (ESR) and effective series inductance (ESL).

SPRS906\_PCB\_FREQ\_01

**Figure 7-6. Characteristics of a Real Capacitor With ESL and ESR**

The magnitude of the impedance of this series model is given as:

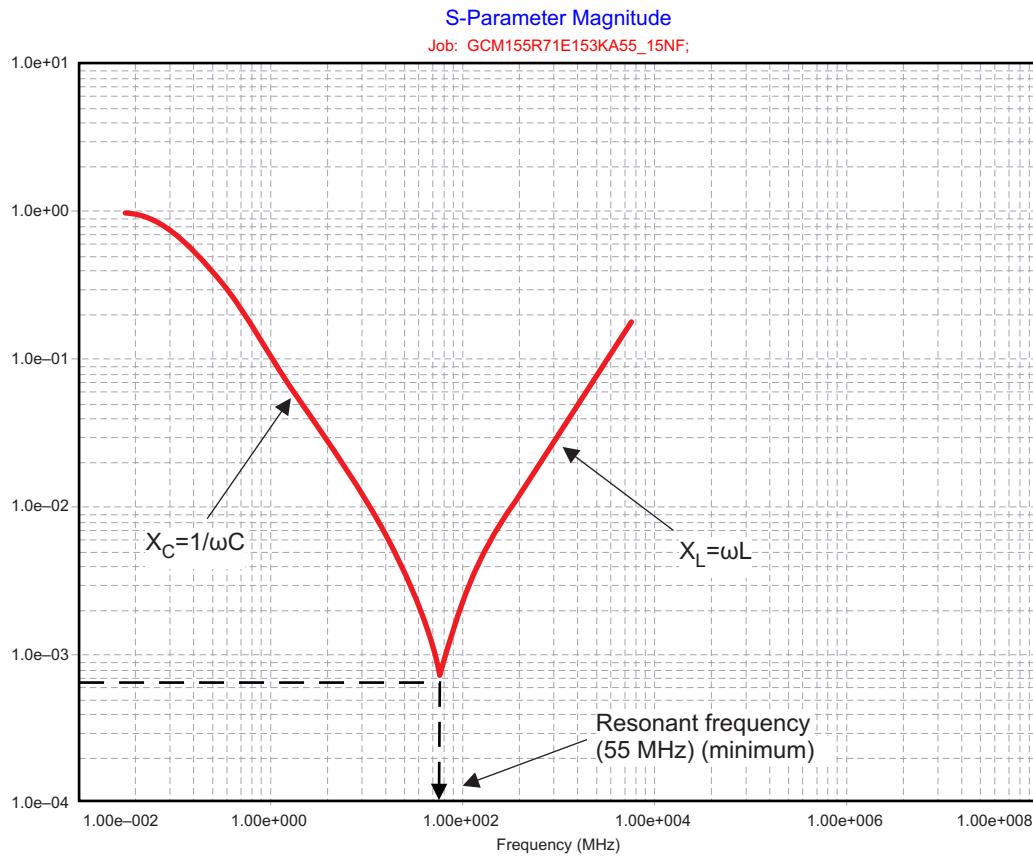

$$|Z| = \sqrt{ESR^2 + \left( \omega ESL - \frac{1}{\omega C} \right)^2}$$

where :  $\omega = 2\pi f$

SPRS906\_PCB\_FREQ\_02

**Figure 7-7. Series Model Impedance Equation**

[Figure 7-8](#) shows the resonant frequency response of a typical capacitor with a self-resonant frequency of 55 MHz. The impedance of the capacitor is a combination of its series resistance and reactive capacitance and inductance as shown in the equation above.

SPRS906\_PCB\_FREQ\_03

**Figure 7-8. Typical Impedance Profile of a Capacitor**

Because a capacitor has series inductance and resistance that impacts its effectiveness, it is important that the following recommendations are adopted in placing capacitors on the PDN.

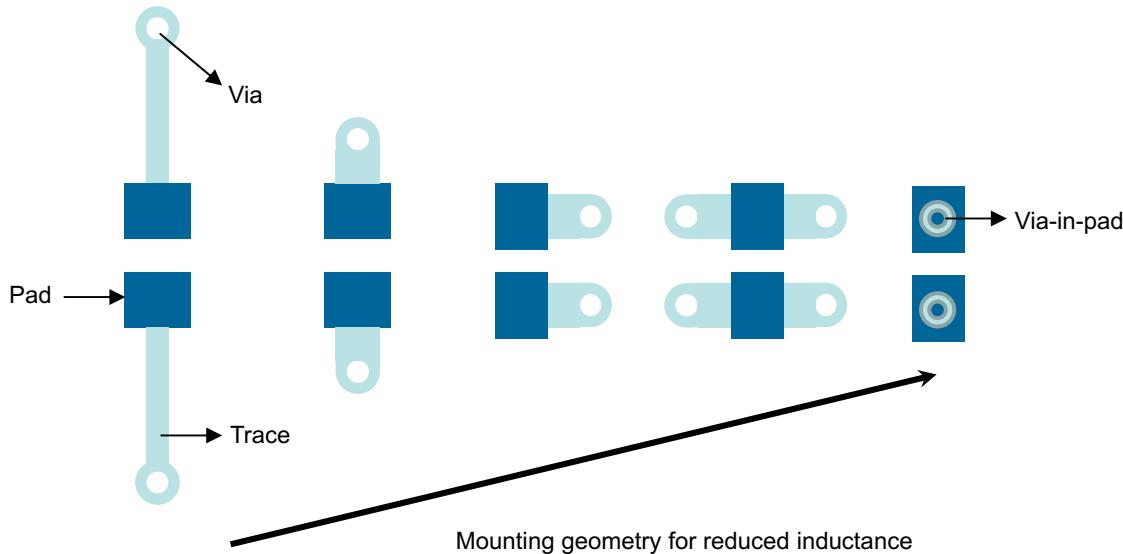

Wherever possible, mount the capacitor with the geometry that minimizes the mounting inductance and resistance. This was shown earlier in [Figure 7-1](#). The capacitor mounting inductance and resistance values include the inductance and resistance of the pads, trace, and vias. Whenever possible, use footprints that have the lowest inductance configuration as shown in [Figure 7-9](#).

The length of a trace used to connect a capacitor has a big impact on parasitic inductance and resistance of the mounting. This trace must be as short and as wide as possible. wherever possible, minimize distance to supply and Gnd vias by locating vias nearby or within the capacitor's solder pad landing. Further improvements can be made to the mounting by placing vias to the side of capacitor lands or doubling the number of vias as shown in [Figure 7-9](#). If the PCB manufacturing processes allow it and if cost-effective, via-in-pad (VIP) geometries are strongly recommended.

In addition to mounting inductance and resistance associated with placing a capacitor on the PCB, the effectiveness of a decoupling capacitor also depends on the spreading inductance and resistance that the capacitor sees with respect to the load. The spreading inductance and resistance is strongly dependent on the layer assignment in the PCB stack-up. Therefore, try to minimize X, Y and Z dimensions where the Z is due to PCB thickness (as shown in [Figure 7-9](#)).

From left (highest inductance) to right (lowest inductance) the capacitor footprint types shown in [Figure 7-9](#) are known as:

- 2-via, Skinny End Exit (2vSEE)
- 2-via, Wide End Exit (2vWEE)
- 2-via, Wide Side Exit (2vWSE)
- 4-via, Wide Side Exit (4vWSE)
- 2-via, In-Pad (2vIP)

SPRS969\_PCB\_FREQ\_04

**Figure 7-9. Capacitor Placement Geometry for Improved Mounting Inductance**

#### NOTE

Evaluation of loop inductance values for decoupling capacitor footprints 2vSEE (worst case) vs 4vWSE (2nd best) has shown a 30% reduction in inductance when 4vWSE footprint was used in place of 2vSEE.

#### Decoupling Capacitor (Dcap) Strategy:

1. Use lowest inductance footprint and trace connection scheme possible for given PCB technology and layout area in order to minimize Dcap loop inductance to power pin as much as possible (see [Figure 7-9](#)).
2. Place Dcaps on “same-side” as component within their power plane outline to minimize “decoupling loop inductance”. Target distance to power pin should be less than ~500mils depending upon PCB layout characteristics (plane's layer assignment and solid nature). Use PI modeling CAD tool to verify minimum inductance for top vs bottom-side placement.
3. Place Dcaps on “opposite-side” as component within their power plane outline if “same-side” is not feasible or if distance to power pin is greater than ~500mils for top-side location. Use PI modeling CAD tool to verify minimum inductance for top vs bottom-side placement.
4. Use minimum 10mil trace width for all voltage and gnd planes connections (i.e. Dcap pads, component power pins, etc.).
5. Place all voltage and gnd plane vias “as close as possible” to point of use (i.e. Dcap pads, component power pins, etc.).
6. Use a “Power/Gnd pad/pin to via” ratio of 1:1 whenever possible. Do not exceed 2:1 ratio for small number of vias within restricted PCB areas (i.e. underneath BGA components).

Frequency analysis for the CORE power domain has yielded the vdd Impedance vs Frequency response shown in [Section 7.3.8.2](#), vdd Example Analysis. As the example shows the overall CORE PDN  $R_{eff}$  meets the maximum recommended PDN resistance of  $10m\Omega$ .

## **7.2.5 System ESD Generic Guidelines**

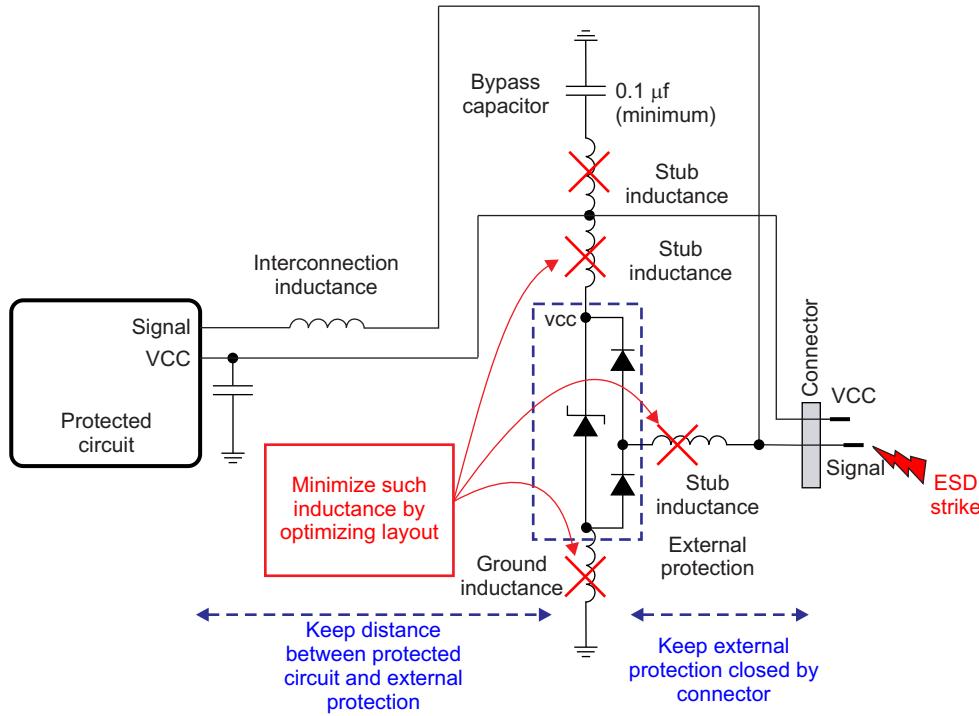

### **7.2.5.1 System ESD Generic PCB Guideline**

Protection devices must be placed close to the ESD source which means close to the connector. This allows the device to subtract the energy associated with an ESD strike before it reaches the internal circuitry of the application board.

To help minimize the residual voltage pulse that will be built-up at the protection device due to its nonzero turn-on impedance, it is mandatory to route the ESD device with minimum stub length so that the low-resistive, low-inductive path from the signal to the ground is granted and not increasing the impedance between signal and ground.

For ESD protection array being railed to a power supply when no decoupling capacitor is available in close vicinity, consider using a decoupling capacitor ( $\geq 0.1 \mu F$ ) tight to the VCC pin of the ESD protection. A positive strike will be partially diverted to this capacitance resulting in a lower residual voltage pulse.

Ensure that there is sufficient metallization for the supply of signals at the interconnect side (VCC and GND in [Figure 7-10](#)) from connector to external protection because the interconnect may see between 15-A to 30-A current in a short period of time during the ESD event.

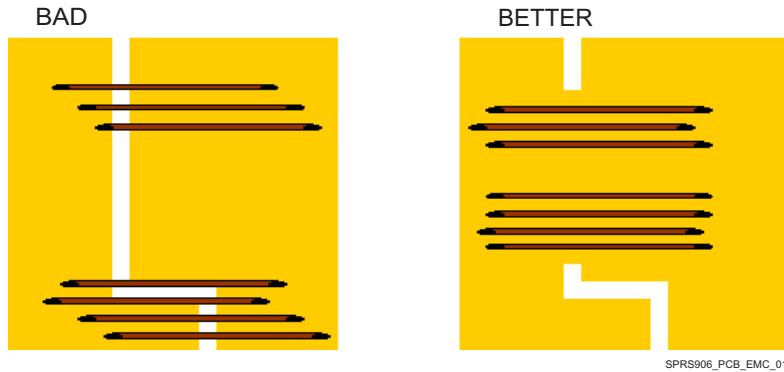

**Figure 7-10. Placement Recommendation for an ESD External Protection**

#### NOTE

To ensure normal behavior of the ESD protection (unwanted leakage), it is better to ground the ESD protection to the board ground rather than any local ground (example isolated shield or audio ground).

#### 7.2.5.2 Miscellaneous EMC Guidelines to Mitigate ESD Immunity

- Avoid running critical signal traces (clocks, resets, interrupts, control signals, and so forth) near PCB edges.
- Add high frequency filtering: Decoupling capacitors close to the receivers rather than close to the drivers to minimize ESD coupling.
- Put a ground (guard) ring around the entire periphery of the PCB to act as a lightning rod.
- Connect the guard ring to the PCB ground plane to provide a low impedance path for ESD-coupled current on the ring.
- Fill unused portions of the PCB with ground plane.
- Minimize circuit loops between power and ground by using multilayer PCB with dedicated power and ground planes.
- Shield long line length (strip lines) to minimize radiated ESD.
- Avoid running traces over split ground planes. It is better to use a bridge connecting the two planes in one area.

**Figure 7-11. Trace Examples**

- Always route signal traces and their associated ground returns as close to one another as possible to minimize the loop area enclosed by current flow:
  - At high frequencies current follows the path of least inductance.
  - At low frequencies current flows through the path of least resistance.

#### 7.2.5.3 ESD Protection System Design Consideration

ESD protection system design consideration is covered in [Section 7.5.2.2](#) of this document. The following are additional considerations for ESD protection in a system.

- Metallic shielding for both ESD and EMI
- Chassis GND isolation from the board GND
- Air gap designed on board to absorb ESD energy
- Clamping diodes to absorb ESD energy
- Capacitors to divert ESD energy
- The use of external ESD components on the DP/DM lines may affect signal quality and are not recommended.

#### 7.2.6 EMI / EMC Issues Prevention

All high-speed digital integrated circuits can be sources of unwanted radiation, which can affect nearby sensitive circuitry and cause the final product to have radiated emissions levels above the limits allowed by the EMC regulations if some preventative steps are not taken.

Likewise, analog and digital circuits can be susceptible to interference from the outside world and picked up by the circuitry interconnections.

To minimize the potential for EMI/EMC issues, the following guidelines are recommended to be followed.

##### 7.2.6.1 Signal Bandwidth

To evaluate the frequency of a digital signal, an estimated rule of thumb is to consider its bandwidth  $f_{BW}$  with respect to its rise time,  $t_R$ :

$$f_{BW} \approx 0.35 / t_R$$

This frequency actually corresponds to the break point in the signal spectrum, where the harmonics start to decay at 40 dB per decade instead of 20 dB per decade.

## 7.2.6.2 Signal Routing

### 7.2.6.2.1 Signal Routing—Sensitive Signals and Shielding

Keep radio frequency (RF) sensitive circuitry (like GPS receivers, GSM/WCDMA, Bluetooth/WLAN transceivers, frequency modulation (FM) radio) away from high-speed ICs (the device, power and audio manager, chargers, memories, and so forth) and ideally on the opposite side of the PCB. For improved protection it is recommended to place these emission sources in a shield can. If the shield can have a removable lid (two-piece shield), ensure there is low contact impedance between the fence and the lid. Leave some space between the lid and the components under it to limit the high-frequency currents induced in the lid. Limit the shield size to put any potential shield resonances above the frequencies of interest; see [Figure 7-8, Typical Impedance Profile of a Capacitor](#).

### 7.2.6.2.2 Signal Routing—Outer Layer Routing

In case there is a need to use the outer layers for routing outside of shielded areas, it is recommended to route only static signals and ensure that these static signals do not carry any high-frequency components (due to parasitic coupling with other signals). In case of long traces, make provision for a bypass capacitor near the signal source.

Routing of high-frequency clock signals on outer layers, even for a short distance, is discouraged, because their emissions energy is concentrated at the discrete harmonics and can become significant even with poor radiators.

Coplanar shielding of traces on outer layers (placing ground near the sides of a track along its length) is effective only if the distance between the trace sides and the ground is smaller than the trace height above the ground reference plane. For modern multilayer PCBs this is often not possible, so coplanar shielding will not be effective. Do not route high-frequency traces near the periphery of the PCB, as the lack of a ground reference near the trace edges can increase EMI: see [Section 7.2.6.3, Ground Guidelines](#).

## 7.2.6.3 Ground Guidelines

### 7.2.6.3.1 PCB Outer Layers

Ideally the areas on the top and bottom layers of the PCB that are not enclosed by a shield should be filled with ground after the routing is completed and connected with an adequate number of vias to the ground on the inner ground planes.

### 7.2.6.3.2 Metallic Frames

Ensure that all metallic parts are well connected to the PCB ground (like LCD screens metallic frames, antennas reference planes, connector cages, flex cables grounds, and so forth). If using flex PCB ribbon cables to bring high-frequency signals off the PCB, ensure they are adequately shielded (coaxial cables or flex ribbons with a solid reference ground).

### 7.2.6.3.3 Connectors

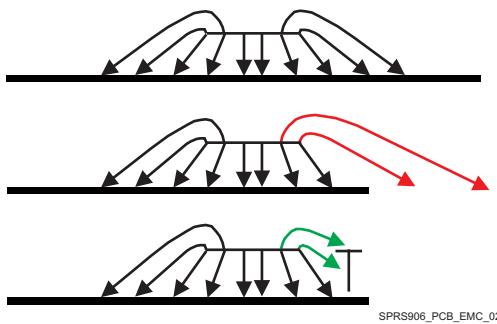

For high-frequency signals going to connectors choose a fully shielded connector, if possible (for example, SD card connectors). For signals going to external connectors or which are routed over long distances, it is recommended to reduce their bandwidth by using low-pass filters (resistor, capacitor (RC) combinations or lossy ferrite inductors). These filters will help to prevent emissions from the board and can also improve the immunity from external disturbances.

### 7.2.6.3.4 Guard Ring on PCB Edges

The major advantage of a multilayer PCB with ground-plane is the ground return path below each and every signal or power trace.

As shown in [Figure 7-12](#) the field lines of the signal return to PCB ground as long as an infinite ground is available.

Traces near the PCB-edges do not have this infinite ground and therefore may radiate more than the others. Thus, signals (clocks) or power traces (core power) identified to be critical must not be routed in the vicinity of PCB edges, or, if not avoidable, must be accompanied by a guard ring on the PCB edge.

**Figure 7-12. Field Lines of a Signal Above Ground**

**Figure 7-13. Guard Ring Routing**

The intention of the guard ring is that HF-energy, that otherwise would have been emitted from the PCB edge, is reflected back into the board where it partially will be absorbed. For this purpose ground traces on the borders of all layers (including power layer) must be applied as shown in Figure 7-13.

As these traces must have the same (HF-) potential as the ground plane they must be connected to the ground plane at least every 10 mm.

#### 7.2.6.3.5 Analog and Digital Ground

For the optimum solution, the AGND and the DGND planes must be connected together at the power supply source in a same point. This ensures that both planes are at the same potential, while the transfer of noise from the digital to the analog domain is minimized.

### 7.3 Core Power Domains

This section provides boundary conditions and theoretical background to be applied as a guide for optimizing a PCB design. The decoupling capacitor and PDN characteristics tables shown below give recommended capacitors and PCB parameters to be followed for schematic and PCB designs. Board designs that meet the static and dynamic PDN characteristics shown in tables below will be aligned to the expected PDN performance needed to optimize SoC performance.

#### 7.3.1 General Constraints and Theory

- Max PCB static/DC voltage drop (IRd) budget of **1.5% of supply voltage** when using TI recommended PMICs **without remote sensing** as measured from PMIC's power inductor and filter capacitor node to Processor input including any ground return losses.
- Max PCB static/DC voltage drop (IRd) budget can be relaxed to **7.5% of supply voltage** when using PMICs **with remote sensing at the load** as measured from PMIC's power inductor and filter capacitor node to Device's supply input including any ground return losses.

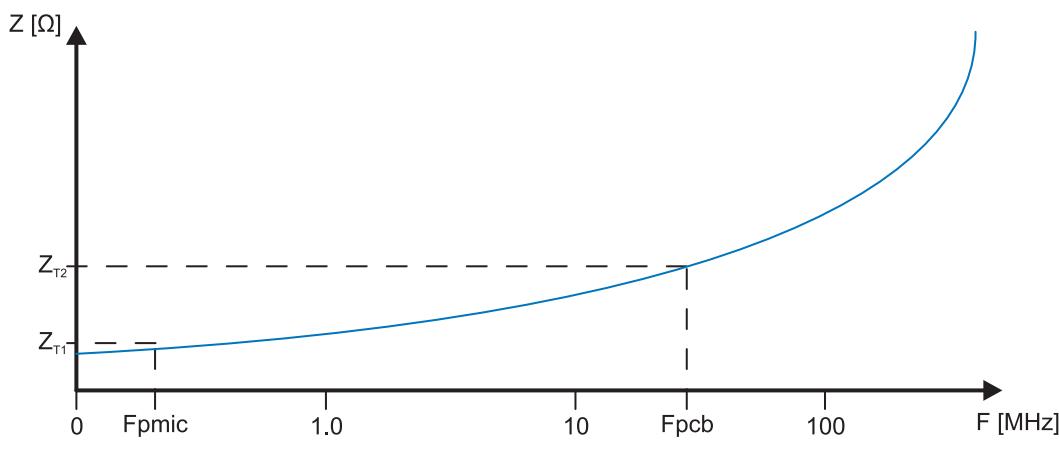

- PMIC component DM and guidelines should be referenced for the following:
  - Routing remote feedback sensing to optimize per each SMPS's implementation
  - Selecting power filtering capacitor values and PCB placement.
- Max Effective Resistance ( $R_{eff}$ ) budget can range from **4 – 100mΩ** for key Device power rails not including ground returns depending upon maximum load currents and maximum DC voltage drop budget (as discussed above).
- Max Device supply input voltage difference budget of **5mV** under max current loading shall be maintained across all balls connected to a common power rail. This represents any voltage difference that may exist between a remote sense point to any power input.
- Max PCB Loop Inductance (LL) budget between Device's power inputs and local bulk and high frequency decoupling capacitors including ground returns should range from **0.4 – 2.5nH depending upon maximum transient load currents.**
- Max PCB dynamic/AC peak-to-peak transient noise voltage budgets between PMIC and Device including ground returns are as follows:
  - **+/-3% of nominal supply voltage** for frequencies below the PMIC bandwidth (typ F<sub>pmic</sub> ~ 200kHz)
  - **+/-5% of nominal supply voltage** for frequencies between F<sub>pmic</sub> to F<sub>pcb</sub> (typ 20 – 100MHz)
- Max PCB Impedance (Z) vs Frequency (F) budget between Device's power inputs and PMIC's output power filter node including ground return is determined by applying the Frequency Domain Target Impedance Method to determine the PCB's maximum frequency of interest (F<sub>pcb</sub>). Ideally a properly designed and decoupled PDN will exhibit smoothly increasing Z vs. F curve. There are 2 general regions of interest as can be seen in [Figure 7-14](#).
  - 1<sup>st</sup> area is from DC (0Hz) up to F<sub>pmic</sub> (typ a few 100 kHz) where a PMIC's transient response characteristic (i.e. Switching Freq, Compensation Loop BW) dominate. A PDN's Z is typically very low due to power filtering & bulk capacitor values when PDN has very low trace resistance (i.e. good R<sub>eff</sub> performance). The goal is to maintain a smoothly increasing Z that is less than Zt1 over this low frequency range. This will ensure that a max transient current event will not cause a voltage drop more than the PMIC's current step response can support (typ 3%).
  - 2<sup>nd</sup> area is from F<sub>pmic</sub> up to F<sub>pcb</sub> (typ 20-100MHz) where a PCB's inherent characteristics (i.e. parasitic capacitance, planar spreading inductances) dominate. A PDN's Z will naturally increase with frequency. At frequencies between F<sub>pmic</sub> up to F<sub>pcb</sub>, the goal is to maintain a smoothly increasing Z to be less than Zt2. This will ensue that the high frequency content of a max transient current event will not cause a voltage drop to be more than 5% of the min supply voltage.

$$Z_T = \frac{\text{Max Voltage Rail Drop}}{\text{Max Transient Current}}$$

Note1  
Note2

$$Z_{T1} = \frac{(\text{Min Voltage}) \times (\text{PMIC's Step Response})}{(\sim 50\% \text{ of Max DC Current})} = \frac{V_{min} \times 3\%(\text{typ})}{I_{max} \times \sim 50\%}$$

$$Z_{T2} = \frac{(\text{Min Voltage}) \times (\text{High-Freq Transient Noise})}{(\sim 50\% \text{ of Max DC Current})} = \frac{V_{min} \times 5\%(\text{typ})}{I_{max} \times \sim 50\%}$$

PCB\_CPD\_8

**Figure 7-14. PDN's Target impedance**

1. Voltage Rail Drop includes regulation accuracy, voltage distribution drops, and all dynamic events such as transient noise, AC ripple, voltage dips etc.
2. Typical max transient current is defined as 50% of max current draw possible.

### 7.3.2 Voltage Decoupling

Recommended power supply decoupling capacitors main characteristics for commercial products whose ambient temperature is not to exceed +85C are shown in table below:

**Table 7-1. Commercial Applications Recommended Decoupling Capacitors Characteristics<sup>(1)(2)(3)</sup>**

Value	Voltage [V]	Package	Stability	Dielectric	Capacitance Tolerance	Temp Range [°C]	Temp Sensitivity [%]	REFERENCE
22µF	6,3	0603	Class 2	X5R	- / + 20%	-55 to + 85	- / + 15	GRM188R60J226MEA0L
10µF	4,0	0402	Class 2	X5R	- / + 20%	-55 to + 85	- / + 15	GRM155R60G106ME44
4.7µF	6,3	0402	Class 2	X5R	- / + 20%	-55 to + 85	- / + 15	GRM155R60J475ME95
2.2µF	6,3	0402	Class 2	X5R	- / + 20%	-55 to + 85	- / + 15	GRM155R60J225ME95
1µF	6,3	0201	Class 2	X5R	- / + 20%	-55 to + 85	- / + 15	GRM033R60J105MEA2

**Table 7-1. Commercial Applications Recommended Decoupling Capacitors Characteristics<sup>(1)(2)(3)</sup> (continued)**

Value	Voltage [V]	Package	Stability	Dielectric	Capacitance Tolerance	Temp Range [°C]	Temp Sensitivity [%]	REFERENCE
470nF	6,3	0201	Class 2	X5R	- / + 20%	-55 to + 85	- / + 15	GRM033R60G474ME90
220nF	6,3	0201	Class 2	X5R	- / + 20%	-55 to + 85	- / + 15	GRM033R60J224ME90
100nF	6,3	0201	Class 2	X5R	- / + 20%	-55 to + 85	- / + 15	GRM033R60J104ME19

(1) Minimum value for each PCB capacitor: 100 nF.

(2) Among the different capacitors, 470 nF is recommended (not required) to filter at 5-MHz to 10-MHz frequency range.

(3) In comparison with the EIA Class 1 dielectrics, Class 2 dielectric capacitors tend to have severe temperature drift, high dependence of capacitance on applied voltage, high voltage coefficient of dissipation factor, high frequency coefficient of dissipation, and problems with aging due to gradual change of crystal structure. Aging causes gradual exponential loss of capacitance and decrease of dissipation factor.

Recommended power supply decoupling capacitors main characteristics for automotive products are shown in table below:

**Table 7-2. Automotive Applications Recommended Decoupling Capacitors Characteristics<sup>(1)(2)</sup>**

Value	Voltage [V]	Package	AEC-Q200	Dielectric	Capacitance Tolerance	Temp Range [°C]	Temp Sensitivity [%]	REFERENCE
22µF	10	1206	Yes	X7R	- / + 10%	-55 to + 125	- / + 15	GCM31CR71A226KE02
10µF	10	0805	Yes	X7R	- / + 10%	-55 to + 125	- / + 15	GCM21BR71A106KE22
4.7µF	10	0805	Yes	X7S	- / + 10%	-55 to + 125	- / + 22	GCM21BC71A475KA73
2.2µF	6,3	0603	Yes	X7R	- / + 10%	-55 to + 125	- / + 15	GCM188R70J225KE22

470nF	10	0402	Yes	X7S	- / + 10%	-55 to + 125	- / + 22	GCM155C71A474KE36
220nF	25	0603	Yes	X7R	- / + 10%	-55 to + 125	- / + 15	GCM155R71A104KA55
100nF	10	0402	Yes	X7R	- / + 10%	-55 to + 125	- / + 15	GCM155R71C104MA55
100nF	6.3	0201	Yes	X7S	- / + 10%	-55 to + 125	- / + 15	GCM033C70J104K
1.0µF	10	3T-0805 <sup>(3)</sup>	Yes		- / + 20%	-55 to + 125		NFM21HC105R1C3
0.47µF	10	3T-0805 <sup>(3)</sup>	Yes		- / + 20%	-55 to + 125		NFM21HC474R1C3
0.22µF	10	3T-0805 <sup>(3)</sup>	Yes		- / + 20%	-55 to + 125		NFM21HC224R1C3
0.1µF	10	3T-0805 <sup>(3)</sup>	Yes		- / + 20%	-55 to + 125		NFM21HC104R1C3

(1) Minimum value for each PCB capacitor: 100 nF.

(2) Among the different capacitors, 470 nF is recommended (not required) to filter at 5-MHz to 10-MHz frequency range.

(3) 3T designates this as a "3-terminal, low inductance type package".

### 7.3.3 Static PDN Analysis

One power net parameter derived from a PCB's PDN static analysis is the Effective Resistance ( $R_{eff}$ ). This is the total PCB power net routing resistance that is the sum of all the individual power net segments used to deliver a supply voltage to the point of load and includes any series resistive elements (i.e. current sensing resistor) that may be installed between the PMIC outputs and Processor inputs.

### 7.3.4 Dynamic PDN Analysis

Three power net parameters derived from a PCB's PDN dynamic analysis are the Loop Inductance (LL), Impedance (Z) and PCB Frequency of Interest ( $F_{pcb}$ ).

- LL values shown are the recommended max PCB trace inductance between a decoupling capacitor's power supply and ground reference terminals when viewed from the decoupling capacitor with a "theoretical shorted" applied across the Processor's supply inputs to ground reference.

- Z values shown are the recommended max PCB trace impedances allowed between Fpmic up to Fpcb frequency range that limits transient noise drops to no more than 5% of min supply voltage during max transient current events.
- Fpcb (Frequency of Interest) is defined to be a power rail's max frequency after which adding a reasonable number of decoupling capacitors no longer significantly reduces the power rail impedance below the desired impedance target ( $Z_t2$ ). This is due to the dominance of the PCB's parasitic planar spreading and internal package inductances.

**Table 7-3. Recommended PDN and Decoupling Characteristics <sup>(1)(2)(3)(4)</sup>**

PDN Analysis:	Static	Dynamic			Number of Recommended Decoupling Capacitors per Supply							
		Max $R_{eff}$ <sup>(5)</sup> [mΩ]	Dec. Cap. Max LL <sup>(6)</sup> [nH]	Max Impedance [mΩ]	Frequency range of Interest [MHz]	100 nF	220 nF	470 nF	1μF	2.2 μF	4.7 μF	10 μF
vdd_dsp	22	2.5	54	≤20	6	1	1	1	1	1		1
vdd	18	2	57	≤20	6	1	1	1	1		1	
vdds_ddr1	33	2.5	200	≤100	8	3		2		2		1
cap_vbbldo_dsp	N/A	6	N/A	N/A				1				
cap_vbbldo_gpu	N/A	6	N/A	N/A				1				
cap_vbbldo_iva	N/A	6	N/A	N/A				1				
cap_vbbldo_mpu	N/A	6	N/A	N/A				1				
cap_vddram_core1	N/A	6	N/A	N/A				1				
cap_vddram_core3	N/A	6	N/A	N/A				1				
cap_vddram_core4	N/A	6	N/A	N/A				1				
cap_vddram_dsp	N/A	6	N/A	N/A				1				
cap_vddram_gpu	N/A	6	N/A	N/A				1				
cap_vddram_iva	N/A	6	N/A	N/A				1				
cap_vddram_mpu	N/A	6	N/A	N/A				1				

(1) For more information on peak-to-peak noise values, see the Recommended Operating Conditions table of the Specifications chapter.

(2) ESL must be as low as possible and must not exceed 0.5 nH.

(3) The PDN (Power Delivery Network) impedance characteristics are defined versus the device activity (that runs at different frequency) based on the Recommended Operating Conditions table of the Specifications chapter.

(4) Maximum static voltage drop allowed drives the maximum acceptable power net resistance (  $R_{eff}$  ) between the PMIC or the external SMPS and the processor power balls.

(5) Maximum  $R_{eff}$  (from SMPS to Processor) allows for max supply voltage drop when both remote voltage sensing very close to processor power balls and TI recommended PMICs are used.

(6) Maximum Loop Inductance to each high-frequency (30-70MHz) decoupling capacitor.

### 7.3.5 Power Supply Mapping

TPS65919 or LP8733 are the Power Management ICs (PMICs) that should be used for the Device designs. TI requires use of these PMICs for the following reasons:

- TI has validated their use with the Device
- Board level margins including transient response and output accuracy are analyzed and optimized for the entire system
- Support for power sequencing requirements (refer to [Section 5.10.3 Power Supply Sequences](#))
- Support for Adaptive Voltage Scaling (AVS) Class 0 requirements, including TI provided software
- Remote sensing at point of load with output voltage compensation allows for the maximum IR drop budget

Whenever one SMPS supplies multiple SoC voltage domains from a common power rail, the most stringent PDN guideline across the voltage domains being combined should be applied to the common power rail.

It is possible that some voltage domains on the device are unused in some systems. In such cases, to ensure device reliability, it is still required that the supply pins for the specific voltage domains are connected to some core power supply output.

These unused supplies though can be combined with any of the core supplies that are used (active) in the system. e.g. if the DSP domain is not used, it can be combined with the CORE domain, thereby having a single power supply driving the combined CORE and DSP domains.

For the combined rail, the following relaxations do apply:

- The AVS voltage of active voltage domain in the combined rail needs to be used to set the power supply
- The decoupling capacitance should be set according to the active voltage domain in the combined rail
- The PDN guideline should be set according to the active voltage domain in the combined rail

**Table 7-4** illustrates the approved and validated power supply connections to the Device for the SMPS outputs of the TPS65919 PMIC.

**Table 7-4. TPS65919 Power Supply Connections<sup>(1)</sup>**

SMPS	Valid Combination	TPS65919 Current Limitation <sup>(2)(3)</sup>
SMPS1	VD_CORE	3.5A
SMPS2	Free (DDR Memory)	3.5A
SMPS3	VD_DSP	3A
SMPS4	VDDS18V	1.5A

(1) Power consumption is highly application-specific. Separate analysis must be performed to ensure output current ratings (average and peak) is within the limits of the PMIC for all rails of the device.

(2) Refer to the PMIC data manual for the latest TPS65919 specifications.

(3) A product's maximum ambient temperature, thermal system design & heat spreading performance could limit the maximum power dissipation below the full PMIC capacity in order to not exceed recommended SoC max T<sub>j</sub>.

**Table 7-5** illustrates the approved and validated power supply connections to the Device for the SMPS outputs of the LP8733 PMIC.

**Table 7-5. LP8733 Power Supply Connections**

SMPS	Valid Combination	LP8733 Current Limitation <sup>(1)</sup> <sup>(2)</sup>
SMPS1	VD_CORE	3A
SMPS2	VD_DSP	3A

(1) Refer to the LP8733 Data Manual for exact current rating limitations, including assumed VIN and other parameters. Values provided in this table are for comparison purposes.

(2) Highly application-specific. Separate analysis must be performed to ensure average and peak power is within the limits of the PMIC.

### 7.3.6 DPLL Voltage Requirement

The voltage input to the DPLLS has a low noise requirement. Board designs should supply these voltage inputs with a low noise LDO to ensure they are isolated from any potential digital switching noise. The TPS65919 PMIC LDOLN output is specifically designed to meet this low noise requirement.

**NOTE**

For more information about Input Voltage Sources, see [Section 5.10.4.3 DPLLs, DLLs Specifications](#).

[Table 7-6](#) presents the voltage inputs that supply the DPLLs.

**Table 7-6. Input Voltage Power Supplies for the DPLLs**

POWER SUPPLY	DPLLs
vdda_per	DPLL_PER and PER HSDIVIDER analog power supply
vdda_ddr	DPLL_DDR and DDR HSDIVIDER analog power supply
vdda_debug	DPLL_DEBUG analog power supply
vdda_core_gmac	DPLL_CORE and HSDIVIDER analog power supply
vdda_gpu	DPLL_GPU analog power supply
vdda_video	DPLL_VIDEO1 analog power supply
vdda_mpu_abe	DPLL_MPUs and DPLL_ABE analog power supply
vdda_osc	not DPLL input but is required to be supplied by low noise input voltage
vdda_dsp_ivs	DSP PLL and IVA PLL analog power supply

### 7.3.7 Loss of Input Power Event

A few key PDN design items needed to enable a controlled and compliant SoC power down sequence for a “Loss of Input Power” event are:

- “Loss of Input Power” early warning
  - TI EVM and Reference Design Study SCHs and PDNs achieve this by using the First Stage Converter’s (i.e. LM536033-Q1) Power Good status output to enable and disable the Second Stage PMIC devices (i.e. TPS65917/919, LP8733, and LP8732). If a different First Stage Converter is used, care must be taken to ensure an adequate “PG\_Status” or “Vbatt\_Status” signal is provided that can disable Second Stage PMIC to begin a controlled and compliant SoC power down sequence. The total elapsed time from asserting “PG\_Status” low until SoC’s PMIC input voltage reaches minimum level of 2.75 V should be minimum of 1.5ms and 2ms preferred.
- Maximize discharge time of First Stage Vout (VSYS\_3V3 power rail = input voltage to SoC PMIC).
  - TI EVM and Reference Design Study SCHs and PDNs achieve this by opening an in-line load switch immediately upon “PG\_Status” low assertion in order to remove the SoC’s 3.3V IO load current from VSYS\_3V3. This will extend the VSYS\_3V3 power rail’s discharge time in order to maximize elapsed time for allowing SoC PMIC to execute a controlled and compliant power down sequence. Care should be taken to either disable or isolate any additional peripheral components that may be loading the VSYS\_3V3 rail as well.
- Sufficient bulk decoupling capacitance on the First Stage Vout (VSYS\_3V3 per PDN) that allows for desired 1.5 – 2 ms elapsed time as described above.
  - TI EVM and Reference Design Study SCHs and PDNs achieve this by using 200  $\mu$ F of total capacitance on VSYS\_3V3. The First Stage Converter (i.e. LM536033-Q1) can typically drive a max of 400  $\mu$ F to help extend VSYS\_3V3 discharge time for a compliant SoC power down sequence.
- Optimizing the Second Stage SoC PMIC’s OTP settings that determines SoC power up and down sequences and total elapsed time needed for a controlled sequence.
  - TI EVM and Reference Design Study SCHs and PDNs achieve this by using optimized OTPs per the SCH and components used. The definition of these OTPs is captured in the detailed timing diagrams for both power up and down sequences. The PDN diagram typically shows a recommended PMIC OTP ID based upon the SoC and DDR memory types.

### 7.3.8 Example PCB Design

The following sections describe an example PCB design and its resulting PDN performance for the vdd processor power domain.

#### NOTE

Materials presented in this section are based on generic PDN analysis on PCB boards and are not specific to systems integrating the Device.

#### 7.3.8.1 Example Stack-up

Layer Assignments:

- Layer Top: Signal and Segmented Power Plane
  - Processor and PMIC components placed on Top-side
- Layer 2: Gnd Plane1
- Layer 3: Signals
- Layer n: Power Plane1
- Layer n+1: Power Plane 2
- Layer n+2: Signal
- Layer n+3: Gnd Plane2
- Layer Bottom: Signal and Segmented Power Planes
  - Decoupling caps, etc.

Via Technology: Through-hole

Copper Weight:

- ½ oz for all signal layers.
- 1-2oz for all power plane for improved PCB heat spreading.

#### 7.3.8.2 vdd Example Analysis

Maximum acceptable PCB resistance ( $R_{eff}$ ) between the PMIC and Processor input power balls should not exceed  $10m\Omega$ .

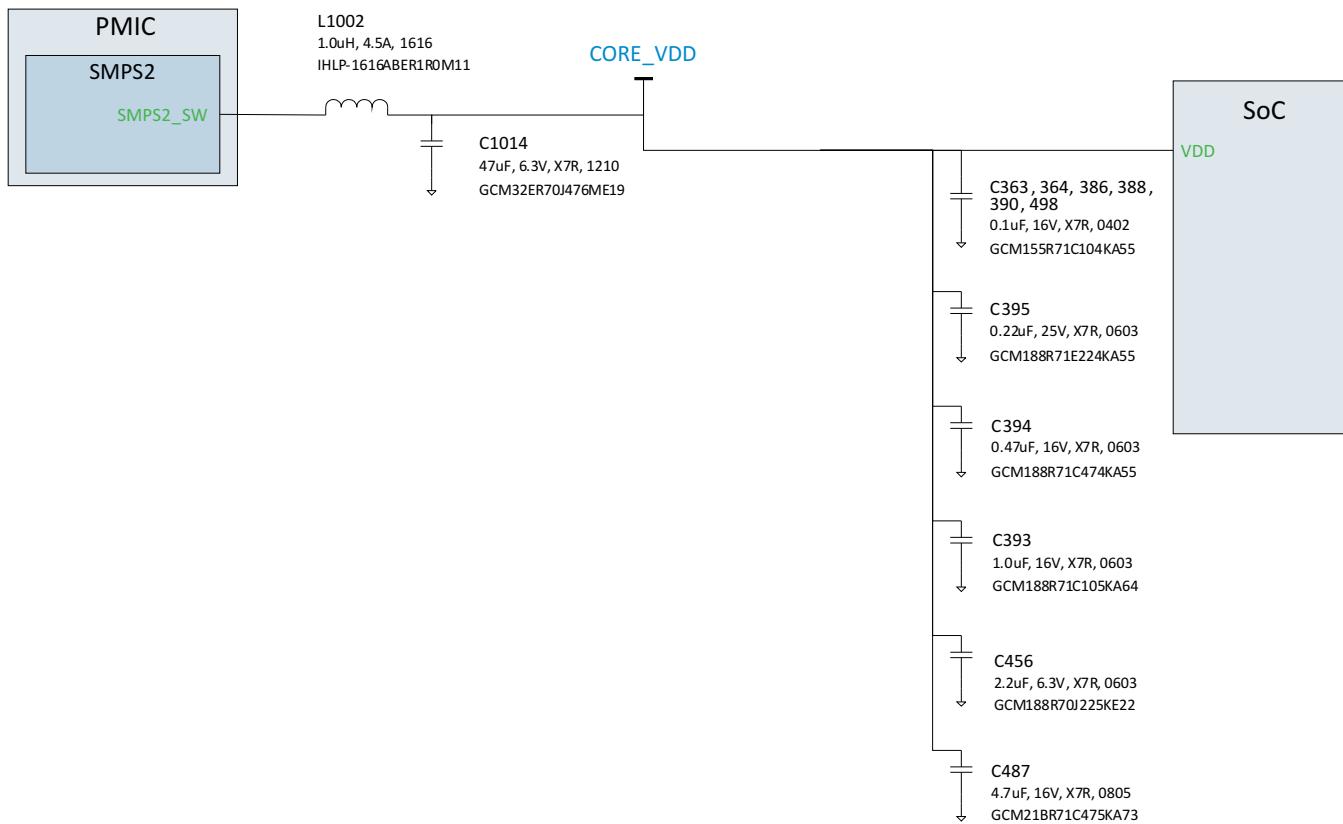

Maximum decoupling capacitance loop inductance (LL) between Processor input power balls and decoupling capacitances should not exceed  $2.0nH$  (ESL NOT included)

Impedance target for key frequency of interest between Processor input power balls and PMIC's SMPS output power balls should not exceed  $57m\Omega$  at 20MHz.

**Table 7-7. Example PCB vdd PI Analysis Summary**

Parameter	Recommendation	Example PCB
OPP	OPP_NOM	
Clocking Rate	266 MHz	
Voltage Level	1 V	1 V
Max Current Draw	1 A	1 A
Max Effective Resistance: Power Inductor Segment Total $R_{eff}$	$10m\Omega$	$9.7 m\Omega$
Max Loop Inductance	$2.0nH$	$0.97 - 1.75nH$
Impedance Target	$57m\Omega$ F<20Mhz	$57m\Omega$ F<20Mhz

Figure 7-15 show a PCB layout example and the resulting PI analysis results.

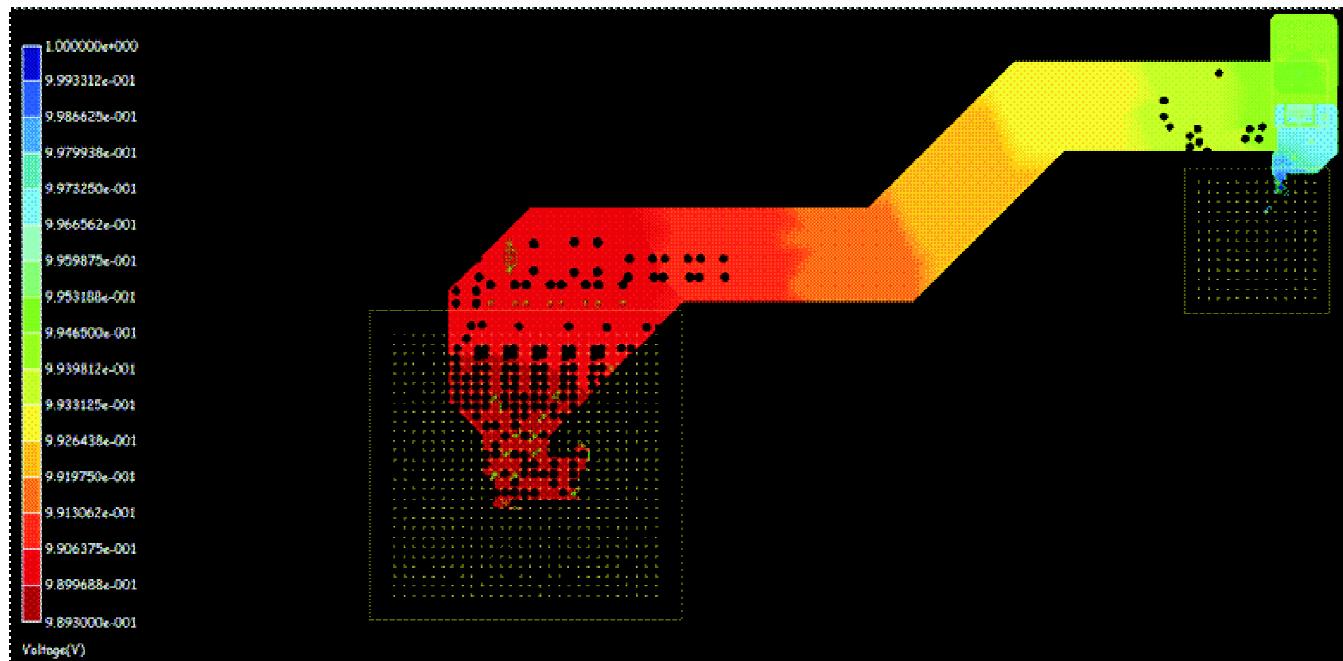

**Figure 7-15. vdd Simplified SCH Diagram**

#### NOTE

PCB Etch Resistance Breakdown, PDN Effective Resistance, and vdd routings are UNDER DEVELOPMENT!

IR Drop: vdd (PCB Rev Oct25, CAD sPSI v13.1.1)

- Source Conditions: 1V @ 1A
- Power Plane/Trace Effective Resistances
  - From PMIC SMPS to SoC load = 9.7mohm
  - From Power Inductor to SoC load = 6mohm
  - "Open-Loop" Voltage/IR Drop for 1A = 6mV

**Figure 7-16. vdd Voltage/IR Drop [All Layers]**

Dynamic analysis of this PCB design for the CORE power domain determined the vdd decoupling capacitor loop inductance and impedance vs frequency analysis shown below. As you can see, the loop inductance values ranged from 0.97 –1.75nH and were less than maximum 2.0nH recommended.

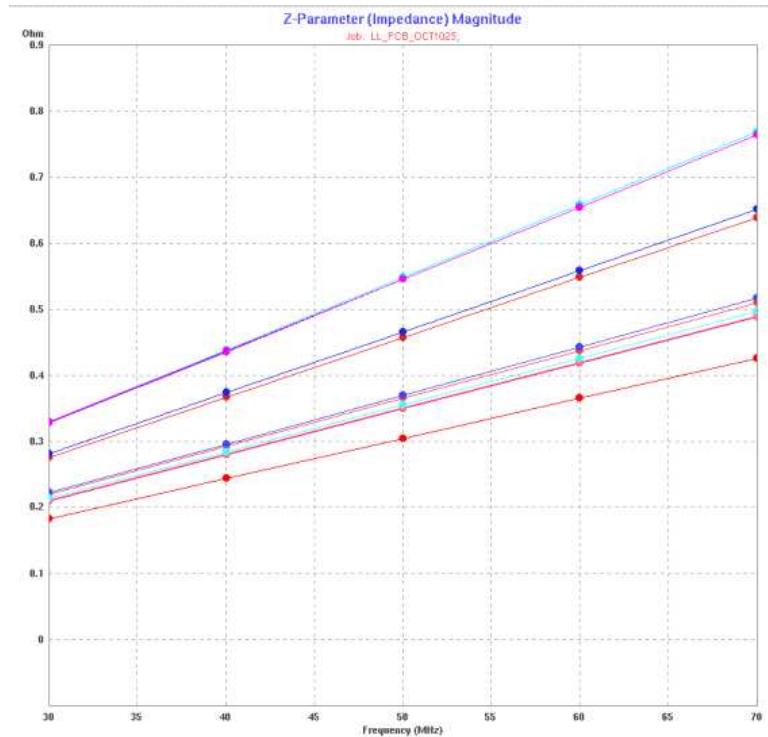

#### NOTE

Comparing loop inductances for capacitors at different distances from the SoC's input power balls shows an 18% reduction for caps placed closer. This was derived by averaging the inductances for the 3 caps with distances over 800mils (Avg LL = 1.33nH) vs the 3 caps with distances less than 600mils (Avg LL = 1.096nH).

**Table 7-8. Rail - vdd**

Cap Ref Des	Model Port #	Loop Inductance [nH]	Footprint Types	PCB Side	Distance to Ball-Field [mils]	Value [ $\mu$ F]	Size
C487	10	0.97	4vWSE	Top	521	4.7	0805
C393	6	1.11	4vWSE	Bottom	358	1.0	0603
C394	7	1.12	4vWSE	Bottom	357	0.47	0603
C456	9	1.13	4vWSE	Bottom	403	2.2	0603
C386	3	1.16	2vWSE	Bottom	40	0.1	0402
C395	8	1.18	4vWSE	Bottom	460	0.22	0603
C363	1	1.46	2vWSE	Bottom	40	0.1	0402
C390	5	1.48	2vWSE	Bottom	40	0.1	0402
C364	2	1.74	2vWSE	Bottom	40	0.1	0402
C498	11	1.74	2vWSE	Bottom	40	0.1	0402
C388	4	1.75	2vWSE	Bottom	40	0.1	0402

Loop Inductance range: 0.97 –1.75nH

**Figure 7-17. vdd Decoupling Cap Loop Inductances**

Figure 7-18 shows vdd Impedance vs Frequency characteristics.

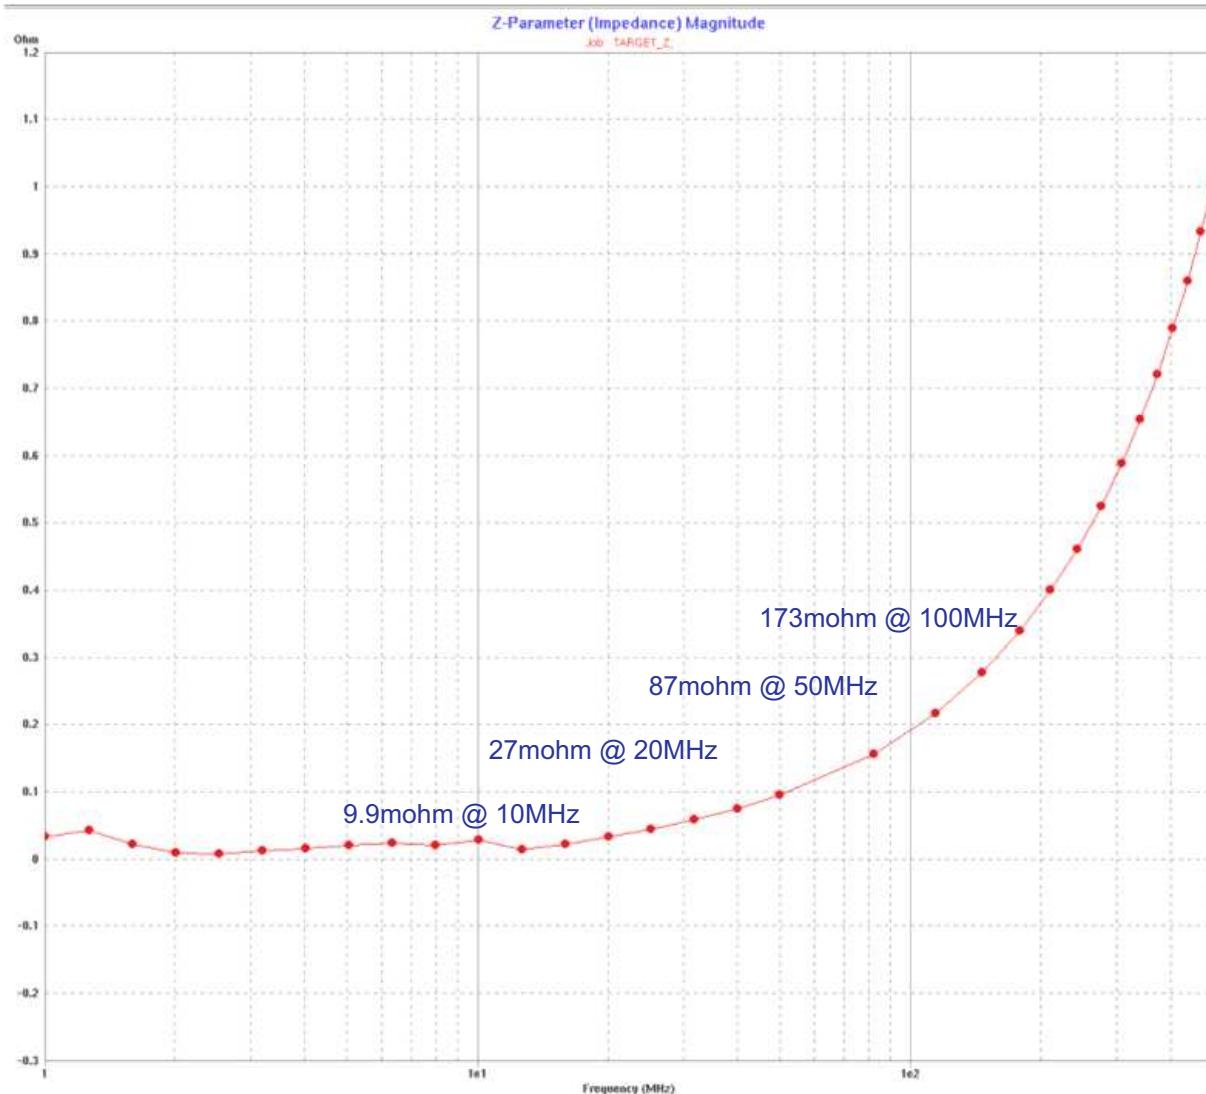

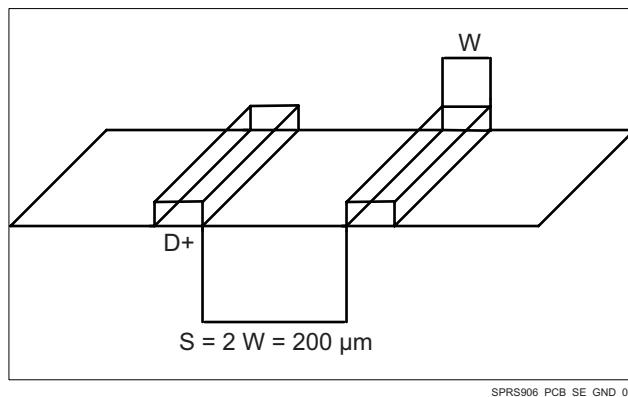

Figure 7-18. vdd Impedance vs Frequency

## 7.4 Single-Ended Interfaces

### 7.4.1 General Routing Guidelines

The following paragraphs detail the routing guidelines that must be observed when routing the various functional LVC MOS interfaces.

- Line spacing:
  - For a line width equal to  $W$ , the spacing between two lines must be  $2W$ , at least. This minimizes the crosstalk between switching signals between the different lines. On the PCB, this is not achievable everywhere (for example, when breaking signals out from the device package), but it is recommended to follow this rule as much as possible. When violating this guideline, minimize the length of the traces running parallel to each other (see [Figure 7-19](#)).

**Figure 7-19. Ground Guard Illustration**

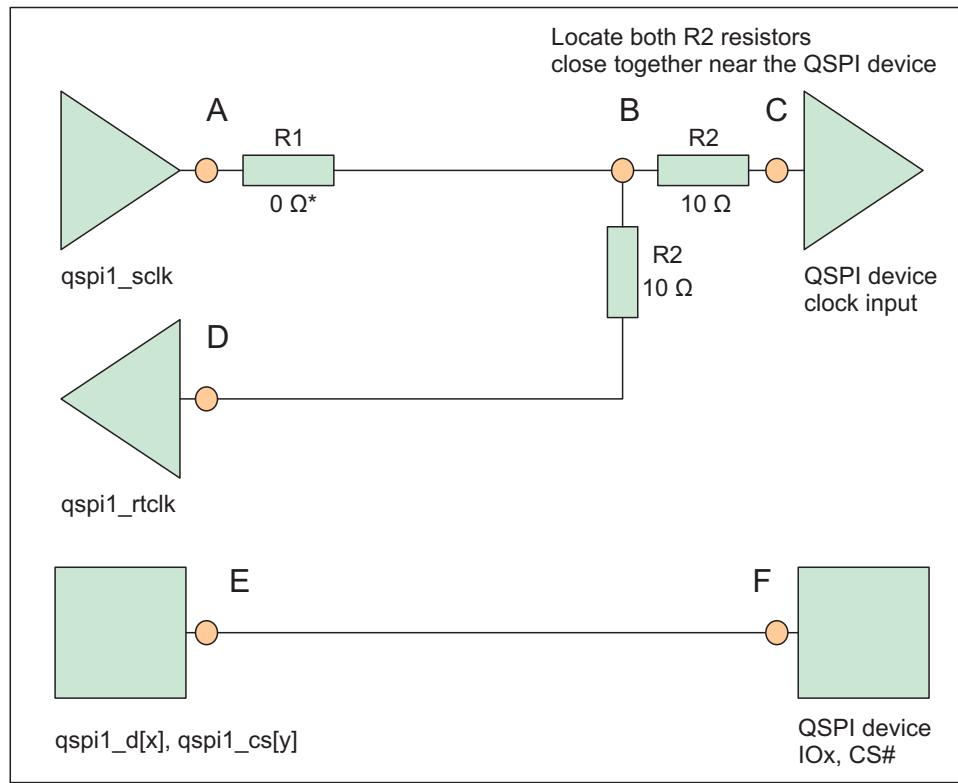

- Length matching (unless otherwise specified):
  - For bus or traces at frequencies less than 10 MHz, the trace length matching (maximum length difference between the longest and the shortest lines) must be less than 25 mm.
  - For bus or traces at frequencies greater than 10 MHz, the trace length matching (maximum length difference between the longest and the shortest lines) must be less than 2.5 mm.
- Characteristic impedance
  - Unless otherwise specified, the characteristic impedance for single-ended interfaces is recommended to be between  $35\Omega$  and  $65\Omega$ .
- Multiple peripheral support
  - For interfaces where multiple peripherals have to be supported in the star topology, the length of each branch has to be balanced. Before closing the PCB design, it is highly recommended to verify signal integrity based on simulations including actual PCB extraction.

#### 7.4.2 QSPI Board Design and Layout Guidelines

The following section details the routing guidelines that must be observed when routing the QSPI interfaces.

- The qspi1\_sclk output signal must be looped back into the qspi1\_rtclk input.
- The signal propagation delay from the qspi1\_sclk ball to the QSPI device CLK input pin (A to C) must be approximately equal to the signal propagation delay from the QSPI device CLK pin to the qspi1\_rtclk ball (C to D).
- The signal propagation delay from the QSPI device CLK pin to the qspi1\_rtclk ball (C to D) must be approximately equal to the signal propagation delay of the control and data signals between the QSPI device and the SoC device (E to F, or F to E).
- The signal propagation delay from the qspi1\_sclk signal to the series terminators ( $R_2 = 10\Omega$ ) near the QSPI device must be  $< 450\text{pS}$  (~7cm as stripline or ~8cm as microstrip)
- $50\Omega$  PCB routing is recommended along with series terminations, as shown in [Figure 7-20](#).

- Propagation delays and matching:
  - A to C = C to D = E to F.
  - Matching skew: < 60pS
  - A to B < 450pS
  - B to C = as small as possible (<60pS)

SPRS906\_PCB\_QSPI\_01

**Figure 7-20. QSPI Interface High Level Schematic****NOTE**

\* $0\ \Omega$  resistor (R1), located as close as possible to the qspi1\_sclk pin, is placeholder for fine-tuning if needed.

## 7.5 Differential Interfaces

### 7.5.1 General Routing Guidelines

To maximize signal integrity, proper routing techniques for differential signals are important for high-speed designs. The following general routing guidelines describe the routing guidelines for differential lanes and differential signals.

- As much as possible, no other high-frequency signals must be routed in close proximity to the differential pair.
- Must be routed as differential traces on the same layer. The trace width and spacing must be chosen to yield the differential impedance value recommended.
- Minimize external components on differential lanes (like external ESD, probe points).
- Through-hole pins are not recommended.
- Differential lanes mustn't cross image planes (ground planes).
- No sharp bend on differential lanes.

- Number of vias on the differential pairs must be minimized, and identical on each line of the differential pair. In case of multiple differential lanes in the same interface, all lines should have the same number of vias.
- Shielded routing is to be promoted as much as possible (for instance, signals must be routed on internal layers that are inside power and/or ground planes).

### **7.5.2 USB 2.0 Board Design and Layout Guidelines**

This section discusses schematic guidelines when designing a universal serial bus (USB) system.

#### **7.5.2.1 Background**

Clock frequencies generate the main source of energy in a USB design. The USB differential DP/DM pairs operate in high-speed mode at 480 Mbps. System clocks can operate at 12 MHz, 48 MHz, and 60 MHz. The USB cable can behave as a monopole antenna; take care to prevent RF currents from coupling onto the cable.

When designing a USB board, the signals of most interest are:

- Device interface signals: Clocks and other signal/data lines that run between devices on the PCB.
- Power going into and out of the cable: The USB connector socket pin 1 (VBUS) may be heavily filtered and need only pass low frequency signals of less than ~100 KHz. The USB socket pin 4 (analog ground) must be able to return the current during data transmission, and must be filtered sparingly.
- Differential twisted pair signals going out on cable, DP and DM: Depending upon the data transfer rate, these device terminals can have signals with fundamental frequencies of 240 MHz (high speed), 6 MHz (full speed), and 750 kHz (low speed).
- External crystal circuit (device terminals XI and X0): 12 MHz, 19.2 MHz, 24 MHz, and 48 MHz fundamental. When using an external crystal as a reference clock, a 24 MHz and higher crystal is highly recommended.

#### **7.5.2.2 USB PHY Layout Guide**

The following sections describe in detail the specific guidelines for USB PHY Layout.

##### **7.5.2.2.1 General Routing and Placement**

Use the following routing and placement guidelines when laying out a new design for the USB physical layer (PHY). These guidelines help minimize signal quality and electromagnetic interference (EMI) problems on a four-or-more layer evaluation module (EVM).

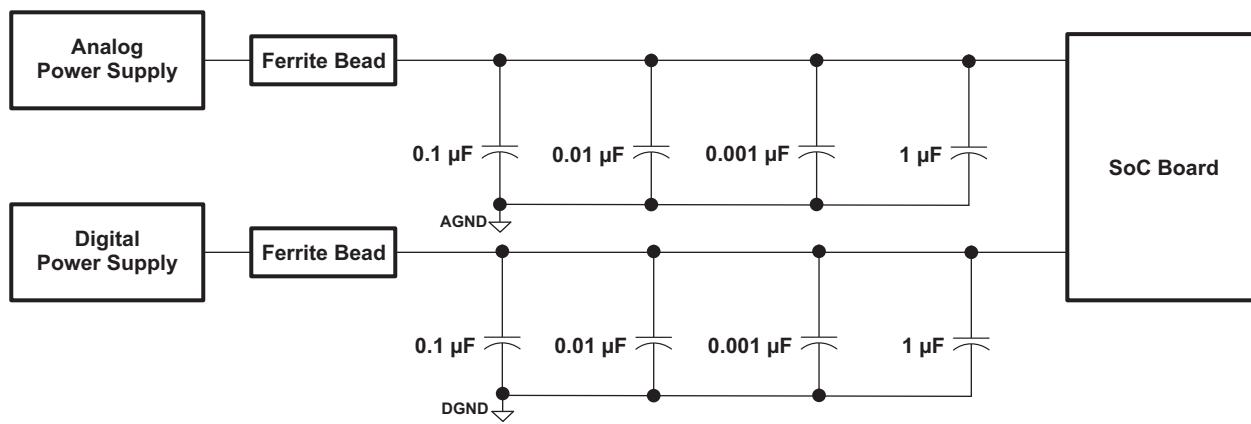

- Place the USB PHY and major components on the un-routed board first. For more details, see [Section 7.5.2.2.3](#).
- Route the high-speed clock and high-speed USB differential signals with minimum trace lengths.
- Route the high-speed USB signals on the plane closest to the ground plane, whenever possible.
- Route the high-speed USB signals using a minimum of vias and corners. This reduces signal reflections and impedance changes.
- When it becomes necessary to turn 90°, use two 45° turns or an arc instead of making a single 90° turn. This reduces reflections on the signal traces by minimizing impedance discontinuities.
- Do not route USB traces under or near crystals, oscillators, clock signal generators, switching regulators, mounting holes, magnetic devices or IC's that use or duplicate clock signals.
- Avoid stubs on the high-speed USB signals because they cause signal reflections. If a stub is unavoidable, then the stub should be less than 200 mils.
- Route all high-speed USB signal traces over continuous planes ( $V_{CC}$  or GND), with no interruptions. Avoid crossing over anti-etch, commonly found with plane splits.

### 7.5.2.2.2 Specific Guidelines for USB PHY Layout

The following sections describe in detail the specific guidelines for USB PHY Layout.

#### 7.5.2.2.2.1 Analog, PLL, and Digital Power Supply Filtering

To minimize EMI emissions, add decoupling capacitors with a ferrite bead at power supply terminals for the analog, phase-locked loop (PLL), and digital portions of the chip. Place this array as close to the chip as possible to minimize the inductance of the line and noise contributions to the system. An analog and digital supply example is shown in [Figure 7-21](#). In case of multiple power supply pins with the same function, tie them up to a single low-impedance point in the board and then add the decoupling capacitors, in addition to the ferrite bead. This array of caps and ferrite bead improve EMI and jitter performance. Take both EMI and jitter into account before altering the configuration.

SPRS906\_PCB\_USB20\_01

**Figure 7-21. Suggested Array Capacitors and a Ferrite Bead to Minimize EMI**

Consider the recommendations listed below to achieve proper ESD/EMI performance:

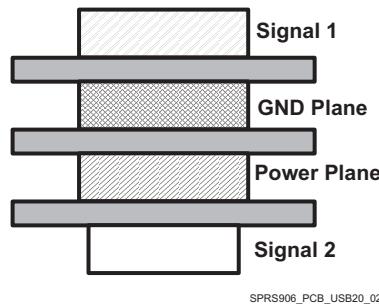

- Use a  $0.01 \mu\text{F}$  cap on each cable power VBUS line to chassis GND close to the USB connector pin.
- Use a  $0.01 \mu\text{F}$  cap on each cable ground line to chassis GND next to the USB connector pin.
- If voltage regulators are used, place a  $0.01 \mu\text{F}$  cap on both input and output. This is to increase the immunity to ESD and reduce EMI. For other requirements, see the device-specific datasheet.

#### 7.5.2.2.2.2 Analog, Digital, and PLL Partitioning

If separate power planes are used, they must be tied together at one point through a low-impedance bridge or preferably through a ferrite bead. Care must be taken to capacitively decouple each power rail close to the device. The analog ground, digital ground, and PLL ground must be tied together to the low-impedance circuit board ground plane.

#### 7.5.2.2.2.3 Board Stackup

Because of the high frequencies associated with the USB, a printed circuit board with at least four layers is recommended; two signal layers separated by a ground and power layer as shown in [Figure 7-22](#).

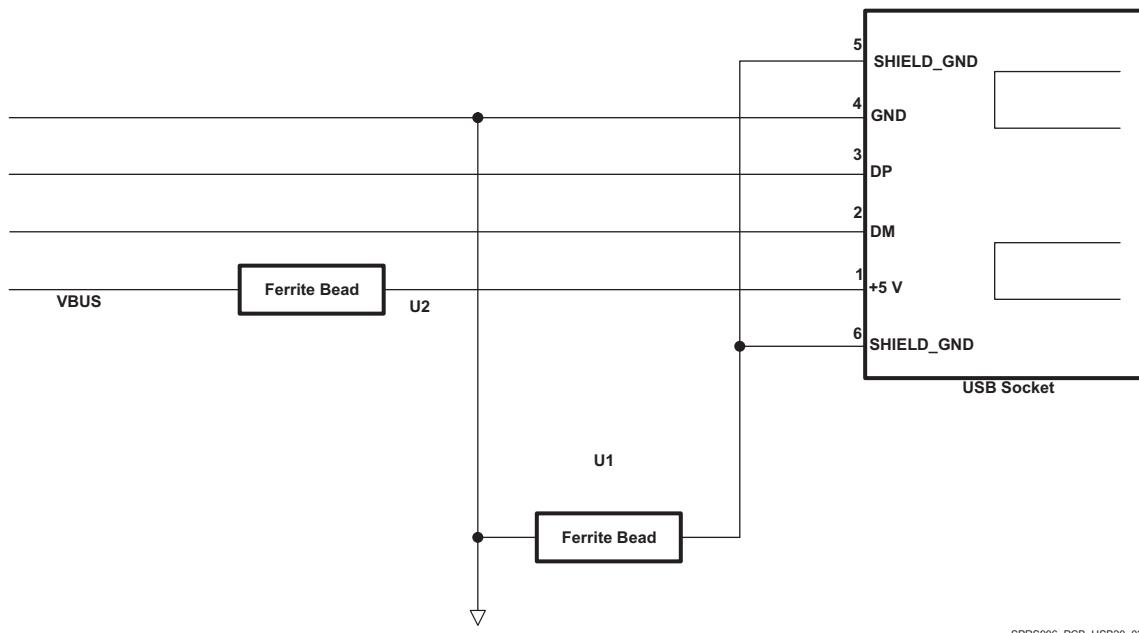

**Figure 7-22. Four-Layer Board Stack-Up**

The majority of signal traces should run on a single layer, preferably SIGNAL1. Immediately next to this layer should be the GND plane, which is solid with no cuts. Avoid running signal traces across a split in the ground or power plane. When running across split planes is unavoidable, sufficient decoupling must be used. Minimizing the number of signal vias reduces EMI by reducing inductance at high frequencies.

#### 7.5.2.2.4 Cable Connector Socket

Short the cable connector sockets directly to a small chassis ground plane (GND strap) that exists immediately underneath the connector sockets. This shorts EMI (and ESD) directly to the chassis ground before it gets onto the USB cable. This etch plane should be as large as possible, but all the conductors coming off connector pins 1 through 6 must have the board signal GND plane run under. If needed, scoop out the chassis GND strap etch to allow for the signal ground to extend under the connector pins. Note that the etches coming from pins 1 and 4 (VBUS power and GND) should be wide and via-ed to their respective planes as soon as possible, respecting the filtering that may be in place between the connector pin and the plane. See [Figure 7-23](#) for a schematic example.

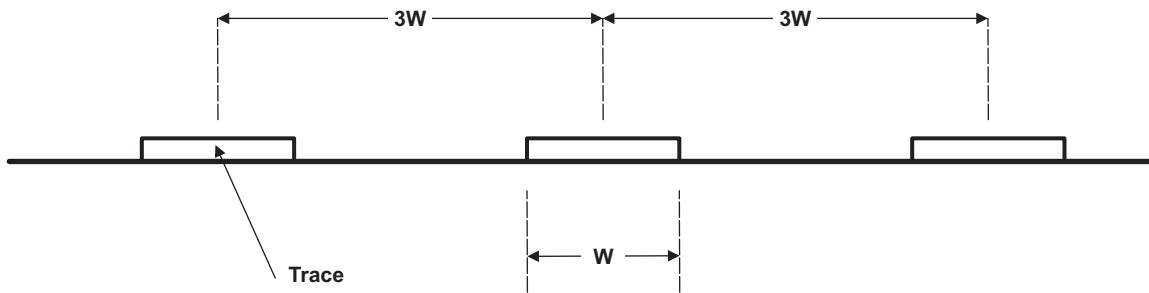

Place a ferrite in series with the cable shield pins near the USB connector socket to keep EMI from getting onto the cable shield. The ferrite bead between the cable shield and ground may be valued between  $10\ \Omega$  and  $50\ \Omega$  at 100 MHz; it should be resistive to approximately 1 GHz. To keep EMI from getting onto the cable bus power wire (a very large antenna) a ferrite may be placed in series with cable bus power, VBUS, near the USB connector pin 1. The ferrite bead between connector pin 1 and bus power may be valued between  $47\ \Omega$  and approximately  $1000\ \Omega$  at 100 MHz. It should continue being resistive out to approximately 1 GHz, as shown in [Figure 7-23](#).

**Figure 7-23. USB Connector**

#### 7.5.2.2.5 Clock Routings

To address the system clock emissions between devices, place a  $\sim 10$  to  $130\ \Omega$  resistor in series with the clock signal. Use a trial and error method of looking at the shape of the clock waveform on a high-speed oscilloscope and of tuning the value of the resistance to minimize waveform distortion. The value on this resistor should be as small as possible to get the desired effect. Place the resistor close to the device generating the clock signal. If an external crystal is used, follow the guidelines detailed in the *Selection and Specification of Crystals for Texas Instruments USB 2.0 Devices* ([SLLA122](#)).

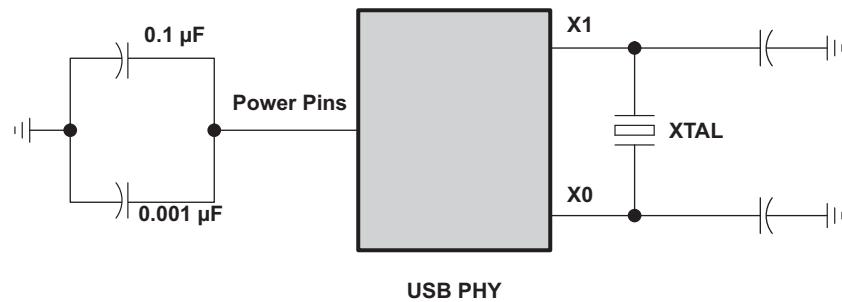

When routing the clock traces from one device to another, try to use the 3W spacing rule. The distance from the center of the clock trace to the center of any adjacent signal trace should be at least three times the width of the clock trace. Many clocks, including slow frequency clocks, can have fast rise and fall times. Using the 3W rule cuts down on crosstalk between traces. In general, leave space between each of the traces running parallel between the devices. Avoid using right angles when routing traces to minimize the routing distance and impedance discontinuities. For further protection from crosstalk, run guard traces beside the clock signals (GND pin to GND pin), if possible. This lessens clock signal coupling, as shown in [Figure 7-24](#).

**Figure 7-24. 3W Spacing Rule**

### 7.5.2.2.2.6 Crystals/Oscillator

Keep the crystal and its load capacitors close to the USB PHY pins, XI and XO (see [Figure 7-25](#)). Note that frequencies from power sources or large capacitors can cause modulations within the clock and should not be placed near the crystal. In these instances, errors such as dropped packets occur. A placeholder for a resistor, in parallel with the crystal, can be incorporated in the design to assist oscillator startup.

Power is proportional to the current squared. The current is  $I = C \times dv/dt$ , because  $dv/dt$  is a function of the PHY, current is proportional to the capacitive load. Cutting the load to 1/2 decreases the current by 1/2 and the power to 1/4 of the original value. For more details on crystal selection, see the *Selection and Specification of Crystals for Texas Instruments USB 2.0 Devices (SLLA122)*.

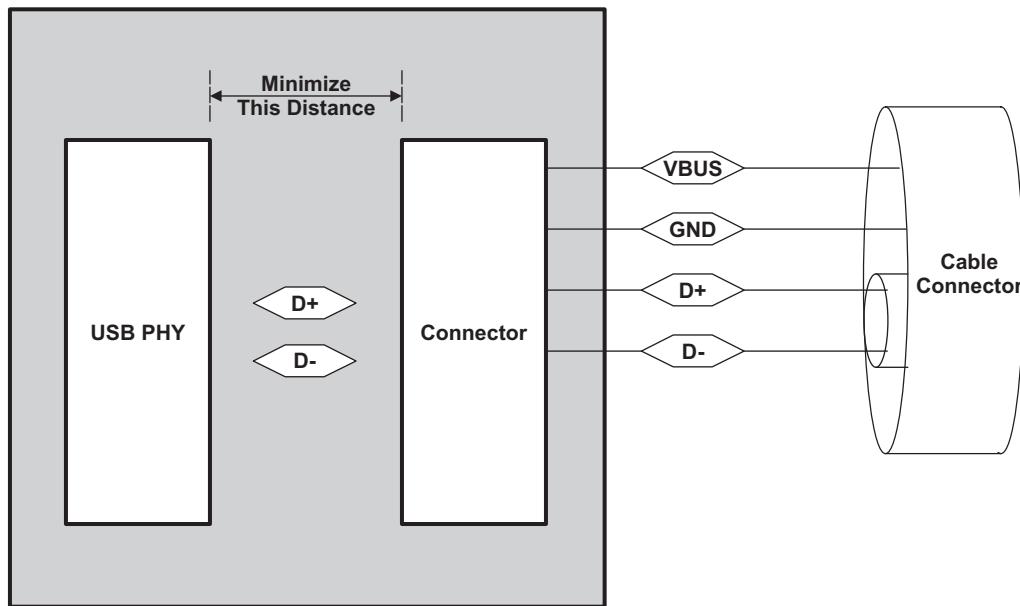

SPRS906\_PCB\_USB20\_05

**Figure 7-25. Power Supply and Clock Connection to the USB PHY**

### 7.5.2.2.2.7 DP/DM Trace

Place the USB PHY as close as possible to the USB 2.0 connector. The signal swing during high-speed operation on the DP/DM lines is relatively small ( $400 \text{ mV} \pm 10\%$ ), so any differential noise picked up on the twisted pair can affect the received signal. When the DP/DM traces do not have any shielding, the traces tend to behave like an antenna and picks up noise generated by the surrounding components in the environment. To minimize the effect of this behavior:

- DP/DM traces should always be matched lengths and must be no more than 4 inches in length; otherwise, the eye opening may be degraded (see [Figure 7-26](#)).
- Route DP/DM traces close together for noise rejection on differential signals, parallel to each other and within two mils in length of each other. The measurement for trace length must be started from device's balls.
- A high-speed USB connection is made through a shielded, twisted pair cable with a differential characteristic impedance of  $90 \Omega \pm 15\%$ . In layout, the impedance of DP and DM should each be  $45 \Omega \pm 10\%$ .
- DP/DM traces should not have any extra components to maintain signal integrity. For example, traces cannot be routed to two USB connectors.

SPRS906\_PCB\_USB20\_06

**Figure 7-26. USB PHY Connector and Cable Connector**

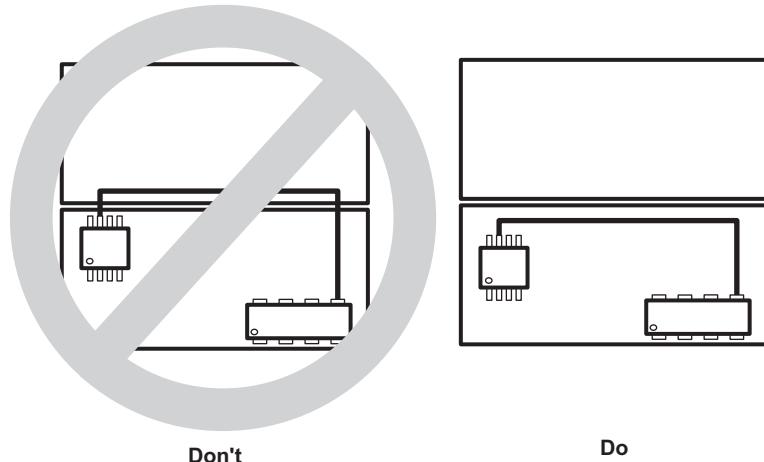

#### 7.5.2.2.8 DP/DM Vias

When a via must be used, increase the clearance size around it to minimize its capacitance. Each via introduces discontinuities in the signal's transmission line and increases the chance of picking up interference from the other layers of the board. Be careful when designing test points on twisted pair lines; through-hole pins are not recommended.

#### 7.5.2.2.9 Image Planes

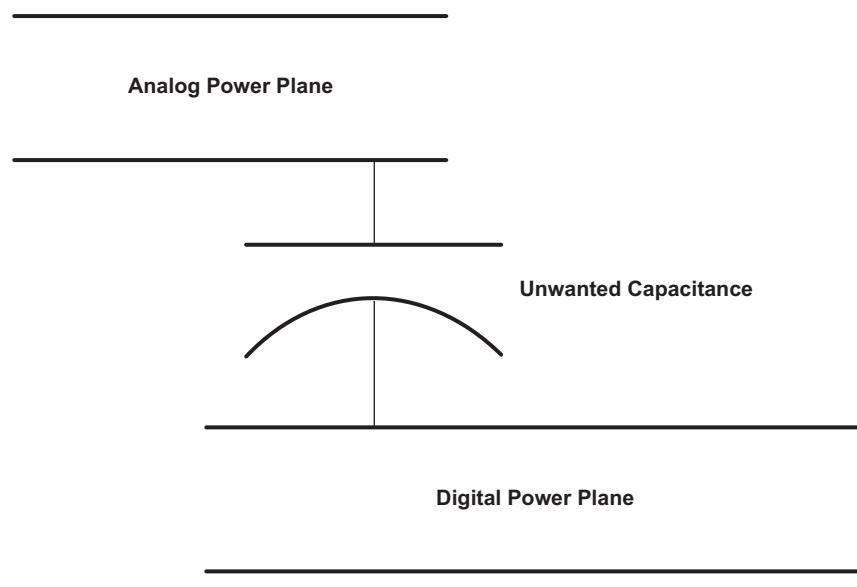

An image plane is a layer of copper (voltage plane or ground plane), physically adjacent to a signal routing plane. Use of image planes provides a low impedance, shortest possible return path for RF currents. For a USB board, the best image plane is the ground plane because it can be used for both analog and digital circuits.

- Do not route traces so they cross from one plane to the other. This can cause a broken RF return path resulting in an EMI radiating loop as shown in [Figure 7-27](#). This is important for higher frequency or repetitive signals. Therefore, on a multi-layer board, it is best to run all clock signals on the signal plane above a solid ground plane.
- Avoid crossing the image power or ground plane boundaries with high-speed clock signal traces immediately above or below the separated planes. This also holds true for the twisted pair signals (DP, DM). Any unused area of the top and bottom signal layers of the PCB can be filled with copper that is connected to the ground plane through vias.

SPRS906\_PCB\_USB20\_07

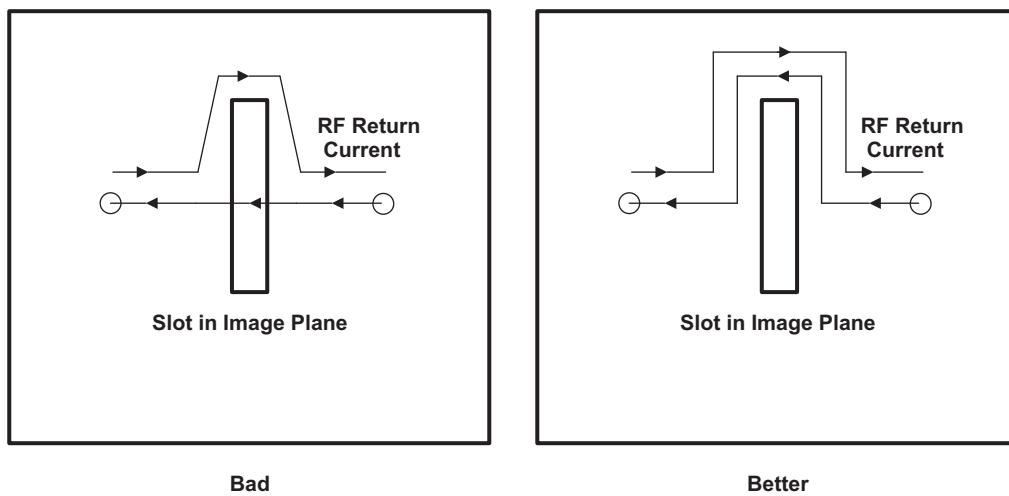

**Figure 7-27. Do Not Cross Plane Boundaries**

- Do not overlap planes that do not reference each other. For example, do not overlap a digital power plane with an analog power plane as this produces a capacitance between the overlapping areas that could pass RF emissions from one plane to the other, as shown in [Figure 7-28](#).

SPRS906\_PCB\_USB20\_08

**Figure 7-28. Do Not Overlap Planes**

- Avoid image plane violations. Traces that route over a slot in an image plane results in a possible RF return loop, as shown in [Figure 7-29](#).

SPRS906\_PCB\_USB20\_09

**Figure 7-29. Do Not Violate Image Planes**

#### 7.5.2.2.10 Power Regulators

Switching power regulators are a source of noise and can cause noise coupling if placed close to sensitive areas on a circuit board. Therefore, the switching power regulator should be kept away from the DP/DM signals, the external clock crystal (or clock oscillator), and the USB PHY.

#### 7.5.3 USB 3.0 Board Design and Layout Guidelines

This section provides the timing specification for the USB3.0 (USB1 in the device) interface as a PCB design and manufacturing specification. The design rules constrain PCB trace length, PCB trace skew, signal integrity, cross-talk, and signal timing. TI has performed the simulation and system design work to ensure the USB3.0 interface requirements are met. The design rules stated within this document are targeted at DEVICE mode electrical compliance. HOST mode and/or systems that do not include the 3m USB cable and far-end 11-inch PCB trace required by DEVICE mode compliance testing may not need the complete list of optimizations shown in this document; however, applying these optimizations to HOST mode systems will lead to optimal DEVICE mode performance.

##### 7.5.3.1 USB 3.0 interface introduction

The USB 3.0 has two unidirectional differential pairs: TXp/TXn pair and RXp/RXn pair. AC coupling caps are needed on the board for TX traces.

[Figure 7-30](#) present high level schematic diagram for USB 3.0 interface.

SPRS85x\_PCB\_USB30\_1

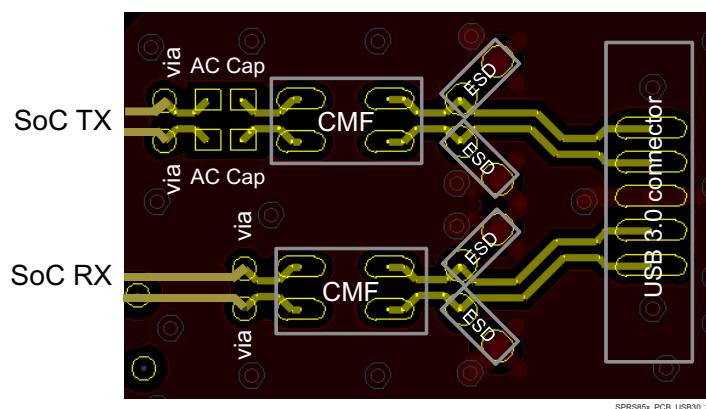

**Figure 7-30. USB 3.0 Interface High Level Schematic**

#### NOTE

ESD components should be on a PCB layer next to a system GND plane layer so the inductance of the via to GND will be minimal.

If vias are used, place the vias near the AC Caps or CMFs and under the SoC BGA, if necessary.

Figure 7-31 present placement diagram for USB 3.0 interface.

SPRS85x\_PCB\_USB30\_2

**Figure 7-31. USB 3.0 placement diagram**

**Table 7-9. USB1 Component Reference**

INTERFACE	COMPONENT	SUPPLIER	PART NUMBER
USB3 PHY	ESD	TI	TPD1E05U06
	CMF	Murata	DLW21SN900HQ2
	C	-	100nF (typical size: 0201)

### 7.5.3.2 USB 3.0 General routing rules

Some general routing guidelines regarding USB 3.0:

- Avoid crossing splits reference plane(s).
- Shorter trace length is preferred.
- Minimize the via usage and layer transition
- Keep large spacing between TX and RX pairs.
- Intra-lane delay mismatch between DP and DM less than 1ps. Same for RXp and RXn.
- Distance between common mode filter (CMF) and ESD protection device should be as short as possible
- Distance between ESD protection device and USB connector should be as short as possible.
- Distance between AC capacitors (TX only) and CMF should be as short as possible.
- USB 3.0 signals should always be routed over an adjacent ground plane.

[Table 7-10](#) and [Table 7-11](#) present routing specification and recommendations for USB1 in the device.

**Table 7-10. USB1 Routing Specifications**

PARAMETER	MIN	TYP	MAX	UNIT
Device balls to USB 3.0 connector trace length			3500	Mils
Skew within a differential pair		3	6	Mils
Number of stubs allowed on TX/RX traces			0	Stubs
TX/RX pair differential impedance	83	90	97	$\Omega$
Number of vias on each TX/RX trace			2	Vias
Differential pair to any other trace spacing	2xDS	3xDS		
Number of ground plane cuts allowed within USB3 routing region (except for specific ground carving as explained in this document)			0	Cuts
Number of layers between USB3.0 routing region and reference ground plane			0	Layers
PCB trace width		6		Mils
PCB BGA escape via pad size		18		Mils
PCB BGA escape via hole size		10		Mils

1. Vias must be used in pairs and spaced equally along a signal path.
2. DS = differential spacing of the traces.
3. Exceptions may be necessary in the SoC package BGA area.
4. GND guard-bands on the same layer may be closer, but should not be allowed to affect the impedance of the differential pair routing. GND guard-bands to isolate USB3.0 differential pairs from all other signals are recommended.

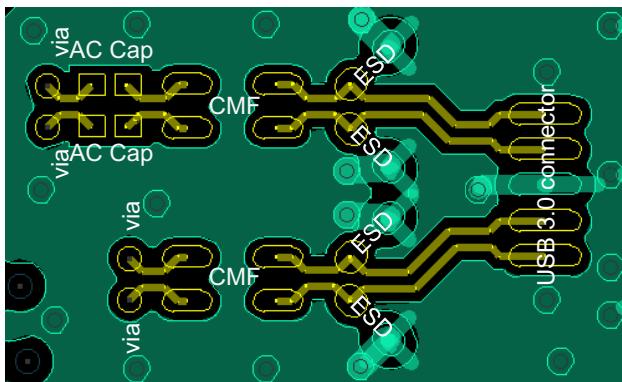

**Table 7-11. USB1 Routing Recommendations**

Item	Description	Reason
ESD location	Place ESD component on same layer as connector (no via or stub to ESD component)	Eliminate reflection loss from via & stub to ESD
ESD part number	TPD1E05U06	Minimize capacitance (0.42pF)
CMF part number	DLW21SN900HQ2	Manufacturer's recommended device
Connector	Use USB3.0 connector with supporting s-parameter model	Enable full signal chain simulation
Carve Ground	Carve GND underneath AC Caps, ESD, CMF, and connector	Minimize capacitance under ESD and CMF

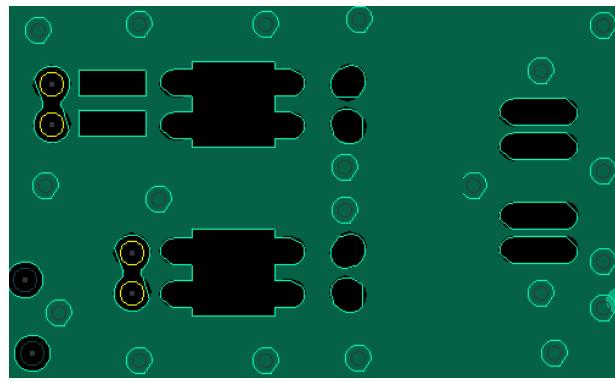

**Table 7-11. USB1 Routing Recommendations (continued)**

Item	Description	Reason
Round pads	Minimize pad size and round the corners of the pads for the ESD and CMF components	Minimize capacitance
Vias	Max 2 vias per signal trace. If vias are required, place vias close to the AC Caps and CMFs. Vias under the SoC grid array may be used if necessary to route signals away from BGA pattern.	Vias significantly degrade signal integrity at 2.5GHz

Figure 7-32 presents an example layout, demonstrating the “carve GND” concept.

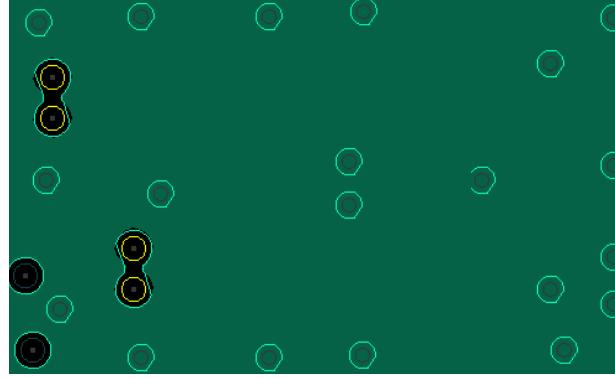

**Top Layer:** Routing from SoC through AC Caps, CMF, and ESD to connector.

**Layer2, GND:** Gaps carved in GND underneath AC Caps, CMF, ESD, and connector.

**Layer3, Signal:** Implement as keep-out zone underneath carved GND areas.

**Layer4, GND Plane:** underneath AC Caps, CMF, ESD, and connector.

SPRS85x\_PCB\_USB30\_3

**Figure 7-32. USB 3.0 Example “carve GND” layout**

### 7.5.4 HDMI Board Design and Layout Guidelines

This section provides the timing specification for the HDMI interface as a PCB design and manufacturing specification. The design rules constrain PCB trace length, PCB trace skew, signal integrity, cross-talk, and signal timing. TI has performed the simulation and system design work to ensure the HDMI interface requirements are met. The design rules stated within this document are targeted at resolutions less than or equal to 1080p60 with 8-bit color; deep color (10-bit) requires further signal integrity optimization.

#### 7.5.4.1 HDMI Interface Schematic

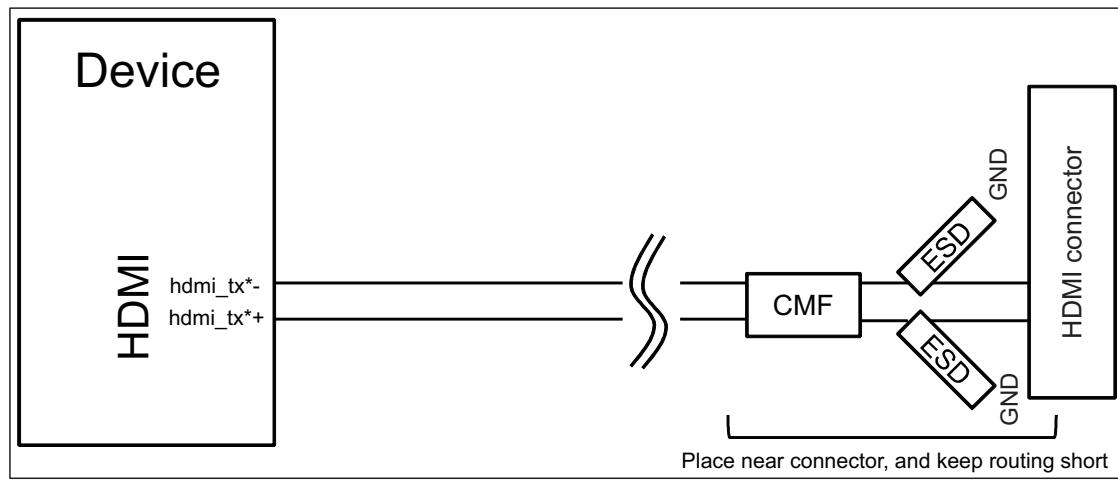

The HDMI bus is separated into three main sections (HDMI Ethernet and the optional Audio Return Channel are not specifically supported by this Device):

1. Transition Minimized Differential Signaling (TMDS) high speed digital video interface
2. Display Data Channel (I2C bus for configuration and status exchange between two devices)
3. Consumer Electronics Control (optional) for remote control of connected devices.

The DDC and CEC are low speed interfaces, so nothing special is required for PCB layout of these signals.

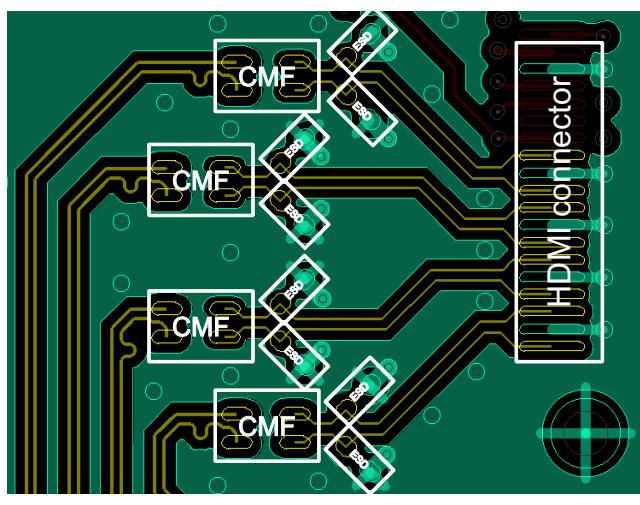

The TMDS channels are high speed differential pairs and therefore require the most care in layout. Specifications for TMDS layout are below.

[Figure 7-33](#) shows the HDMI interface schematic.

**Figure 7-33. HDMI Interface High Level Schematic**

[Figure 7-34](#) presents placement diagram for HDMI interface.

**Figure 7-34. HDMI Placement Diagram**

**Table 7-12. HDMI Component Reference**

INTERFACE	DEVICE	SUPPLIER	PART NUMBER
HDMI	ESD	TI	TPD1E05U06
	CMF	Murata	DLW21SN900HQ2

#### 7.5.4.2 TMDS General Routing Guidelines

The TMDS signals are high speed differential pairs. Care must be taken in the PCB layout of these signals to ensure good signal integrity.

The TMDS differential signal traces must be routed to achieve 100 Ohms (+/- 10%) differential impedance and 60 ohms (+/-10%) single ended impedance. Single ended impedance control is required because differential signals can't be closely coupled on PCBs and therefore single ended impedance becomes important.

These impedances are impacted by trace width, trace spacing, distance to reference planes, and dielectric material. Verify with a PCB design tool that the trace geometry for both data signal pairs results in as close to 60 ohms impedance traces as possible. For best accuracy, work with your PCB fabricator to ensure this impedance is met.

In general, closely coupled differential signal traces are not an advantage on PCBs. When differential signals are closely coupled, tight spacing and width control is necessary. Very small width and spacing variations affect impedance dramatically, so tight impedance control can be more problematic to maintain in production.

Loosely coupled PCB differential signals make impedance control much easier. Wider traces and spacing make obstacle avoidance easier, and trace width variations don't affect impedance as much, therefore it's easier to maintain accurate impedance over the length of the signal. The wider traces also show reduced skin effect and therefore often result in better signal integrity.

Some general routing guidelines regarding TMDS:

- Avoid crossing splits reference plane(s).
- Shorter trace length is preferred.
- Distance between common mode filter (CMF) and ESD protection device should be as short as possible
- Distance between ESD protection device and HDMI connector should be as short as possible.

[Table 7-13](#) shows the routing specifications for the TMDS signals.

**Table 7-13. TMDS Routing Specifications**

PARAMETER	MIN	TYP	MAX	UNIT
Device balls to HDMI header trace length			4000	Mils
Skew within a differential pair		3	5	Mils
Number of stubs allowed on TMDS traces			0	stubs
TMDS pair differential impedance	90	100	110	$\Omega$
TMDS single-ended impedance	54	60	66	$\Omega$
Number of vias on each TMDS trace			0	Vias
TMDS differential pair to any other trace spacing <sup>(1) (2) (3)</sup>	2xDS	3xDS		Mils
Number of ground plane cuts allowed within HDMI routing region (except for specific ground carving as explained in this document)			0	Cuts
Number of layers between HDMI routing region and reference ground plane			0	Layers
PCB trace width		4.4		Mils

(1) DS = differential spacing of the traces.

(2) Exceptions may be necessary in the SoC package BGA area.

(3) GND guard-bands may be closer, but should not be allowed to affect the impedance of the differential pair routing. GND guard-bands to isolate HDMI differential pairs from all other signals is recommended.

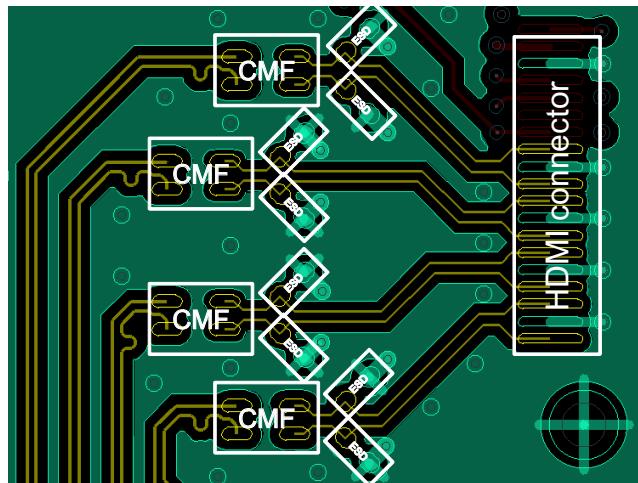

**Table 7-14. TDMS Routing Recommendations**

Item	Description	Reason
ESD part number	TPD1E05U06	Minimize capacitance (0.42pF)

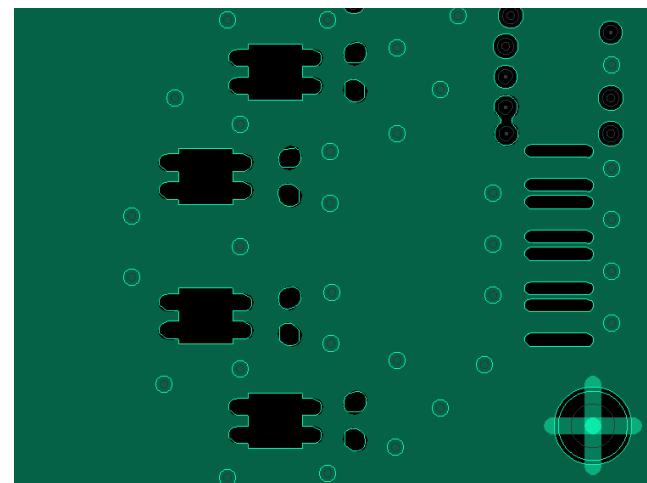

**Table 7-14. TDMS Routing Recommendations (continued)**

Item	Description	Reason
Carve Ground	Carve GND underneath ESD and CMF	Minimize capacitance under ESD and CMF
Round pads	Reduce pad size and round the corners of the pads for the ESD and CMF components	Minimize capacitance
Routing layer	Route all signals only on the same layer as SoC	Minimize reflection loss

Figure 7-35 presents an example layout, demonstrating the “carve GND” concept.

**Top Layer:** Routing from SoC through CMF, and ESD to connector.

**Layer2, GND:** Gaps carved in GND underneath, CMF, ESD, and connector.

SPRS85x\_PCB\_HDMI\_3

**Figure 7-35. HDMI Example “carve GND” layout**

#### 7.5.4.3 TPD5S115

The TPD5S115 is an integrated HDMI companion chip solution. The device provides a regulated 5 V output (5VOUT) for sourcing the HDMI power line. The TPD5S115 exceeds the IEC61000-4-2 (Level 4) ESD protection level.

#### 7.5.4.4 HDMI ESD Protection Device (Required)

Interfaces that connect to a cable such as HDMI generally require more ESD protection than can be built into the processor's outputs. Therefore this HDMI interface requires the use of an ESD protection chip to provide adequate ESD.

When selecting an ESD protection chip, choose the lowest capacitance ESD protection available to minimize signal degradation. In no case should be ESD protection circuit capacitance be more than 5pF.

TI manufactures these devices that provide ESD protection for HDMI signals such as the TPDxE05U06. For more information see the [www.ti.com](http://www.ti.com) website.

#### 7.5.4.5 PCB Stackup Specifications

Table 7-15 shows the stackup and feature sizes required for HDMI.

**Table 7-15. HDMI PCB Stackup Specifications**

PARAMETER	MIN	TYP	MAX	UNIT
PCB Routing/Plane Layers	4	6	-	Layers

**Table 7-15. HDMI PCB Stackup Specifications (continued)**

PARAMETER	MIN	TYP	MAX	UNIT
Signal Routing Layers	2	3	-	Layers
Number of ground plane cuts allowed within HDMI routing region	-	-	0	Cuts
Number of layers between HDMI routing region and reference ground plane	-	-	0	Layers
PCB Trace width		4		Mils

#### 7.5.4.6 Grounding

Each TMDS channel has its own shield pin and they should be grounded to provide a return current path for the TMDS signal.

### 7.5.5 PCIe Board Design and Layout Guidelines

The PCIe interface on the device provides support for a 5.0 Gbps lane with polarity inversion.

#### 7.5.5.1 PCIe Connections and Interface Compliance

The PCIe interface on the device is compliant with the PCIe revision 3.0 specification. Please refer to the PCIe specifications for all connections that are described in it. Those recommendations are more descriptive and exhaustive than what is possible here.

The use of PCIe compatible bridges and switches is allowed for interfacing with more than one other processor or PCIe device.

##### 7.5.5.1.1 Coupling Capacitors

AC coupling capacitors are required on the transmit data pair. [Table 7-16](#) shows the requirements for these capacitors.

**Table 7-16. PCIe AC Coupling Capacitors Requirements**

PARAMETER	MIN	TYP	MAX	UNIT
PCIe AC coupling capacitor value	90	100	110	nF
PCIe AC coupling capacitor package size		0402	0603	EIA <sup>(1)(2)</sup>

(1) EIA LxW units, i.e., a 0402 is a 40x20 mils surface mount capacitor.

(2) The physical size of the capacitor should be as small as practical. Use the same size on both lines in each pair placed side by side.

##### 7.5.5.1.2 Polarity Inversion

The PCIe specification requires polarity inversion support. This means for layout purposes, polarity is unimportant because each signal can change its polarity on die inside the chip. This means polarity within a lane is unimportant for layout.

#### 7.5.5.2 Non-standard PCIe connections

The following sections contain suggestions for any PCIe connection that is NOT described in the official PCIe specification, such as an on-board Device to Device or Device to other PCIe compliant processor connection.

##### 7.5.5.2.1 PCB Stackup Specifications

[Table 7-17](#) shows the stackup and feature sizes required for these types of PCIe connections.

**Table 7-17. PCIe PCB Stackup Specifications**

PARAMETER	MIN	TYP	MAX	UNIT
Number of ground plane cuts allowed within PCIe routing region	-	-	0	Cuts
Number of layers between PCIe routing area and reference plane <sup>(1)</sup>	-	-	0	Layers
PCB Routing clearance		4		Mils
PCB Trace width		4		Mils

(1) A reference plane may be a ground plane or the power plane referencing the PCIe signals.

### 7.5.5.2.2 Routing Specifications

#### 7.5.5.2.2.1 Impedance

The PCIe data signal traces must be routed to achieve 100- $\Omega$  ( $\pm 10\%$ ) differential impedance and 60- $\Omega$  ( $\pm 10\%$ ) single-ended impedance. The single-ended impedance is required because differential signals are extremely difficult to closely couple on PCBs and, therefore, single-ended impedance becomes important. These requirements are the same as those recommended in the PCIe Motherboard Checklist 1.0 document, available from PCI-SIG ([www.pcisig.com](http://www.pcisig.com)).

These impedances are impacted by trace width, trace spacing, distance between signals and referencing planes, and dielectric material. Verify with a PCB design tool that the trace geometry for both data signal pairs result in as close to 100- $\Omega$  differential impedance and 60- $\Omega$  single-ended impedance as possible. For best accuracy, work with your PCB fabricator to ensure this impedance is met. See [Table 7-18](#) below.

#### 7.5.5.2.2.2 Differential Coupling

In general, closely coupled differential signal traces are not an advantage on PCBs. When differential signals are closely coupled, tight spacing and width control is necessary. Very small width and spacing variations affect impedance dramatically, so tight impedance control can be more problematic to maintain in production. For PCBs with very tight space limitations (which are usually small) this can work, but for most PCBs, the loosely coupled option is probably best.

Loosely coupled PCB differential signals make impedance control much easier. Wider traces and spacing make obstacle avoidance easier (because each trace is not so fixed in position relative to the other), and trace width variations don't affect impedance as much, therefore it's easier to maintain an accurate impedance over the length of the signal. For longer routes, the wider traces also show reduced skin effect and therefore often result in better signal integrity with a larger eye diagram opening.

[Table 7-18](#) shows the routing specifications for the PCIe data signals.

**Table 7-18. PCI-E Routing Specifications**

PARAMETER	MIN	TYP	MAX	UNIT
PCIe signal trace length (device balls to PCIe connector)			4700 <sup>(1)</sup>	Mils
Differential pair trace matching			5 <sup>(2)</sup>	Mils
Number of stubs allowed on PCIe traces <sup>(3)</sup>			0	stubs
TX/RX pair differential impedance	90	100	110	$\Omega$
TX/RX single-ended impedance	54	60	66	$\Omega$
Pad size of vias on PCIe trace			25 <sup>(4)</sup>	Mils
Hole size of vias on PCIe trace			14	Mils
Number of vias on each PCIe trace			0	Vias
PCIe differential pair to any other trace spacing	2xDS <sup>(5)</sup>			

- (1) Beyond this, signal integrity may suffer.
- (2) For example, RXPO within 5 Mils of RXNO.
- (3) Inline pads may be used for probing.
- (4) 35-Mil antipad maximum recommended.
- (5) DS = differential spacing of the PCIe traces.

**Table 7-19. PCI-E Routing Recommendations**

Item	Description	Reason
ESD part number	None	ESD suppression generally not used on PCIe

#### 7.5.5.2.2.3 Pair Length Matching

Each signal in the differential pair should be matched to within 5 mils of its matching differential signal. Length matching should be done as close to the mismatch as possible.

#### 7.5.5.3 LJCB\_REFN/P Connections

A Common Refclk Rx Architecture is required to be used for the device PCIe interface. Specifically, two modes of Common Refclk Rx Architecture are supported:

- **External REFCLK Mode:** An common external 100MHz clock source is distributed to both the Device and the link partner
- **Output REFCLK Mode:** A 100MHz HCSL clock source is output by the device and used by the link partner

In **External REFCLK Mode**, a high-quality, low-jitter, differential HCSL 100MHz clock source compliant to the PCIe REFCLK AC Specifications should be provided on the Device's ljcb\_clkn / ljcb\_clkp inputs. Alternatively, an LVDS clock source can be used with the following additional requirements:

- External AC coupling capacitors described in [Table 7-20](#) should be populated at the ljcb\_clkn / ljcb\_clkp inputs.
- All termination requirements (ex. parallel 100ohm termination) from the clock source manufacturer should be followed.

In **Output REFCLK Mode**, the 100MHz clock from the Device's DPLL\_PCIE\_REF should be output on the Device's ljcb\_clkn / ljcb\_clkp pins and used as the HCSL REFCLK by the link partner. External near-side termination to ground described in [Table 7-21](#) is required on both of the ljcb\_clkn / ljcb\_clkp outputs in this mode.

**Table 7-20. LJCB\_REFN/P Requirements in External LVDS REFCLK Mode**

PARAMETER	MIN	TYP	MAX	UNIT
ljcb_clkn / ljcb_clkp AC coupling capacitor value		100		nF
ljcb_clkn / ljcb_clkp AC coupling capacitor package size		0402	0603	EIA <sup>(1)(2)</sup>

(1) EIA LxW units, i.e., a 0402 is a 40x20 mils surface mount capacitor.

(2) The physical size of the capacitor should be as small as practical. Use the same size on both lines in each pair placed side by side.

**Table 7-21. LJCB\_REFN/P Requirements in Output REFCLK Mode**

PARAMETER	MIN	TYP	MAX	UNIT
ljcb_clkn / ljcb_clkp near-side termination to ground value	47.5	50	52.5	Ohms

#### 7.5.6 CSI2 Board Design and Routing Guidelines

The MIPI D-PHY signals include the CSI2\_0 camera serial interfaces to or from the Device.

For more information regarding the MIPI-PHY signals and corresponding balls, see [Table 4-5, CSI2 Signal Descriptions](#).

For more information, you can also see the MIPI D-PHY specification v1-01-00\_r0-03 (specifically the Interconnect and Lane Configuration and Annex B Interconnect Design Guidelines chapters).

In the next section, the PCB guidelines of the following differential interfaces are presented:

- CSI2\_0 CSI-2 at 1.5 Gbps

[Table 7-22](#) lists the MIPI D-PHY interface signals in the Device.

**Table 7-22. MIPI D-PHY Interface Signals in the Device**

SIGNAL NAME	BOTTOM BALL	SIGNAL NAME	BOTTOM BALL
csi2_0_dx0	AC1	csi2_0_dy0	AB2
csi2_0_dx1	AD1	csi2_0_dy1	AC2
csi2_0_dx2	AE2	csi2_0_dy2	AD2

### 7.5.6.1 CSI2\_0 MIPI CSI-2 (1.5 Gbps)

#### 7.5.6.1.1 General Guidelines

The general guidelines for the PCB differential lines are:

- Differential trace impedance  $Z_0 = 100 \Omega$  (minimum =  $85 \Omega$ , maximum =  $115 \Omega$ )
- Total conductor length from the Device package pins to the peripheral device package pins is 25 to 30 cm with common FR4 PCB and flex materials.

#### NOTE

Longer interconnect length can be supported at the expense of detailed simulations of the complete link including driver and receiver models.

The general rule of thumb for the space  $S = 2 \times W$  is not designated (see [Figure 7-19, Guard Illustration](#)). It is because although the  $S = 2 \times W$  rule is a good rule of thumb, it is not always the best solution. The electrical performance will be checked with the frequency-domain specification. Even though the designer does not follow the  $S = 2 \times W$  rule, the differential lines are ok if the lines satisfy the frequency-domain specification.

Because the MIPI signals are used for low-power, single-ended signaling in addition to their high-speed differential implementation, the pairs must be loosely coupled.

#### 7.5.6.1.2 Length Mismatch Guidelines

##### 7.5.6.1.2.1 CSI2\_0 MIPI CSI-2 (1.5 Gbps)

The guidelines of the length mismatch for CSI-2 are presented in [Table 7-23](#).

**Table 7-23. Length Mismatch Guidelines for CSI-2 (1.5 Gbps)**

PARAMETER	TYPICAL VALUE	UNIT
Operating speed	1500	Mbps
UI (bit time)	667	ps
INTRALANE skew	Have to satisfy mode-conversion S parameters <sup>(1)</sup>	
INTERLANE skew (UI / 50)	13.34	ps
PCB lane-to-lane skew (0.1 UI)	66.7	ps

(1) sdc12, scd21, scd12, sdc21, scd11, sdc11, scd22, and sdc22

#### **7.5.6.1.3 Frequency-domain Specification Guidelines**

After the PCB design is finished, the S-parameters of the PCB differential lines will be extracted with a 3D Maxwell Equation Solver such as the high-frequency structure simulator (HFSS) or equivalent, and compared to the frequency-domain specification as defined in the section 7 of the MIPI Alliance Specification for D-PHY Version v1-01-00\_r0-03.

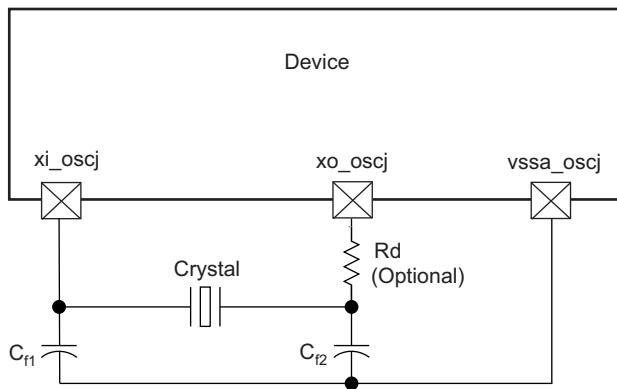

If the PCB lines satisfy the frequency-domain specification, the design is finished. Otherwise, the design needs to be improved.

### **7.6 Clock Routing Guidelines**

#### **7.6.1 Oscillator Ground Connection**

Although the impedance of a ground plane is low it is, of course, not zero. Therefore, any noise current in the ground plane causes a voltage drop in the ground.

Figure 7-36 shows the grounding scheme for high-frequency clock.

SPRS906\_PCB\_CLK\_OSC\_03

(1)  $j$  in  $*_{osc} = 0$  or  $1$

**Figure 7-36. Grounding Scheme for High-Frequency Clock**

### **7.7 DDR3 Board Design and Layout Guidelines**

#### **7.7.1 DDR3 General Board Layout Guidelines**

To help ensure good signaling performance, consider the following board design guidelines:

- Avoid crossing splits in the power plane.
- Minimize Vref noise.
- Use the widest trace that is practical between decoupling capacitors and memory module.
- Maintain a single reference.
- Minimize ISI by keeping impedances matched.
- Minimize crosstalk by isolating sensitive bits, such as strobes, and avoiding return path discontinuities.
- Use proper low-pass filtering on the Vref pins.
- Keep the stub length as short as possible.
- Add additional spacing for on-clock and strobe nets to eliminate crosstalk.
- Maintain a common ground reference for all bypass and decoupling capacitors.
- Take into account the differences in propagation delays between microstrip and stripline nets when evaluating timing constraints.

## 7.7.2 DDR3 Board Design and Layout Guidelines

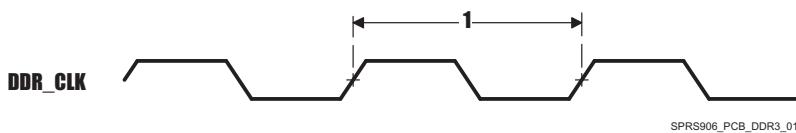

### 7.7.2.1 Board Designs

TI only supports board designs using DDR3 memory that follow the guidelines in this document. The switching characteristics and timing diagram for the DDR3 memory controller are shown in [Table 7-24](#) and [Figure 7-37](#).

**Table 7-24. Switching Characteristics Over Recommended Operating Conditions for DDR3 Memory Controller**

NO.	PARAMETER		MIN	MAX	UNIT
1	$t_{C(DDR\_CLK)}$	Cycle time, DDR_CLK	1.5	2.5 <sup>(1)</sup>	ns

(1) This is the absolute maximum the clock period can be. Actual maximum clock period may be limited by DDR3 speed grade and operating frequency (see the DDR3 memory device data sheet).

**Figure 7-37. DDR3 Memory Controller Clock Timing**

### 7.7.2.2 DDR3 EMIF

The processor contains one DDR3 EMIF with one chip select.

### 7.7.2.3 DDR3 Device Combinations

Because there are several possible combinations of device counts and single- or dual-side mounting, [Table 7-25](#) summarizes the supported device configurations.

**Table 7-25. Supported DDR3 Device Combinations**

NUMBER OF DDR3 DEVICES	DDR3 DATA DEVICE WIDTH (BITS)	MIRRORED?	DDR3 EMIF WIDTH (BITS)
1	16	N	16
2	8	Y <sup>(1)</sup>	16
2	16	N	32
2	16	Y <sup>(1)</sup>	32
3	16	N <sup>(3)(4)</sup>	32
4	8	N	32
4	8	Y <sup>(2)</sup>	32
5	8	N <sup>(3)(4)</sup>	32

(1) Two DDR3 devices are mirrored when one device is placed on the top of the board and the second device is placed on the bottom of the board.

(2) This is two mirrored pairs of DDR3 devices.

(3) Three or five DDR3 device combination is not available on this device, but combination types are retained for consistency with the DRA7xx family of devices.

(4) The DDR memory connected to the DDR ECC bus does NOT need to be the same part number as the DDR memories connected to the DDR data bus. However, some constraints do apply. When selecting a memory for the DDR ECC bus, the following restrictions must be adhered to as compared to the DDR memories on the data bus:

- Match the same DDR3 speed grade
- Have an equal number of internal banks
- Have an equal number of columns
- Have a greater or equal number of rows

### 7.7.2.4 DDR3 Interface Schematic

#### 7.7.2.4.1 32-Bit DDR3 Interface

The DDR3 interface schematic varies, depending upon the width of the DDR3 devices used and the width of the bus used (16 or 32 bits). General connectivity is straightforward and very similar. 16-bit DDR devices look like two 8-bit devices. [Figure 7-38](#) and [Figure 7-39](#) show the schematic connections for 32-bit interfaces using x16 devices.

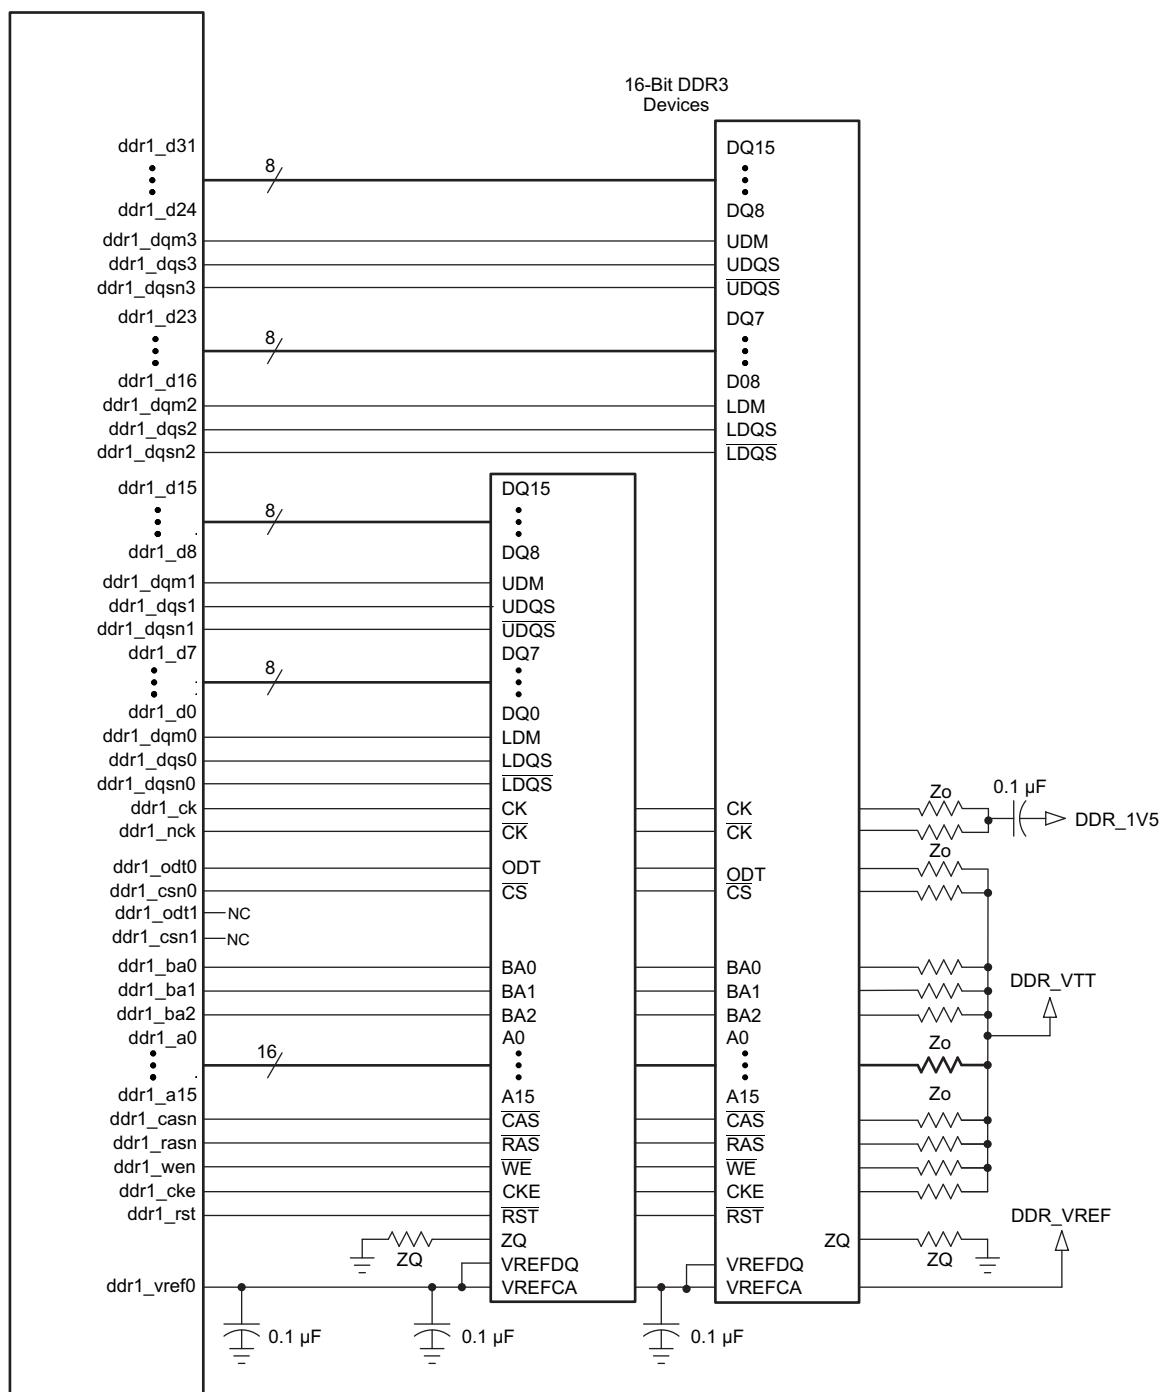

#### 7.7.2.4.2 16-Bit DDR3 Interface

Note that the 16-bit wide interface schematic is practically identical to the 32-bit interface (see [Figure 7-38](#) and [Figure 7-39](#)); only the high-word DDR memories are removed and the unused DQS inputs are tied off.

When not using all or part of a DDR interface, the proper method of handling the unused pins is to tie off the `ddrx_dqsi` pins to ground via a  $1\text{k}\Omega$  resistor and to tie off the `ddrx_dqsn` pins to the corresponding `vdds_ddrx` supply via a  $1\text{k}\Omega$  resistor. This needs to be done for each byte not used. Although these signals have internal pullups and pulldowns, external pullups and pulldowns provide additional protection against external electrical noise causing activity on the signals.

The `vdds_ddrx` and `ddrx_vref0` power supply pins need to be connected to their respective power supplies even if `ddrx` is not being used. All other DDR interface pins can be left unconnected. Note that the supported modes for use of the DDR EMIF are 32-bits wide, 16-bits wide, or not used.

## 32-bit DDR3 EMIF

 Termination is required. See terminator comments.

 Value determined according to the DDR memory device data sheet.

SPRS966\_PCB\_DDR3\_02

**Figure 7-38. 32-Bit, One-Bank DDR3 Interface Schematic Using Two 16-Bit DDR3 Devices**

32-bit DDR3 EMIF

$Z_o$  Termination is required. See terminator comments.

$Z_Q$  Value determined according to the DDR memory device data sheet.

SPRS969E\_PCB\_DDR3\_03

**Figure 7-39. 32-Bit, One-Bank DDR3 Interface Schematic Using Four 8-Bit DDR3 Devices**

### 7.7.2.5 Compatible JEDEC DDR3 Devices

[Table 7-26](#) shows the parameters of the JEDEC DDR3 devices that are compatible with this interface. Generally, the DDR3 interface is compatible with DDR3-1333 devices in the x8 or x16 widths.

**Table 7-26. Compatible JEDEC DDR3 Devices (Per Interface)**

N.O.	PARAMETER	CONDITION	MIN	MAX	UNIT
1	JEDEC DDR3 device speed grade <sup>(1)</sup>	DDR clock rate = 400MHz	DDR3-800	DDR3-1600	
		400MHz < DDR clock rate ≤ 533MHz	DDR3-1066	DDR3-1600	
		533MHz < DDR clock rate ≤ 667MHz	DDR3-1333	DDR3-1600	
2	JEDEC DDR3 device bit width		x8	x16	Bits
3	JEDEC DDR3 device count <sup>(2)</sup>		2	4	Devices

(1) Refer to [Table 7-24](#) Switching Characteristics Over Recommended Operating Conditions for DDR3 Memory Controller for the range of supported DDR clock rates.

(2) For valid DDR3 device configurations and device counts, see [Section 7.7.2.4](#), [Figure 7-38](#), and [Figure 7-39](#).

### 7.7.2.6 PCB Stackup

The minimum stackup for routing the DDR3 interface is a six-layer stack up as shown in [Table 7-27](#). Additional layers may be added to the PCB stackup to accommodate other circuitry, enhance SI/EMI performance, or to reduce the size of the PCB footprint. Complete stackup specifications are provided in [Table 7-28](#).

**Table 7-27. Six-Layer PCB Stackup Suggestion**

LAYER	TYPE	DESCRIPTION
1	Signal	Top routing mostly vertical
2	Plane	Ground
3	Plane	Split power plane
4	Plane	Split power plane or Internal routing
5	Plane	Ground
6	Signal	Bottom routing mostly horizontal

**Table 7-28. PCB Stackup Specifications**

NO.	PARAMETER	MIN	TYP	MAX	UNIT
PS1	PCB routing/plane layers	6			
PS2	Signal routing layers	3			
PS3	Full ground reference layers under DDR3 routing region <sup>(1)</sup>	1			
PS4	Full 1.5-V power reference layers under the DDR3 routing region <sup>(1)</sup>	1			
PS5	Number of reference plane cuts allowed within DDR3 routing region <sup>(2)</sup>			0	
PS6	Number of layers between DDR3 routing layer and reference plane <sup>(3)</sup>			0	
PS7	PCB routing feature size		4		Mils
PS8	PCB trace width, w		4		Mils
PS9	Single-ended impedance, $Z_o$	50		75	$\Omega$
PS10	Impedance control <sup>(5)</sup>	Z-5	Z	Z+5	$\Omega$

(1) Ground reference layers are preferred over power reference layers. Be sure to include bypass caps to accommodate reference layer return current as the trace routes switch routing layers.

(2) No traces should cross reference plane cuts within the DDR routing region. High-speed signal traces crossing reference plane cuts create large return current paths which can lead to excessive crosstalk and EMI radiation.

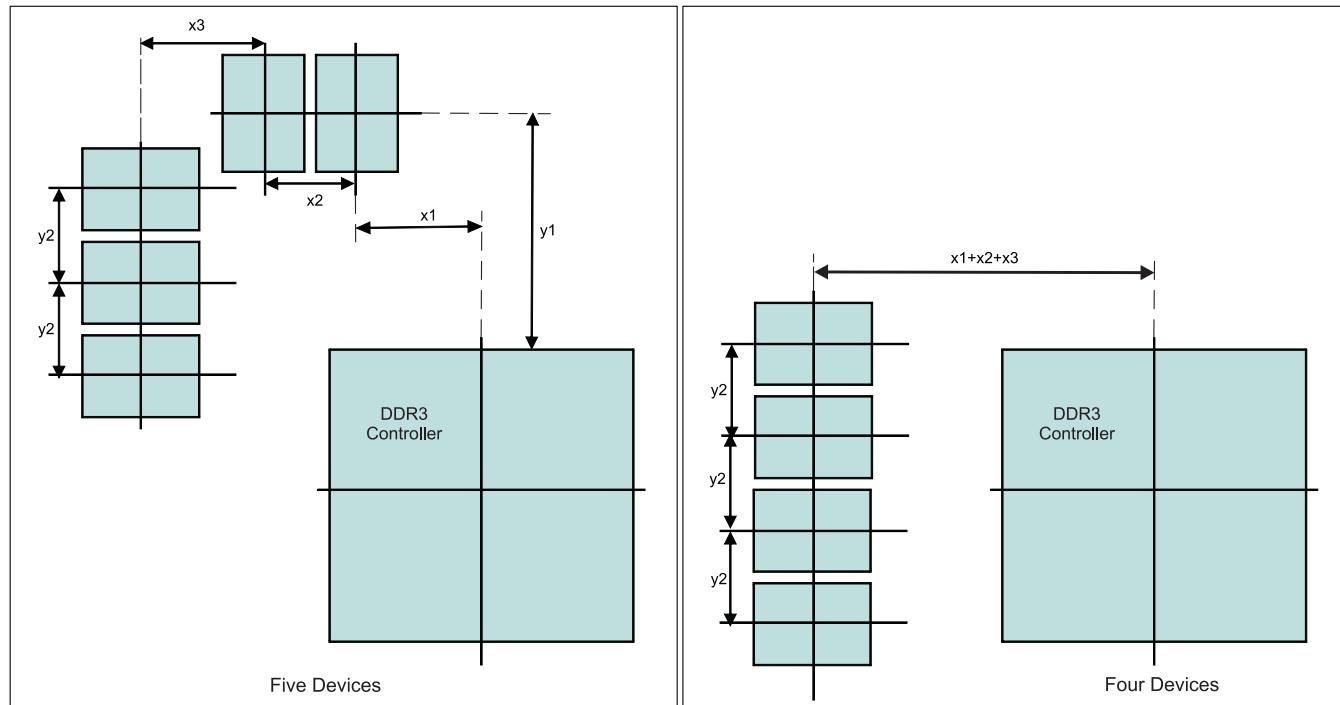

(3) Reference planes are to be directly adjacent to the signal plane to minimize the size of the return current loop.

(4) An 18-mil pad assumes Via Channel is the most economical BGA escape. A 20-mil pad may be used if additional layers are available for power routing. An 18-mil pad is required for minimum layer count escape.

(5) Z is the nominal singled-ended impedance selected for the PCB specified by PS9.

### 7.7.2.7 Placement

Figure 7-40 shows the required placement for the processor as well as the DDR3 devices. The dimensions for this figure are defined in Table 7-29. The placement does not restrict the side of the PCB on which the devices are mounted. The ultimate purpose of the placement is to limit the maximum trace lengths and allow for proper routing space. For a 16-bit DDR memory system, the high-word DDR3 devices are omitted from the placement.

SPRS969G\_PCB\_DDR3\_04

**Figure 7-40. Placement Specifications**

**Table 7-29. Placement Specifications DDR3**

NO.	PARAMETER	MIN	MAX	UNIT
KOD31	X1		500	Mils
KOD32	X2		600	Mils
KOD33	X3		600	Mils
KOD34	Y1		1800	Mils
KOD35	Y2		600	Mils
KOD36	DDR3 keepout region <sup>(1)</sup>			
KOD37	Clearance from non-DDR3 signal to DDR3 keepout region <sup>(2) (3)</sup>	4		W

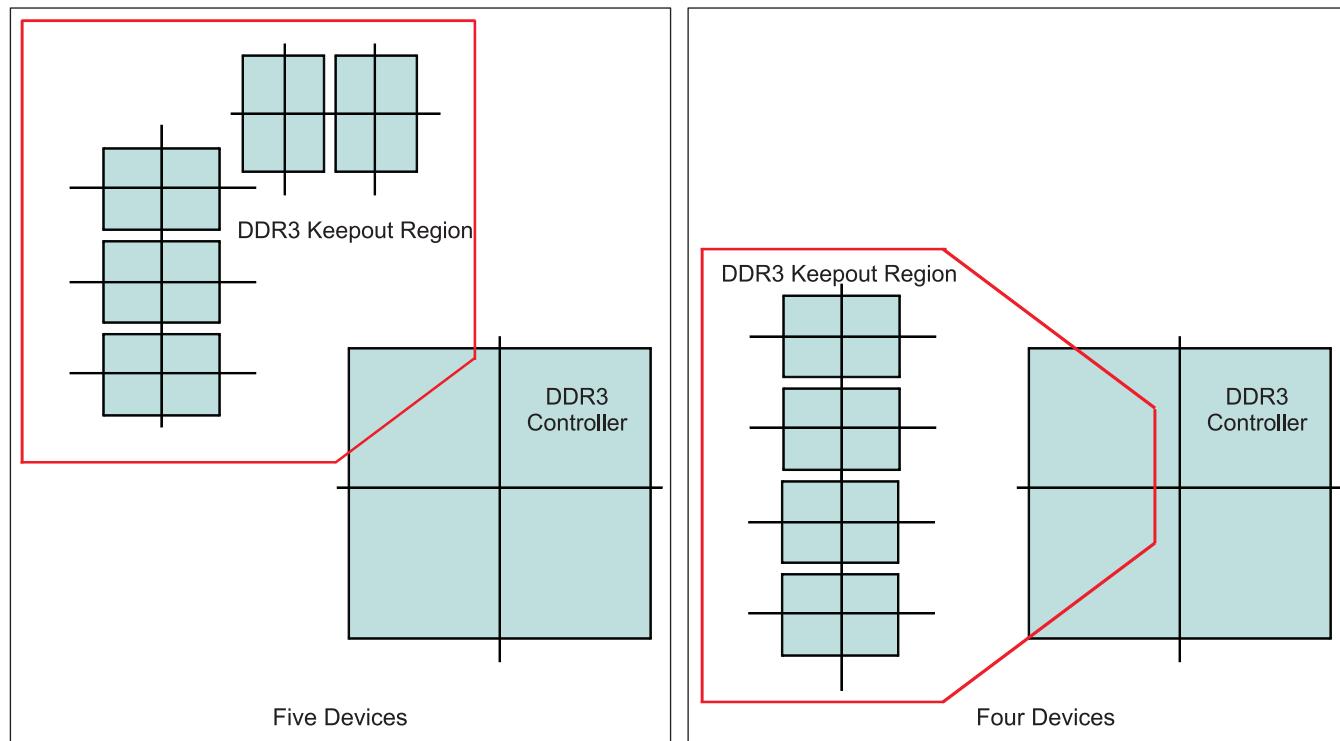

(1) DDR3 keepout region to encompass entire DDR3 routing area.

(2) Non-DDR3 signals allowed within DDR3 keepout region provided they are separated from DDR3 routing layers by a ground plane.

(3) If a device has more than one DDR controller, the signals from the other controller(s) are considered non-DDR3 and should be separated by this specification.

### 7.7.2.8 DDR3 Keepout Region

The region of the PCB used for DDR3 circuitry must be isolated from other signals. The DDR3 keepout region is defined for this purpose and is shown in [Figure 7-41](#). The size of this region varies with the placement and DDR routing. Additional clearances required for the keepout region are shown in [Table 7-29](#). Non-DDR3 signals should not be routed on the DDR signal layers within the DDR3 keepout region. Non-DDR3 signals may be routed in the region, provided they are routed on layers separated from the DDR signal layers by a ground layer. No breaks should be allowed in the reference ground layers in this region. In addition, the 1.5-V DDR3 power plane should cover the entire keepout region. Also note that the two signals from the DDR3 controller should be separated from each other by the specification in [Table 7-29](#) (see KOD37).

**Figure 7-41. DDR3 Keepout Region**

SPRS908\_PCB\_DDR3\_05

### 7.7.2.9 Bulk Bypass Capacitors

Bulk bypass capacitors are required for moderate speed bypassing of the DDR3 and other circuitry. [Table 7-30](#) contains the minimum numbers and capacitance required for the bulk bypass capacitors. Note that this table only covers the bypass needs of the DDR3 controllers and DDR3 devices. Additional bulk bypass capacitance may be needed for other circuitry.

**Table 7-30. Bulk Bypass Capacitors**

NO.	PARAMETER	MIN	MAX	UNIT
1	vdds_ddrx bulk bypass capacitor count <sup>(1)</sup>	1		Devices
2	vdds_ddrx bulk bypass total capacitance	22		µF

(1) These devices should be placed near the devices they are bypassing, but preference should be given to the placement of the high-speed (HS) bypass capacitors and DDR3 signal routing.

### 7.7.2.10 High-Speed Bypass Capacitors

High-speed (HS) bypass capacitors are critical for proper DDR3 interface operation. It is particularly important to minimize the parasitic series inductance of the HS bypass capacitors, processor/DDR power, and processor/DDR ground connections. [Table 7-31](#) contains the specification for the HS bypass capacitors as well as for the power connections on the PCB. Generally speaking, it is good to:

1. Fit as many HS bypass capacitors as possible.
2. Minimize the distance from the bypass cap to the pins/balls being bypassed.
3. Use the smallest physical sized capacitors possible with the highest capacitance readily available.
4. Connect the bypass capacitor pads to their vias using the widest traces possible and using the largest hole size via possible.
5. Minimize via sharing. Note the limits on via sharing shown in [Table 7-31](#).

**Table 7-31. High-Speed Bypass Capacitors**

NO.	PARAMETER	MIN	TYP	MAX	UNIT
1	HS bypass capacitor package size <sup>(1)</sup>		0201	0402	10 Mils
2	Distance, HS bypass capacitor to processor being bypassed <sup>(2)(3)(4)</sup>			400	Mils
3	Processor HS bypass capacitor count per vdds_ddrx rail <sup>(12)</sup>		See <a href="#">Table 7-3</a> and <sup>(11)</sup>		Devices
4	Processor HS bypass capacitor total capacitance per vdds_ddrx rail <sup>(12)</sup>		See <a href="#">Table 7-3</a> and <sup>(11)</sup>		µF
5	Number of connection vias for each device power/ground ball <sup>(5)</sup>				Vias
6	Trace length from device power/ground ball to connection via <sup>(2)</sup>		35	70	Mils
7	Distance, HS bypass capacitor to DDR device being bypassed <sup>(6)</sup>			150	Mils
8	DDR3 device HS bypass capacitor count <sup>(7)</sup>	12			Devices
9	DDR3 device HS bypass capacitor total capacitance <sup>(7)</sup>	0.85			µF
10	Number of connection vias for each HS capacitor <sup>(8)(9)</sup>	2			Vias
11	Trace length from bypass capacitor connect to connection via <sup>(2)(9)</sup>		35	100	Mils
12	Number of connection vias for each DDR3 device power/ground ball <sup>(10)</sup>	1			Vias
13	Trace length from DDR3 device power/ground ball to connection via <sup>(2)(8)</sup>		35	60	Mils

(1) LxW, 10-mil units, that is, a 0402 is a 40x20-mil surface-mount capacitor.

(2) Closer/shorter is better.

(3) Measured from the nearest processor power/ground ball to the center of the capacitor package.

(4) Three of these capacitors should be located underneath the processor, between the cluster of DDR\_1V5 balls and ground balls, between the DDR interfaces on the package.

(5) See the Via Channel™ escape for the processor package.

(6) Measured from the DDR3 device power/ground ball to the center of the capacitor package.

(7) Per DDR3 device.

(8) An additional HS bypass capacitor can share the connection vias only if it is mounted on the opposite side of the board. No sharing of vias is permitted on the same side of the board.

- (9) An HS bypass capacitor may share a via with a DDR device mounted on the same side of the PCB. A wide trace should be used for the connection and the length from the capacitor pad to the DDR device pad should be less than 150 mils.
- (10) Up to a total of two pairs of DDR power/ground balls may share a via.
- (11) The capacitor recommendations in this data manual reflect only the needs of this processor. Please see the memory vendor's guidelines for determining the appropriate decoupling capacitor arrangement for the memory device itself.
- (12) For more information, see [Section 7.3, Core Power Domains](#).

#### 7.7.2.10.1 Return Current Bypass Capacitors

Use additional bypass capacitors if the return current reference plane changes due to DDR3 signals hopping from one signal layer to another. The bypass capacitor here provides a path for the return current to hop planes along with the signal. As many of these return current bypass capacitors should be used as possible. Because these are returns for signal current, the signal via size may be used for these capacitors.

#### 7.7.2.11 Net Classes

[Table 7-32](#) lists the clock net classes for the DDR3 interface. [Table 7-33](#) lists the signal net classes, and associated clock net classes, for signals in the DDR3 interface. These net classes are used for the termination and routing rules that follow.

**Table 7-32. Clock Net Class Definitions**

CLOCK NET CLASS	processor PIN NAMES
CK	ddrx_ck/ddrx_nck
DQS0	ddrx_dqs0 / ddrx_dqsn0
DQS1	ddrx_dqs1 / ddrx_dqsn1
DQS2 <sup>(1)</sup>	ddrx_dqs2 / ddrx_dqsn2
DQS3 <sup>(1)</sup>	ddrx_dqs3 / ddrx_dqsn3

(1) Only used on 32-bit wide DDR3 memory systems.

**Table 7-33. Signal Net Class Definitions**

SIGNAL NET CLASS	ASSOCIATED CLOCK NET CLASS	processor PIN NAMES
ADDR_CTRL	CK	ddrx_ba[2:0], ddrx_a[14:0], ddrx_csnj, ddrx_casn, ddrx_rasn, ddrx_wen, ddrx_cke, ddrx_odti
DQ0	DQS0	ddrx_d[7:0], ddrx_dqm0
DQ1	DQS1	ddrx_d[15:8], ddrx_dqm1
DQ2 <sup>(1)</sup>	DQS2	ddrx_d[23:16], ddrx_dqm2
DQ3 <sup>(1)</sup>	DQS3	ddrx_d[31:24], ddrx_dqm3

(1) Only used on 32-bit wide DDR3 memory systems.

#### 7.7.2.12 DDR3 Signal Termination

Signal terminators are required for the CK and ADDR\_CTRL net classes. The data lines are terminated by ODT and, thus, the PCB traces should be unterminated. Detailed termination specifications are covered in the routing rules in the following sections.

#### 7.7.2.13 VREF\_DDR Routing

ddrx\_vref0 (VREF) is used as a reference by the input buffers of the DDR3 memories as well as the processor. VREF is intended to be half the DDR3 power supply voltage and is typically generated with the DDR3 VDDS and VTT power supply. It should be routed as a nominal 20-mil wide trace with 0.1  $\mu$ F bypass capacitors near each device connection. Narrowing of VREF is allowed to accommodate routing congestion.

### 7.7.2.14 VTT

Like VREF, the nominal value of the VTT supply is half the DDR3 supply voltage. Unlike VREF, VTT is expected to source and sink current, specifically the termination current for the ADDR\_CTRL net class Thevenin terminators. VTT is needed at the end of the address bus and it should be routed as a power sub-plane. VTT should be bypassed near the terminator resistors.

### 7.7.2.15 CK and ADDR\_CTRL Topologies and Routing Definition

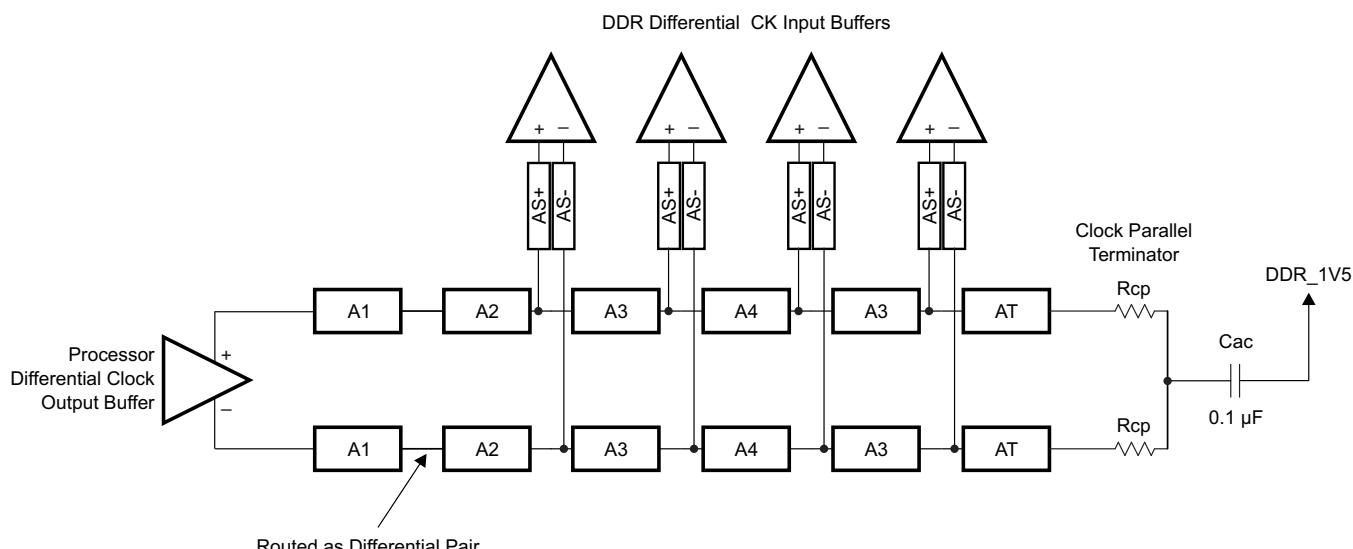

The CK and ADDR\_CTRL net classes are routed in a fly-by topology. They are routed in a similar manner and are length matched to minimize skew between them. CK is a bit more complicated because it runs at a higher transition rate and is differential. The following subsections show the topology and routing for various DDR3 configurations for CK and ADDR\_CTRL. The figures in the following subsections define the terms for the routing specification detailed in [Table 7-34](#). Balanced-T routing is not recommended.

#### 7.7.2.15.1 Four DDR3 Devices

Four DDR3 devices are supported on the DDR EMIF consisting of four x8 DDR3 devices arranged as one bank (CS). These four devices may be mounted on a single side of the PCB, or may be mirrored in two pairs to save board space at a cost of increased routing complexity and parts on the backside of the PCB.

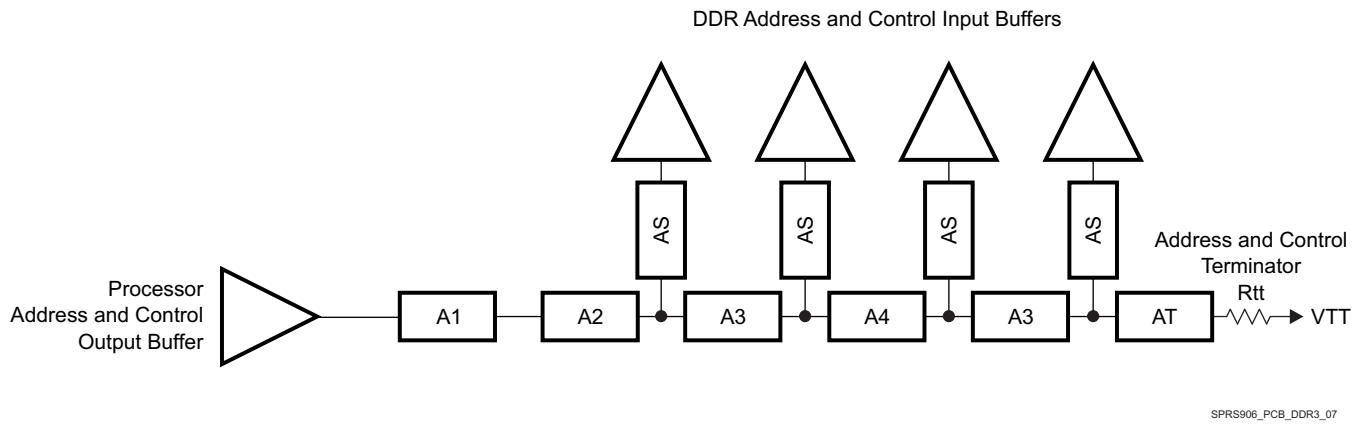

##### 7.7.2.15.1.1 CK and ADDR\_CTRL Topologies, Four DDR3 Devices

[Figure 7-42](#) shows the topology of the CK net classes and [Figure 7-43](#) shows the topology for the corresponding ADDR\_CTRL net classes.

SPRS906\_PCB\_DDR3\_06

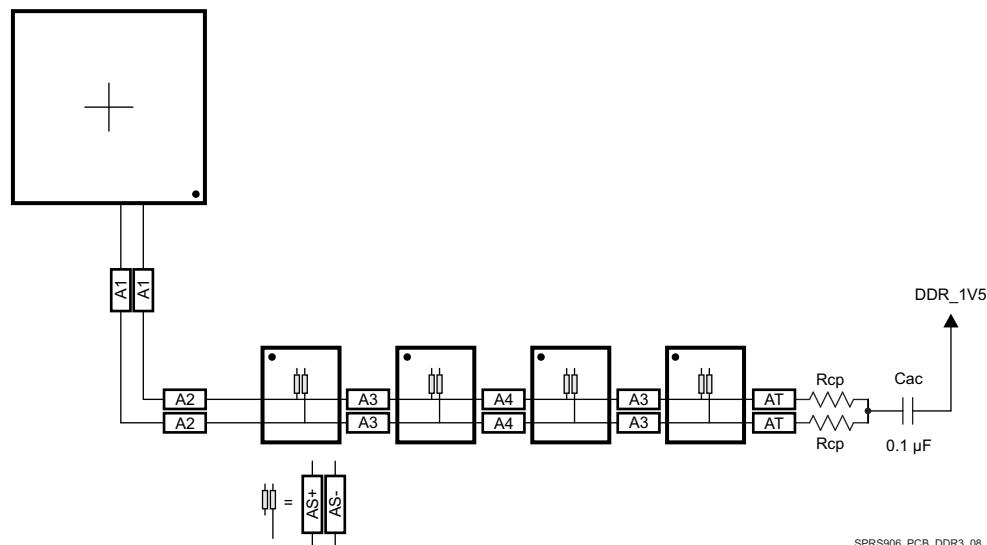

**Figure 7-42. CK Topology for Four x8 DDR3 Devices**

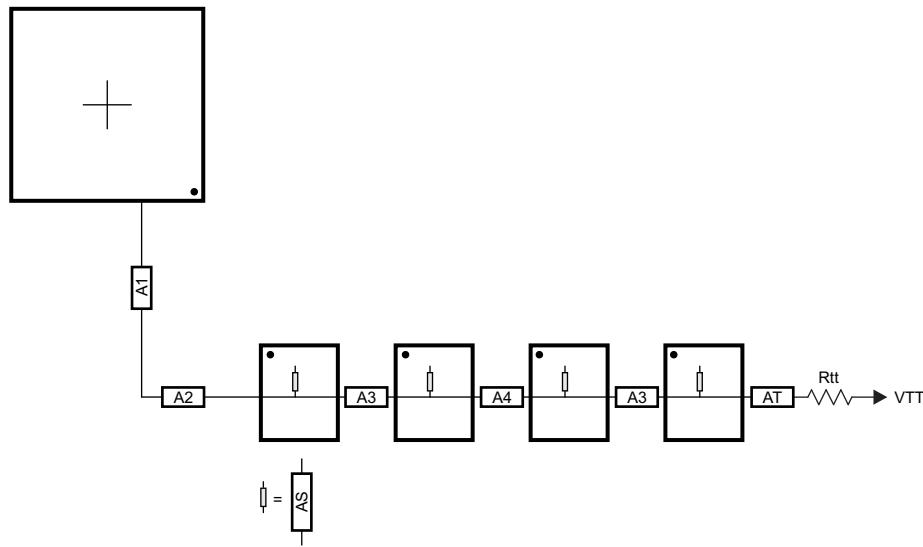

**Figure 7-43. ADDR\_CTRL Topology for Four  $x8$  DDR3 Devices**

#### 7.7.2.15.1.2 CK and ADDR\_CTRL Routing, Four DDR3 Devices

Figure 7-44 shows the CK routing for four DDR3 devices placed on the same side of the PCB. Figure 7-45 shows the corresponding ADDR\_CTRL routing.

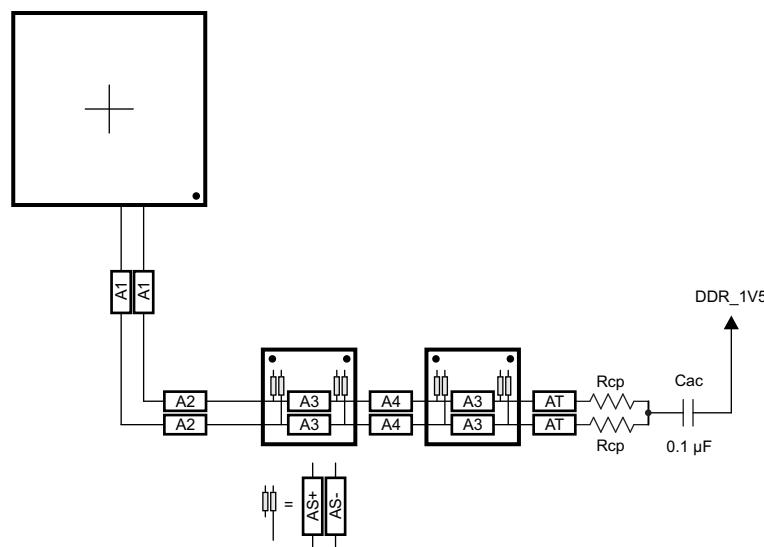

**Figure 7-44. CK Routing for Four Single-Side DDR3 Devices**

SPRS906\_PCB\_DDR3\_09

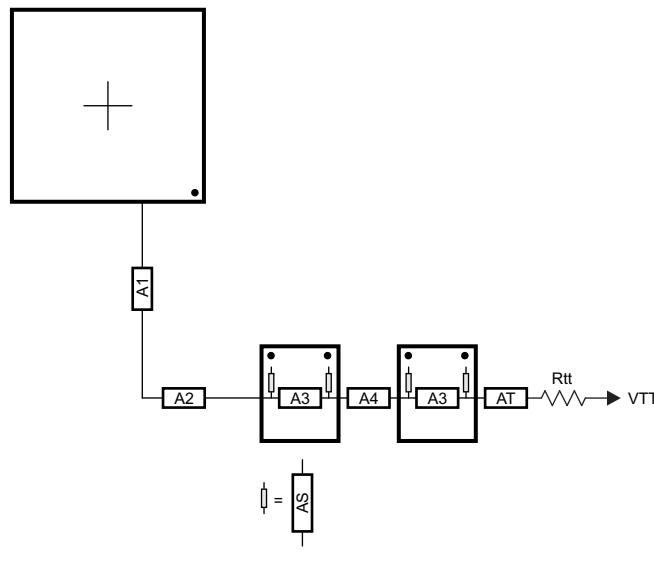

**Figure 7-45. ADDR\_CTRL Routing for Four Single-Side DDR3 Devices**

To save PCB space, the four DDR3 memories may be mounted as two mirrored pairs at a cost of increased routing and assembly complexity. [Figure 7-46](#) and [Figure 7-47](#) show the routing for CK and ADDR\_CTRL, respectively, for four DDR3 devices mirrored in a two-pair configuration.

SPRS906\_PCB\_DDR3\_10

**Figure 7-46. CK Routing for Four Mirrored DDR3 Devices**

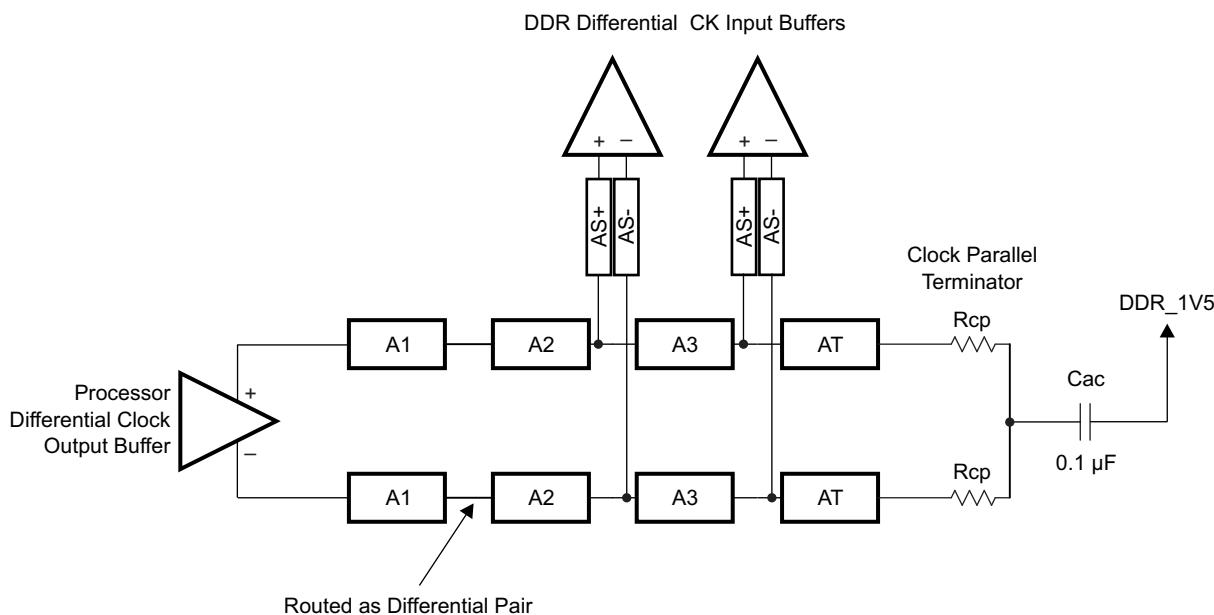

**Figure 7-47. ADDR\_CTRL Routing for Four Mirrored DDR3 Devices**

#### 7.7.2.15.2 Two DDR3 Devices

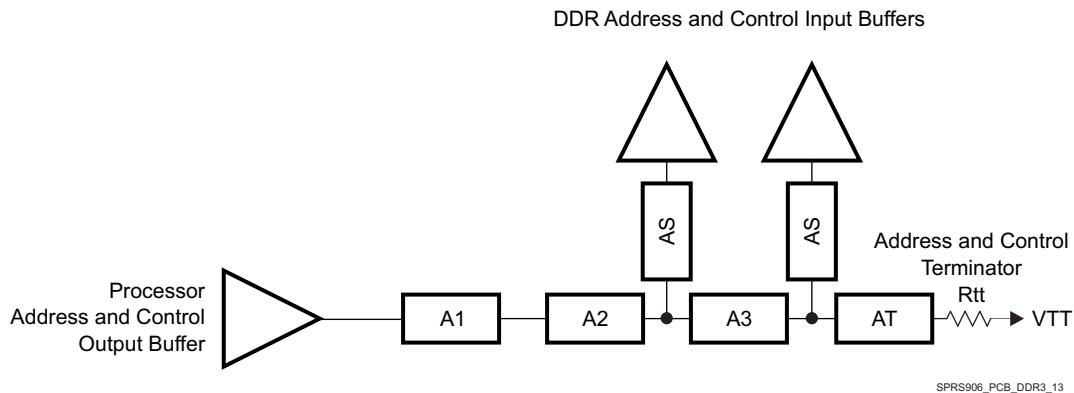

Two DDR3 devices are supported on the DDR EMIF consisting of two x8 DDR3 devices arranged as one bank (CS), 16 bits wide, or two x16 DDR3 devices arranged as one bank (CS), 32 bits wide. These two devices may be mounted on a single side of the PCB, or may be mirrored in a pair to save board space at a cost of increased routing complexity and parts on the backside of the PCB.

##### 7.7.2.15.2.1 CK and ADDR\_CTRL Topologies, Two DDR3 Devices

Figure 7-48 shows the topology of the CK net classes and Figure 7-49 shows the topology for the corresponding ADDR\_CTRL net classes.

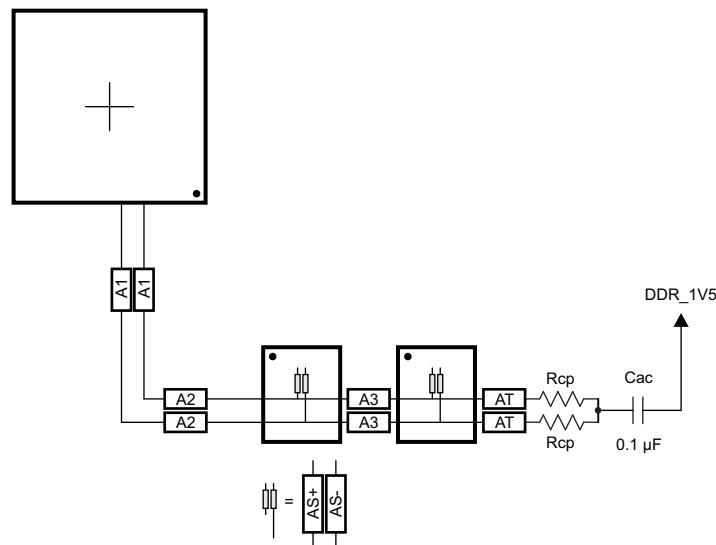

**Figure 7-48. CK Topology for Two DDR3 Devices**

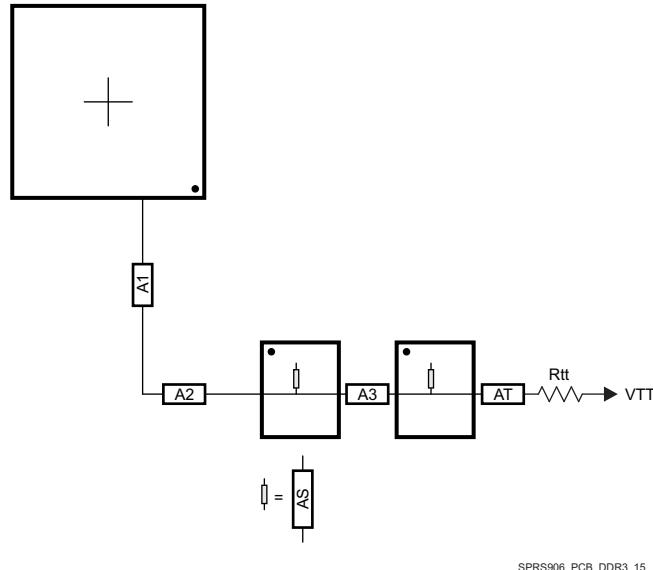

**Figure 7-49. ADDR\_CTRL Topology for Two DDR3 Devices**

#### 7.7.2.15.2.2 CK and ADDR\_CTRL Routing, Two DDR3 Devices

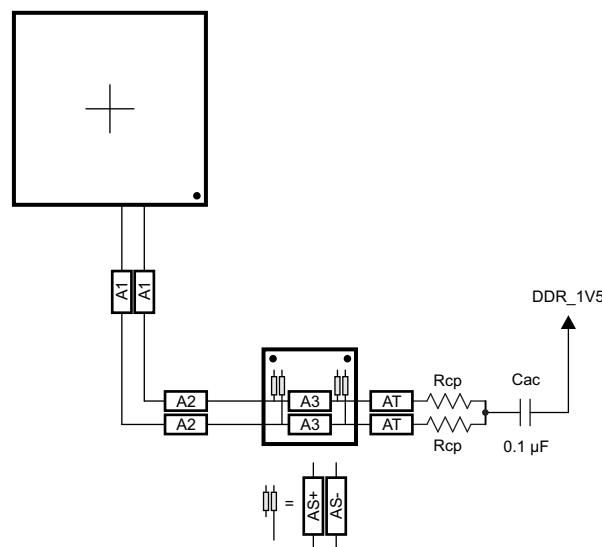

Figure 7-50 shows the CK routing for two DDR3 devices placed on the same side of the PCB. Figure 7-51 shows the corresponding ADDR\_CTRL routing.

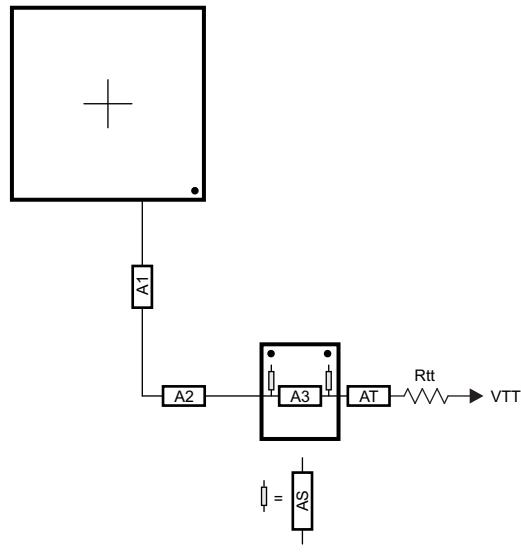

**Figure 7-50. CK Routing for Two Single-Side DDR3 Devices**

**Figure 7-51. ADDR\_CTRL Routing for Two Single-Side DDR3 Devices**

To save PCB space, the two DDR3 memories may be mounted as a mirrored pair at a cost of increased routing and assembly complexity. [Figure 7-52](#) and [Figure 7-53](#) show the routing for CK and ADDR\_CTRL, respectively, for two DDR3 devices mirrored in a single-pair configuration.

**Figure 7-52. CK Routing for Two Mirrored DDR3 Devices**

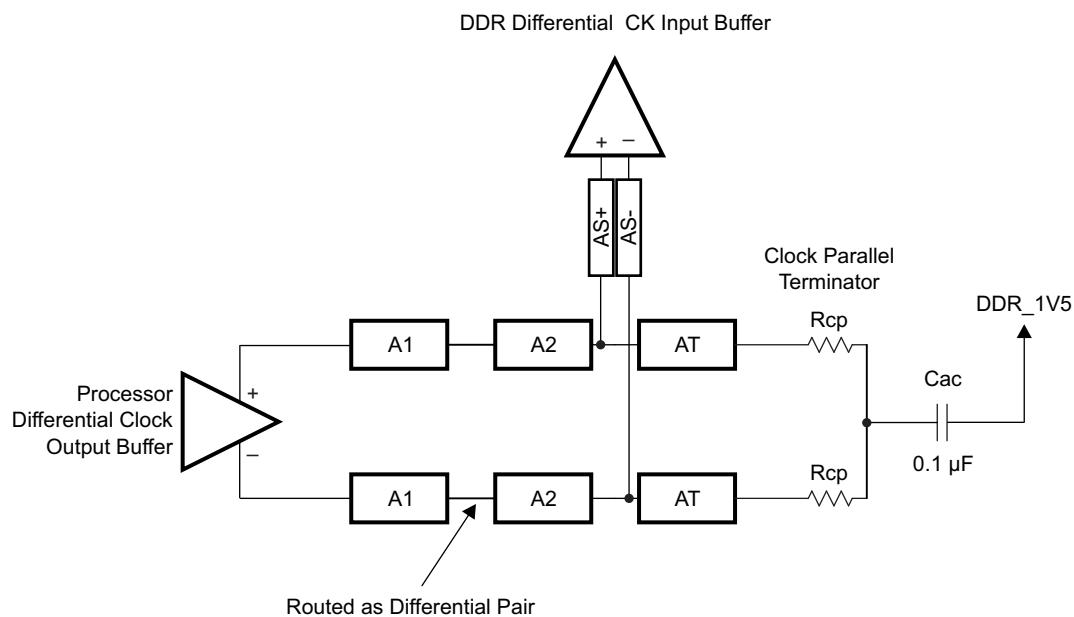

**Figure 7-53. ADDR\_CTRL Routing for Two Mirrored DDR3 Devices**

#### 7.7.2.15.3 One DDR3 Device

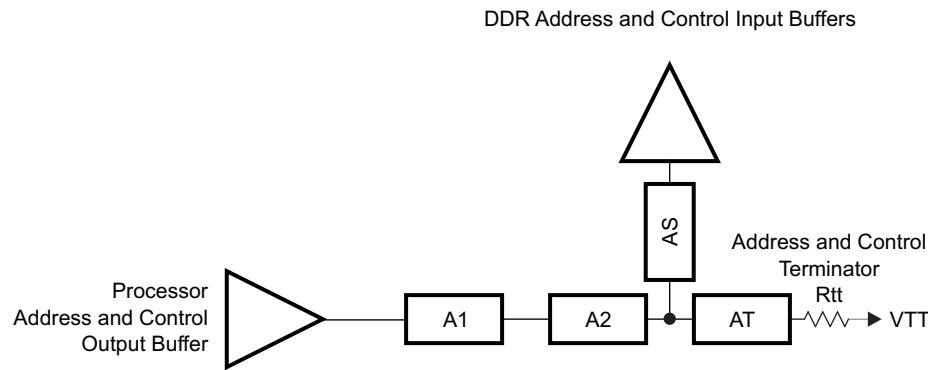

A single DDR3 device is supported on the DDR EMIF consisting of one x16 DDR3 device arranged as one bank (CS), 16 bits wide.

##### 7.7.2.15.3.1 CK and ADDR\_CTRL Topologies, One DDR3 Device

Figure 7-54 shows the topology of the CK net classes and Figure 7-55 shows the topology for the corresponding ADDR\_CTRL net classes.

**Figure 7-54. CK Topology for One DDR3 Device**

#### 7.7.2.15.3.2 CK and ADDR/CTRL Routing, One DDR3 Device

Figure 7-56 shows the CK routing for one DDR3 device placed on the same side of the PCB. Figure 7-57 shows the corresponding ADDR\_CTRL routing.

SPRS906\_PCB\_DDR3\_20

**Figure 7-56. CK Routing for One DDR3 Device**

SPRS906\_PCB\_DDR3\_21

**Figure 7-57. ADDR\_CTRL Routing for One DDR3 Device**

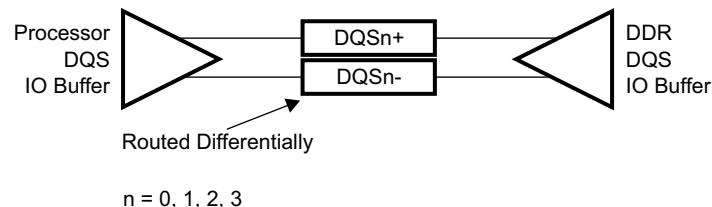

#### 7.7.2.16 Data Topologies and Routing Definition

No matter the number of DDR3 devices used, the data line topology is always point to point, so its definition is simple.

Care should be taken to minimize layer transitions during routing. If a layer transition is necessary, it is better to transition to a layer using the same reference plane. If this cannot be accommodated, ensure there are nearby ground vias to allow the return currents to transition between reference planes if both reference planes are ground or vdds\_ddr. Ensure there are nearby bypass capacitors to allow the return currents to transition between reference planes if one of the reference planes is ground. The goal is to minimize the size of the return current loops.

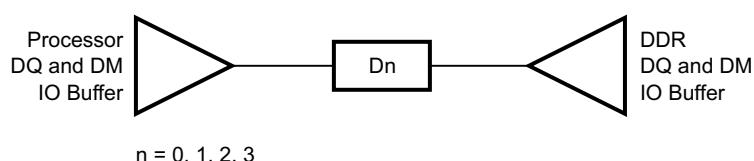

##### 7.7.2.16.1 DQS and DQ/DM Topologies, Any Number of Allowed DDR3 Devices

DQS lines are point-to-point differential, and DQ/DM lines are point-to-point singled ended. [Figure 7-58](#) and [Figure 7-59](#) show these topologies.

SPRS906\_PCB\_DDR3\_22

**Figure 7-58. DQS Topology**

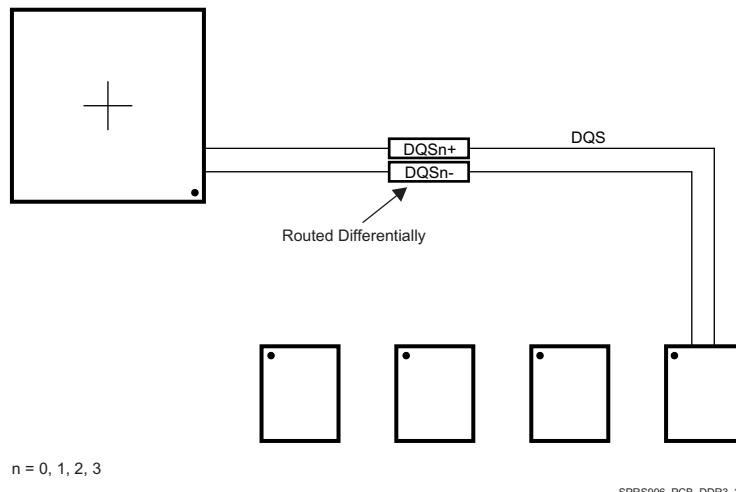

SPRS906\_PCB\_DDR3\_23

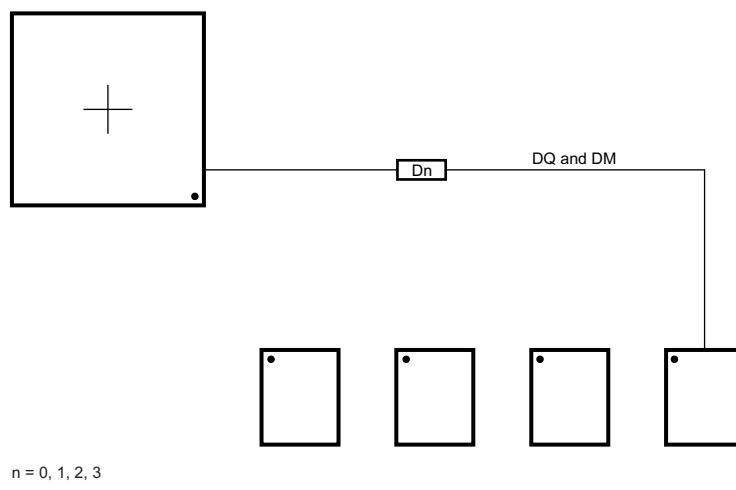

**Figure 7-59. DQ/DM Topology**

### 7.7.2.16.2 DQS and DQ/DM Routing, Any Number of Allowed DDR3 Devices

Figure 7-60 and Figure 7-61 show the DQS and DQ/DM routing.

**Figure 7-60. DQS Routing With Any Number of Allowed DDR3 Devices**

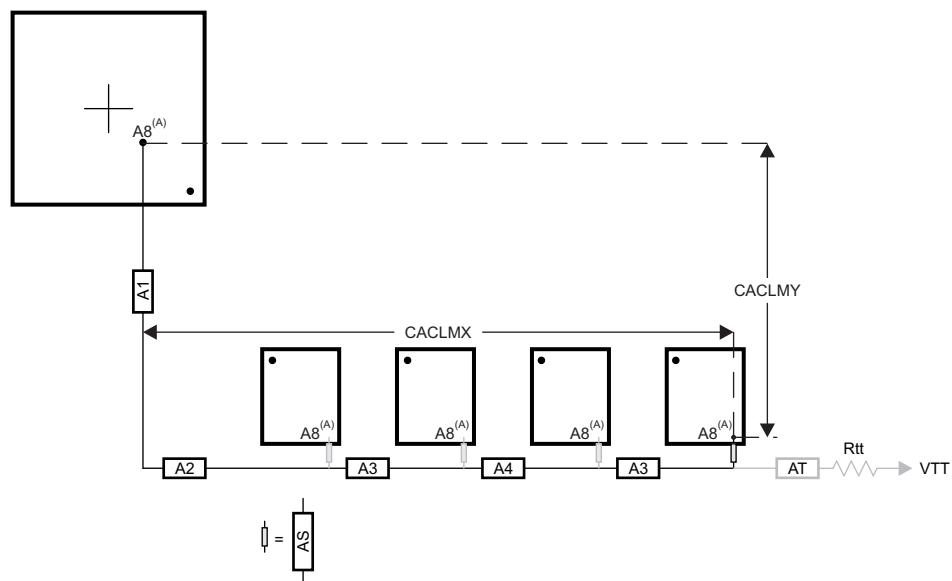

**Figure 7-61. DQ/DM Routing With Any Number of Allowed DDR3 Devices**

### 7.7.2.17 Routing Specification

#### 7.7.2.17.1 CK and ADDR\_CTRL Routing Specification

Skew within the CK and ADDR\_CTRL net classes directly reduces setup and hold margin and, thus, this skew must be controlled. The only way to practically match lengths on a PCB is to lengthen the shorter traces up to the length of the longest net in the net class and its associated clock. A metric to establish this maximum length is Manhattan distance. The Manhattan distance between two points on a PCB is the length between the points when connecting them only with horizontal or vertical segments. A reasonable trace route length is to within a percentage of its Manhattan distance. CACLM is defined as Clock Address Control Longest Manhattan distance.

Given the clock and address pin locations on the processor and the DDR3 memories, the maximum possible Manhattan distance can be determined given the placement. [Figure 7-62](#) and [Figure 7-63](#) show this distance for four loads and two loads, respectively. It is from this distance that the specifications on the lengths of the transmission lines for the address bus are determined. CACLM is determined similarly for other address bus configurations; that is, it is based on the longest net of the CK/ADDR\_CTRL net class. For CK and ADDR\_CTRL routing, these specifications are contained in [Table 7-34](#).

SPRS969G\_PCB\_DDR3\_26

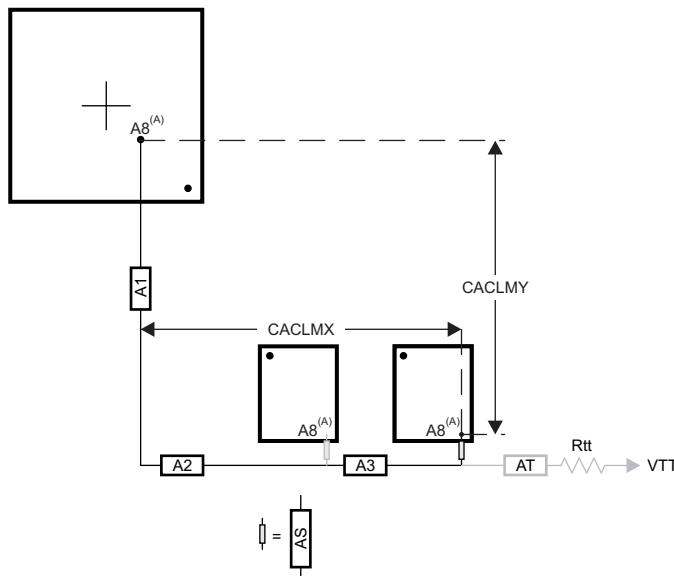

- A. It is very likely that the longest CK/ADDR\_CTRL Manhattan distance will be for Address Input 8 (A8) on the DDR3 memories. CACLM is based on the longest Manhattan distance due to the device placement. Verify the net class that satisfies this criteria and use as the baseline for CK/ADDR\_CTRL skew matching and length control.

The length of shorter CK/ADDR\_CTRL stubs as well as the length of the terminator stub are not included in this length calculation. Non-included lengths are grayed out in the figure.

Assuming A8 is the longest, CALM = CACLMY + CACLMX + 300 mils.

The extra 300 mils allows for routing down lower than the DDR3 memories and returning up to reach A8.

**Figure 7-62. CACLM for Four Address Loads on One Side of PCB**

SPRS906\_PCB\_DDR3\_27

- A. It is very likely that the longest CK/ADDR\_CTRL Manhattan distance will be for Address Input 8 (A8) on the DDR3 memories. CACLM is based on the longest Manhattan distance due to the device placement. Verify the net class that satisfies this criteria and use as the baseline for CK/ADDR\_CTRL skew matching and length control.

The length of shorter CK/ADDR\_CTRL stubs as well as the length of the terminator stub are not included in this length calculation. Non-included lengths are grayed out in the figure.

Assuming A8 is the longest, CALM = CACLY + CACLX + 300 mils.

The extra 300 mils allows for routing down lower than the DDR3 memories and returning up to reach A8.

**Figure 7-63. CACLM for Two Address Loads on One Side of PCB**

**Table 7-34. CK and ADDR\_CTRL Routing Specification<sup>(2)(3)</sup>**

NO.	PARAMETER	MIN	TYP	MAX	UNIT
CARS31	A1+A2 length			500 <sup>(1)</sup>	ps
CARS32	A1+A2 skew			29	ps
CARS33	A3 length			125	ps
CARS34	A3 skew <sup>(4)</sup>			6	ps
CARS35	A3 skew <sup>(5)</sup>			6	ps
CARS36	A4 length			125	ps
CARS37	A4 skew			6	ps
CARS38	AS length	5		17 <sup>(1)</sup>	ps
CARS39	AS skew	1.3		14 <sup>(1)</sup>	ps
CARS310	AS+/AS- length	5		12	ps
CARS311	AS+/AS- skew			1	ps
CARS312	AT length <sup>(6)</sup>	75			ps
CARS313	AT skew <sup>(7)</sup>	14			ps
CARS314	AT skew <sup>(8)</sup>			1	ps
CARS315	CK/ADDR_CTRL trace length			1020	ps
CARS316	Vias per trace			3 <sup>(1)</sup>	vias
CARS317	Via count difference			1 <sup>(15)</sup>	vias
CARS318	Center-to-center CK to other DDR3 trace spacing <sup>(9)</sup>	4w			
CARS319	Center-to-center ADDR_CTRL to other DDR3 trace spacing <sup>(9)(10)</sup>	4w			
CARS320	Center-to-center ADDR_CTRL to other ADDR_CTRL trace spacing <sup>(9)</sup>	3w			

**Table 7-34. CK and ADDR\_CTRL Routing Specification<sup>(2)(3)</sup> (continued)**

NO.	PARAMETER	MIN	TYP	MAX	UNIT
CARS321	CK center-to-center spacing <sup>(11)(12)</sup>				
CARS322	CK spacing to other net <sup>(9)</sup>	4w			
CARS323	Rcp <sup>(13)</sup>	Zo-1	Zo	Zo+1	$\Omega$
CARS324	Rtt <sup>(13)(14)</sup>	Zo-5	Zo	Zo+5	$\Omega$

(1) Max value is based upon conservative signal integrity approach. This value could be extended only if detailed signal integrity analysis of rise time and fall time confirms desired operation.

(2) The use of vias should be minimized.

(3) Additional bypass capacitors are required when using the DDR\_1V5 plane as the reference plane to allow the return current to jump between the DDR\_1V5 plane and the ground plane when the net class switches layers at a via.

(4) Non-mirrored configuration (all DDR3 memories on same side of PCB).

(5) Mirrored configuration (one DDR3 device on top of the board and one DDR3 device on the bottom).

(6) While this length can be increased for convenience, its length should be minimized.

(7) ADDR\_CTRL net class only (not CK net class). Minimizing this skew is recommended, but not required.

(8) CK net class only.

(9) Center-to-center spacing is allowed to fall to minimum 2w for up to 1250 mils of routed length.

(10) The ADDR\_CTRL net class of the other DDR EMIF is considered *other DDR3 trace spacing*.

(11) CK spacing set to ensure proper differential impedance.

(12) The most important thing to do is control the impedance so inadvertent impedance mismatches are not created. Generally speaking, center-to-center spacing should be either 2w or slightly larger than 2w to achieve a differential impedance equal to twice the singleended impedance, Zo.

(13) Source termination (series resistor at driver) is specifically not allowed.

(14) Termination values should be uniform across the net class.

(15) Via count difference may increase by 1 only if accurate 3-D modeling of the signal flight times – including accurately modeled signal propagation through vias – has been applied to ensure all segment skew maximums are not exceeded.

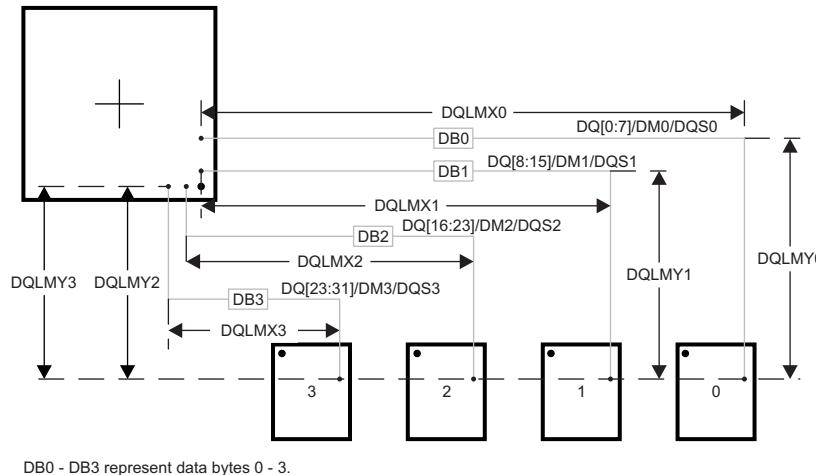

### 7.7.2.17.2 DQS and DQ Routing Specification

Skew within the DQS and DQ/DM net classes directly reduces setup and hold margin and thus this skew must be controlled. The only way to practically match lengths on a PCB is to lengthen the shorter traces up to the length of the longest net in the net class and its associated clock. As with CK and ADDR\_CTRL, a reasonable trace route length is to within a percentage of its Manhattan distance. DQLM<sub>n</sub> is defined as DQ Longest Manhattan distance n, where n is the byte number. For a 32-bit interface, there are four DQLMs, DQLM0-DQLM3. Likewise, for a 16-bit interface, there are two DQLMs, DQLM0-DQLM1.

#### NOTE

It is not required, nor is it recommended, to match the lengths across all bytes. Length matching is only required within each byte.

Given the DQS and DQ/DM pin locations on the processor and the DDR3 memories, the maximum possible Manhattan distance can be determined given the placement. [Figure 7-64](#) shows this distance for four loads. It is from this distance that the specifications on the lengths of the transmission lines for the data bus are determined. For DQS and DQ/DM routing, these specifications are contained in [Table 7-35](#).

SPRS906\_PCB\_DDR3\_28

There are four DQLMs, one for each byte (32-bit interface). Each DQLM is the longest Manhattan distance of the byte; therefore:

$$\text{DQLM0} = \text{DQLMX0} + \text{DQLMY0}$$

$$\text{DQLM1} = \text{DQLMX1} + \text{DQLMY1}$$

$$\text{DQLM2} = \text{DQLMX2} + \text{DQLMY2}$$

$$\text{DQLM3} = \text{DQLMX3} + \text{DQLMY3}$$

**Figure 7-64. DQLM for Any Number of Allowed DDR3 Devices**

**Table 7-35. Data Routing Specification<sup>(2)</sup>**

NO.	PARAMETER	MIN	TYP	MAX	UNIT
DRS31	DB0 length			340	ps
DRS32	DB1 length			340	ps
DRS33	DB2 length			340	ps
DRS34	DB3 length			340	ps
DRS35	DBn skew <sup>(3)</sup>			5	ps
DRS36	DQSn+ to DQSn- skew			1	ps
DRS37	DQSn to DBn skew <sup>(3)(4)</sup>			5 <sup>(10)</sup>	ps
DRS38	Vias per trace			2 <sup>(1)</sup>	vias
DRS39	Via count difference			0 <sup>(10)</sup>	vias
DRS310	Center-to-center DBn to other DDR3 trace spacing <sup>(6)</sup>	4			w <sup>(5)</sup>
DRS311	Center-to-center DBn to other DBn trace spacing <sup>(7)</sup>	3			w <sup>(5)</sup>
DRS312	DQSn center-to-center spacing <sup>(8)(9)</sup>				
DRS313	DQSn center-to-center spacing to other net	4			w <sup>(5)</sup>

(1) Max value is based upon conservative signal integrity approach. This value could be extended only if detailed signal integrity analysis of rise time and fall time confirms desired operation.

(2) External termination disallowed. Data termination should use built-in ODT functionality.

(3) Length matching is only done within a byte. Length matching across bytes is neither required nor recommended.

(4) Each DQS pair is length matched to its associated byte.

(5) Center-to-center spacing is allowed to fall to minimum 2w for up to 1250 mils of routed length.

(6) Other DDR3 trace spacing means other DDR3 net classes not within the byte.

(7) This applies to spacing within the net classes of a byte.

(8) DQS pair spacing is set to ensure proper differential impedance.

(9) The most important thing to do is control the impedance so inadvertent impedance mismatches are not created. Generally speaking, center-to-center spacing should be either 2w or slightly larger than 2w to achieve a differential impedance equal to twice the single-ended impedance, Zo.

(10) Via count difference may increase by 1 only if accurate 3-D modeling of the signal flight times – including accurately modeled signal propagation through vias – has been applied to ensure DBn skew and DQSn to DBn skew maximums are not exceeded.

## 8 Device and Documentation Support

TI offers an extensive line of development tools, including methods to evaluate the performance of the processors, generate code, develop algorithm implementations, and fully integrate and debug software and hardware modules as listed below.

### 8.1 Device Nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all microprocessors (MPUs) and support tools. Each device has one of three prefixes: X, P, or null (no prefix) (for example, TDA2Ex). Texas Instruments recommends two of three possible prefix designators for its support tools: TMDX and TMDS. These prefixes represent evolutionary stages of product development from engineering prototypes (TMDX) through fully qualified production devices and tools (TMDS).

Device development evolutionary flow:

- X** Experimental device that is not necessarily representative of the final device's electrical specifications and may not use production assembly flow.
- P** Prototype device that is not necessarily the final silicon die and may not necessarily meet final electrical specifications.
- null** Production version of the silicon die that is fully qualified.

Support tool development evolutionary flow:

- TMDX** Development-support product that has not yet completed Texas Instruments internal qualification testing.
- TMDS** Fully-qualified development-support product.

X and P devices and TMDX development-support tools are shipped against the following disclaimer:

"Developmental product is intended for internal evaluation purposes."

Production devices and TMDS development-support tools have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

Predictions show that prototype devices (X or P) have a greater failure rate than the standard production devices. Texas Instruments recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

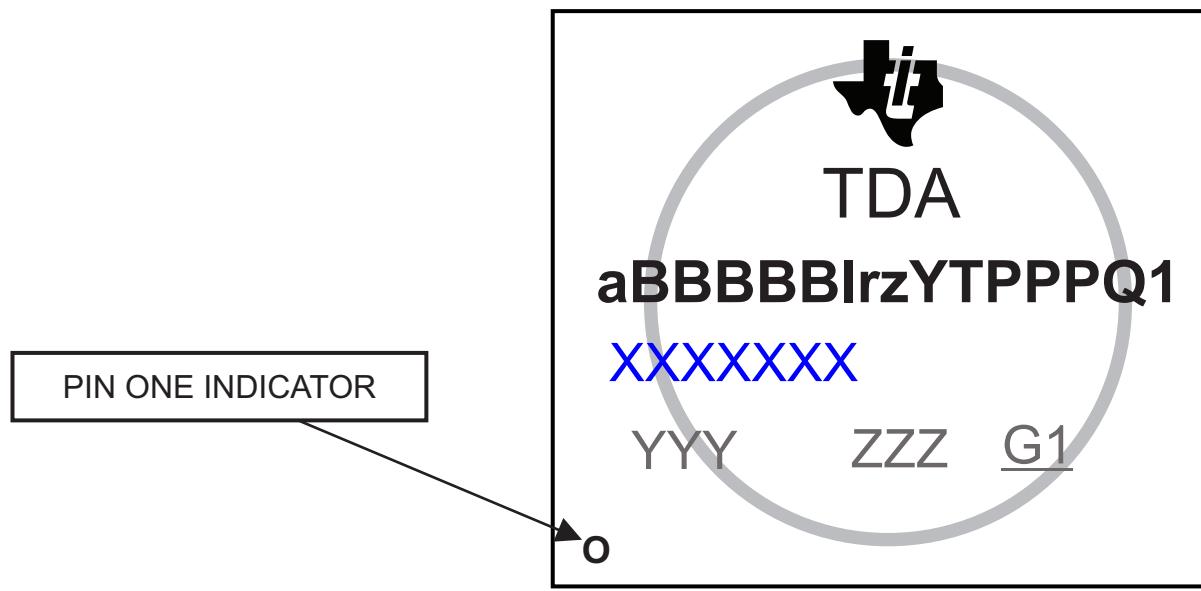

For orderable part numbers of TDA2Ex devices in the CBD package type, see the Package Option Addendum of this document, the TI website ([ti.com](http://ti.com)), or contact your TI sales representative.

For additional description of the device nomenclature markings on the die, see the [TDA2Ex SoC for Advanced Driver Assistance Systems \(ADAS\) 23mm \(ABC\) Package \(SR2.0, SR1.0\) 17mm \(CBD\) Package \(SR2.1, SR2.0\)](#).

#### 8.1.1 Standard Package Symbolization

##### NOTE

Some devices may have a cosmetic circular marking visible on the top of the device package which results from the production test process. In addition, some devices may also show a color variation in the package substrate which results from the substrate manufacturer. These differences are cosmetic only with no reliability impact.

SWPS859\_PACK\_01

Figure 8-1. Printed Device Reference

### 8.1.2 Device Naming Convention

Table 8-1. Nomenclature Description

FIELD PARAMETER	FIELD DESCRIPTION	VALUES		DESCRIPTION
		SYMBOLIZATION	ORDERABLE	
a	Device evolution stage	X	Contact TI	Prototype
		P		Preproduction (production test flow, no reliability data)
		BLANK		Production
BBBBB <sup>(3)</sup>	Base production part number	TDA2E		ADAS 2 <sup>nd</sup> Generation Entry Tier
I	Device Identity	V		Scene Viewing
		G		GFX enabled
r	Device revision	BLANK		SR 1.0
		A		SR 2.0
		B		SR 2.1
z	Device Speed	D		Indicates the speed grade for each of the cores in the device. For more information see Table 3-1, <i>Device Comparison</i> .
		H		
Y	Device type	BLANK		General purpose (Prototype and Production)
		E		Emulation (E) devices
		D		High security prototype devices with TI Development keys (D)
		S		High-Security device, Secure Boot Supported
T	Temperature	Q		Full temp range: -40°C to 125°C
PPP	Package designator	CBD		S-PBGA-N538 (17mm × 17mm) Package
c	Carrier designator	N/A	BLANK	Tray
		N/A	R	Tape & Reel
Q1	Automotive Designator	BLANK		Not meeting automotive qualification
		Q1		Meeting Q100 equal requirements, with exceptions as specified in DM.
XXXXXX	Lot Trace Code	As marked	N/A	

**Table 8-1. Nomenclature Description (continued)**

<b>FIELD PARAMETER</b>	<b>FIELD DESCRIPTION</b>	<b>VALUES</b>		<b>DESCRIPTION</b>
		<b>SYMBOLIZATION</b>	<b>ORDERABLE</b>	
YYY	Production Code, For TI use only	As marked	N/A	
ZZZ	Production Code, For TI use only	As marked	N/A	
O	Pin one designator	As marked	N/A	
G1	ECAT—Green package designator	As marked	N/A	

- (1) To designate the stages in the product development cycle, TI assigns prefixes to the part numbers. These prefixes represent evolutionary stages of product development from engineering prototypes through fully qualified production devices.  
 Prototype devices are shipped against the following disclaimer:  
 "This product is still under development and is intended for internal evaluation purposes."  
 Notwithstanding any provision to the contrary, TI makes no warranty expressed, implied, or statutory, including any implied warranty of merchantability or fitness for a specific purpose, of this device.
- (2) Applies to device max junction temperature.
- (3) X777 base part number with X speed grade indicator is the part number for the superset device. Software should constrain the features and speed used to match the intended production device.

#### **NOTE**

BLANK in the symbol or part number is collapsed so there are no gaps between characters.

## 8.2 Tools and Software

The following products support development for TDA2Ex platforms:

### Design Kits and Evaluation Modules

#### **TDA2EX17 Evaluation Module**

The TDA2Ex-17 EVM is an evaluation platform designed to speed up development efforts and reduce time-to-market for ADAS applications. The EVM is based on the TDA2Eco SoC, which incorporates a heterogeneous, scalable architecture that includes a mix of TI's fixed and floating-point TMS320C66x digital signal processor (DSP) core, ARM Cortex-A15 MP core, 3D GPU core, H.264 encode/decode acceleration, and dual Cortex-M4 processor cores. The EVM also integrates a host of peripherals including multicamera interfaces (both parallel and serial) for LVDS-based surround view systems, displays, CAN, and GigB Ethernet AVB. The main board integrates these key peripherals such as Ethernet, FPD-Link and HDMI, while the Visionapplication board provides interfaces for popular imagers.

### Development tools

#### **Clock Tree Tool for Sitara, Automotive, Vision Analytics, & Digital Signal Processors**

The Clock Tree Tool (CTT) for Sitara™ Arm®, Automotive, and Digital Signal Processors is an interactive clock tree configuration software that provides information about the clocks and modules in these TI devices. It allows the user to: Visualize the device clock tree. Interact with clock tree elements and view the effect on PRCM registers. Interact with the PRCM registers and view the effect on the device clock tree. View a trace of all the device registers affected by the user interaction with clock tree.

#### **XDS110 JTAG Debug Probe**

The Texas Instruments XDS110 is a new class of debug probe (emulator) for TI embedded processors. The XDS110 replaces the XDS100 family while supporting a wider variety of standards (IEEE1149.1, IEEE1149.7, SWD) in a single pod. Also, all XDS debug probes support Core and System Trace in all Arm and DSP processors that feature an Embedded Trace Buffer (ETB).

The Texas Instruments XDS110 connects to the target board via a TI 20-pin connector (with multiple adapters for TI 14-pin and, Arm 10-pin and Arm 20-pin) and to the host PC via USB2.0 High Speed (480Mbps). It also features two additional connections: the Auxiliary 14-pin port connector that enables EnergyTrace™, a full duplex UART port and four General-Purpose I/Os, and the Expansion 30-pin connector to connect the XDS110 EnergyTrace HDR add-on.

## Models

[TDA2Ex-17 BSDL Model](#) BSDL Model

[TDA2Ex-17 IBIS Model](#) IBIS Model

[TDA2Ex-17 Thermal Model](#) Thermal Model

For a complete listing of development-support tools for the processor platform, visit the Texas Instruments website at [www.ti.com](http://www.ti.com). For information on pricing and availability, contact the nearest TI field sales office or authorized distributor.

## 8.3 Documentation Support

To receive notification of documentation updates, navigate to the device product folder on [ti.com](http://ti.com). In the upper right corner, click on *Alert me* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

The following documents describe the TDA2Ex devices.

### Technical Reference Manual

[TDA2Ex SoC for Advanced Driver Assistance Systems \(ADAS\) 23mm \(ABC\) Package \(SR2.0, SR1.0\) 17mm \(CBD\) Package \(SR2.1, SR2.0\)](#)

Details the integration, the environment, the functional description, and the programming models for each peripheral and subsystem in the TDA3 family of devices.

### Errata

[TDA2Ex SoC for Advanced Driver Assistance Systems \(ADAS\) 23mm \(ABC\) Package \(SR2.0, SR1.0\) 17mm \(CBD\) Package \(SR2.1, SR2.0\)](#)

Describes the known exceptions to the functional specifications for the device.

## 8.4 Related Links

The table below lists quick access links. Categories include technical documents, support and community resources, tools and software, and quick access to sample or buy.

**Table 8-2. Related Links**

PARTS	PRODUCT FOLDER	SAMPLE & BUY	TECHNICAL DOCUMENTS	TOOLS & SOFTWARE	SUPPORT & COMMUNITY
TDA2EG-17	<a href="#">Click here</a>				

## 8.5 Support Resources

[TI E2E™ support forums](#) are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

## 8.6 Trademarks

E2E is a trademark of Texas Instruments.

OpenCL is a trademark of Apple, Inc.

Arm, Cortex, Thumb are registered trademarks of Arm Limited (or its subsidiaries) in the US and/or elsewhere.

HDMI is a trademark of HDMI Licensing, LLC.

PowerVR is a trademark of Imagination Technologies Limited.

JTAG is a registered trademark of JTAG Technologies, Inc.

Direct3D is a registered trademark of Microsoft Corporation in the United States and other countries.

MIPI is a registered trademark of Mobile Industry Processor Interface (MIPI) Alliance.

MMC, eMMC are trademarks of MultiMediaCard Association.

PCI Express is a registered trademark of PCI-SIG.

SD is a registered trademark of Toshiba Corporation.

Vivante is a registered trademark of Vivante Corporation.

All other trademarks are the property of their respective owners.

## 8.7 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

## 8.8 Glossary

**TI Glossary** This glossary lists and explains terms, acronyms, and definitions.

## 9 Mechanical, Packaging, and Orderable Information

### 9.1 Packaging Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

The device package has been specially engineered with a technology called Via Channel. The Via Channel Array technology allows larger than normal PCB via sizes, reduces the number of PCB signal layers required in a PCB design with this package, and will substantially reduce PCB costs compared to a full array 0.65mm pitch package.

**PACKAGING INFORMATION**

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TDA2EGBHQCBDRQ1	ACTIVE	FCCSP	CBD	538	750	RoHS & Green	Call TI	Level-3-260C-168 HR	-40 to 125	TDA2EGBHQCBDRQ1 TDA 784 784 CBD G1	Samples

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

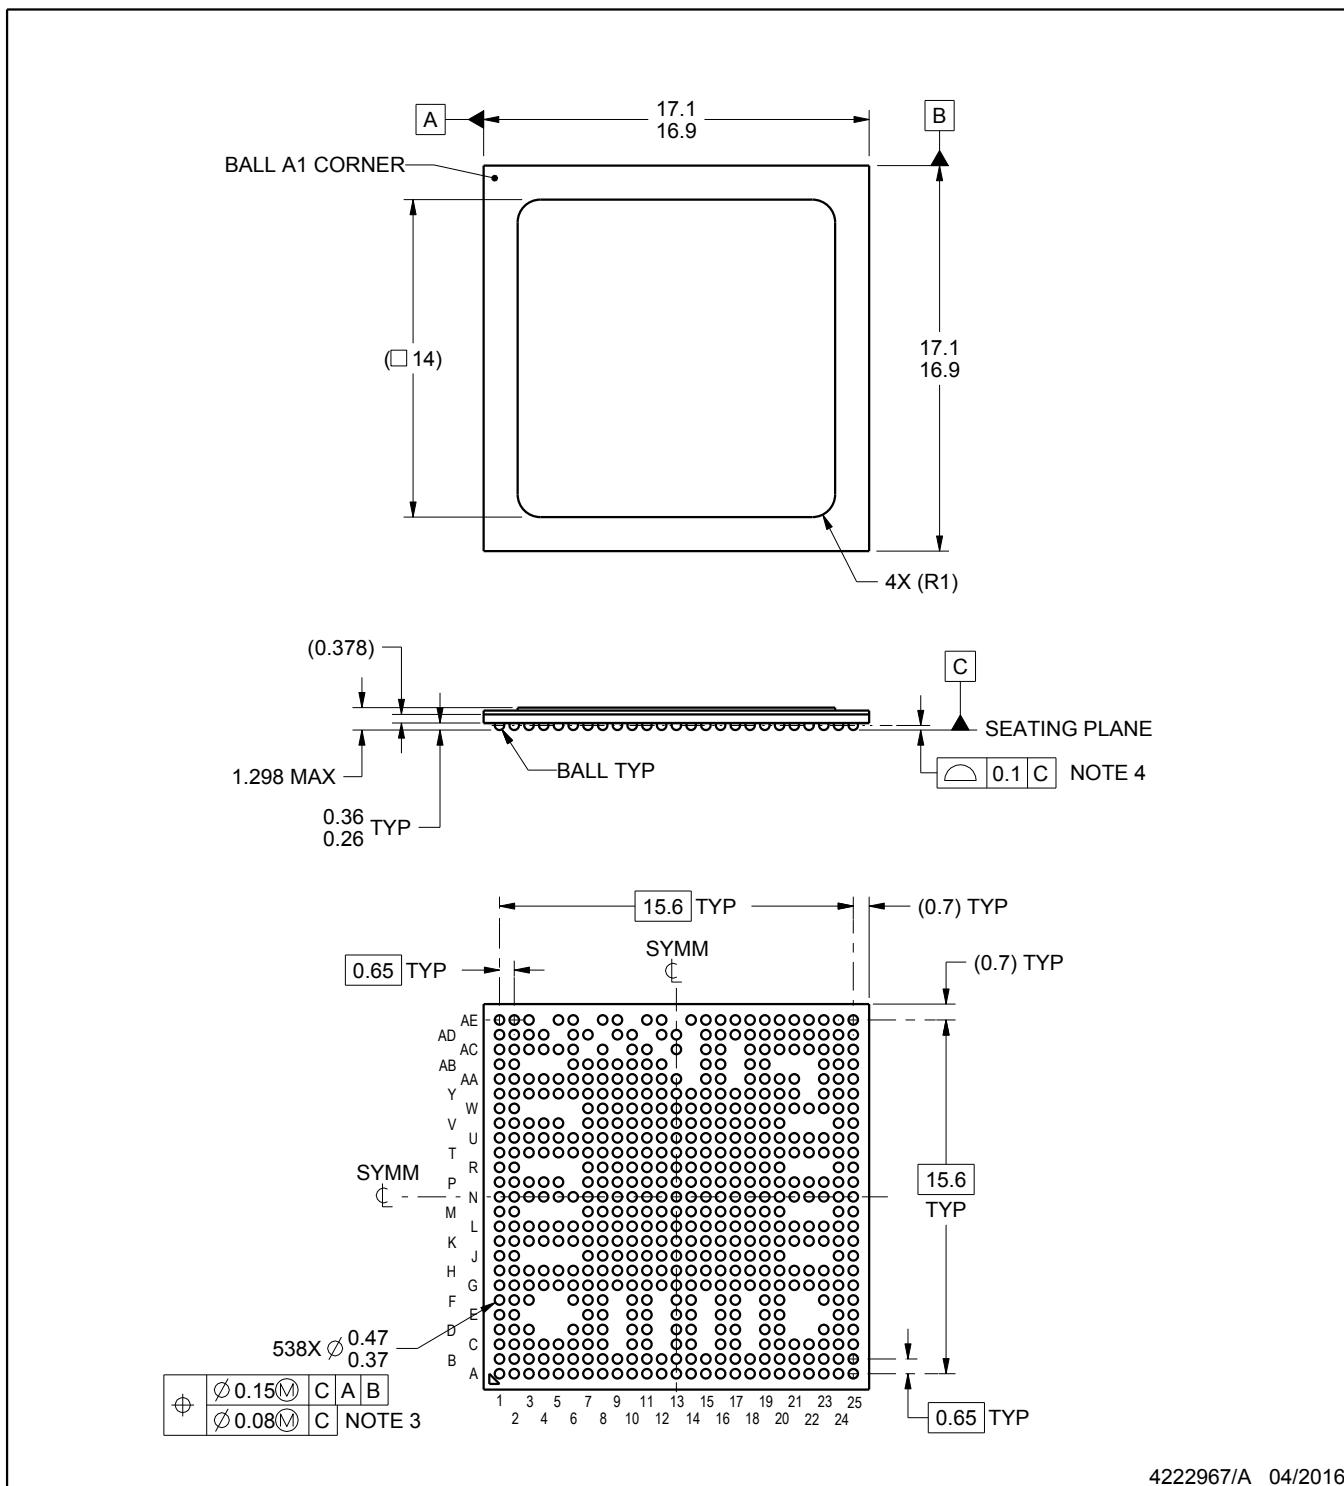

# PACKAGE OUTLINE

**CBD0538A**

**FCBGA - 1.298 mm max height**

BALL GRID ARRAY

4222967/A 04/2016

NOTES:

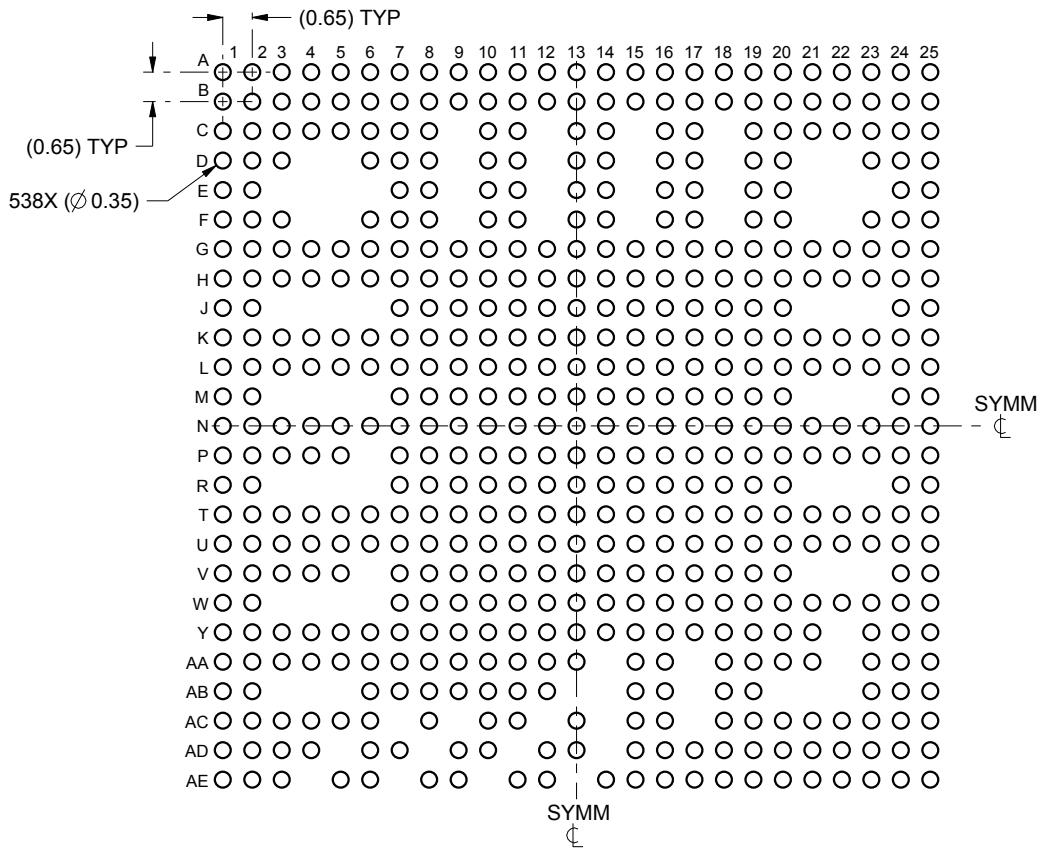

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. Dimension is measured at the maximum solder ball diameter, parallel to primary datum C.
4. Primary datum C and seating plane are defined by the spherical crowns of the solder balls.
