CC2340R5

ZHCSSA2C - APRIL 2023 - REVISED JUNE 2023

# CC2340R5 SimpleLink™ 低功耗 Bluetooth<sup>®</sup> 5.3 无线 MCU

# 1 特性

# 无线微控制器

- 经过优化的 48MHz Arm<sup>®</sup> Cortex<sup>®</sup>-M0+ 处理器
- 512KB 系统内可编程闪存
- 12KB ROM 用于引导加载程序和驱动程序
- 36KB 超低泄漏 SRAM。待机模式下完全 RAM 保
- 与低功耗 Bluetooth<sup>®</sup> 5.3 兼容的 2.4GHz 射频收发 哭
- 集成平衡-非平衡变压器
- 支持无线升级 (OTA)
- 串行线调试 (SWD)

# 低功耗

- MCU 功耗:
  - 2.6mA 有源模式, CoreMark<sup>®</sup>
  - 53 µ A/MHz (运行 CoreMark<sup>®</sup> 时)
  - < 710nA 待机模式, RTC, 36KB RAM
  - 150nA 关断模式,引脚唤醒
- 无线电功耗:
  - RX : 5.3mA
  - TX:5.1mA(在0dBm条件下)
  - TX: < 11.0mA(在+8dBm条件下)

# 无线协议支持

- 低功耗 Bluetooth® 5.3
- ZigBee®<sup>1</sup>
- SimpleLink<sup>™</sup> TI 15.4-stack<sup>1</sup>
- 专有系统

# 高性能无线电

- -102dBm (在 125kbps 低功耗 Bluetooth®下)
- -96.5dBm (在 1Mbps 低功耗 Bluetooth®下)
- 高达 +8dBm 的输出功率,具有温度补偿

# 法规遵从性

- 适用于符合以下标准的系统:
  - EN 300 328 (欧洲)
  - FCC CFR47 第 15 部分
  - ARIB STD-T66(日本)

# MCU 外设

- 多达 26 个 I/O 板
  - 2个 IO 焊盘 SWD, 与 GPIO 进行多路复用
  - 2个 IO 焊盘 LFXT, 与 GPIO 进行多路复用
  - 多达 22 个 DIO ( 模拟或数字 IO )
  - <sup>1</sup> 在未来的 SDK 中提供

- 3×16 位和 1×24 位通用计时器,支持正交解码模式
- 12 位 ADC,使用外部基准时 1.2MSPS,使用内部 基准时 267ksps、高达 12 个外部 ADC 输入
- 1×低功耗比较器
- 1 个异步收发器 (UART)
- 1× SPI
- 1× I<sup>2</sup>C
- 实时时钟 (RTC)
- 集成温度和电池监控器
- 看门狗计时器

# 安全驱动工具

- AES 128 位加密加速计
- 来自片上模拟噪声的随机数生成器

# 开发工具和软件

- LP-EM-CC2340R5 LaunchPad 开发套件
- SimpleLink<sup>™</sup> CC23xx 软件开发套件 (SDK)
- 用于简单无线电配置的 SmartRF<sup>™</sup> Studio
- SysConfig 系统配置工具

# 工作温度范围

- 片上降压直流/直流转换器
- 1.71V 至 3.8V 单电源电压
- T<sub>i</sub>:-40 至 +125°C

# 符合 RoHS 标准的封装

- 5mm × 5mm RKP QFN40 (26 个 GPIO)
- 4mm × 4mm RGE QFN24 (12 个 GPIO )

# 2 应用

- 医疗
  - 居家医疗保健 血糖监测仪、血压监测仪、 CPAP 呼吸机、电子温度计
  - 患者监护和诊断 医疗传感器贴片
  - 个人护理和健身 电动牙刷、可穿戴健身和活
- 动监测仪<br/>• 楼宇自动化
  - 楼宇安防系统 运动检测器、电子智能锁、门 窗传感器、车库门系统、网关
  - HVAC 恒温器、无线环境传感器
  - 防火安全系统 烟雾和热量探测器
  - 视频监控 IP 网络摄像头

- 照明
  - LED 灯具
    - 照明控制 日光传感器、照明传感器、无线控 制
- 工厂自动化和控制
- 零售自动化和支付 电子销售终端
- 电子货架标签
- 通信设备
  - 有线网络
    - 无线 LAN 或 Wi-Fi 接入点,边缘路由器
- 个人电子产品
  - 联网外设 消费类无线模块、指点设备、键盘
  - 游戏 电子玩具和机器人玩具
  - 可穿戴设备(非医用)- 智能追踪器、智能服装。

# 3 说明

SimpleLink<sup>™</sup> CC2340R5 器件是面向低功耗 *Bluetooth*® 5.3 和专有 2.4GHz 应用的 2.4GHz 无线微控制器 (MCU)。该器件针对低功耗无线通信进行了优化,并支持片上双映像无线下载 (OAD) 功能,<sup>2</sup>适用于楼宇自动化 (无线传感器、照明控制、信标)、资产跟踪、医疗、零售 EPOS(电子销售终端)、ESL(电子货架标签)和 个人电子产品(玩具、HID、触控笔)市场。 的突出特性包括:

- 支持 *Bluetooth*<sup>®</sup> 5 特性:高速模式 (2Mbps PHY)、远距离 (LE 编码 125kbps 和 500kbps PHY)、Privacy 1.2.1 和通道选择算法 2,以及对 *Bluetooth*<sup>®</sup> 4.2 和早期低功耗规范的向后兼容性和支持。
- 完全合格的 Bluetooth <sup>®</sup> 5.3 软件协议栈 (SimpleLink™ CC23xx 软件开发套件 (SDK) 随附)。
- SimpleLink™ CC23xx 软件开发套件 (SDK) 支持 Zigbee® 协议栈 <sup>2</sup>
- 超低待机电流不到 0.71 µ A 并具有 RTC 操作和完全 RAM 保持,可显著延长电池寿命,尤其是对于睡眠间隔 较长的应用。
- 集成平衡-非平衡变压器,可减少物料清单(BOM)电路板布局布线
- 出色的无线电敏感度和稳健性(选择性与阻断)性能,适用于低功耗 Bluetooth <sup>®</sup>(125kbps LE 编码 PHY 且 集成平衡-非平衡变压器时为 -102dBm)。

CC2340R5 器件是 SimpleLink<sup>™</sup> MCU 平台的一部分,该平台包括 Wi-Fi<sup>®</sup>、低功耗*蓝牙*、Thread、Zigbee、Sub-1GHz MCU 和主机 MCU,它们共用一个通用、易于使用的开发环境,其中包含单核软件开发套件 (SDK) 和 丰富的工具集。借助一次性集成的 SimpleLink<sup>™</sup> 平台,可以将产品组合中的任何器件组合添加至您的设计中,从 而在设计要求变更时实现 100% 的代码重用。如需更多信息,请访问 SimpleLink<sup>™</sup> MCU 平台。

<sup>&</sup>lt;sup>2</sup> 在未来的 SDK 中提供

器件信息							
器件型号 <sup>(1)</sup>	封装	封装尺寸(标称值)					
CC2340R52E0RGER	QFN24	4.00mm × 4.00mm					
CC2340R52E0RKPR	QFN40	5.00mm × 5.00mm					

(1) 如需所有可用器件的最新器件、封装和订购信息,请参阅节 12 中的"封装选项附录"或访问 TI 网站。

# **5** Revision History

注:以前版本的页码可能与当前版本的页码不同

# Changes from April 31, 2023 to June 30, 2023 (from Revision B (April 2023) to Revision C (June 2023))

•		-
•	删除了 4mm × 4mm RGE QFN24 封装的预发布状态	1
•	更正了应用的链接	2
•	Corrected pin pitch in pin diagram title	6
•	Corrected pin pitch in pin diagram title	9
•	Corrected signal name column for DIO19	11
•	Changed CDM ESD value to +/- 500 V in ESD Ratings	.21
•	Clarified that HFOSC tracks HFXT in Table 9-2 and is off in Standby	.47
•	Corrected temperature calculation example	. 50

# 7 Pin Configuration and Functions

# 7.1 Pin Diagram - RKP Package (Top View)

#### 图 7-1. RKP (5-mm × 5-mm) Pinout, 0.5-mm Pitch (Top View)

The following I/O pins marked in **8** 7-1 in **bold** have high-drive capabilities:

- Pin 6, DIO12
- Pin 11, DIO16\_SWDIO
- Pin 12, DIO17\_SWDCK
- Pin 13, DIO18
- Pin 14, DIO19
- Pin 20, DIO24\_A7

The following I/O pins marked in **1**/2 7-1 in *italics* have analog capabilities:

- Pin 15, DIO20\_A11
- Pin 16, DIO21\_A10
- Pin 18, DIO22 A9
- Pin 19, DIO23\_A8
- Pin 20, DIO24 A7
- Pin 21, DIO25 A6
- Pin 22, DIO0 A5
- Pin 23, DIO1 A4
- Pin 24, DIO2 A3
- Pin 29, DIO5 A2
- Pin 32, DIO6, A1
- Pin 33, DIO7\_A0

# 7.2 Signal Descriptions - RKP Package

PIN		10	TYPE	DESCRIPTION		
NAME	NO.	1/0	TIFE	DEGORIFIION		
EGP	—	_	GND	Ground - exposed ground pad <sup>(1)</sup>		
VDDR	1	_	Power	Internal supply, must be powered from the internal DC/DC converter or the internal LDO <sup>(2)</sup> <sup>(3)</sup> <sup>(4)</sup>		
DIO8	2	I/O	Digital	GPIO		
DIO9	3	I/O	Digital	GPIO

DIO13	7	I/O	Digital	GPIO		
VDDS	8		Power	1.71-V to 3.8-V DIO supply <sup>(5)</sup>		
DIO14	9	I/O	Digital	GPIO		
DIO15	10	I/O	Digital	GPIO		
DIO16_SWDIO	11	I/O	Digital	GPIO, SWD interface: mode select or SWDIO, high-drive capability		
DIO17_SWDCK	12	I/O	Digital	GPIO, SWD interface: clock, high-drive capability		
DIO18	13	I/O	Digital	GPIO, high-drive capability		
DIO19	14	I/O	Digital	GPIO, high-drive capability		
DIO20_A11	15	I/O	Digital or Analog	GPIO, analog capability		
DIO21_A10	16	I/O	Digital or Analog	GPIO, analog capability		
VDDS	17	—	Power	1.71-V to 3.8-V DIO supply <sup>(5)</sup>		
DIO22_A9	18	I/O	Digital or Analog	GPIO, analog capability		
DIO23_A8	19	I/O	Digital or Analog	GPIO, analog capability		
DIO24_A7	20	I/O	Digital or Analog	GPIO, Analog capability, high-drive capability		
DIO25_A6	21	I/O	Digital or Analog	GPIO, analog capability		
DIO0_A5	22	I/O	Digital or Analog	GPIO, analog capability		
DIO1_A4	23	I/O	Digital or Analog	GPIO, analog capability		
DIO2_A3	24	I/O	Digital or Analog	GPIO, analog capability		
RSTN	25	I	Digital	Reset, active low. No internal pullup resistor		
DIO3_X32P	26	I/O	Digital or Analog	GPIO, 32-kHz crystal oscillator pin 1, Optional TCXO input		
DIO4_X32N	27	I/O	Digital or Analog	GPIO, 32-kHz crystal oscillator pin 2		
VDDD	28		Power	For decoupling of internal 1.28-V regulated core-supply. Connect an external 1 $\mu$ F decoupling capacitor. <sup>(2)</sup>		
DIO5_A2	29	I/O	Digital or Analog	GPIO, analog capability		
DCDC	30		Power	Switching node of internal DC/DC converter <sup>(5)</sup>		
VDDS	31		Power	1.71-V to 3.8-V analog supply <sup>(5)</sup>		
DIO6_A1	32	I/O	Digital or Analog	GPIO, analog capability		
DIO7_A0	33	I/O	Digital or Analog	GPIO, analog capability		
VDDR	34		Power	Internal supply, must be powered from the internal DC/DC converter or the internal LDO. Connect an external 10 $\mu$ F decoupling capacitor. <sup>(2)</sup> (3) (4)		
X48P	35	_	Analog	48-MHz crystal oscillator pin 1		
X48N	36	—	Analog	48-MHz crystal oscillator pin 2		
NC	37	—	_	No Connect		
VDDS	38		Power	1.71-V to 3.8-V analog supply <sup>(5)</sup>		

# 表 7-1. Signal Descriptions - RKP Package

Copyright © 2023 Texas Instruments Incorporated

#### 表 7-1. Signal Descriptions - RKP Package (continued)

PIN		1/0	TVDE	DESCRIPTION	
NAME	NO.		1175	DESCRIPTION	
ANT	39	I/O	RF	2.4 GHz TX, RX	
RFGND	40	—	RFGND	RF Ground	

(1) EGP is the only non-RF ground connection for the device. Good electrical connection to PCB ground plane is required for proper device operation.

(2) Do not supply external circuitry from this pin.

(3) VDDR pins 1 and 34 must be tied together on the PCB.

(4) Output from internal DC/DC and LDO is trimmed to 1.5 V.

(5) For more details, see the technical reference manual listed in  $\ddagger$  11.3.

### 7.3 Connections for Unused Pins and Modules - RKP Package

FUNCTION	SIGNAL NAME	PIN NUMBER	ACCEPTABLE PRACTICE <sup>(1)</sup>	PREFERRED PRACTICE <sup>(1)</sup>
GPIO (digital)	DIOn	2 - 7 9 - 10 13 - 14	NC, GND, or VDDS	NC
SWD	DIO16_SWDIO	11	NC, GND, or VDDS	GND or VDDS
500	DIO17_SWDCK	12	NC, GND, or VDDS	GND or VDDS
GPIO (digital or analog)	DIOn_Am	15 - 16 18 - 24 29 32 - 33	NC, GND, or VDDS	NC
22 768 kHz crystal	DIO3_X32P	26		NC
32.700-KHZ CIYSIAI	DIO4_X32N	27		NC
DC/DC convertor <sup>(2)</sup>	DCDC	30	NC	NC
	VDDS	8, 17, 31, 38	VDDS	VDDS

#### 表 7-2. Connections for Unused Pins - RKP Package

(1) NC = No connect

(2) When the DC/DC converter is not used, the inductor between DCDC and VDDR can be removed. VDDR must still be connected and the 10 µ F DCDC capacitor must be kept on the VDDR net.

# 7.4 Pin Diagram - RGE Package (Top View)

#### 图 7-2. RGE (4-mm × 4-mm) Pinout, 0.5-mm Pitch(Top View)

The following I/O pins marked in 🛛 7-2 in **bold** have high-drive capabilities:

- Pin 5, DIO12
- Pin 7, DIO16\_SWDIO
- Pin 8, DIO17\_SWDCK
- Pin 12, DIO24\_A7

The following I/O pins marked in **1**/2 in *italics* have analog capabilities:

- Pin 9, DIO20\_A11
- Pin 10, DIO21\_A10
- Pin 12, DIO24\_A7
- Pin 19, DIO6\_A1

#### 7.5 Signal Descriptions - RGE Package

# **8** Specifications

#### 8.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup> <sup>(2)</sup>

		MIN	MAX	UNIT
VDDS	Supply voltage	- 0.3	4.1	V
	Voltage on any digital pin <sup>(3)</sup>	- 0.3	VDDS + 0.3, max 4.1	V
	Voltage on crystal oscillator pins X48P and X48N	- 0.3	1.24	V
V <sub>in_adc</sub>	Voltage on ADC input	0	VDDS	V
	Input level, RF pins		5	dBm
T <sub>stg</sub>	Storage temperature	- 40	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

(2) All voltage values are with respect to ground, unless otherwise noted.

(3) Including analog capable DIOs.

### 8.2 ESD Ratings

				VALUE	UNIT
V <sub>ESD</sub> Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	All pins	±1000	V	
	Electrostatic discharge	Charged device model (CDM), per ANSI/ESDA/JEDEC JS-002 <sup>(2)</sup>	All pins	±500	V

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process

#### 8.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

	MIN	MAX	UNIT
Operating ambient temperature <sup>(1) (2)</sup>	- 40	125	°C
Operating junction temperature <sup>(1) (2)</sup>	- 40	125	°C
Operating supply voltage (VDDS)	1.71	3.8	V
Rising supply voltage slew rate	0	100	mV/µs
Falling supply voltage slew rate <sup>(3)</sup>	0	1	mV/µs

(1) Operation at or near maximum operating temperature for extended durations will result in a reduction in lifetime.

(2) For thermal resistance details, refer to Thermal Resistance Characteristics table in this document.

(3) For small coin-cell batteries, with high worst-case end-of-life equivalent source resistance, a 10-µF VDDS input capacitor must be used to ensure compliance with this slew rate.

#### 8.4 DCDC

When measured on the CC2340R5 reference design with  $T_c = 25$  °C and DCDC enabled unless otherwise noted.

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
VDDS supply voltage for DCDC operation <sup>(1)</sup> <sup>(2)</sup>		2.2	3.0	3.8	V

(1) When the supply voltage drops below the DCDC operation min voltage, the device automatically transitions to use GLDO regulator onchip.

(2) A 10uH and 10uF load capacitor are required on the VDDR voltage rail. They should be placed close to the DCDC output pin.

# 8.5 Global LDO (GLDO)

When measured on the CC2340R5 reference design with  $T_c = 25$  °C.

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
VDDS supply voltage for GLDO operation <sup>(1)</sup>		1.71	3.0	3.8	V

(1) A 10 µF capacitor is recommended at VDDR pin.

#### 8.6 Power Supply and Modules

over operating free-air temperature range (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN TYP	MAX	UNIT		
VDDS_BOD						
Untrimmed brownout rising threshold	Before initial boot <sup>(1)</sup>	1.67		V		
Trimmed brownout rising threshold <sup>(1)</sup>		1.68		V		
Trimmed brownout falling threshold <sup>(1)</sup>		1.67		V		
POR						
power-on reset power-up level		1.5		V		
power-on reset power-down level		1.45		V		

(1) Brown-out Detector is trimmed at initial boot, value is kept until device is reset by a POR reset or the RSTN pin.

### 8.7 Battery Monitor

Measured on the CC2340R5 reference design with T<sub>c</sub> = 25 °C, unless otherwise noted.

PARAMETER	TEST CONDITIONS	MIN	ΤΥΡ ΜΑΧ	UNIT
Resolution			22	mV
Range		1.7	3.8	s V
Accuracy	VDDS = 3.0 V		30	mV

### 8.8 Temperature Sensor

Measured on the CC2340R5 reference design with  $T_c$  = 25 °C,  $V_{DDS}$  = 3.0 V, unless otherwise noted.

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
Accuracy	-40 °C to 85 °C		±10 <sup>(1)</sup>		°C

(1) Raw output from register.

#### 8.9 Power Consumption - Power Modes

When measured on the CC2340R5 reference design with  $T_c = 25$  °C,  $V_{DDS} = 3.0$  V, DCDC enabled, GLDO disabled, unless otherwise noted.

PAI	RAMETER	TEST CONDITIONS	TYP	UNIT

#### 8.10 Power Consumption - Radio Modes

When measured on the CC2340R5 reference design with T<sub>c</sub> = 25 °C,  $V_{DDS}$  = 3.0 V with DCDC enabled unless otherwise noted.

	PARAMETER	TEST CONDITIONS	TYP	UNIT
I <sub>RX</sub>	Radio receive current	2440 MHz, 1 Mbps, GFSK, system bus off <sup>(1)</sup>	5.3	mA
I <sub>RX</sub>	Radio receive current	2440 MHz, 1 Mbps, GFSK, DCDC OFF, system bus off <sup>(1)</sup>	9	mA
I <sub>TX</sub>	Radio transmit current	-8 dBm output power setting 2440 MHz system bus off <sup>(1)</sup>	4.0	mA
I <sub>TX</sub>	Radio transmit current	0 dBm output power setting 2440 MHz system bus off <sup>(1)</sup>	5.1	mA
I <sub>TX</sub>	Radio transmit current	0 dBm output power setting 2440 MHz DCDC OFF, system bus off <sup>(1)</sup>	8.8	mA
I <sub>TX</sub>	Radio transmit current	+4 dBm output power setting 2440 MHz system bus off <sup>(1)</sup>	7.7	mA
I <sub>TX</sub>	Radio transmit current	+6 dBm output power setting 2440 MHz system bus off <sup>(1)</sup>	8.9	mA
I <sub>TX</sub>	Radio transmit current	+8 dBm output power setting 2440 MHz system bus off <sup>(1)</sup>	10.7	mA
I <sub>TX</sub>	Radio transmit current	+8 dBm output power setting 2440 MHz DCDC OFF, system bus off <sup>(1)</sup>	19	mA

(1) System bus off refers to device idle mode, DMA disabled, flash disabled

### 8.11 Nonvolatile (Flash) Memory Characteristics

Over operating free-air temperature range and  $V_{DDS} = 3.0 \text{ V}$  (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
Flash sector size			2		KB
Supported flash erase cycles before failure, full bank <sup>(1)</sup> <sup>(2)</sup>		30			k Cycles
Supported flash erase cycles before failure, single sector <sup>(3)</sup>		60			k Cycles
Maximum number of write operations per row before sector erase <sup>(4)</sup>				83	Write Operations
Flash retention	105 °C	11.4			Years
Flash retention	125 °C	10			Years
Flash sector erase current	Average delta current		1.2		mA
Flash sector erase time <sup>(5)</sup>	0 erase cycles		2.2		ms
Flash write current	Average delta current, full sector at a time		1.7		mA
Flash write time <sup>(5)</sup>	full sector at a time, 0 erase cycles		7.7		μs

(1) A full bank erase is counted as a single erase cycle on each sector

(2) Aborting flash during erase or program modes is not a safe operation.

(3) Up to 16 customer-designated sectors can be individually erased an additional 30k times beyond the baseline bank limitation of 30k cycles

(4) Each wordline is 2048 bits (or 256 bytes) wide. This limitation corresponds to sequential memory writes of 4 (3.1) bytes minimum per write over a whole wordline. If additional writes to the same wordline are required, a sector erase is required once the maximum number of write operations per row is reached.

(5) This number is dependent on Flash aging and increases over time and erase cycles

#### 8.12 Thermal Resistance Characteristics

# 8.18 Timing and Switching Characteristics

#### 8.18.1 Reset Timing

PARAMETER	MIN	TYP M	X UNIT
RSTN low duration	1		μs

#### 8.18.2 Wakeup Timing

Measured over operating free-air temperature with  $V_{DDS}$  = 3.0 V (unless otherwise noted). The times listed here do not include any software overhead (unless otherwise noted).

PARAMETER	TEST CONDITIONS	MIN TYI	P MAX	UNIT
MCU, Reset/Shutdown to Active <sup>(1)</sup>	GLDO default charge current setting, VDDR capacitor fully charged <sup>(2)</sup>	350-45	D	μs
MCU, Standby to Active	MCU, Standby to Active (ready to execute code from flash). DCDC ON, default recharge current configuration	33-43 (\$	3)	μs
MCU, Standby to Active	MCU, Standby to Active (ready to execute code from flash). GLDO ON, default recharge current configuration	33-50 <sup>(\$</sup>	3)	μs
MCU, Idle to Active	Flash enabled in idle mode		3	μs
MCU, Idle to Active	Flash disabled in idle mode	14	4	μs

(1) Wakeup time includes device ROM bootcode execution time. The wakeup time is dependent on remaining charge on VDDR capacitor when starting the device, and thus how long the device has been in Reset or Shutdown before starting up again.

(2) This is the best case reset/shutdown to active time (including ROM bootcode operation), for the specified GLDO charge current setting considering the VDDR capacitor is fully charged and is not discharged during the reset and shutdown events; that is, when the device is in reset / shutdown modes for only a very short period of time

(3) Depending on VDDR capacitor voltage level.

#### 8.18.3 Clock Specifications

#### 8.18.3.1 48 MHz Crystal Oscillator (HFXT)

Measured on the CC2340R5 reference design with  $T_c = 25$  °C,  $V_{DDS} = 3.0$  V, unless otherwise noted.<sup>(4)</sup>

	PARAMETER	MIN	ТҮР	MAX	UNIT
	Crystal frequency		48		MHz
ESR	Equivalent series resistance 6 pF < C <sub>L</sub> $\leq$ 9 pF		20	60	Ω
ESR	Equivalent series resistance 5 pF < C <sub>L</sub> $\leqslant$ 6 pF			80	Ω
CL	Crystal load capacitance <sup>(1)</sup>	3	7 <sup>(2)</sup>	9	pF

Measured on the CC2340R5 reference design with  $T_c = 25$  °C,  $V_{DDS} = 3.0$  V, unless otherwise noted.<sup>(4)</sup>

	PARAMETER	MIN	TYP MAX	UNIT
Start-up time <sup>(3)</sup>	Until clock is qualified		200	μs

(1) Adjustable load capacitance is integrated into the device. External load capacitors are required for systems targeting compliance with certain regulations.

(2) On-chip default connected capacitance including reference design parasitic capacitance. Connected internal capacitance is changed through software in the Customer Configuration section (CCFG).

(3) Start-up time using the TI-provided power driver. Start-up time may increase if driver is not used.

(4) Tai-Saw TZ3908AAAO43 has been validated for CC2340R5 design.

### 8.18.3.2 48 MHz RC Oscillator (HFOSC)

Measured on the CC2340R5 reference design with T<sub>c</sub> = 25 °C,  $V_{DDS}$  = 3.0 V, unless otherwise noted.

	MIN TYP	MAX	UNIT
Frequency	48		MHz
Uncalibrated frequency accuracy	±3		%
Calibrated frequency accuracy (1)	±0.25		%

(1) Accuracy relative to the calibration source (HFXT)

### 8.18.3.3 32 kHz Crystal Oscillator (LFXT)

Measured on the CC2340R5 reference design with  $T_c$  = 25 °C,  $V_{DDS}$  = 3.0 V, unless otherwise noted.

	MIN	TYP	MAX	UNIT
Crystal frequency		32.768		kHz
Supported crystal load capacitance	6		12	pF
ESR		30	100	kΩ

# 8.18.3.4 32 kHz RC Oscillator (LFOSC)

Measured on the CC2340R5 reference design with  $T_c$  = 25 °C,  $V_{DDS}$  = 3.0 V, unless otherwise noted.

	MIN	ТҮР	MAX	UNIT
Calibrated frequency		32.768 <sup>(1)</sup>		kHz
Temperature coefficient.		±600		ppm/°C

(1) When using LFOSC as source for the low frequency system clock (LFCLK), the accuracy of the LFCLK-derived Real Time Clock (RTC) can be improved by measuring LFOSC relative to HFXT and compensating for the RTC tick speed. This functionality is available through the TI-provided Power driver.

# 9 Detailed Description

# 9.1 Overview

<sup> $\ddagger$ </sup> 4 shows the core modules of the CC2340R5 device.

# 9.2 System CPU

The CC2340R5 SimpleLink<sup>™</sup> Wireless MCU contains an Arm<sup>®</sup> Cortex<sup>®</sup>-M0+ system CPU, which runs the application, the protocol stacks, and the radio. The Cortex-M0+ processor is built on a highly area and power optimized 32-bit processor core, with a 2-stage pipeline Von Neumann architecture. The processor delivers exceptional energy efficiency through a small but powerful instruction set and extensively optimized design, providing high-end processing hardware including a single-cycle multiplier. The Cortex-M0+ processor offers multiple benefits to developers including:

- Ultra-low power, energy efficient operation
- Deterministic, high-performance interrupt handling for time-critical applications
- Upward compatibility with the Cortex-M processors family

The Cortex-M0+ processor provides the excellent performance expected of a modern 32- bit architecture core, with higher code density than other 8-bit and 16-bit microcontrollers. Its features include the following:

- ARMv6-M architecture optimized for small-footprint embedded applications
- Subset of Arm Thumb/Thumb-2 mixed 16- and 32-bit instructions delivers the high performance expected of a 32-bit Arm
- Single-cycle multiply instruction
- VTOR supporting offset of the vector table base address
- Serial Wire debug with HW break-point comparators
- Ultra-low-power consumption with integrated sleep modes
- SysTick timer
- 48 MHz operation
- 0.99 DMIPS/MHz

Additionally, the CC2340Rx devices are compatible with all ARM tools and software.

### 9.3 Radio (RF Core)

The low-power RF Core (LRF) implements a high performance and highly flexible RF sub system containing RF and baseband circuitry in addition to a software defined digital radio (LRFD). LRFD provides a high-level, command-based API to the main CPU and handles all of the timing critical and low-level details of many different radio PHYs. Several signals are also available to control external circuitry such as RF switches or range extenders autonomously.

The software-defined modem is not programmable by customers but is instead loaded with pre-compiled images provided in the radio driver in the SimpleLink<sup>™</sup> CC23xx software development kit (SDK). This mechanism allows the radio platform to be updated for support of future versions of standards with over-the-air (OTA) updates while still using the same silicon. LRFD stores the code images in the RF SRAM and does not make use of any ROM memory, thus image loading from NV memory only occurs once after boot and also, no patching is required when exiting power modes.

#### 9.3.1 Bluetooth 5.3 Low Energy

The RF Core offers full support for Bluetooth 5.3 Low Energy, including the high-speed 2 Mbps physical layer and the 500 kbps and 125 kbps long range PHYs (Coded PHY) through the TI provided Bluetooth 5.3 stack or through a high-level Bluetooth API.

The new high-speed mode allows data transfers up to 2 Mbps, twice the speed of Bluetooth 4.2 and five times the speed of Bluetooth 4.0, without increasing power consumption. In addition to faster speeds, this mode offers significant improvements for energy efficiency and wireless coexistence with reduced radio communication time.

Bluetooth 5.3 also enables unparalleled flexibility for adjustment of speed and range based on application needs, which capitalizes on the high-speed or long-range modes respectively. Data transfers are now possible at 2 Mbps, enabling development of applications using voice, audio, imaging, and data logging that were not previously an option using Bluetooth low energy. With high-speed mode, existing applications deliver faster responses, richer engagement, and longer battery life. Bluetooth 5.3 enables fast, reliable firmware updates.

#### 9.3.2 802.15.4 (Thread and Zigbee)

Through a dedicated IEEE radio API, the RF sub-system supports the 2.4-GHz IEEE 802.15.4-2011 physical layer (2 Mchips per second Offset-QPSK with DSSS 1:8), used in Thread and Zigbee protocols. TI also provides royalty-free protocol stacks for Thread and Zigbee as part of the SimpleLink SDK, enabling a robust end-to-end solution.

#### 9.4 Memory

The 512 KB nonvolatile (Flash) memory provides storage for code and data. The flash memory is in-system programmable and erasable. A special flash memory sector must contain a Customer Configuration section (CCFG) that is used by boot ROM and TI provided drivers to configure the device. This configuration is done through the ccfg.c source file that is included in all TI provided examples.

The ultra-low leakage system static 36 KB RAM (SRAM) can be used for both storage of data and execution of code. Retention of SRAM contents in Standby power mode is enabled by default and included in Standby mode power consumption numbers. System SRAM is always initialized to zeroes upon code execution during boot.

The ROM includes device bootcode firmware handling initial device trimming operations, security configurations and device lifecycle management. The ROM also contains a serial (SPI and UART) bootloader that can be used for initial programming of the device.

# 9.5 Cryptography

The CC2340R5 device comes with AES-128 cryptography hardware accelerator, reducing code footprint and execution time for cryptographic operations. It also has the benefit of being lower power and improves availability and responsiveness of the system because the cryptography operations run in a background hardware thread. The AES hardware accelerators supports the following block cipher modes and message authentication codes:

- AES ECB encrypt
- AES CBC encrypt
- AES CTR encrypt/decrypt
- AES CBC-MAC
- AES GCM
- AEC CCM (uses a combination of CTR + CBC-MAC hardware via software drivers)

The AES hardware accelerator can be fed with plaintext/ciphertext from either CPU or using DMA. Sustained throughput of one 16 byte ECB block per 23 cycles is possible corresponding to > 30 Mbps.

The CC2340R5 device supports Random Number Generation (RNG) using on-chip analog noise as the nondeterministic noise source for the purpose of generating a seed for a cryptographically secure counter deterministic random bit generator (CTR-DRBG) that in turn is used to generate random numbers for keys, initialization vectors (IVs), and other random number requirements. Hardware acceleration of AES CTR-DRBG is supported.

The CC2340R5 device includes a complete SHA 256 library in ROM, reducing the code footprint of the application. Uses cases may include generating digests for use in digital signature algorithms, data integrity checks, and password storage.

Together with a large selection of open-source cryptography libraries provided with the Software Development Kit (SDK), this allows for secure and future proof IoT applications to be easily built on top of the platform.

# 9.6 Timers

A large selection of timers are available as part of the CC2340R5 device. These timers are:

#### • Real-Time Clock (RTC)

The RTC is a 67-bit, 2-channel timer running on the LFCLK system clock. The RTC is active in STANDBY and ACTIVE power states. When the device enters the RESET or SHUTDOWN state the RTC is reset.

The RTC accumulates time elapsed since reset on each LFCLK. The RTC counter is incremented by LFINC at a rate of 32.768 kHz. LFINC indicates the period of LFCLK in  $\mu$  s, with an additional granularity of 16 fractional bits.

The counter can be read from two 32-bit registers. RTC.TIME8U has a range of approximately 9.5 hours with an LSB representing 8 microseconds. RTC.TIME524M has a range of approximately 71.4 years with an LSB representing 524 milliseconds.

There is hardware synchronization between the system timer (SYSTIM) and the RTC so that the multichannel and higher resolution SYSTIM remain in synchronization with the RTC' s time base.

The RTC has two channels: one compare channel and one capture channel and is capable of waking the device out of the standby power state. The RTC compare channel is typically used only by system software and only during the standby power state.

#### • System Timer (SYSTIM)

The SYSTIM is a 34-bit, 5-channel wrap-around timer with a per-channel selectable 32b slice with either a 1 us resolution and 1h11m35s range or 250 ns resolution and 17m54s range. All channels support both capture and single-shot compare (posting an event) operation. One channel is reserved for system software, three channels are reserved for radio software and one channel is freely available to user applications.

For software convenience a hardware synchronization mechanism automatically ensures that the RTC and SYSTIM share a common time base (albeit with different resolutions/spans). Another software convenience feature is that SYSTIM qualifies any submitted compare values so that the timer channel will immediately trigger if the submitted event is in the immediate past (4.294s with 1 us resolution and 1.049s with 250 ns resolution).

#### • General Purpose Timers (LGPT)

The CC2340R5 device provides four LGPTs with 3 × 16 bit timers and 1× 24 bit timer, all running on up to 48 MHz. The LGPTs support a wide range of features such as:

- 3 capture/compare channels
- One-shot or periodic counting
- Pulse width modulation (PWM)
- Time counting between edges and edge counting
- Input filter implemented on each of the channels for all timers
- IR generation feature available on Timer-0
- Dead band feature available on Timer-1

The timer capture/compare and PWM signals are connected to IOs via IO controller module (IOC) and the internal timer event connections to CPU, DMA and other peripherals are via the event fabric, which allows the timers to interact with signals such as GPIO inputs, other timers, DMA and ADC. Two LGPTs (2× 16 bit timers) supports quadrature decoder mode to enable buffered decoding of quadrature-encoded sensor signals. The LGPTs are available in device Active and Idle power modes.

Feature	Timer 0	Timer 1	Timer 2	Timer 3		
Counter Width	16-bit counter width	24-bit counter width	24-bit counter width	24-bit counter width		
Quadrature Decoder	Yes	No	Yes	No		
Park Mode on Fault	No	Yes	No	No		
Programmable Dead- Band Insertion	No	Yes	No	No		

表 9-1. Timer Comparison

#### Watchdog timer

The watchdog timer is used to regain control if the system operates incorrectly due to software errors. Upon counter expiry, the watchdog timer resets the device when periodic monitoring of the system components and tasks fails to verify proper functionality. The watchdog timer runs on a 32 kHz clock rate and operates in device active, idle, and standby modes and cannot be stopped once enabled.

#### 9.7 Serial Peripherals and I/O

The CC2340R5 device provides 1xUART, 1xSPI and 1xI2C serial peripherals

The SPI module supports both SPI controller and peripheral up to 12 MHz with configurable phase and polarity.

The UART module implement universal asynchronous receiver and transmitter functions. They support flexible baud-rate generation up to a maximum of 3 Mbps and IRDA SIR mode of operation.

The I2C module is used to communicate with devices compatible with the I<sup>2</sup>C standard. The I<sup>2</sup>C interface can handle 100 kHz and 400 kHz operation, and can serve as both controller and target.

The I/O controller (IOC) controls the digital I/O pins and contains multiplexer circuitry to allow a set of peripherals to be assigned to I/O pins in a fixed manner over DIOs. All digital I/Os are interrupt and wake-up capable, have a programmable pullup and pulldown function, and can generate an interrupt on a negative or positive edge (configurable). When configured as an output, pins can function as either push-pull, open-drain, or open source. Some GPIOs have high-drive capabilities, which are marked in **bold** in <sup>‡</sup> 7.

For more information, see the CC23xx SimpleLink™ Wireless MCU Technical Reference Manual.

#### 9.8 Battery and Temperature Monitor

A combined temperature and battery voltage monitor is available in the CC2340R5 device. The battery and temperature monitor allows an application to continuously monitor on-chip temperature and supply voltage and respond to changes in environmental conditions as needed. The module contains window comparators to interrupt the system CPU when temperature or supply voltage go outside defined windows. These events can also be used to wake up the device from Standby mode through the Always-On (AON) event fabric.

### 9.9 µDMA

The device includes a direct memory access ( $\mu$ DMA) controller. The  $\mu$ DMA controller provides a way to offload data-transfer tasks from the system CPU, thus allowing for more efficient use of the processor and the available bus bandwidth. The  $\mu$ DMA controller can perform a transfer between memory and peripherals. The  $\mu$ DMA controller has dedicated channels for each supported on-chip module and can be programmed to automatically perform transfers between peripherals and memory when the peripheral is ready to transfer more data.

Some features of the µDMA controller include the following (this is not an exhaustive list):

- Channel operation of up to 8 channels, with 6 channels having dedicated peripheral interface and 2 channels having ability to be triggered via configurable events.
- Transfer modes: memory-to-memory, memory-to-peripheral, peripheral-to-memory, and peripheral-to-peripheral
- Data sizes of 8, 16, and 32 bits
- Ping-pong mode for continuous streaming of data

#### 9.10 Debug

On-chip debug is supported through the serial wire debug (SWD) interface, which is an ARM bi-directional 2-wire protocol that communicates with the JTAG Test Access Port (TAP) controller and allows for complete debug functionality. SWD is fully compatible with Texas Instruments' XDS family of debug probes.

#### 9.11 Power Management

To minimize power consumption, the CC2340R5 supports a number of power modes and power management features (see  $\frac{1}{5}$  9-2).

表 9-2. Power Modes										
MODE	SOFTW	ARE CONFIGURABLE PO	OWER MODES (1)		RESET PIN					
MODE	ACTIVE	IDLE	STANDBY	SHUTDOWN	HELD					
CPU	Active Off		Off	Off	Off					
Flash	On	Available	Off	Off	Off					
SRAM	On	On	Retention	Off	Off					
Radio	Available	Available	Off	Off	Off					
Supply System	On	On	Duty Cycled	Off	Off					
CPU register retention	Full	Full	Full <sup>(2)</sup>	No	No					
SRAM retention	Full	Full	Full	Off	Off					
48 MHz high-speed clock (HFCLK)	HFOSC (tracks HFXT)	HFOSC (tracks HFXT)	Off	Off	Off					
32 kHz low-speed clock (LFCLK)	LFXT or LFOSC	LFXT or LFOSC	LFXT or LFOSC	Off	Off					
Peripherals	Available	Available	IOC, BATMON, RTC, LPCOMP	Off	Off					
Wake-up on RTC	N/A	Available	Available	Off	Off					
Wake-up on pin edge	N/A	Available	Available	Available	Off					
Wake-up on reset pin	On	On	On	On	On					
Brownout detector (BOD)	On	On	Duty Cycled	Off	Off					
Power-on reset (POR)	On	On	On	On	On					
Watchdog timer (WDT)	Available	Available	Available	Off	Off					

(1) "Available" indicates that the specific IP or feature can be enabled by user application in the corresponding device operating modes. "On" indicates that the specific IP or feature is turned on irrespective of the user application configuration of the device in the corresponding device operating mode. "Off" indicates that the specific IP or feature is turned off and not available for the user application in the corresponding device operating mode.

(2) Software-based retention of CPU registers with context save and restore when entering and exiting standby power mode

In the **Active** mode, both of MCU and AON power domains are powered. Clock gating is used to minimize power consumption. Clock gating to peripherals/subsystems is controlled manually by the CPU.

In **Idle** mode the CPU is in sleep but selected peripherals and subsystems (such as the radio) can be active. Infrastructure (Flash, ROM, SRAM, bus) clock gating is possible depending on state of the DMA and debug subsystem.

In **Standby** mode, only the always-on (AON) domain is active. An external wake-up event, RTC event, or comparator event (LP-COMP) is required to bring the device back to active mode. Pin Reset will also drive the device from Standby to Active. MCU peripherals with retention do not need to be reconfigured when waking up again, and the CPU continues execution from where it went into standby mode. All GPIOs are latched in standby mode.

In **Shutdown** mode, the device is entirely turned off (including the AON domain), and the I/Os are latched with the value they had before entering shutdown mode. A change of state on any I/O pin defined as a *wake from shutdown pin* wakes up the device and functions as a reset trigger. The CPU can differentiate between reset in this way and reset-by-reset pin or power-on reset, or thermal shutdown reset, by reading the reset status register. The only state retained in this mode are the latched I/O state, 3V register bank, and the flash memory contents.

# 备注

The power, RF and clock management for the CC2340R5 device require specific configuration and handling by software for optimized performance. This configuration and handling is implemented in the TI-provided drivers that are part of the CC2340R5 software development kit (SDK). Therefore, TI highly recommends using this software framework for all application development on the device. The complete SDK with FreeRTOS, device drivers, and examples are offered free of charge in source code.

# 9.12 Clock Systems

The CC2340R5 device has the following internal system clocks.

The 48 MHz HFCLK is used as the main system (MCU and peripherals) clock. This is driven by the internal 48 MHz RC Oscillator (HFOSC), which can track its accuracy against an external 48 MHz crystal (HFXT). Radio operation requires an external 48 MHz crystal.

The 32.768 kHz LFCLK is used as the internal low-frequency system clock. It is used for the RTC, the watchdog timer (if enabled in standby power mode), and to synchronize the radio timer before or after Standby power mode. LFCLK can be driven by the internal 32.8 kHz RC Oscillator (LFOSC), a 32.768 kHz watch-type crystal, or clock input in LFXT bypass mode. When using a crystal or the internal RC oscillator, the device can output the 32 kHz LFCLK signal to other devices, thereby reducing the overall system cost.

#### 9.13 Network Processor

Depending on the product configuration, the CC2340R5 device can function as a wireless network processor (WNP - a device running the wireless protocol stack with the application running on a separate host MCU), or as a system-on-chip (SoC - with the application and protocol stack running on the system CPU inside the device).

In the first case, the external host MCU communicates with the device using SPI or UART. In the second case, the application must be written according to the application framework supplied with the wireless protocol stack.

# 10 Application, Implementation, and Layout

备注

以下应用部分中的信息不属于 TI 器件规格的范围, TI 不担保其准确性和完整性。TI 的客 户应负责确定器件是否适用于其应用。客户应验证并测试其设计,以确保系统功能。

#### **10.1 Reference Designs**

The following reference designs should be followed closely when implementing designs using the CC2340R5 device.

Special attention must be paid to RF component placement, decoupling capacitors and DCDC regulator components, as well as ground connections for all of these.

LP-EM-CC2340R5 Design Files The CC2340R5 LaunchPad Design Files contain detailed schematics and layouts to build application specific boards using the CC2340R5 device.

Sub-1 GHz and 2.4 GHz Antenna Kit for LaunchPad™ Development Kit and SensorTag The antenna kit allows real-life testing to identify the optimal antenna for your application. The antenna kit includes 16 antennas for frequencies from 169 MHz to 2.4 GHz, including:

- PCB antennas
- Helical antennas
- Chip antennas
- Dual-band antennas for 868 MHz and 915 MHz combined with 2.4 GHz

The antenna kit includes a JSC cable to connect to the Wireless MCU LaunchPad Development Kits and SensorTags.

#### **10.2 Junction Temperature Calculation**

This section shows the different techniques for calculating the junction temperature under various operating conditions. For more details, see Semiconductor and IC Package Thermal Metrics.

There are two recommended ways to derive the junction temperature from other measured temperatures:

1. From package temperature:

$$T_J = \psi_{\rm JT} \times P + T_{\rm case} \tag{1}$$

2. From board temperature:

$$T_{I} = \psi_{\rm JB} \times P + T_{\rm board} \tag{2}$$

P is the power dissipated from the device and can be calculated by multiplying current consumption with supply voltage. Thermal resistance coefficients are found in *Thermal Resistance Characteristics*.

#### Example:

In this example, we assume a simple use case where the radio is transmitting continuously at 0 dBm output power. Let us assume we want to maintain a junction temperature equal or less than 85 °C and the supply voltage is 3 V. Using Equation 1, the temperature difference between the top of the case and junction temperature is calculated. To calculate P, look up the current consumption for Tx at 85 °C. At 85 °C the current consumption is approximately 5.5 mA. This means that P is 5.5 mA × 3 V = 16.5 mW.

The maximum case temperature to maintain and junction temperature of 85 °C is then calculated as:

$$T_{\text{case}} < T_j - 0.4^{\circ}C/_W \times 23.4mW = 84.99^{\circ}C$$
 (3)

For various application use cases current consumption for other modules may have to be added to calculate the appropriate power dissipation. For example, the MCU may be running simultaneously as the radio, peripheral modules may be enabled, and so on. Typically, the easiest way to find the peak current consumption, and thus the peak power dissipation in the device, is to measure as described in the Measuring CC13xx and CC26xx Current Consumption application report.

# **11 Device and Documentation Support**

TI offers an extensive line of development tools. Tools and software to evaluate the performance of the device, generate code, and develop solutions are listed as follows.

#### **11.1 Device Nomenclature**

To designate the stages in the product development cycle, TI assigns prefixes to all part numbers and/or datecode. Each device has one of three prefixes/identifications: X, P, or null (no prefix) (for example, X is in preview; therefore, an X prefix/identification is assigned).

Device development evolutionary flow:

- **X** Experimental device that is not necessarily representative of the final device's electrical specifications and may not use production assembly flow.
- **P** Prototype device that is not necessarily the final silicon die and may not necessarily meet final electrical specifications.

null Production version of the silicon die that is fully qualified.

Production devices have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

Predictions show that prototype devices (X or P) have a greater failure rate than the standard production devices. Texas Instruments recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

TI device nomenclature also includes a suffix with the device family name. This suffix indicates the package type (for example, *RHB*).

For orderable part numbers of devices in the RHB (5-mm x 5-mm) package type, see the *Package Option Addendum* of this document, the Device Information in  $\ddagger$  3, the TI website (www.ti.com), or contact your TI sales representative.

#### 11.2 Tools and Software

The CC2340R5 device is supported by a variety of software and hardware development tools.

#### **Development Kit**

CC2340R5 LaunchPad™ Development Kit

The CC2340R5 LaunchPad <sup>™</sup> Development Kit enables development of highperformance wireless applications that benefit from low-power operation. The kit features the CC2340R5 SimpleLink Wireless MCU, which allows you to quickly evaluate and prototype 2.4-GHz wireless applications such as Bluetooth 5 Low Energy, Zigbee and

Thread, plus combinations of these. The kit works with the LaunchPad ecosystem, easily enabling additional functionality like sensors, display and more.

#### Software

SimpleLink™ CC23xx software development kit (SDK)

The SimpleLink CC23xx software development kit (SDK) provides a complete package for the development of wireless applications on the CC23xx family of devices. The SDK includes a comprehensive software package for the CC2340R5 device, including the following protocol stacks:

• Bluetooth Low Energy 4 and 5.3

The SimpleLink CC23xx SDK is part of TI's SimpleLink MCU platform, offering a single development environment that delivers flexible hardware, software and tool options for customers developing wired and wireless applications. For more information about the SimpleLink MCU Platform, visit https://www.ti.com/simplelink.

**Code Composer** Code Composer Studio is an integrated development environment (IDE) that supports TI's Studio<sup>™</sup> Integrated Microcontroller and Embedded Processors portfolio. Code Composer Studio comprises a **Development** suite of tools used to develop and debug embedded applications. It includes an optimizing Environment (IDE) C/C++ compiler, source code editor, project build environment, debugger, profiler, and many other features. The intuitive IDE provides a single user interface taking you through each step of the application development flow. Familiar tools and interfaces allow users to get started faster than ever before. Code Composer Studio combines the advantages of the Eclipse® software framework with advanced embedded debug capabilities from TI resulting in a compelling feature-rich development environment for embedded developers. CCS has support for all SimpleLink Wireless MCUs and includes support for EnergyTrace™ software (application energy usage profiling). A real-time object viewer plugin is available for TI-RTOS, part of the SimpleLink SDK. Code Composer Studio is provided free of charge when used in conjunction with the XDS debuggers included on a LaunchPad Development Kit. Code Composer Code Composer Studio (CCS) Cloud is a web-based IDE that allows you to create, edit and Studio<sup>™</sup> Cloud build CCS and Energia™ projects. After you have successfully built your project, you can IDE download and run on your connected LaunchPad. Basic debugging, including features like setting breakpoints and viewing variable values is now supported with CCS Cloud. IAR Embedded IAR Embedded Workbench® is a set of development tools for building and debugging Workbench<sup>®</sup> for embedded system applications using assembler, C and C++. It provides a completely Arm® integrated development environment that includes a project manager, editor, and build tools. IAR has support for all SimpleLink Wireless MCUs. It offers broad debugger support, including XDS110, IAR I-jet<sup>™</sup> and Segger J-Link<sup>™</sup>. A real-time object viewer plugin is available for TI-RTOS, part of the SimpleLink SDK. IAR is also supported out-of-the-box on most software examples provided as part of the SimpleLink SDK. A 30-day evaluation or a 32 KB size-limited version is available through iar.com. SmartRF<sup>™</sup> Studio SmartRF<sup>™</sup> Studio is a Windows<sup>®</sup> application that can be used to evaluate and configure SimpleLink Wireless MCUs from Texas Instruments. The application will help designers of RF systems to easily evaluate the radio at an early stage in the design process. It is especially useful for generation of configuration register values and for practical testing and debugging of the RF system. SmartRF Studio can be used either as a standalone application or together with applicable evaluation boards or debug probes for the RF device. Features of the SmartRF Studio include: Link tests - send and receive packets between nodes Antenna and radiation tests - set the radio in continuous wave TX and RX states · Export radio configuration code for use with the TI SimpleLink SDK RF driver Custom GPIO configuration for signaling and control of external switches **CCS UniFlash** CCS UniFlash is a standalone tool used to program on-chip flash memory on TI MCUs. UniFlash has a GUI, command line, and scripting interface. CCS UniFlash is available free of charge.

#### 11.2.1 SimpleLink<sup>™</sup> Microcontroller Platform

The SimpleLink microcontroller platform sets a new standard for developers with the broadest portfolio of wired and wireless Arm<sup>®</sup> MCUs (System-on-Chip) in a single software development environment. Delivering flexible hardware, software and tool options for your IoT applications. Invest once in the SimpleLink software development kit and use throughout your entire portfolio. Learn more on ti.com/simplelink.

#### 11.3 Documentation Support

To receive notification of documentation updates on data sheets, errata, application notes and similar, navigate to the device product folder (CC2340R5). In the upper right corner, click on *Alert me* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

The current documentation that describes the MCU, related peripherals, and other technical collateral is listed as follows.

#### **TI Resource Explorer**

TI Resource Explorer Software examples, libraries, executables, and documentation are available for your device and development board.

#### Errata

*CC2340R5 Silicon Errata* The silicon errata describes the known exceptions to the functional specifications for each silicon revision of the device and description on how to recognize a device revision.

#### **Application Reports**

All application reports for the CC2340R5 device are found on the device product folder (CC2340R5).

#### **Technical Reference Manual (TRM)**

CC23xx SimpleLink™ Wireless MCU	The	TRM	provides	а	detailed	description	of	all	modules	and
IRM	peripherals available in the device family.									

#### 11.4 支持资源

TI E2E<sup>™</sup> 支持论坛是工程师的重要参考资料,可直接从专家获得快速、经过验证的解答和设计帮助。搜索现有解 答或提出自己的问题可获得所需的快速设计帮助。

链接的内容由各个贡献者"按原样"提供。这些内容并不构成 TI 技术规范,并且不一定反映 TI 的观点;请参阅 TI 的《使用条款》。

#### 11.5 Trademarks

SimpleLink<sup>™</sup>, LaunchPad<sup>™</sup>, Code Composer Studio<sup>™</sup>, EnergyTrace<sup>™</sup>, and TI E2E<sup>™</sup> are trademarks of Texas Instruments.

I-jet<sup>™</sup> is a trademark of IAR Systems AB.

J-Link<sup>™</sup> is a trademark of SEGGER Microcontroller Systeme GmbH.

Arm<sup>®</sup> and Cortex<sup>®</sup> are registered trademarks of Arm Limited (or its subsidiaries) in the US and/or elsewhere. Bluetooth<sup>®</sup> is a registered trademark of Bluetooth SIG.

CoreMark<sup>®</sup> is a registered trademark of Embedded Microprocessor Benchmark Consortium Corporation. Wi-Fi<sup>®</sup> is a registered trademark of Wi-Fi Alliance.

Eclipse<sup>®</sup> is a registered trademark of Eclipse Foundation.

IAR Embedded Workbench® is a registered trademark of IAR Systems AB.

Windows<sup>®</sup> is a registered trademark of Microsoft Corporation.

所有商标均为其各自所有者的财产。

#### 11.6 静电放电警告

静电放电 (ESD) 会损坏这个集成电路。德州仪器 (TI) 建议通过适当的预防措施处理所有集成电路。如果不遵守正确的处理和安装程序,可能会损坏集成电路。

ESD 的损坏小至导致微小的性能降级,大至整个器件故障。精密的集成电路可能更容易受到损坏,这是因为非常细微的参数更改都可能会导致器件与其发布的规格不相符。

# 11.7 术语表

TI术语表 本术语表列出并解释了术语、首字母缩略词和定义。

# 12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical packaging and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

# PACKAGING INFORMATION

<sup>(1)</sup> The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

<sup>(2)</sup> RoHS: TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (CI) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

<sup>(3)</sup> MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

<sup>(4)</sup> There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

<sup>(5)</sup> Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

<sup>(6)</sup> Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
