

## TLV6208x 采用 2mm x 2mm WSON 封装的 1.2A 和 2A 高效降压转换器

### 1 特性

- DCS-Control™ 架构，用于快速瞬态稳压
- 2.5V 至 6V 输入电压范围 (TLV62080)
- 2.7V 至 6V 输入电压范围 (TLV62084 和 TLV62084A)
- 100% 占空比，以实现最低降压
- 用于实现轻载效率的省电模式
- 输出放电功能
- 电源正常输出
- 热关断
- 采用 2mm x 2mm、8 引脚晶圆级小外形无引线 (WSON) 封装
- 有关改进的特性集，请参见 [TPS62080](#)
- 使用 TLV6208x 并借助 [WEBENCH® Power Designer](#) 创建定制设计方案

### 2 应用范围

- 电池供电类便携式器件
- 负载点稳压器
- PC、笔记本电脑、服务器
- 机顶盒
- 固态硬盘 (SSD)、存储器电源

### 3 说明

TLV6208x 系列器件是小型降压转换器，所用外部组件较少，可实现具有成本效益的解决方案。此类器件属于同步降压转换器，其输入电压范围为 2.5V/2.7V (TLV62080 为 2.5V，TLV62084x 为 2.7V) 至 6V。TLV6208x 器件专注于在宽输出电流范围内实现高效降压转换。该转换器在中等至高负载条件下采用脉宽调制 (PWM) 模式，而在轻载电流条件下自动进入省电模式，从而在整个负载电流范围内保持高效运行。

为了满足系统电源轨需求，内部补偿电路支持在较大外部输出电容值范围内进行选择。凭借 DCS-Control™ (无缝过渡至节能模式的直接控制) 架构，该器件实现了优异的负载瞬态性能和输出电压稳压精度。该器件采用带有散热焊盘的 2mm x 2mm 晶圆级小外形无引线 (WSON) 封装。

## 6 Pin Configurations and Functions

### Pin Functions

PIN		I/O	DESCRIPTION
NO.	NAME		
1	EN	IN	Device enable logic input. Do not leave floating. Logic HIGH enables the device, logic LOW disables the device and turns it into shutdown.
2, 3	GND	PWR	Power and signal ground.
4	FB	IN	Feedback terminal for the internal control loop. Connect this terminal to the external feedback divider to program the output voltage.
5	VOS	IN	Output voltage sense terminal for the internal control loop. Must be connected to output.
6	PG	OUT	Power Good open drain output. This terminal is pulled to low if the output voltage is below regulation limits. This terminal can be left floating if not used.
7	SW	PWR	Switch terminal connected to the internal MOSFET switches and inductor terminal. Connect the inductor of the output filter here.
8	VIN	PWR	Power supply voltage input.
Exposed Thermal Pad		—	Must be connected to GND. Must be soldered to achieve appropriate power dissipation and mechanical reliability.

## 8 Detailed Description

### 8.1 Overview

The TLV62080 and TLV62084x synchronous switched-mode converters are based on DCS-Control™. DCS-Control™ is an advanced regulation topology that combines the advantages of hysteretic and voltage mode control.

The DCS-Control™ topology operates in PWM (pulse width modulation) mode for medium to heavy load conditions and in power save mode at light load currents. In PWM mode, the TLV6208x converter operates with the nominal switching frequency of 2 MHz, having a controlled frequency variation over the input voltage range. As the load current decreases, the converter enters power save mode, reducing the switching frequency and minimizing the IC quiescent current to achieve high efficiency over the entire load current range. DCS-Control™ supports both operation modes (PWM and PFM) using a single building block with a seamless transition from PWM to power save mode without effects on the output voltage. The TLV62080 and TLV62084x devices offer both excellent DC voltage and superior load transient regulation, combined with very low output voltage ripple, minimizing interference with RF circuits.

### 8.3 Feature Description

#### 8.3.1 100% Duty-Cycle Low-Dropout Operation

The devices offer low input-to-output voltage difference by entering the 100% duty-cycle mode. In this mode the high-side MOSFET switch is constantly turned on and the low-side MOSFET is switched off. This mode is particularly useful in battery powered applications to achieve the longest operation time by taking full advantage of the whole battery voltage range. [公式 1](#) calculates the minimum input voltage to maintain regulation based on the load current and output voltage.

## Feature Description (接下页)

$$V_{IN,MIN} = V_{OUT} + I_{OUT,MAX} \times (R_{DS(on)} + R_L)$$

With:

- $V_{IN,MIN}$  = Minimum input voltage
- $I_{OUT,MAX}$  = Maximum output current
- $R_{DS(on)}$  = High-side FET on-resistance
- $R_L$  = Inductor ohmic resistance

(1)

### 8.3.2 Enabling and Disabling the Device

The device is enabled by setting the EN input to a logic HIGH. Accordingly, a logic LOW disables the device. If the device is enabled, the internal power stage starts switching and regulates the output voltage to the programmed threshold. The EN input must be terminated and not left floating.

### 8.3.3 Output Discharge

The output gets discharged through the SW terminal with a typical discharge resistor of  $R_{DIS}$  whenever the device shuts down (by disable, thermal shutdown or UVLO).

### 8.3.4 Soft Start

When EN is set to start device operation, the device starts switching after a delay of about 40  $\mu$ s and VOUT rises with a slope of about 10mV/ $\mu$ s (See 图 16 and 图 17 for typical startup operation). Soft start avoids excessive inrush current and creates a smooth output voltage rise slope. Soft start also prevents excessive voltage drops of primary cells and rechargeable batteries with high internal impedance.

If the output voltage is not reached within the soft start time, such as in the case of heavy load, the converter enters standard operation. Consequently, the inductor current limit operates as described in [Inductor Current-Limit](#). The TLV62080 and TLV62084x devices are able to start into a pre-biased output capacitor. The converter starts with the applied bias voltage and ramps the output voltage to the nominal value.

### 8.3.5 Power Good

The TLV62080 and TLV62084x devices have a power-good output going low when the output voltage is below the nominal value. The power good maintains high impedance once the output is above 95% of the regulated voltage, and is driven to low once the output voltage falls below typically 90% of the regulated voltage. The PG terminal is an open drain output and is specified to sink typically up to 0.5 mA. The power good output requires a pull-up resistor which is recommended connecting to the device output. When the device is off because of disable, UVLO, or thermal shutdown, the PG terminal is at high impedance. TLV62084A features PG=Low in these cases. 表 2 and 表 3 show the different PG operation for the TLV6208x and TLV62084A. The PG output can be left floating if unused.

**表 2. Power Good Pin Logic Table (TLV62080/84)**

Device Information		PG Logic Status	
		High Z	Low
Enable (EN=High)	$V_{FB} \geq V_{PG}$	√	
	$V_{FB} \leq V_{PG}$		√
Shutdown (EN=Low)		√	
UVLO	$0.7V < V_{IN} < V_{UVLO}$	√	
Thermal Shutdown	$T_J > T_{JSD}$	√	
Power Supply Removal	$V_{IN} < 0.7V$	√	

**表 3. Power Good Pin Logic Table (TLV62084A)**

Device Information		PG Logic Status	
		High Z	Low
Enable (EN=High)	$V_{FB} \geq V_{PG}$	√	
	$V_{FB} \leq V_{PG}$		√
Shutdown (EN=Low)			√
UVLO	$0.7V < V_{IN} < V_{UVLO}$		√
Thermal Shutdown	$T_J > T_{JSD}$		√
Power Supply Removal	$V_{IN} < 0.7V$	√	

The PG signal can be used for sequencing of multiple rails by connecting to the EN terminal of other converters. Leave the PG terminal unconnected when not in use.

### 8.3.6 Undervoltage Lockout

To avoid misoperation of the device at low input voltages, an undervoltage lockout is implemented which shuts down the device at voltages lower than  $V_{UVLO}$  with a  $V_{HYS\_UVLO}$  hysteresis.

### 8.3.7 Thermal Shutdown

The device goes into thermal shutdown once the junction temperature exceeds typically  $T_{JSD}$ . Once the device temperature falls below the threshold, the device returns to normal operation automatically.

### 8.3.8 Inductor Current-Limit

The Inductor current-limit prevents the device from high inductor current and drawing excessive current from the battery or input voltage rail. Excessive current can occur with a shorted or saturated inductor, a heavy load, or shorted output circuit condition.

The incorporated inductor peak-current limit measures the current during the high-side and low-side power MOSFET on-phase. Once the high-side switch current-limit is tripped, the high-side MOSFET is turned off and the low-side MOSFET is turned on to reduce the inductor current. When the inductor current drops down to the low-side switch current-limit, the low-side MOSFET is turned off and the high-side switch is turned on again. This operation repeats until the inductor current does not reach the high-side switch current-limit. Because of an internal propagation delay, the real current-limit value exceeds the static-current limit in the [Electrical Characteristics](#) table.

## 8.4 Device Functional Modes

### 8.4.1 Power Save Mode

As the load current decreases, the TLV62080 and TLV62084x devices enter power save mode operation. During power save mode, the converter operates with a reduced switching frequency in PFM mode and with a minimum quiescent current maintaining high efficiency. Power save mode occurs when the inductor current becomes discontinuous. Operation in power save mode is based on a fixed on time architecture. The typical on time is given by  $t_{on} = 400 \text{ ns} \times (V_{OUT} / V_{IN})$ . The switching frequency over the whole load current range is shown in [图 8](#).

## 9 Application and Implementation

### 注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 9.1 Application Information

The devices are designed to operate from an input voltage supply range between 2.5 V (2.7 V for the TLV62084x devices) and 6 V with a maximum output current of 2 A (1.2 A for the TLV62080 device). The TLV6208x devices operate in PWM mode for medium to heavy load conditions and in power save mode at light load currents.

In PWM mode the TLV6208x converters operate with the nominal switching frequency of 2 MHz which provides a controlled frequency variation over the input voltage range. As the load current decreases, the converter enters power save mode, reducing the switching frequency and minimizing the IC quiescent current to achieve high efficiency over the entire load current range.

The WEBENCH software uses an iterative design procedure and accesses a comprehensive database of components when generating a design. See the [文档支持](#) section for additional documentation.

## 9.2.2 Detailed Design Procedure

### 9.2.2.1 Custom Design With WEBENCH® Tools

[Click here](#) to create a custom design using the TLV62080 device with the WEBENCH® Power Designer.

1. Start by entering the input voltage ( $V_{IN}$ ), output voltage ( $V_{OUT}$ ), and output current ( $I_{OUT}$ ) requirements.
2. Optimize the design for key parameters such as efficiency, footprint, and cost using the optimizer dial.
3. Compare the generated design with other possible solutions from Texas Instruments.

The WEBENCH Power Designer provides a customized schematic along with a list of materials with real-time pricing and component availability.

In most cases, these actions are available:

- Run electrical simulations to see important waveforms and circuit performance
- Run thermal simulations to understand board thermal performance
- Export customized schematic and layout into popular CAD formats
- Print PDF reports for the design, and share the design with colleagues

Get more information about WEBENCH tools at [www.ti.com/WEBENCH](http://www.ti.com/WEBENCH).

- (2) Plus signs (+) indicates recommended filter combinations.
- (3) Filter combination in typical application.

### 9.2.2.3 Inductor Selection

The main parameter for the inductor selection is the inductor value and then the saturation current of the inductor. To calculate the maximum inductor current under static load conditions, 公式 2 is given.

$$I_{L,MAX} = I_{OUT,MAX} + \frac{\Delta I_L}{2}$$

$$\Delta I_L = V_{OUT} \times \frac{1 - \frac{V_{OUT}}{V_{IN}}}{L \times f_{SW}}$$

Where

- $I_{OUT,MAX}$  = Maximum output current
- $\Delta I_L$  = Inductor current ripple
- $f_{SW}$  = Switching frequency
- $L$  = Inductor value

(2)

TI recommends choosing the saturation current for the inductor 20% to approximately 30% higher than the  $I_{L,MAX}$ , out of 公式 2. A higher inductor value is also useful to lower ripple current, but increases the transient response time as well. The following inductors are recommended to be used in designs (see 表 7).

### 9.2.2.4 Capacitor Selection

The input capacitor is the low impedance energy source for the converter which helps to provide stable operation. A low ESR multilayer ceramic capacitor is recommended for best filtering and must be placed between VIN and GND as close as possible to those terminals. For most applications 10 μF is sufficient though a larger value reduces input current ripple.

The architecture of the TLV6208x device allows use of tiny ceramic-type output capacitors with low equivalent-series resistance (ESR). These capacitors provide low output voltage ripple and are recommended. To keep the resistance up to high frequencies and to get narrow capacitance variation with temperature, TI recommends use of the X7R or X5R dielectric. The TLV62080 and TLV62084x devices are designed to operate with an output capacitance of 10 to 100 μF and beyond, as listed in 表 6. Load transient testing and measuring the bode plot are good ways to verify stability with larger capacitor values.

### 9.2.2.5 Setting the Output Voltage

By selecting  $R_1$  and  $R_2$ , the output voltage is programmed to the desired value. Use 公式 3 to calculate  $R_1$  and  $R_2$ .

图 10. Typical Application Circuit

$$V_{OUT} = V_{FB} \times \left(1 + \frac{R_1}{R_2}\right) = 0.45V \times \left(1 + \frac{R_1}{R_2}\right) \quad (3)$$

For best accuracy,  $R_2$  must be kept smaller than 40 kΩ to ensure that the current flowing through  $R_2$  is at least 100-times larger than  $I_{FB}$ . Changing the sum towards a lower value increases the robustness against noise injection. Changing the sum towards higher values reduces the current consumption.

## 10 Power Supply Recommendations

The input power supply's output current needs to be rated according to the supply voltage, output voltage and output current of the TLV6208x.

## 11 Layout

### 11.1 Layout Guidelines

The PCB layout is an important step to maintain the high performance of the TLV62080 and TLV62084x devices.

- Place input and output capacitors, along with the inductor, as close as possible to the IC which keeps the traces short. Routing these traces direct and wide results in low trace resistance and low parasitic inductance.
- Use a common-power GND.
- Properly connect the low side of the input and output capacitors to the power GND to avoid a GND potential shift.
- The sense traces connected to FB and VOS terminals are signal traces. Keep these traces away from SW nodes.
- Use care to avoid noise induction. By a direct routing, parasitic inductance can be kept small.
- Use GND layers for shielding if needed.

### 11.2 Layout Example

图 18. PCB Layout Suggestion

### 11.3 Thermal Considerations

Implementation of integrated circuits in low-profile and fine-pitch surface-mount packages typically requires special attention to power dissipation. Many system-dependent issues such as thermal coupling, airflow, added heat sinks and convection surfaces, and the presence of other heat-generating components affect the power-dissipation limits of a given component.

Three basic approaches for enhancing thermal performance are listed below:

- Improving the power dissipation capability of the PCB design.
- Improving the thermal coupling of the component to the PCB by soldering the Thermal Pad.
- Introducing airflow in the system.

For more details on how to use the thermal parameters, see the Thermal Characteristics application notes [SZZA017](#) and [SPRA953](#).

#### 12.1.2 开发支持

##### 12.1.2.1 使用 WEBENCH® 工具定制设计方案

请单击[此处](#)，借助 WEBENCH® Power Designer 并使用 TLV62080 器件定制设计方案

1. 在开始阶段键入输出电压 ( $V_{IN}$ )、输出电压 ( $V_{OUT}$ ) 和输出电流 ( $I_{OUT}$ ) 要求。
2. 使用优化器拨盘优化关键设计参数，如效率、封装和成本。
3. 将生成的设计与德州仪器 (TI) 的其他解决方案进行比较。

WEBENCH Power Designer 提供一份定制原理图以及罗列实时价格和组件可用性的物料清单。

在多数情况下，可执行以下操作：

- 运行电气仿真，观察重要波形以及电路性能
- 运行热性能仿真，了解电路板热性能
- 将定制原理图和布局方案导出至常用 CAD 格式
- 打印设计方案的 PDF 报告并与同事共享

有关 WEBENCH 工具的详细信息，请访问 [www.ti.com/WEBENCH](http://www.ti.com/WEBENCH)。

### 12.5 静电放电警告

ESD 可能会损坏该集成电路。德州仪器 (TI) 建议通过适当的预防措施处理所有集成电路。如果不遵守正确的处理措施和安装程序，可能会损坏集成电路。

ESD 的损坏小至导致微小的性能降级，大至整个器件故障。精密的集成电路可能更容易受到损坏，这是因为非常细微的参数更改都可能会导致器件与其发布的规格不相符。

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
