AM26LV32 低压高速四路差分线路接收器

1 特性

- 开关频率高达 32MHz
- 由 3.3V 单电源供电
- 超低功耗：27mW（典型值）
- 开路、短路及终止失效防护
- 具有 ±200mV 灵敏度的 −0.3V 至 5.5V 共模范围
- 接受具有 3.3V V_{CC} 的 5V 逻辑输入
- 输入迟滞：50mV（典型值）
- 32MHz 具有四个接收器时为 235mW
- 与 AM26C32 和 AM26LS32 引脚对引脚兼容

2 应用

- 高可靠性汽车应用
- 工厂自动化
- ATM 和点钞机
- 智能电网
- 交流和伺服电机驱动器

3 说明

AM26LV32 器件是一款具有三态输出的 BiCMOS 四路差分线路接收器，其设计类似于 TIA/EIA-422-B 和 ITU Recommendation V.11 接收器，但由于电源电压降低，共模电压范围减小。

这款器件经过优化，可在高达 32MHz 的开关速率下实现平衡总线传输。四个接收器均具有使能功能，该功能提供了两种可选输入：高电平有效输入和低电平有效输入。通过三态输出，该器件可直接连接至总线组织式系统。每个器件都具有高输入阻抗、用于提高抗噪能力的输入滞后，以及在 −0.3V 至 5.5V 的共模输入电压范围内 ±200mV 的输入灵敏度。当输入开路时，输出处于逻辑高电平状态。

AM26LV32C 的特点是可在 0°C 至 70°C 的温度范围内工作。AM26LV32I 的特点是可在 -40°C 至 85°C 的温度范围内工作。

封装信息

器件型号	封装(1)	封装尺寸(2)
AM26LV32	SOIC (16)	9.9mm × 6mm
	SO (16)	10.2mm × 7.8mm

(1) 如需了解所有可用封装，请参阅数据表末尾的可订购产品附录。

(2) 封装尺寸（长 x 宽）为标称值，并包括引脚（如适用）。

6 Specifications

6.1 Absolute Maximum Ratings

Over operating free-air temperature range (unless otherwise noted)(1)

	MIN	MAX	UNIT
Supply voltage, V_{CC} (2)	–0.3	6	V
Input voltage, V_I	–4	8	V
Differential input voltage, V_{ID} (3)		±12	V
Enable input voltage	–0.3	6	V
Output voltage, V_O	–0.3	6	V
Maximum output current, I_O		±25	mA
Storage temperature, T_{stg}	–65	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) All voltage values are with respect to the GND terminal.
(3) Differential input voltage is measured at the noninverting input with respect to the corresponding inverting input.

6.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001(1)	±500	V
		Charged-device model (CDM), per JEDEC specification JESD22-C101(2)	±500	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
Supply voltage, V_{CC}		3	3.3	3.6	V
High-level input voltage, $V_{IH(EN)}$		2			V
Low-level input voltage, $V_{IL(EN)}$				0.8	V
Common-mode input voltage, V_{IC}		–0.3		5.5	V
Differential input voltage, V_{ID}				±5.8	V
High-level output current, I_{OH}				–5	mA
Low-level output current, I_{OL}				5	mA
Operating free-air temperature, T_A	AM26LV32C	0		70	°C
	AM26LV32I	–40		85	

6.4 Thermal Information

THERMAL METRIC[1] [2]		AM26LV32				
		D (SOIC)	DR (SOIC-Reel)	NS (SO)	NSR (SO-Reel)	UNIT
		16 PINS	16 PINS	16 PINS	16 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	72.9	84.6	74	88.5	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	32.4	43.5	31.1	46.2	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	30.4	43.2	34.8	50.7	°C/W
ψ_{JT}	Junction-to-top characterization parameter	5.4	10.4	5.1	13.5	°C/W
ψ_{JB}	Junction-to-board characterization parameter	30.1	42.8	34.5	50.3	°C/W

(1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report.
(2) The package thermal impedance is calculated in accordance with JESD 51.

6.5 Electrical Characteristics

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP[1]	MAX	UNIT
V_{IT+}	Differential input high-threshold voltage				0.2	V
V_{IT-}	Differential input low-threshold voltage		−0.2			V
V_{IK}	Enable input clamp voltage	I_I = − 18 mA		−0.8	−1.5	V
V_{OH}	High-level output voltage	V_{ID} = 200 mV, I_{OH} = −5 mA	2.4	3.2		V
V_{OL}	Low-level output voltage	V_{ID} = 200 mV, I_{OH} = 5 mA		0.17	0.5	V
I_{OZ}	High-impedance-state output current	V_O = 0 to V_{CC}			±50	μA
$I_{IH(E)}$	High-level enable input current	V_{CC} = 0 or 3 V, V_I = 5.5 V			10	μA
$I_{IL(E)}$	Low-level enable input current	V_{CC} = 3.6 V, V_I = 0 V			−10	μA
r_I	Input resistance		7	12		kΩ
I_I	Input current	V_I = 5.5 V or − 0.3 V, all other inputs GND			±700	μA
I_{CC}	Supply current	$V_{I(E)}$ = V_{CC} or GND, no load, line inputs open		8	17	mA
C_{pd}	Power dissipation capacitance[2]	One channel		150		pF

(1) All typical values are at V_{CC} = 3.3 V and T_A = 25°C.
(2) C_{pd} determines the no-load dynamic current: $I_S = C_{pd} \times V_{CC} \times f + I_{CC}$.

6.6 Switching Characteristics

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
t_{PLH}	Propagation delay time, low- to high-level output	See 图 7-1	8	16	20	ns
t_{PHL}	Propagation delay time, high- to low-level output	See 图 7-1	8	16	20	ns
t_t	Transition time (t_r or t_f)	See 图 7-1		5		ns
t_{PZH}	Output-enable time to high level	See 图 7-2		17	40	ns
t_{PZL}	Output-enable time to low level	See 图 7-3		10	40	ns
t_{PHZ}	Output-disable time from high level	See 图 7-2		20	40	ns
t_{PLZ}	Output-disable time from low level	See 图 7-3		16	40	ns
$t_{sk(p)}$ (1)	Pulse skew			4	14	ns
$t_{sk(o)}$ (2)	Pulse skew			4	14	ns
$t_{sk(pp)}$ (3)	Pulse skew (device to device)			6	9	ns

(1) $t_{sk(p)}$ is $|t_{PLH} - t_{PHL}|$ of each channel of the same device.
(2) $t_{sk(o)}$ is the maximum difference in propagation delay times between any two channels of the same device switching in the same direction.
(3) $t_{sk(pp)}$ is the maximum difference in propagation delay times between any two channels of any two devices switching in the same direction.

8 Detailed Description

8.1 Overview

The AM26LV32 device is a quadruple differential line receiver that meets the necessary requirements for NSI TIA/EIA-422-B, TIA/EIA-423-B, and ITU Recommendation V.10 and V.11. This device allows a low-power or low-voltage MCU to interface with heavy machinery, subsystems, and other devices through long wires of up to 1000 m, giving any design a reliable and easy-to-use connection. As with any RS422 interface, the AM26LV32 works in a differential voltage range, which enables very good signal integrity.

8.2 Functional Block Diagram

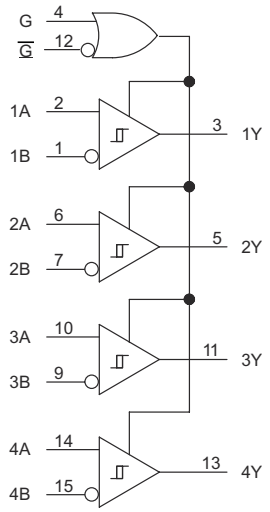

图 8-1. Logic Diagram (Positive Logic)

8.3 Feature Description

The device can be configured using the G and $\overline{G}$ logic inputs to select receiver output. The high voltage or logic 1 on the G pin allows the device to operate on an active-high, and having a low voltage or logic 0 on the $\overline{G}$ enables active-low operation. These are simple ways to configure the logic to match that of the receiving or transmitting controller or microprocessor.

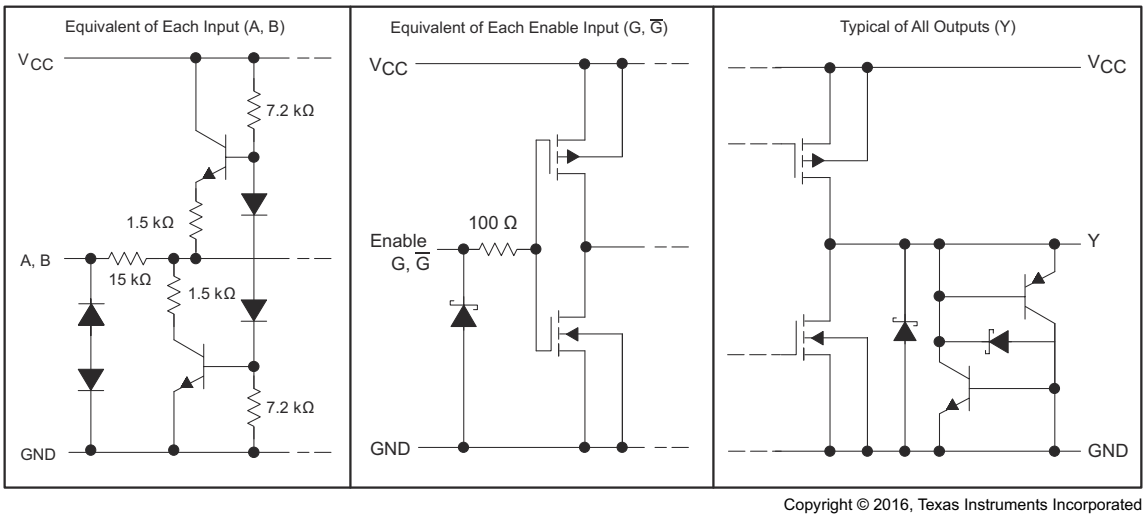

图 8-2. Schematics of Equivalent Inputs and Outputs

8.4 Device Functional Modes

The receivers implemented in these RS422 devices can be configured using the G and $\overline{G}$ logic pins to be enabled or disabled. This allows the option to ignore or filter out transmissions as desired. 表 8-1 lists the function of each receiver.

表 8-1. Function Table (Each Receiver)

DIFFERENTIAL INPUT	ENABLES		OUTPUT(1)
	G	$\overline{G}$	
$V_{ID} \geq 0.2$ V	H	X	H
	X	L	H
-0.2 V < V_{ID} < 0.2 V	H	X	?
	X	L	?
$V_{ID} \leq -0.2$ V	H	X	L
	X	L	L
Open, shorted, or terminated(2)	H	X	H
	X	L	H
X	L	H	Z

(1) H = high level, L = low level, X = irrelevant, Z = high impedance (off), ? = indeterminate
(2) See 节 9 section

8.4.1 Fail-Safe Conditions

The AM26LV32 is a quadruple differential line receiver that is designed to function properly when appropriately connected to active drivers. Applications do not always have ideal situations where all bits are being used, the receiver inputs are never left floating, and fault conditions do not exist. In actuality, most applications have the capability to either place the drivers in a high-impedance mode or power down the drivers altogether, and cables may be purposely (or inadvertently) disconnected, both of which lead to floating receiver inputs. Furthermore, even though measures are taken to avoid fault conditions like a short between the differential signals, this does occur. The AM26LV32 device has an internal fail-safe circuitry which prevents the device from putting an unknown voltage signal at the receiver outputs. In the following three cases, a high-state is produced at the respective output:

1. Open fail-safe: Unused input pins are left open. Do not tie unused pins to ground or any other voltage. Internal circuitry places the output in the high state.
2. 100-Ω terminated fail-safe: Disconnected cables, drivers in high-impedance state, or powered-down drivers does not cause the AM26LV32 to malfunction. The outputs remain in a high state under these conditions. When the drivers are either turned-off or placed into the high-impedance state, the receiver input may still be able to pick up noise due to the cable acting as an antenna. To avoid having a large differential voltage being generated, the use of twisted-pair cable induces the noise as a common-mode signal and is rejected.
3. Shorted fail-safe: Fault conditions that short the differential input pairs together does not cause incorrect data at the outputs. A differential voltage (V_{ID}) of 0 V forces a high state at the outputs. Shorted fail-safe, however, is not supported across the recommended common-mode input voltage (V_{IC}) range. An unwanted state can be induced to all outputs when an input is shorted and is biased with a voltage between −0.3 V and +5.5 V. The shorted fail-safe circuitry functions properly when an input is shorted, but with no external common-mode voltage applied.

8.4.2 Fail-Safe Precautions

The internal fail-safe circuitry was designed such that the input common-mode (V_{IC}) and differential (V_{ID}) voltages must be observed. To ensure the outputs of unused or inactive receivers remain in a high state when the inputs are open-circuited, shorted, or terminated, extra precaution must be taken on the active signal. In applications where the drivers are placed in a high-impedance mode or are powered-down, TI recommends that for 1, 2, or 3 active receiver inputs, the low-level input voltage (V_{IL}) must be greater than 0.4 V. As in all data transmission applications, it is necessary to provide a return ground path between the two remote grounds

(driver and receiver ground references) to avoid ground differences. 表 8-2 and 图 8-3 through 图 8-5 are examples of active input voltages with their respective waveforms and the effect each have on unused or inactive outputs. Note that the active receivers behave as expected, regardless of the input levels.

表 8-2. Active Receiver Inputs vs Outputs

1, 2, OR 3 ACTIVE INPUTS			SEE FIGURE	1, 2, OR 3 ACTIVE OUTPUTS	3, 2, OR 1 UNUSED OR INACTIVE OUTPUTS
V_{IL}	V_{ID}	V_{IC}			
900 mV	200 mV	1 V	图 8-3	Known state	High state
– 100 mV	200 mV	0 V	图 8-4	Known state	?
600 mV	800 mV	1 V	图 8-5	Known state	High state
0 mV	800 mV	400 mV	图 8-6	Known state	?

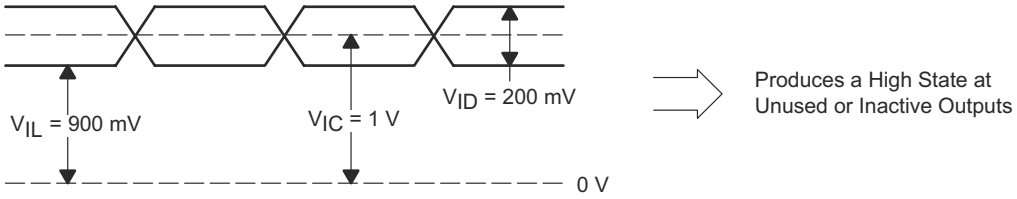

图 8-3. Waveform 1

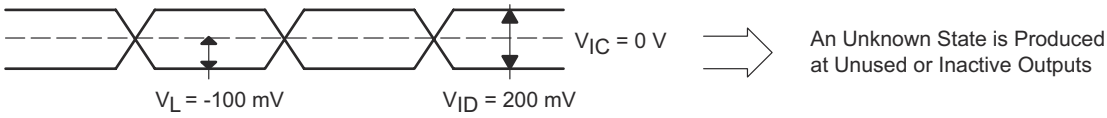

图 8-4. Waveform 2

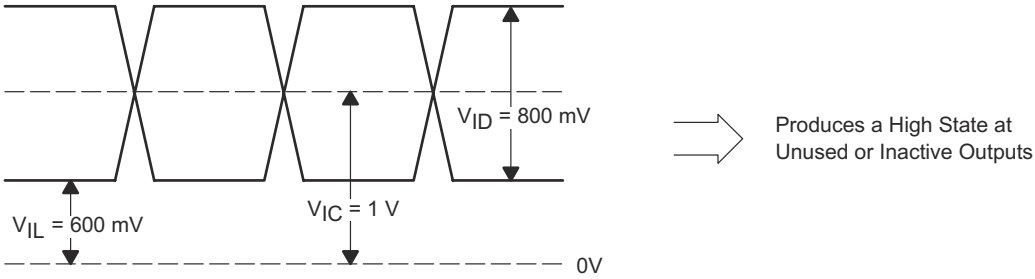

图 8-5. Waveform 3

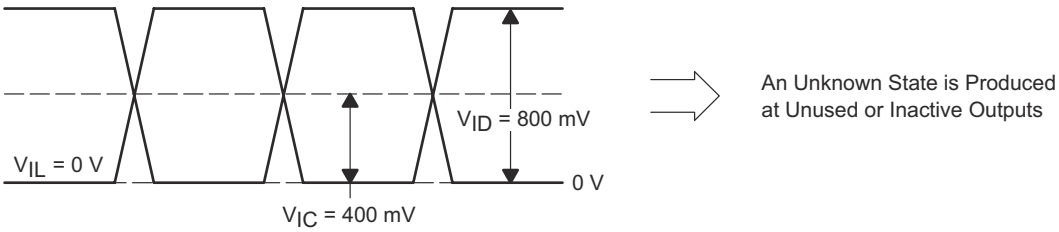

图 8-6. Waveform 4

In most applications, having a common-mode input close to ground and a differential voltage larger than 2 V is not customary. Because the common-mode input voltage is typically around 1.5 V, a 2-V V_{ID} would result in a V_{IL} of 0.5 V, thus satisfying the recommended V_{IL} level of greater than 0.4 V.

图 8-7 plots seven different input threshold curves from a variety of production lots and shows how the fail-safe circuitry behaves with the input common-mode voltage levels. These input threshold curves are representative samples of production devices. The curves specifically illustrate a typical range of input threshold variation. The

AM26LV32 is specified with ±200 mV of input sensitivity to account for the variance in input threshold. Each data point represents the input’s ability to produce a known state at the output for a given V_{IC} and V_{ID}. Applying a differential voltage at or above a certain point on a curve would produce a known state at the output. Applying a differential voltage less than a certain point on a curve would activate the fail-safe circuit and the output would be in a high state. For example, inspecting the top input threshold curve reveals that for a V_{IC} that is approximately 1.6 V, V_{ID} yields around 87 mV. Applying 90 mV of differential voltage to this particular production lot generates a known receiver output voltage. Applying a V_{ID} of 80 mV activates the input fail-safe circuitry and the receiver output is placed in the high state. Texas Instruments specifies the input threshold at ±200 mV, because normal process variations affect this parameter. Note that at common-mode input voltages around 0.2 V, the input differential voltages are low compared to their respective data points. This phenomenon points to the fact that the inputs are very sensitive to small differential voltages around 0.2 V V_{IC}. TI recommends that V_{IC} levels be kept greater than 0.5 V to avoid this increased sensitivity at $V_{IC} \approx 0.2$ V. In most applications, because V_{IC} typically is 1.5 V, the fail-safe circuitry functions properly to provide a high state at the receiver output.

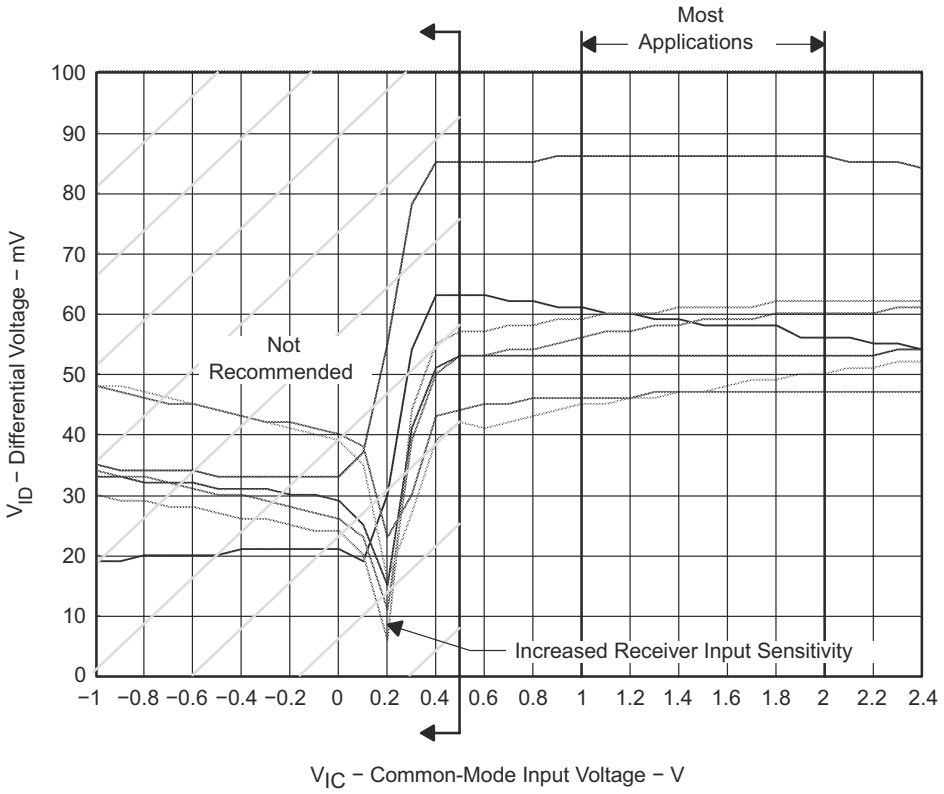

图 8-7. V_{IC} vs V_{ID} Receiver Sensitivity Levels

图 8-8 represents a typical application where two receivers are not used. In this case, there is no need to worry about the output voltages of the unused receivers because these are not connected in the system architecture.

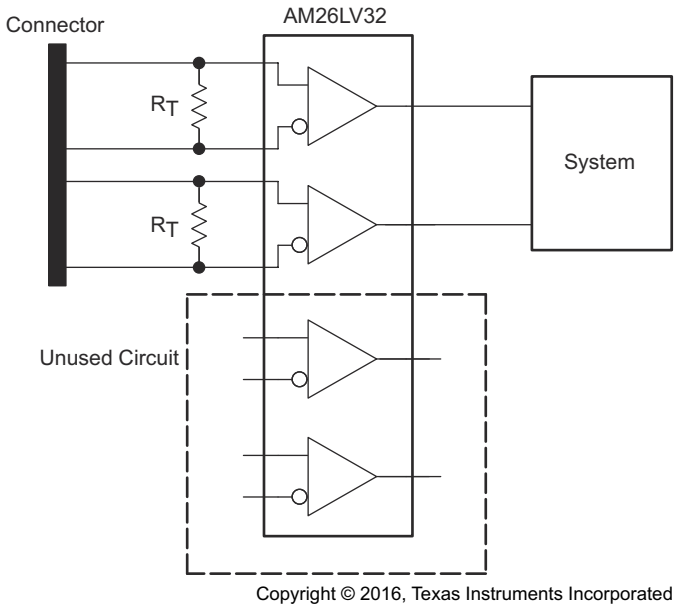

图 8-8. Typical Application With Unused Receivers

图 8-9 shows a common application where one or more drivers are either disabled or powered down. To ensure the inactive receiver outputs are in a high state, the active receiver inputs must have V_{IL} > 0.4 V and V_{IC} > 0.5 V.

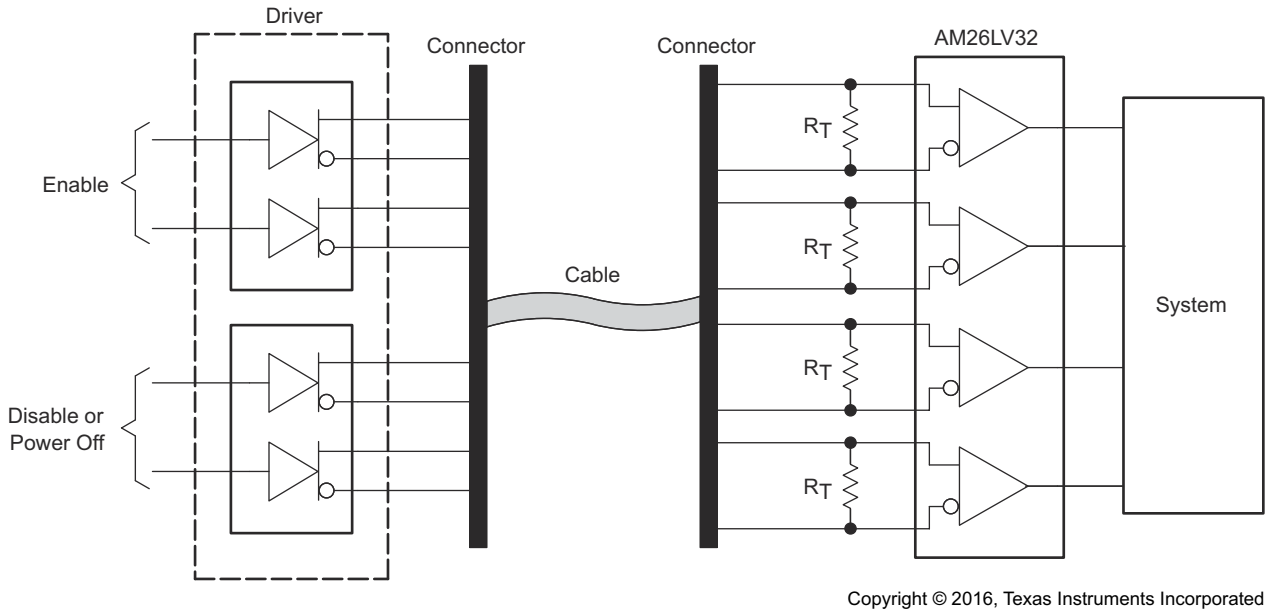

图 8-9. Typical Application Where Two or More Drivers Are Disabled

图 8-10 is an alternative application design to replace the application in 图 8-9. This design uses two AM26LV32 devices instead of one. However, this design does not require the input levels be monitored to ensure the outputs are in the correct state, only that they comply to the RS-232 standard.

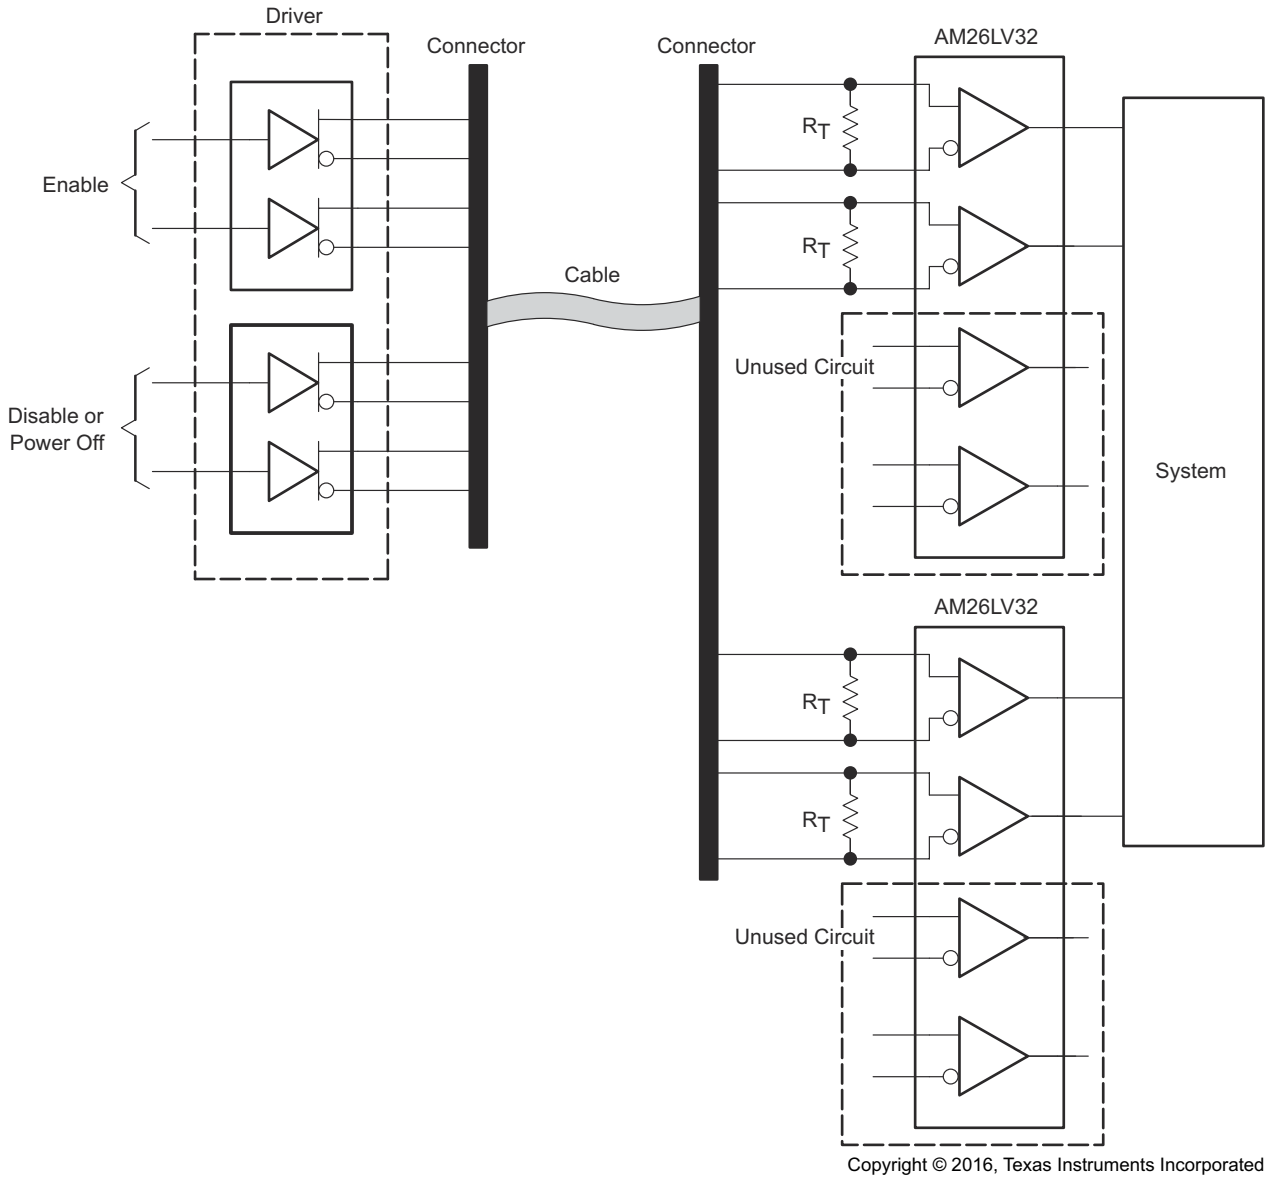

图 8-10. Alternative Solution for 图 8-9

图 8-11 and 图 8-12 show typical applications where a disconnected cable occurs. 图 8-11 illustrates a typical application where a cable is disconnected. Similar to 图 8-9, the active input levels must be monitored to make sure the inactive receiver outputs are in a high state. An alternative solution is shown in 图 8-12.

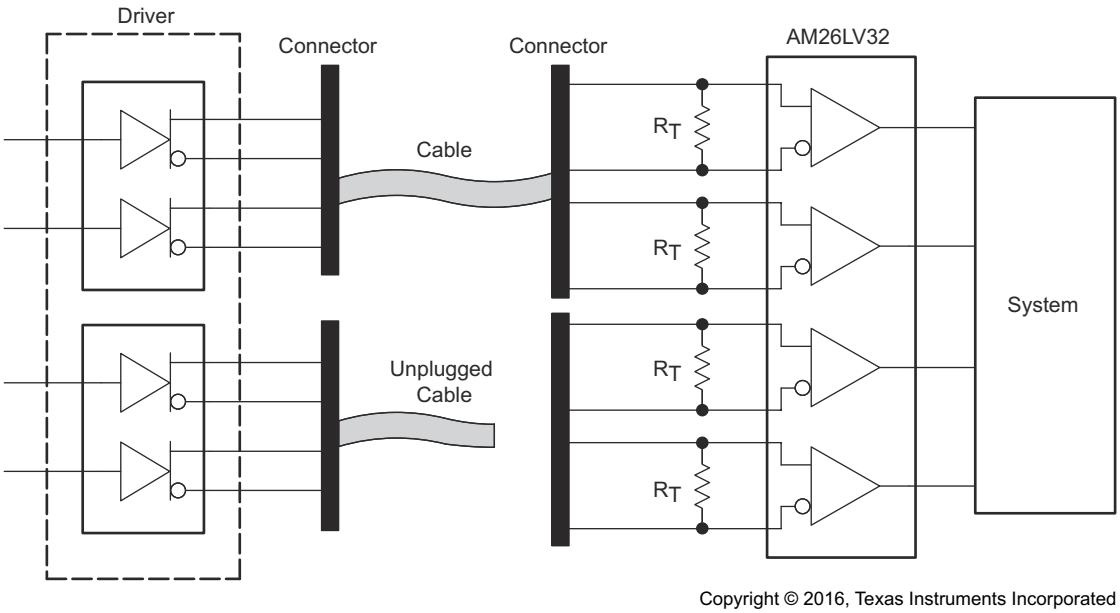

图 8-11. Typical Application Where Two or More Drivers Are Disconnected

图 8-12 is an alternative solution so the receiver inputs do not have to be monitored. This solution also requires the use of two AM26LV32 devices instead of one.

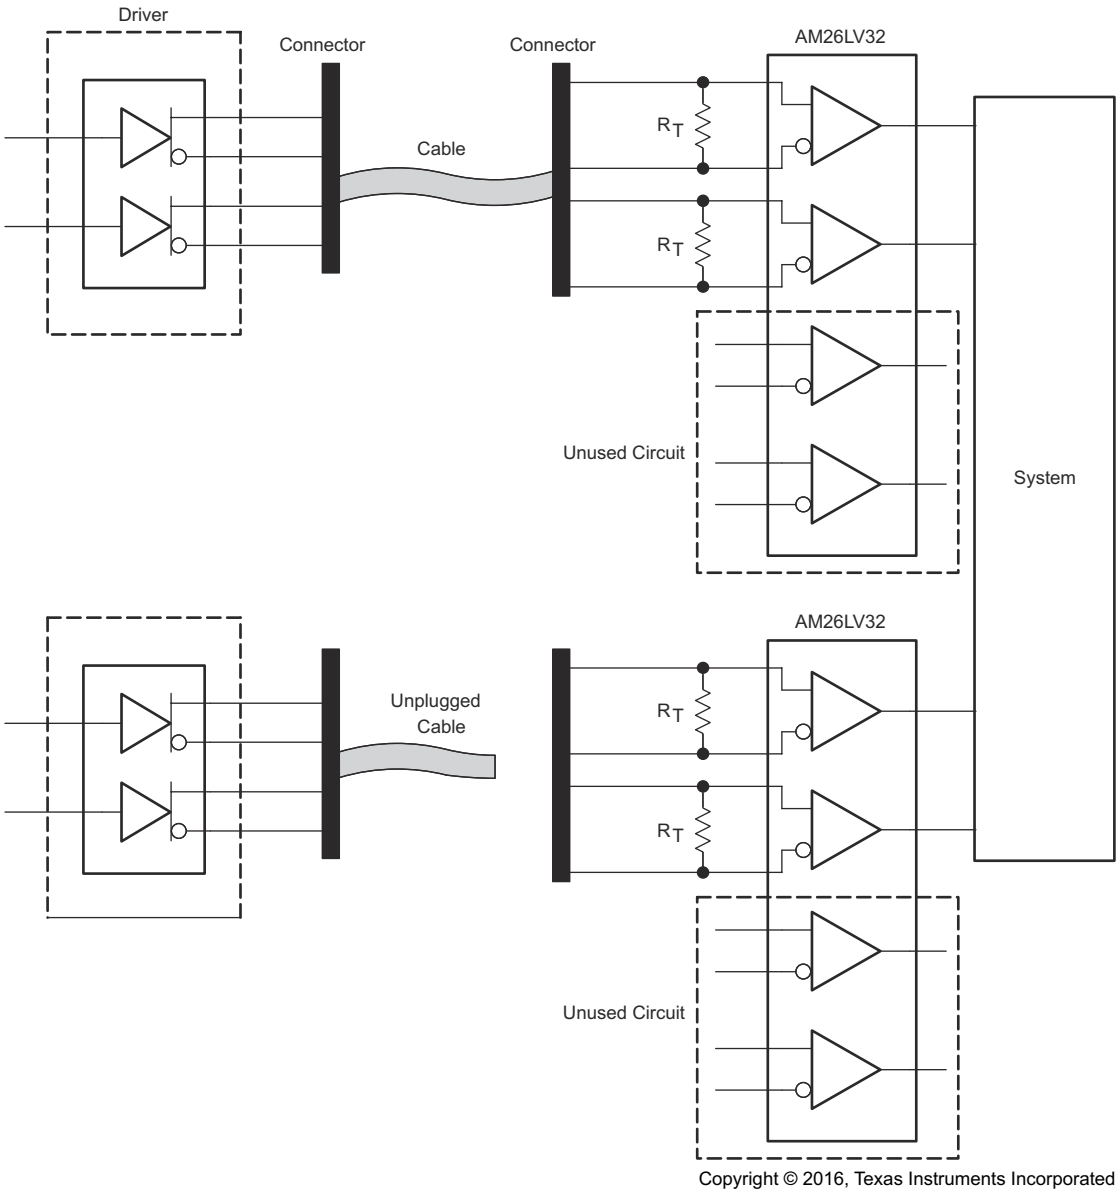

图 8-12. Alternative Solution to 图 8-11

When designing a system using the AM26LV32, the device provides a robust solution where fail-safe and fault conditions are of concern. The RS422-like inputs accept common-mode input levels from −0.3 V to 5.5 V with a specified sensitivity of ±200mV. As previously shown, take care with active input levels because this can affect the outputs of unused or inactive bits. However, most applications meet or exceed the requirements to allow the device to perform properly.

9 Application and Implementation

备注

以下应用部分中的信息不属于 TI 器件规格的范围，TI 不担保其准确性和完整性。TI 的客 户应负责确定器件是否适用于其应用。客户应验证并测试其设计，以确保系统功能。

9.1 Application Information

When designing a system that uses drivers, receivers, and transceivers that comply with RS422 or RS485, proper cable termination is essential for highly reliable applications with reduced reflections in the transmission line. Because RS422 allows only one driver on the bus, if termination is used, it is placed only at the end of the cable near the last receiver. In general, RS485 requires termination at both ends of the cable. Factors to consider when determining the type of termination usually are performance requirements of the application and the ever-present factor, cost. The different types of termination techniques include unterminated lines, parallel termination, ac termination, and multipoint termination.

9.2 Typical Application

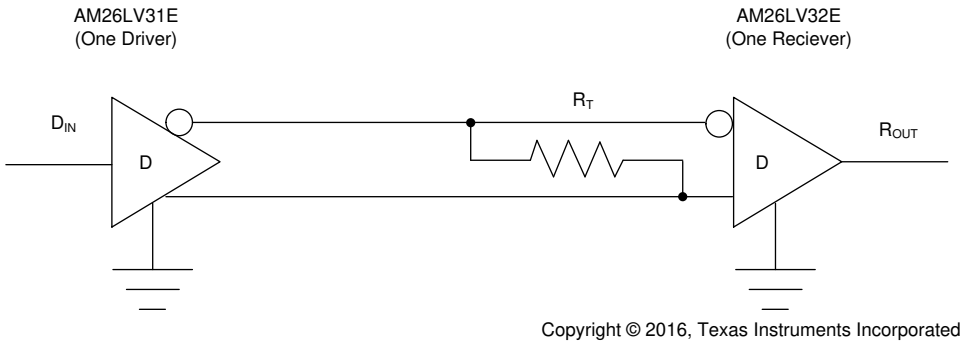

图 9-1. Differential Terminated Configuration

9.2.1 Design Requirements

Resistor and capacitor (if used) termination values vary from system to system. The termination resistor, R_T, must be within 20% of the characteristic impedance, R_{OUT}, of the cable and can vary from about 80 Ω to 120 Ω.

9.2.2 Detailed Design Procedure

图 9-1 shows a configuration with R_T as termination. Although reflections are present at the receiver inputs at a data signaling rate of 200 kbps with no termination, the RS422-compliant receiver reads only the input differential voltage and produces a clean signal at the output.

9.2.3 Application Curve

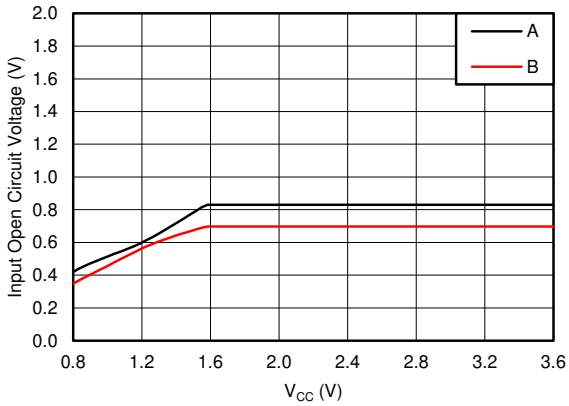

图 9-2. RS422 Port Open-Circuit Voltage vs V_{CC}

9.3 Power Supply Recommendations

Place 0.1-µF bypass capacitors close to the power-supply pins to reduce errors coupling in from noisy or high-impedance power supplies.

9.4 Layout

9.4.1 Layout Guidelines

For best operational performance of the device, use good PCB layout practices including:

- Noise can propagate into analog circuitry through the power pins of the circuit as a whole, as well as the operational amplifier. Bypass capacitors are used to reduce the coupled noise by providing low impedance power sources local to the analog circuitry.
- Connect low-ESR, 0.1-µF ceramic bypass capacitors between each supply pin and ground, placed as close to the device as possible. A single bypass capacitor from V+ to ground is applicable for single-supply applications.
- Separate grounding for analog and digital portions of circuitry is one of the simplest and most-effective methods of noise suppression. One or more layers on multilayer PCBs are usually devoted to ground planes. A ground plane helps distribute heat and reduces EMI noise pickup. Make sure to physically separate digital and analog grounds, and pay attention to the flow of the ground current.
- To reduce parasitic coupling, run the input traces as far away from the supply or output traces as possible. If it is not possible to keep them separate, it is much better to cross the sensitive trace perpendicular as opposed to in parallel with the noisy trace.
- Place the external components as close to the device as possible. Keeping RF and RG close to the inverting input minimizes parasitic capacitance.
- Keep the length of input traces as short as possible. Always remember that the input traces are the most sensitive part of the circuit.
- Consider a driven, low-impedance guard ring around the critical traces. A guard ring can significantly reduce leakage currents from nearby traces that are at different potentials.

10 Device and Documentation Support

10.1 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. In the upper right corner, click on *Alert me* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

10.2 支持资源

TI E2E™ 支持论坛是工程师的重要参考资料，可直接从专家获得快速、经过验证的解答和设计帮助。搜索现有解答或提出自己的问题可获得所需的快速设计帮助。

链接的内容由各个贡献者“按原样”提供。这些内容并不构成 TI 技术规范，并且不一定反映 TI 的观点；请参阅 TI 的《使用条款》。

10.3 Trademarks

TI E2E™ is a trademark of Texas Instruments.
所有商标均为其各自所有者的财产。

10.4 静电放电警告

静电放电 (ESD) 会损坏这个集成电路。德州仪器 (TI) 建议通过适当的预防措施处理所有集成电路。如果不遵守正确的处理和安装程序，可能会损坏集成电路。

ESD 的损坏小至导致微小的性能降级，大至整个器件故障。精密的集成电路可能更容易受到损坏，这是因为非常细微的参数更改都可能会导致器件与其发布的规格不相符。

10.5 术语表

TI 术语表	本术语表列出并解释了术语、首字母缩略词和定义。

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

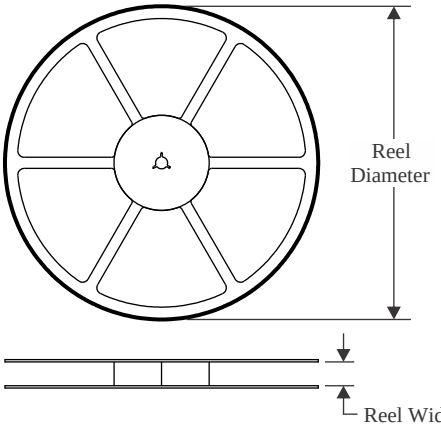
(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

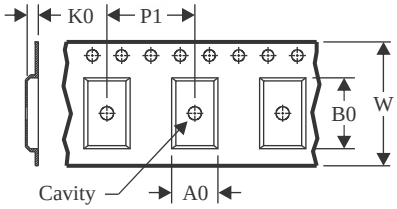
(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

TAPE AND REEL INFORMATION

REEL DIMENSIONS



TAPE DIMENSIONS



A0	Dimension designed to accommodate the component width
B0	Dimension designed to accommodate the component length
K0	Dimension designed to accommodate the component thickness
W	Overall width of the carrier tape
P1	Pitch between successive cavity centers

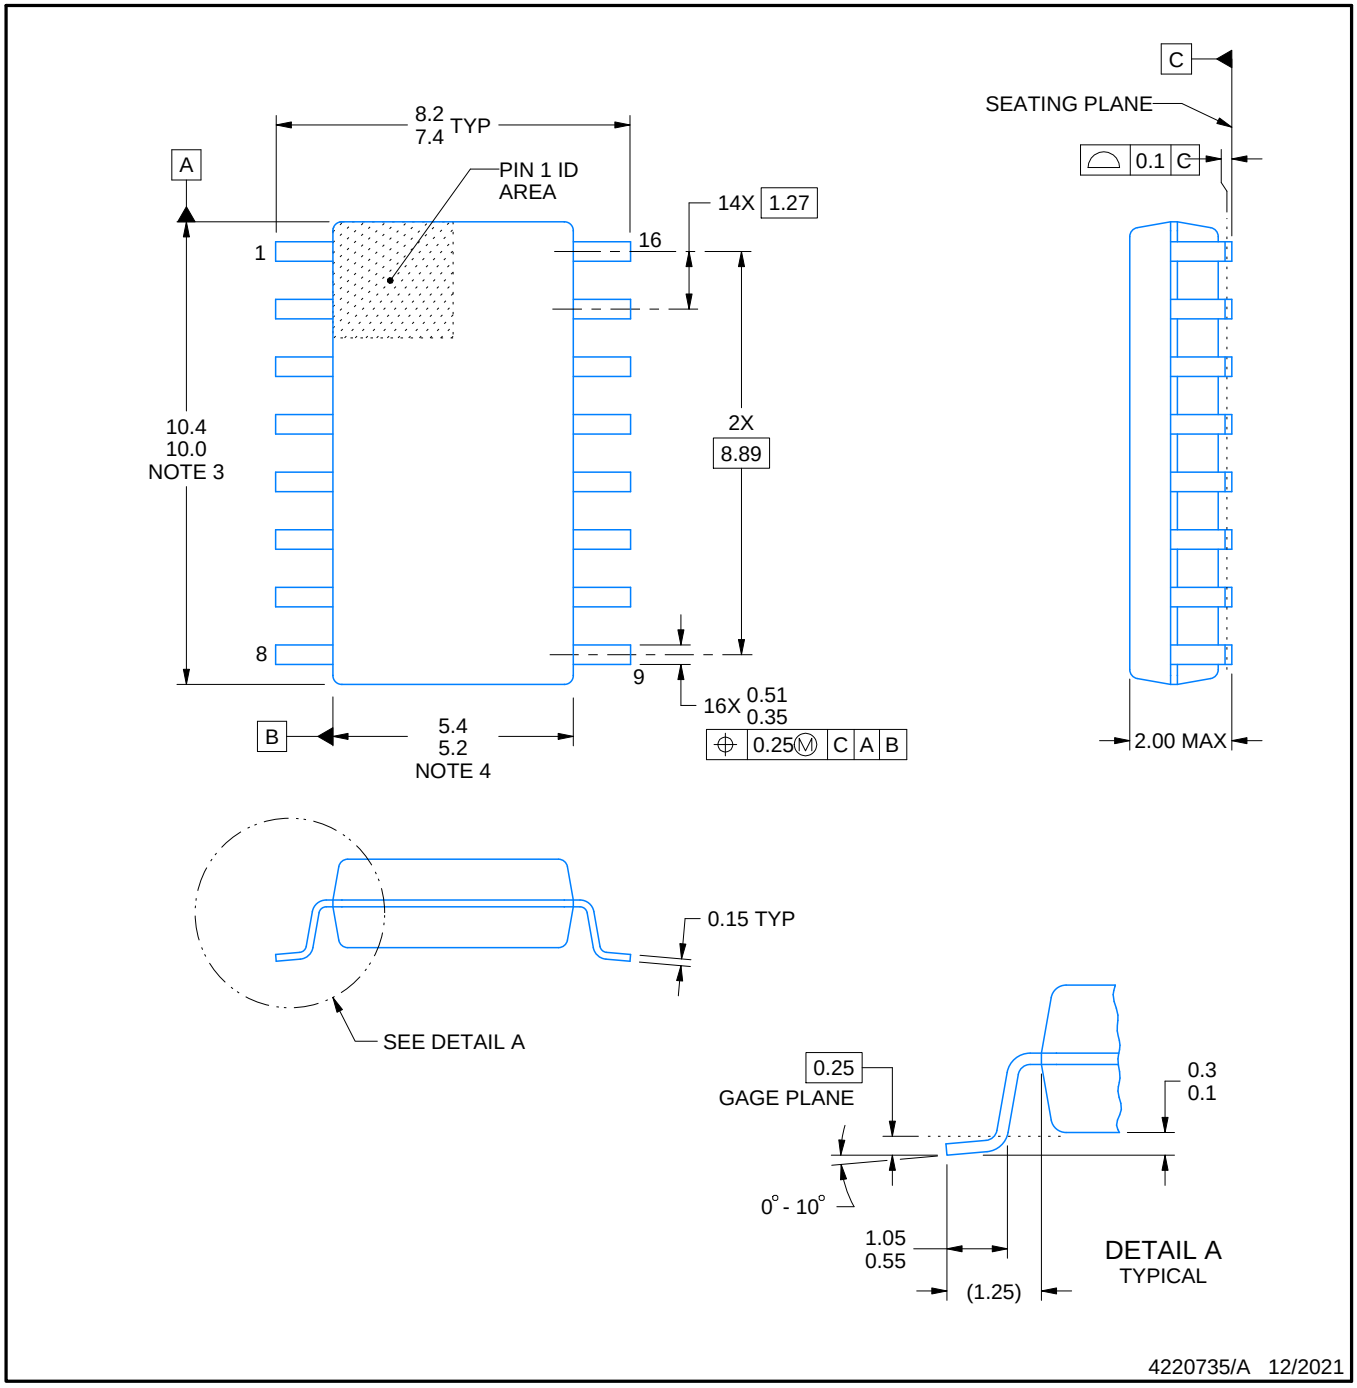
PACKAGE OUTLINE

NS0016A

SOP - 2.00 mm max height

SOP



NOTES:

1. All linear dimensions are in millimeters. Dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 mm, per side.
4. This dimension does not include interlead flash. Interlead flash shall not exceed 0.25 mm, per side.

DEFINED

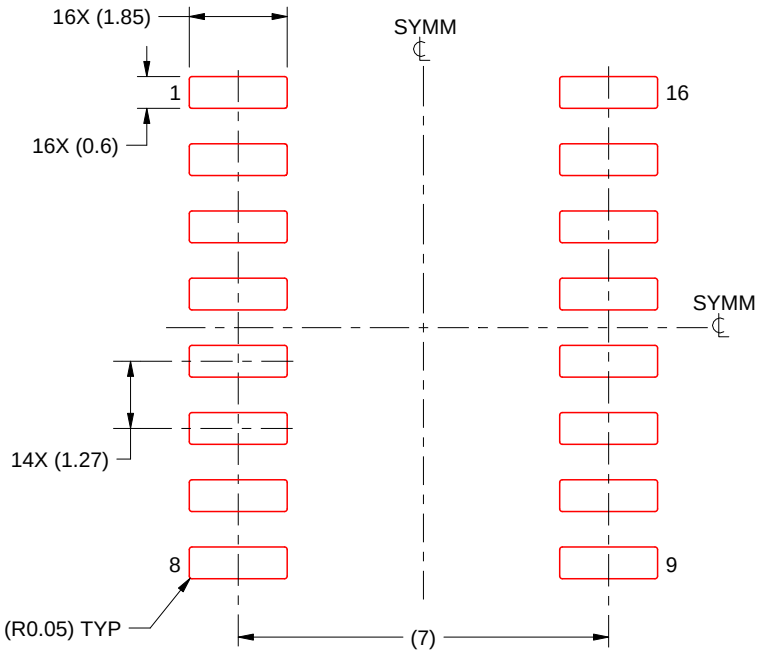
SOLDER MASK
DEFINED

SOLDER MASK DETAILS

4220735/A 12/2021

NOTES: (continued)

5. Publication IPC-7351 may have alternate designs.
6. Solder mask tolerances between and around signal pads can vary based on board fabrication site.



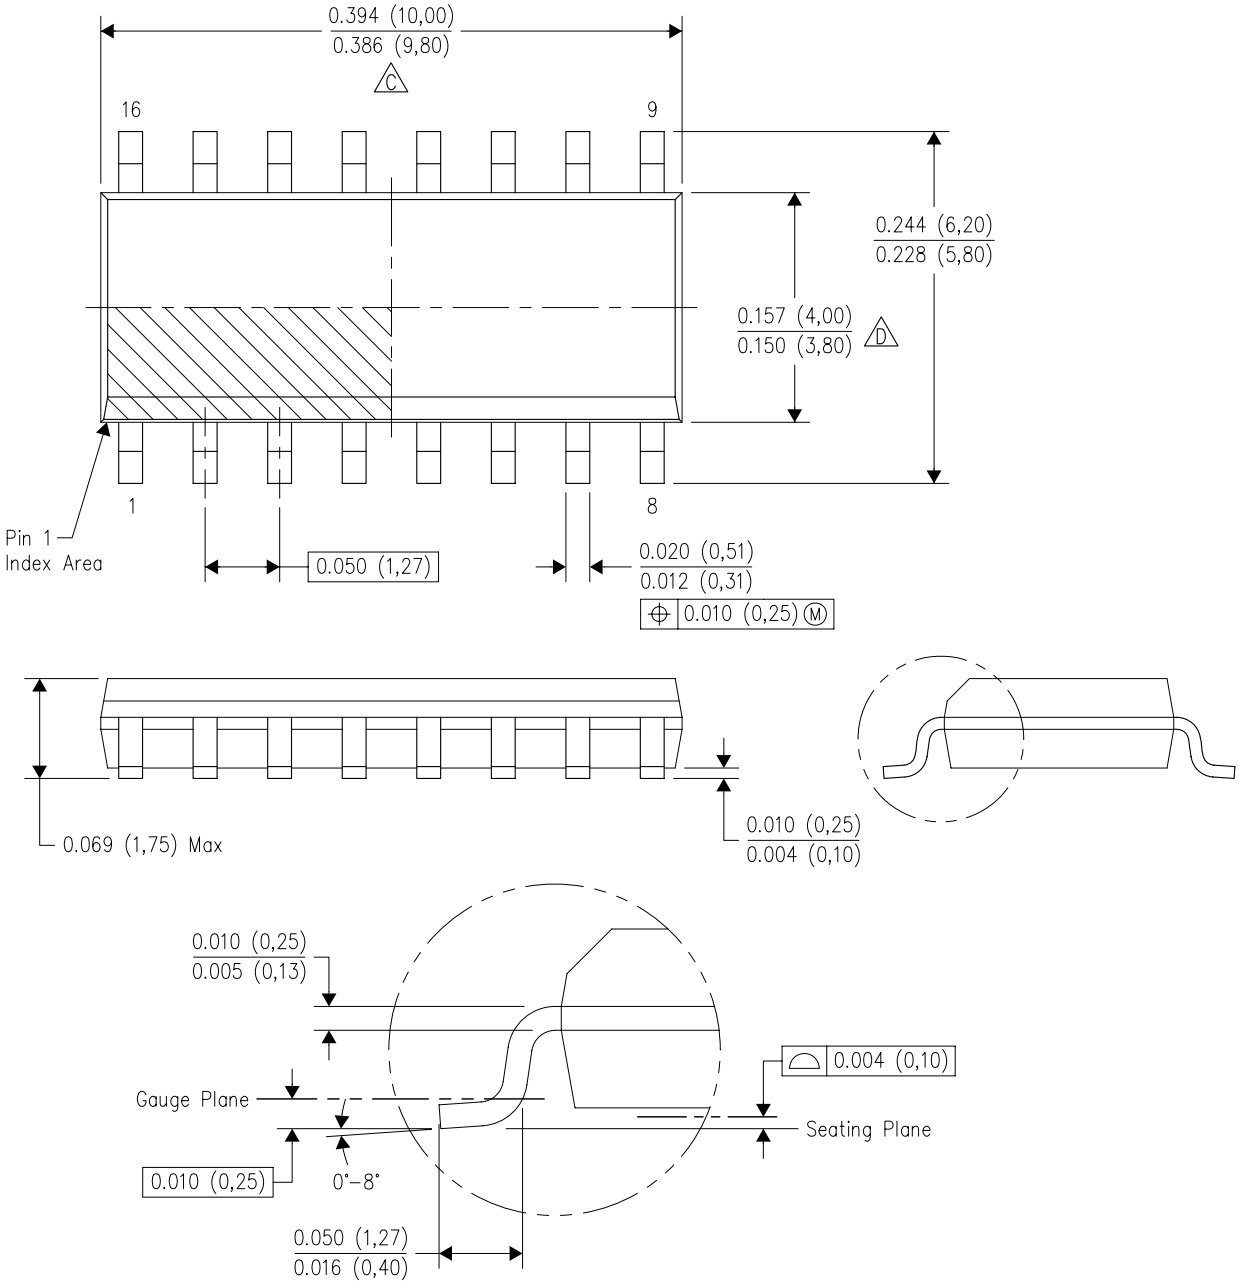
SOLDER PASTE EXAMPLE
BASED ON 0.125 mm THICK STENCIL
SCALE:7X

4220735/A 12/2021

NOTES: (continued)

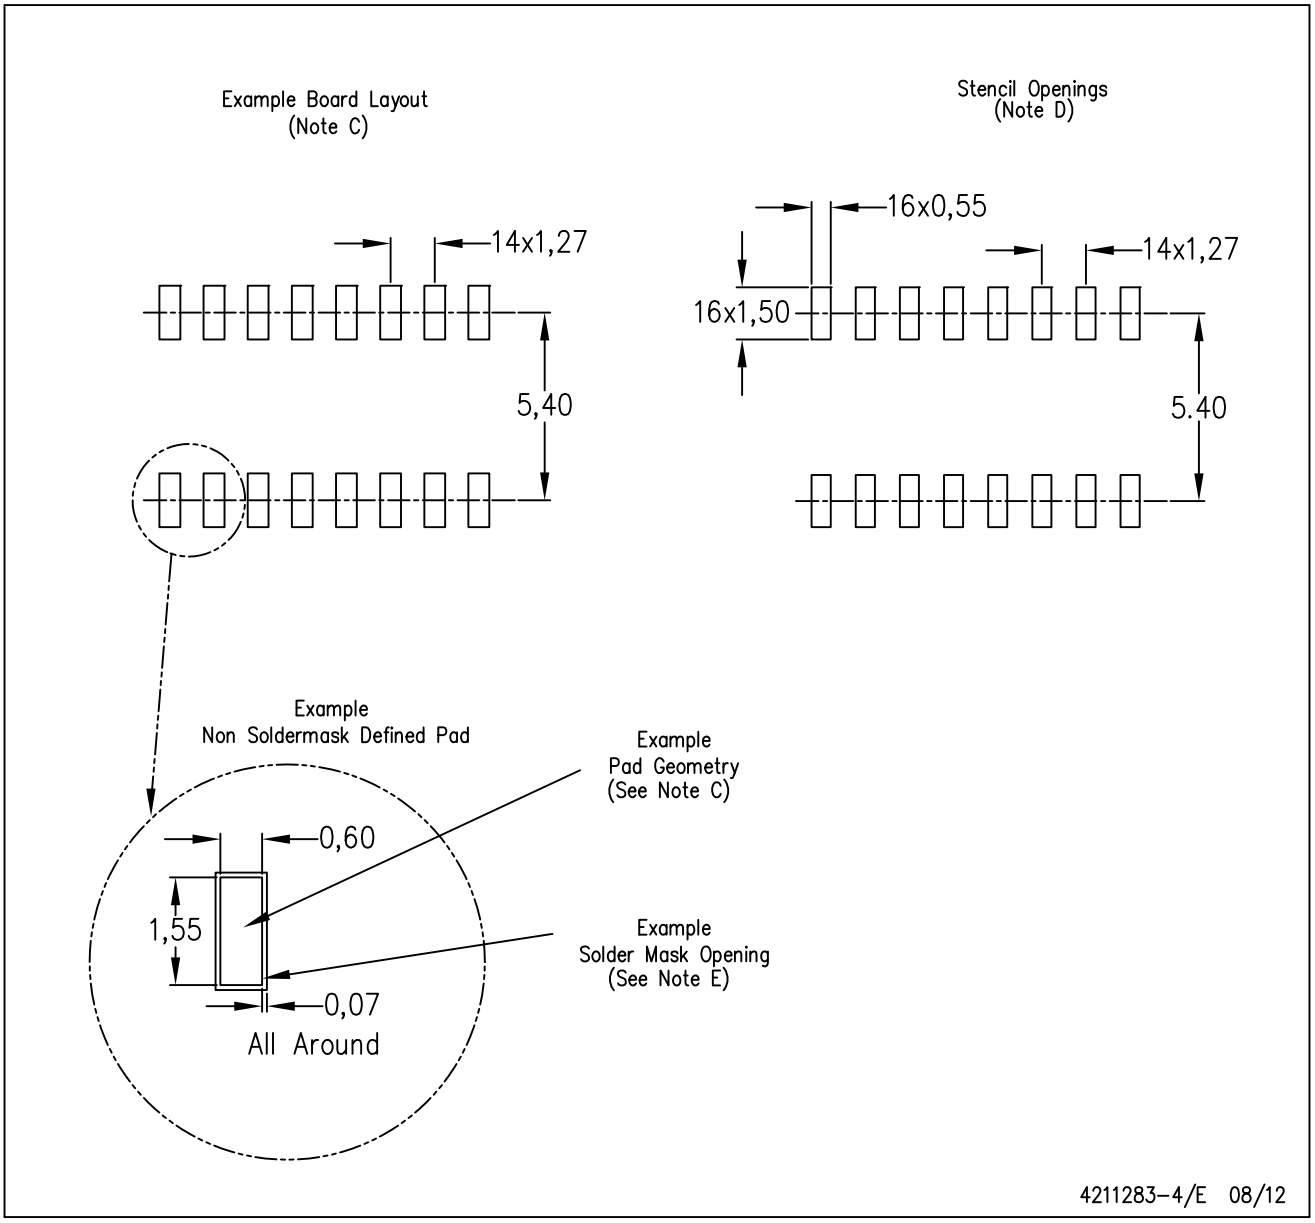
7. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
8. Board assembly site may have different recommendations for stencil design.

D (R–PDSO–G16) PLASTIC SMALL OUTLINE



NOTES:
A. All linear dimensions are in inches (millimeters).
B. This drawing is subject to change without notice.
C. Body length does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.006 (0,15) each side.
D. Body width does not include interlead flash. Interlead flash shall not exceed 0.017 (0,43) each side.
E. Reference JEDEC MS–012 variation AC.

D (R–PDSO–G16) PLASTIC SMALL OUTLINE



NOTES:
A. All linear dimensions are in millimeters.
B. This drawing is subject to change without notice.
C. Publication IPC–7351 is recommended for alternate designs.
D. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC–7525 for other stencil recommendations.
E. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.
