# Specifying Selected Op Amps and Comparators

National Semiconductor  
Linear Brief 26  
October 1973

It is not infrequent that commercially available standard IC components do not fit a particular application as they are specified. Often, however, a standard device selected to tighter limits will work. Thereupon, the IC manufacturer may be requested to supply a specially tested device.

The usual chain of events for a selected part is as follows: A specification is sent to the manufacturer with a request for quote. It is evaluated at the manufacturer for feasibility, yield, and testing requirements. Then price and delivery are quoted to the customer. (Sometimes this route is shortened by calling the manufacturer—but this does not always work.)

Some insight into the IC design and IC testing can help both the manufacturer and IC user with special selection. Proper specification helps the manufacturer test as well as reduce IC costs. Ambiguous or impossible specs will usually result in the return of the specification to the customer for clarification and delay the delivery of the required parts.

The manufacturer is usually familiar with the product and production spread of devices. Further, test equipment is available for measuring parameters specified by the data sheet. In general, tightening selected data sheet parameters causes no problems. Further, no additional test equipment is needed for these tests—only the limits need be changed.

Perhaps one of the largest problems is over-specification. Each tightened specification reduces the number of parts available to the specification. For example, tightening several specifications at once could result in a 1% or 0.1% yield; to supply 100 parts at this yield, between 10,000 and 100,000 parts might have to be tested, and that gets expensive.

Of course, spec limits cannot be tightened to any desired value. This is due to limitations on the IC design. For example, bias current, which depends on transistor  $H_{fe}$ ; can not be tightened by a factor of 10. This would require beta's 10 times higher than normal. Also, some specifications are not independent, such as op amp bandwidth and slew-rate.

## Op Amp and Comparators

These are the two most popular linear IC components requiring selection. Since many of the same specifications apply to both types of devices, they will be covered together. *Table 1* shows the most common parameters tested on these devices and the relative difficulty of testing on high speed equipment.

Selected offset voltage and drift are very commonly specified parameters. Offset voltage and drift depends on component matching. In general, drift is not usually tested on general purpose devices; although, it may be guaranteed. Offset voltage can be correlated to drift, and the offset limits are set to guarantee the standard drift specification. Of course, very low drift devices must be 100% tested for drift, making them

relatively expensive. Drift testing requires measuring the offset voltage at three or more temperatures; then subtracting and dividing by the temperature change to obtain the drift—a long and tedious measurement.

In some cases tightened offset voltage specifications over the operating temperature range offer the same performance as a drift tested device, but are less expensive. This is because offset voltage measurement can be a go/no-go measurement. For example,  $15 \mu\text{V}/^\circ\text{C}$  can be guaranteed over a  $100^\circ\text{C}$  range by limiting the maximum offset voltage to  $\pm 0.75 \text{ mV}$  or a 1.5 mV band. If the application has an error budget of  $\pm "X"$  volts, it may be better to tighten the offset voltage rather than have the manufacturer to drift test. Drift testing a comparator is virtually impossible since they are not designed to operate closed loop.

Other parameters dependent upon matching are: offset current, common mode rejection, and supply rejections. These can be greatly tightened at the expense of yield.

Bias current, supply current, gain, slew rate, and response time are dependent upon both device design and processing. The limits for tighter parameters on these specifications are more restrictive. *Table 2* gives reasonable special selection limits. This is only a guideline and, of course, depends on the device.

Noise testing is in a class by itself. Op amp noise will vary between manufacturers of the same device. Further, noise will vary between different types of devices from the same manufacturer. Since noise on a particular device is mostly process dependent, it will be relatively constant from a single IC producer.

Noise can be broken into two categories: white noise, and popcorn noise. Both of these noise sources can be either voltage or current noise. It is possible with advanced processing to make IC transistors as good as the best discrete low noise transistors. With good processing only a very small percentage of op amps will have any popcorn noise.

Noise measurements are time consuming and costly. Popcorn noise testing may take as much as 30 seconds per unit which limits production to about 100 devices per hour. This low production rate will increase costs. If not absolutely necessary—do not specify noise.

As a final note, some mention should be made of other special testing. Anything reasonable can be done; however, it should be kept in mind that accurate specification in terms of the IC parameters is necessary. It is unlikely a positive result will come from a specification showing a system schematic, system output, and stating "select devices to produce desired outputs." Although this is an exaggeration, it points out the type of specification to be avoided. Performance specification should apply to the IC not to a circuit using the IC. Many manufacturers have circuits available showing the various electrical tests and the way they are done.

## Op Amp and Comparators (Continued)

**TABLE 1. Relative Ease of Parameter Testing**

| Parameter                    | Op Amp                                       | Comparator                                   | Cost           |
|------------------------------|--|--|----------------|
| Offset Voltage               | Easy   | Easy   | Low            |
| Offset Current               | Easy   | Easy   | Low            |
| Bias Current                 | Easy   | Easy   | Low            |
| Supply Current               | Easy   | Easy   | Low            |
| Common Mode/Supply Rejection | Easy   | Easy   | Low            |
| Gain                         | Moderate                                     | Moderate                                     | Low            |
| Input Resistance             | Guaranteed by<br>Bias Current<br>Measurement | Guaranteed by<br>Bias Current<br>Measurement | Not Tested     |
| Slew Rate                    | Moderate                                     | Moderate                                     | Relatively Low |
| Bandwidth/Response Time      | Difficult                                    | Difficult                                    | Moderate       |
| Offset Voltage Drift         | Very Difficult                               | Very Difficult                               | High           |
| Offset Current Drift         | Very Difficult                               | Very Difficult                               | High           |

**TABLE 2. Guideline to Tightened Specifications**

| Parameters                   | Limit  | Comments                                     |
|------------------------------|--|--|
| Offset Voltage               | 0.1 mV                                       | Matching                                     |
| Offset Current               | -50% of Nominal                              | Matching                                     |
| Bias Current                 | -50% of Nominal                              | Depends on $H_{fe}$                          |
| Supply Current               | -25% of Nominal                              | Depends on Various Process<br>Parameters     |
| Gain                         | +100% of Nominal                             | Set by Design                                |
| Common Mode/Supply Rejection | +200% of Nominal                             | Matching                                     |
| Slew Rate                    | +30% of Nominal                              | Set by Design                                |
| Bandwidth                    | +30% of Nominal                              | Set by Design                                |
| Response Time                | -30% of Nominal                              | Set by Design and Processing                 |
| Offset Voltage Drift         | 0.2 $\mu V/^{\circ}C$ to 5 $\mu V/^{\circ}C$ | Lower Limit May Not Apply<br>to Many Op Amps |
| Offset Current Drift         | Guarantee by Offset<br>Current Limit         |  |

### LIFE SUPPORT POLICY

NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT AND GENERAL COUNSEL OF NATIONAL SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
