3 说明

ISO721、ISO721M、ISO722 和 ISO722M 器件是数字隔离器，其逻辑输入和输出缓冲器由二氧化硅 (SiO_2) 绝缘隔栅进行隔离。该隔离栅可提供符合 VDE 0884-17 标准、高达 $4000V_{PK}$ 的电隔离。与隔离式电源一起使用时，这些器件可防止数据总线或者其他电路上的噪声电流进入本地接地并且干扰或损坏敏感电路。

对二进制输入信号进行调理并转换为平衡的信号，然后由隔离层进行差分。跨越该隔离层，差分比较器可接收逻辑转换信息，然后相应地设置或重置触发器和输出电路。电路将跨越隔离层发送定期更新脉冲，以提供适当的直流输出电平。

如果没有接收到该直流刷新脉冲的时间超过 4 µs，则输入被视为未通电或未被主动驱动，失效防护电路会将输出驱动至逻辑高电平状态。

这些器件需要两个 3.3V 和 5V 电源电压或二者的任意组合。通过 3.3V 电源供电时，所有输入均可耐受 5V 电压，所有输出均为 4mA CMOS。

ISO722 和 ISO722M 器件包含一个低电平有效输出使能端，当被驱动至高逻辑电平时，该使能端会将输出置于高阻抗状态并关闭内部偏置电路以节省功耗。

ISO721 和 ISO722 器件具有 TTL 输入阈值，并且在输入端具有噪声滤波器，可防止持续时间高达 2ns 的瞬态脉冲传递到器件的输出端。

ISO721M 和 ISO722M 器件具有 CMOS $V_{CC}/2$ 输入阈值，但没有输入噪声滤波器和额外的传播延迟。ISO721M 器件的这些特性还可以实现低抖动运行。

ISO721、ISO721M、ISO722 和 ISO722M 器件的额定工作环境温度范围为 –40°C 至 +125°C。

6.6 Safety Limiting Values

Safety limiting intends to minimize potential damage to the isolation barrier upon failure of input or output circuitry. A failure of the I/O can allow low resistance to ground or the supply and, without current limiting, dissipate sufficient power to overheat the die and damage the isolation barrier, potentially leading to secondary system failures.

(1) Creepage and clearance requirements should be applied according to the specific equipment isolation standards of an application. Care should be taken to maintain the creepage and clearance distance of a board design to ensure that the mounting pads of the isolator on the printed-circuit board do not reduce this distance. Creepage and clearance on a printed-circuit board become equal in certain cases. Techniques such as inserting grooves and/or ribs on a printed circuit board are used to help increase these specifications.
(2) This coupler is suitable for *basic electrical insulation* only within the maximum operating ratings. Compliance with the safety ratings shall be ensured by means of suitable protective circuits.
(3) Apparent charge is electrical discharge caused by a partial discharge (pd).
(4) All pins on each side of the barrier tied together creating a two-terminal device

8 Detailed Description

8.1 Overview

The ISO72x family of devices transmit digital data across a silicon dioxide based isolation barrier. The digital input signal (IN) of the device is sampled by a transmitter and at every data edge the transmitter sends a corresponding differential signal across the isolation barrier. When the input signal is static, the refresh logic periodically sends the necessary differential signal from the transmitter. On the other side of the isolation barrier, the receiver converts the differential signal into a single-ended signal which is output on the OUT pin through a buffer. If the receiver does not receive a data or refresh signal, the timeout logic detects the loss of signal or power from the input side and drives the output to the default level.

9 Application and Implementation

备注

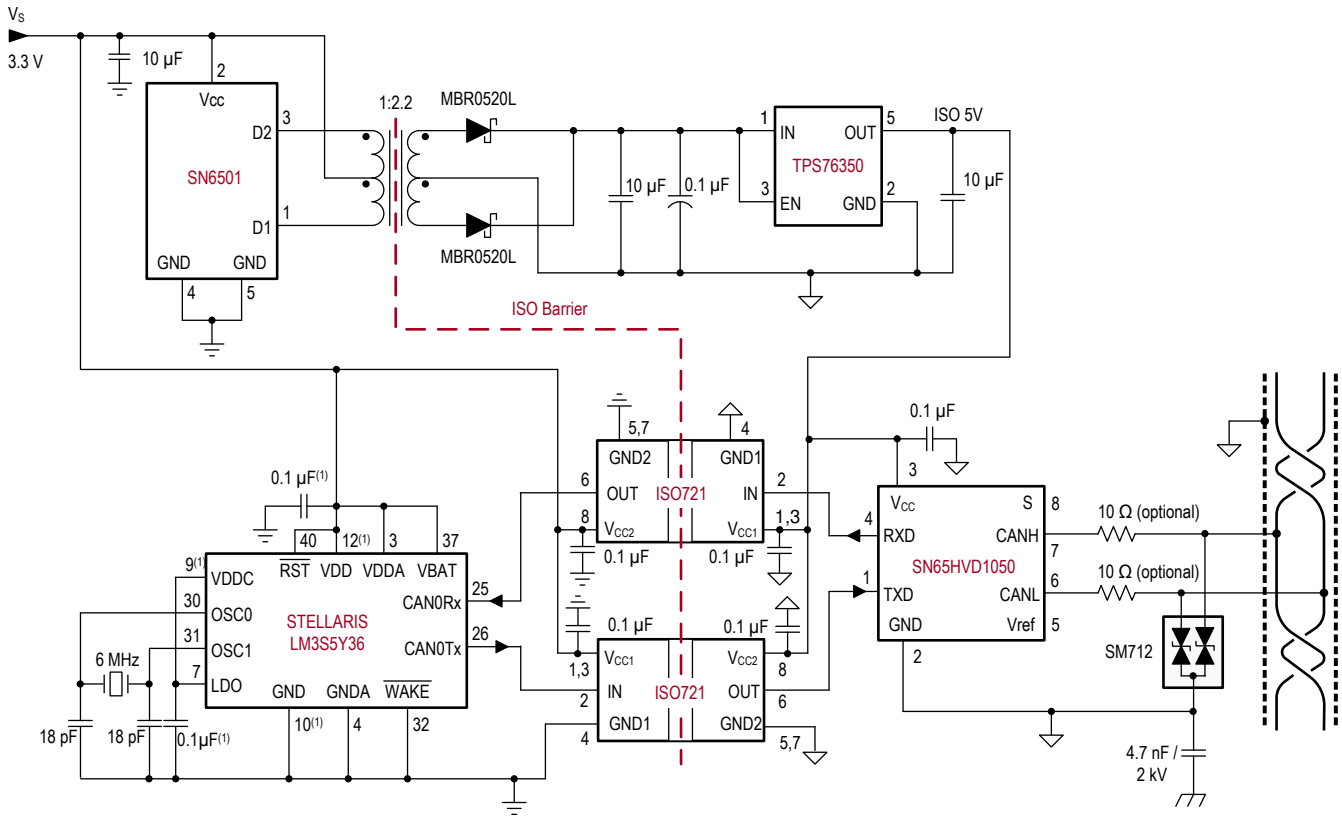
以下应用部分中的信息不属于 TI 器件规格的范围，TI 不担保其准确性和完整性。TI 的客 户应负责确定器件是否适用于其应用。客户应验证并测试其设计，以确保系统功能。

9.1 Application Information

The ISO72x devices use single-ended TTL or CMOS-logic-switching technology. The supply voltage range of the devices is from 3 V to 5.5 V for both supplies, V_{CC1} and V_{CC2}. When designing with digital isolators, because the single-ended design structure, digital isolators do not conform to any specific interface standard and are only intended for isolating single-ended CMOS or TTL digital signal lines. The isolator is typically placed between the data controller (µ C or UART), and a data converter or a line transceiver, regardless of the interface type or standard.

9.2 Typical Application

The ISO721 device can be used with Texas Instruments' microcontroller, CAN transceiver, transformer driver, and low-dropout voltage regulator to create an Isolated CAN Interface as shown in 图 9-1.



A. Multiple pins and capacitors omitted for clarity purpose.

图 9-1. Isolated CAN Interface

9.2.1 Design Requirements

Unlike optocouplers, which require external components to improve performance, provide bias, or limit current, the ISO72x devices only require two external bypass capacitors to operate.

9.2.2 Detailed Design Procedure

图 9-2 shows a typical circuit hook-up for the ISO721 device.

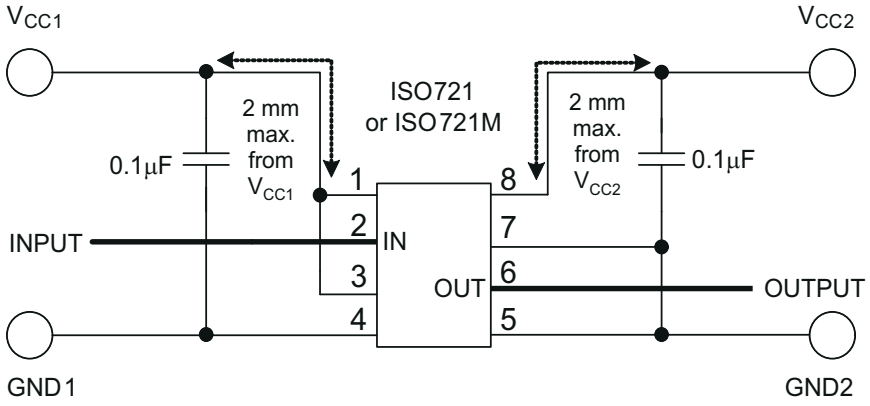


图 9-2. Typical ISO721 Circuit Hook-up

The ISO72x isolators have the same functional pinout as those of most other vendors as shown in 图 9-3, and are often pin-for-pin drop-in replacements. The notable differences in the products are propagation delay, signaling rate, power consumption, and transient protection rating. 表 9-1 is used as a guide for replacing other isolators with the ISO72x family of single-channel isolators.

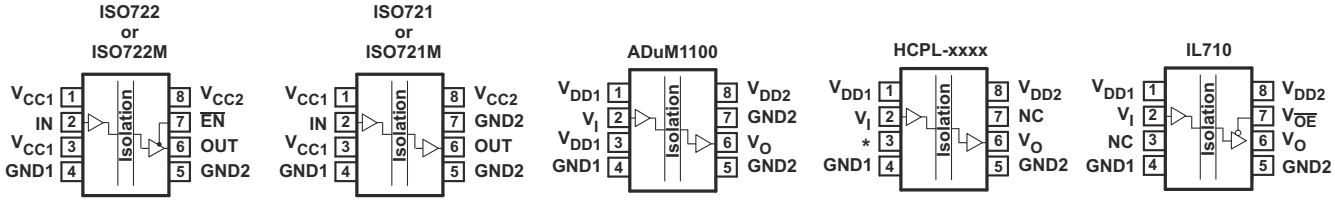

图 9-3. Pin Cross Reference

表 9-1. Cross Reference

ISOLATOR	PIN 1	PIN 2	PIN 3	PIN 4	PIN 5	PIN 6	PIN 7		PIN 8
							ISO721 OR ISO721M	ISO722 OR ISO722M	
ISO721(1) (2)	V_{CC1}	IN	V_{CC1}	GND1	GND2	OUT	GND2	$\overline{EN}$	V_{CC2}
ADuM1100(1) (2)	V_{DD1}	V_I	V_{DD1}	GND1	GND2	V_O	GND2		V_{DD2}
HCPL-xxxx	V_{DD1}	V_I	*Leave Open(3)	GND1	GND2	V_O	NC(5)		V_{DD2}
IL710	V_{DD1}	V_I	NC(4)	GND1	GND2	V_O	$V_{\overline{OE}}$		V_{DD2}

(1) Pin 1 must be used as V_{CC1}. Pin 3 can also be used as V_{CC1} or left open, as long as pin 1 is connected to V_{CC1}.
(2) Pin 5 must be used as GND2. Pin 7 can also be used as GND2 or left open, as long as pin 5 is connected to GND2.
(3) Pin 3 of the HCPL devices must be left open. This is not a problem when substituting an ISO72x device, because the extra V_{CC1} on pin 3 can be left an open circuit as well.
(4) Pin 3 of the IL710 must not be tied to ground on the circuit board because this shorts the ISO72x V_{CC1} to ground. The IL710 pin 3 can only be tied to V_{CC} or left open to drop in an ISO72x device.
(5) An HCPL device pin 7 must be left floating (open) or grounded when an ISO722 or ISO722M device is to be used as a drop-in replacement. If pin 7 of the ISO722 or ISO722M device is placed in a high logic state, the output of the device is disabled.

9.2.3.2 Insulation Lifetime

At maximum working voltage, the isolation barrier of the ISO72x and ISO72xM family of devices has more than 28 years of life.

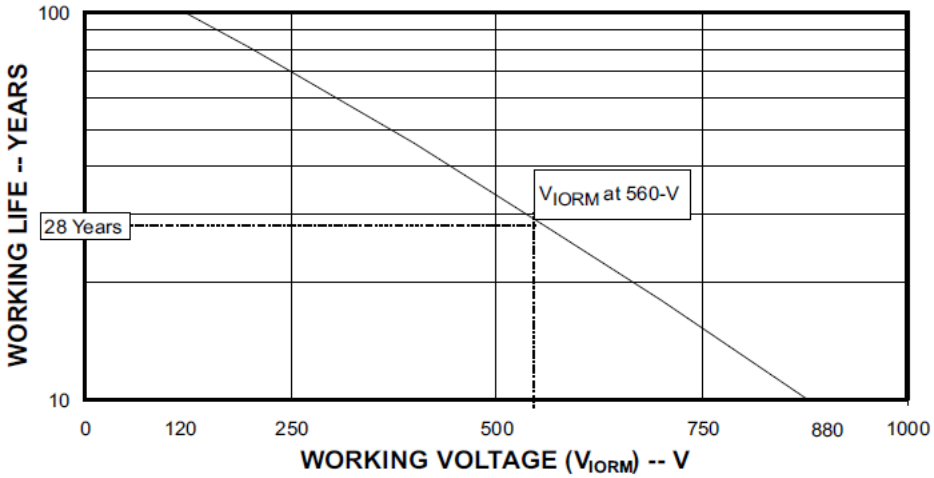

图 9-7. Insulation Lifetime Projection

9.3 Power Supply Recommendations

To help provide reliable operation at data rates and supply voltages, a 0.1-μF bypass capacitor must be placed at input and output supply pins (V_{CC1} and V_{CC2}). The capacitors must be placed as close to the supply pins as possible. If only a single primary-side power supply is available in an application, isolated power can be generated for the secondary-side with the help of a transformer driver such as Texas Instruments SN6501 device. For such applications, detailed power supply design and transformer selection recommendations are available in the *SN6501 Transformer Driver for Isolated Power Supplies* data sheet.

9.4 Layout

9.4.1 Layout Guidelines

A minimum of four layers is required to accomplish a low EMI PCB design (see 图 9-8). Layer stacking must be in the following order (top-to-bottom): high-speed signal layer, ground plane, power plane and low-frequency signal layer.

- Routing the high-speed traces on the top layer avoids the use of vias (and the introduction of the inductances) and allows for clean interconnects between the isolator and the transmitter and receiver circuits of the data link.
- Placing a solid ground plane next to the high-speed signal layer establishes controlled impedance for transmission line interconnects and provides an excellent low-inductance path for the return current flow.
- Placing the power plane next to the ground plane creates additional high-frequency bypass capacitance of approximately 100 pF/in^2.
- Routing the slower speed control signals on the bottom layer allows for greater flexibility as these signal links usually have margin to tolerate discontinuities such as vias.

If an additional supply voltage plane or signal layer is needed, add a second power or ground plane system to the stack to keep the planes symmetrical. This makes the stack mechanically stable and prevents warping. Also the power and ground plane of each power system can be placed closer together, thus increasing the high-frequency bypass capacitance significantly.

For detailed layout recommendations, refer to the *Digital Isolator Design Guide*.

9.4.1.1 PCB Material

For digital circuit boards operating at less than 150 Mbps, (or rise and fall times greater than 1 ns), and trace lengths of up to 10 inches, use standard FR-4 UL94V-0 printed circuit board. This PCB is preferred over cheaper

alternatives because of lower dielectric losses at high frequencies, less moisture absorption, greater strength and stiffness, and the self-extinguishing flammability-characteristics.
