

具有高级 Eco-mode™ 的 TPS560200-Q1 4.5V 至 17V 输入、500mA 同步降压转换器

1 特性

- 符合面向汽车应用的 AEC-Q100 标准
 - 温度范围：等级 1，-40°C 至 125°C
 - 人体模型 (HBM) 静电放电 (ESD) 分类等级：H2
 - 带电器件模型 (CDM) 静电放电 (ESD) 分类等级：C4B
- 集成单片 0.95Ω 高侧和 0.33Ω 低侧 MOSFET
- 500mA 持续输出电流
- 输出电压范围：0.8V 至 6.5V
- 0.8V 基准电压，温度范围内的精度为 ±1.3%
- 高级自动跳跃 Eco-mode™ 用于在轻负载时实现高效率
- D-CAP2™ 模式启用快速瞬态响应
- 无需外部补偿
- 600kHz 开关频率
- 2ms 内部软启动
- 安全启动至预偏置 VOUT
- 热关断
- 40°C 至 125°C 的工作结温范围
- 采用 8 引脚微型小外形尺寸封装 (MSOP)

2 应用

- 电动汽车 (EV) 充电站
- 信息娱乐系统

3 说明

TPS560200-Q1 是一款集成 MOSFET 的 17V、500mA、低 Iq 自适应导通时间 D-CAP2 模式同步单片降压转换器，采用简单易用的 8 引脚 MSOP 封装。

TPS560200-Q1 有助于系统设计人员通过具备成本效益、所用组件较少并且待机电流较低的解决方案完成各种终端设备的电源总线调节器集。器件主控制回路采用 D-CAP2 模式控制，无需外部补偿元件即可实现快速瞬态响应。自适应导通时间控制支持器件在高负载条件下的 PWM 模式与轻负载条件下的高级 Eco-mode 工作模式之间实现无缝切换。

TPS560200-Q1 的专有电路还可使其适应低等效串联电阻 (ESR) 输出电容（如导电性聚合物钽固体电解电容 (POSCAP) 和导电性聚合物铝电解电容 (SP-CAP)）以及超低 ESR 陶瓷电容。该器件由 4.5V 至 17V 范围内的输入电压供电。输出电压可在 0.8V 至 6.5V 范围内进行编程。该器件还具有 2ms 固定软启动时间。该器件采用 8 引脚 MSOP 封装。

5 Pin Configuration and Functions

Pin Functions

PIN		I/O	DESCRIPTION
NAME	NO.		
EN	1	I	Enable pin. Float to enable
GND	2, 8	—	Return for control circuitry and low-side power MOSFET
VSENSE	3	I	Converter feedback input. Connect to output voltage with feedback resistor divider
NC	4, 5	—	No connection inside, can be connected to any node or can be floating
VIN	6	I	Supplies the control circuitry of the power converter
PH	7	O	The switch node

6 Specifications

6.1 Absolute Maximum Ratings⁽¹⁾

		MIN	MAX	UNIT
Input voltage	VIN	−0.3	19	V
	EN	−0.3	7	V
	VSENSE	−0.3	3	V
Output voltage	PH	−0.6	19	V
	PH 10-ns transient	−2	21	V
Source current	EN		±100	μA
	PH	Current limit		A
Sink current	PH	Current limit		A
Operating junction temperature		−40	150	°C
Storage temperature, T _{stg}		−65	150	

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

6.2 ESD Ratings

		VALUE	UNIT
V _(ESD) Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001, all −2000, 2000 pins ⁽¹⁾	±2000	V
	Charged-device model (CDM), per AEC Q100-011, all pins	±500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	MAX	UNIT
V _I	Input voltage range	4.5	17	V
T _J	Operating junction temperature	−40	125	°C

Output UVP threshold	Falling	56	63	69	%VREF
Hiccup time			15		ms

(1) Not production tested

6.6 Typical Characteristics

$V_{IN} = 12\text{ V}$, $T_A = 25^\circ\text{C}$ (unless otherwise noted).

7 Detailed Description

7.1 Overview

The TPS560200-Q1 is a 500-mA synchronous step-down (buck) converter with two integrated N-channel MOSFETs. It operates using D-CAP2 mode control. The fast transient response of D-CAP2 control reduces the output capacitance required to meet a specific level of performance. Proprietary internal circuitry allows the use of low-ESR output capacitors including ceramic and special polymer types.

7.2 Functional Block Diagram

Copyright © 2016, Texas Instruments Incorporated

7.3 Feature Description

7.3.1 PWM Operation

The main control loop of the TPS560200-Q1 is an adaptive on-time pulse width modulation (PWM) controller that supports a proprietary D-CAP2 mode control. D-CAP2 mode control combines constant on-time control with an internal compensation circuit for pseudo-fixed frequency and low external component count configuration with both low-ESR and ceramic output capacitors. It is stable even with virtually no ripple at the output.

At the beginning of each cycle, the high-side MOSFET is turned on. This MOSFET is turned off after internal one-shot timer expires. This one shot is set by the converter input voltage, V_{IN} , and the output voltage, V_{OUT} , to maintain a pseudo-fixed frequency over the input voltage range, hence it is called adaptive on-time control. The one-shot timer is reset and the high-side MOSFET is turned on again when the feedback voltage falls below the reference voltage. An internal ramp is added to reference voltage to simulate output ripple, eliminating the need for ESR induced output ripple from D-CAP2 mode control.

Feature Description (接下页)

7.3.2 PWM Frequency and Adaptive On-Time Control

TPS560200-Q1 uses an adaptive on-time control scheme and does not have a dedicated on board oscillator. The TPS560200-Q1 runs with a pseudo-constant frequency of 600 kHz by using the input voltage and output voltage to set the on-time, one-shot timer. The on-time is inversely proportional to the input voltage and proportional to the output voltage; therefore, when the duty ratio is V_{OUT}/V_{IN} , the frequency is constant.

7.3.3 Advanced Auto-Skip Eco-Mode Control

The TPS560200-Q1 is designed with advanced auto-skip Eco-Mode to increase higher light-load efficiency. As the output current decreases from heavy-load condition, the inductor current is also reduced. If the output current is reduced enough, the inductor current ripple valley reaches the zero level, which is the boundary between continuous conduction and discontinuous conduction modes. The rectifying low-side MOSFET is turned off when its zero inductor current is detected. As the load current further decreases the converter run into discontinuous conduction mode. The on-time is kept approximately the same as is in continuous conduction mode. The off-time increases as it takes more time to discharge the output capacitor to the level of the reference voltage with smaller load current. The transition point to the light load operation $I_{OUT(LL)}$ current can be calculated in [公式 1](#).

$$I_{OUT(LL)} = \frac{1}{2 \times L_{OUT} \times f_{SW}} \times \frac{(V_{IN} - V_{OUT}) \times V_{OUT}}{V_{IN}} \quad (1)$$

7.3.4 Soft-Start and Prebiased Soft-Start

The TPS560200-Q1 has an internal 2-ms soft-start. When the EN pin becomes high, internal soft-start function begins ramping up the reference voltage to the PWM comparator.

The TPS560200-Q1 contains a unique circuit to prevent current from being pulled from the output during start-up if the output is prebiased. When the soft-start commands a voltage higher than the prebias level (internal soft-start becomes greater than feedback voltage V_{VSENSE}), the controller slowly activates synchronous rectification by starting the first low-side FET gate driver pulses with a narrow on-time. It then increments that on-time on a cycle-by-cycle basis until it coincides with the time dictated by $(1-D)$, where D is the duty cycle of the converter. This scheme prevents the initial sinking of the prebias output, and ensure that the out voltage (V_{OUT}) starts and ramps up smoothly into regulation and the control loop is given time to transition from prebiased start-up to normal mode operation.

7.3.5 Current Protection

The output overcurrent protection (OCP) is implemented using a cycle-by-cycle valley detect control circuit. The switch current is monitored by measuring the low-side FET switch voltage between the PH pin and GND. This voltage is proportional to the switch current. To improve accuracy, the voltage sensing is temperature compensated.

During the on-time of the high-side FET switch, the switch current increases at a linear rate determined by V_{IN} , V_{OUT} , the on-time and the output inductor value. During the on time of the low-side FET switch, this current decreases linearly. The average value of the switch current is the load current I_{out} . The TPS560200-Q1 constantly monitors the low-side FET switch voltage, which is proportional to the switch current, during the low-side on-time. If the measured voltage is above the voltage proportional to the current limit, an internal counter is incremented per each switching cycle and the converter maintains the low-side switch on until the measured voltage is below the voltage corresponding to the current limit at which time the switching cycle is terminated and a new switching cycle begins. In subsequent switching cycles, the on-time is set to a fixed value and the current is monitored in the same manner.

There are some important considerations for this type of overcurrent protection. The peak current is the average load current plus one half of the peak-to-peak inductor current. The valley current is the average load current minus one half of the peak-to-peak inductor current. Because the valley current is used to detect the overcurrent threshold, the load current is higher than the overcurrent threshold. Also, when the current is being limited, the output voltage tends to fall as the demanded load current may be higher than the current available from the converter. This protection is nonlatching. When the V_{SENSE} voltage becomes lower than 63% of the target voltage, the UVP comparator detects it. After 7 μ s detecting the UVP voltage, device shuts down and re-starts after hiccup time.

When the overcurrent condition is removed, the output voltage returns to the regulated value.

Feature Description (接下页)

7.3.6 Thermal Shutdown

TPS560200-Q1 monitors the temperature of itself. If the temperature exceeds the threshold value (typically 160°C), the device is shut off. This is nonlatch protection.

7.4 Device Functional Modes

7.4.1 Normal Operation

When the input voltage is above the UVLO threshold and the EN voltage is above the enable threshold, the TPS560200-Q1 can operate in its normal switching modes. Normal continuous conduction mode (CCM) occurs when the minimum switch current is above 0 A. In CCM, the TPS560200-Q1 operates at a quasi-fixed frequency of 600 kHz.

7.4.2 Eco-Mode Operation

When the TPS560200-Q1 is in the normal CCM operating mode and the switch current falls to 0 A, the TPS560200-Q1 begins operating in pulse-skipping Eco-Mode. Each switching cycle is followed by a period of energy-saving sleep time. The sleep time ends when the VFB voltage falls below the Eco-Mode threshold voltage. As the output current decreases the perceived time between switching pulses increases.

7.4.3 Standby Operation

When the TPS560200-Q1 is operating in either normal CCM or Eco-Mode, it may be placed in standby by asserting the EN pin low.

8 Application and Implementation

注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

The TPS560200-Q1 is used as a step-down converter which converts a voltage of 4.5 V to 17 V to a lower voltage. WEBENCH[®] software is available to aid in the design and analysis of circuits.

8.2 Typical Application

Copyright © 2016, Texas Instruments Incorporated

图 7. Typical Application Schematic

8.2.1 Design Requirements

For this design example, refer to the application parameters shown in 表 1.

表 1. Design Parameters

PARAMETER	VALUES
Input voltage range	4.5 V to 17 V
Output voltage	1.05 V
Output current	500 mA
Output voltage ripple	30 mV/pp

8.2.2 Detailed Design Procedure

8.2.2.1 Output Voltage Resistors Selection

The output voltage is set with a resistor divider from the output node to the VFB pin. TI recommends using 1% tolerance or better divider resistors. Start by using 公式 2 to calculate V_{OUT} .

To improve efficiency at light loads, consider using larger value resistors, high resistance is more susceptible to noise, and the voltage errors from the VSENSE input current are more noticeable.

$$R2 = \frac{R1 \times 0.8 \text{ V}}{V_{OUT} - 0.8 \text{ V}} \quad (2)$$

8.2.2.2 Output Filter Selection

The output filter used with the TPS560200-Q1 is an LC circuit. This LC filter has double pole at:

$$F_P = \frac{1}{2\pi\sqrt{L_{OUT} \times C_{OUT}}} \quad (3)$$

At low frequencies, the overall loop gain is set by the output set-point resistor divider network and the internal gain of the TPS560200-Q1. The low frequency phase is 180 degrees. At the output filter pole frequency, the gain rolls off at a –40 dB per decade rate and the phase drops rapidly. D-CAP2 introduces a high frequency zero that reduces the gain roll off to –20 dB per decade and increases the phase to 90 degrees one decade above the zero frequency. The inductor and capacitor selected for the output filter must be selected so that the double pole of 公式 3 is located below the high frequency zero but close enough that the phase boost provided by the high frequency zero provides adequate phase margin for a stable circuit. To meet this requirement use the values recommended in 表 2.

表 2. Recommended Component Values

Output Voltage (V)	R1 (kΩ)	R2 (kΩ)	C5 (pF)	L1 (μH)			C3 + C4 (μF)
				MIN	TYP	MAX	
1.0	4.99	20.0			10		10 + 10
1.05	6.19	20.0			10		10 + 10
1.2	10.0	20.0			10		10 + 10
1.5	17.4	20.0			10		10 + 10
1.8	24.9	20.0	optional		10		10 + 10
2.5	42.2	20.0	optional		10		10 + 10
3.3	61.9	20.0	optional		10		10 + 10
5.0	105	20.0	optional		10		10 + 10

Because the DC gain is dependent on the output voltage, the required inductor value increases as the output voltage increases. Additional phase boost can be achieved by adding a feed-forward capacitor (C5) in parallel with R1. The feed-forward capacitor is most effective for output voltages at or above 1.8 V.

The inductor peak-to-peak ripple current, peak current, and RMS current are calculated using 公式 4, 公式 5, and 公式 6. The inductor saturation current rating must be greater than the calculated peak current and the RMS or heating current rating must be greater than the calculated RMS current. Use 600 kHz for f_{sw} .

Use 600 kHz for f_{sw} . Make sure the chosen inductor is rated for the peak current of 公式 5 and the RMS current of 公式 6.

$$I_{LPP} = \frac{V_{OUT}}{V_{IN(max)}} \times \frac{V_{IN(max)} - V_{OUT}}{L_{OUT} \times f_{sw}} \quad (4)$$

$$I_{LPEAK} = I_{OUT} + \frac{I_{LPP}}{2} \quad (5)$$

$$I_{L_{OUT}(RMS)} = \sqrt{I_{OUT}^2 + \frac{1}{12} I_{LPP}^2} \quad (6)$$

For this design example, the calculated peak current is 0.582 A and the calculated RMS current is 0.502 A. The inductor used is a Würth 744777910 with a peak current rating of 2.6 A and an RMS current rating of 2 A.

The capacitor value and ESR determines the amount of output voltage ripple. The TPS560200-Q1 is intended for use with ceramic or other low-ESR capacitors. The recommended values are given in 表 2. Use 公式 7 to determine the required RMS current rating for the output capacitor.

$$I_{C_{OUT}(RMS)} = \frac{V_{OUT} \times (V_{IN} - V_{OUT})}{\sqrt{12} \times V_{IN} \times L_{OUT} \times f_{sw}} \quad (7)$$

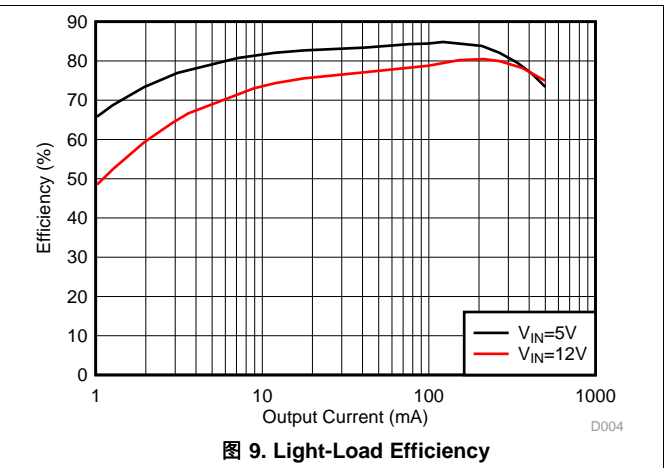

For this design two MuRata GRM32DR61E106KA12L 10-μF output capacitors are used. The typical ESR is 2 mΩ each. The calculated RMS current is 0.047 A and each output capacitor is rated for 3 A.

8.2.2.3 Input Capacitor Selection

The TPS560200-Q1 requires an input decoupling capacitor and a bulk capacitor is needed depending on the application. A ceramic capacitor over 10 μF is recommended for the decoupling capacitor. An additional 0.1-μF capacitor (C2) from pin 6 to ground is optional to provide additional high frequency filtering. The capacitor voltage rating must be greater than the maximum input voltage.

8.2.3 Application Curves

$V_{IN} = 12\text{ V}$, $V_{OUT} = 1.05\text{ V}$, $T_A = 25^\circ\text{C}$ (unless otherwise noted).

9 Power Supply Recommendations

The TPS560200-Q1 is designed to operate from input supply voltage in the range of 4.5 V to 17 V. Buck converters require the input voltage to be higher than the output voltage for proper operation. The maximum recommended operating duty cycle is 75%. Using that criteria, the minimum recommended input voltage is $V_O / 0.75$.

10 Layout

10.1 Layout Guidelines

The VIN pin should be bypassed to ground with a low-ESR ceramic bypass capacitor. Take care to minimize the loop area formed by the bypass capacitor connection, the VIN pin, and the GND pin of the IC. The typical recommended bypass capacitance is 10- μ F ceramic with a X5R or X7R dielectric and the optimum placement is closest to the VIN and GND pins of the device. An additional high-frequency bypass capacitor may be added. See for a PCB layout example. The GND pin should be tied to the PCB ground plane at the pin of the IC. The PH pin should be routed to a small copper area directly adjacent to the pin. Make the circulating loop from PH to the output inductor, output capacitors and back to GND as tight as possible while preserving adequate etch width to reduce conduction losses in the copper. Use vias adjacent to the IC to tie top-side ground copper plane to the internal or bottom layer ground planes. The additional external components can be placed approximately as shown. It may be possible to obtain acceptable performance with alternate layout schemes; however, this layout produced good results and is intended as a guideline.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TPS560200QDGKRQ1	ACTIVE	VSSOP	DGK	8	2500	RoHS & Green	NIPDAU NIPDAUAG	Level-2-260C-1 YEAR	-40 to 125	ZDNK	Samples
TPS560200QDGKTQ1	ACTIVE	VSSOP	DGK	8	250	RoHS & Green	NIPDAU NIPDAUAG	Level-2-260C-1 YEAR	-40 to 125	ZDNK	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer:The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

PACKAGE OUTLINE

VSSOP - 1.1 mm max height

SMALL OUTLINE PACKAGE

4214862/A 04/2023

NOTES:

PowerPAD is a trademark of Texas Instruments.

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 mm per side.
4. This dimension does not include interlead flash. Interlead flash shall not exceed 0.25 mm per side.
5. Reference JEDEC registration MO-187.

EXAMPLE BOARD LAYOUT

DGK0008A

™ VSSOP - 1.1 mm max height

SMALL OUTLINE PACKAGE

LAND PATTERN EXAMPLE
EXPOSED METAL SHOWN
SCALE: 15X

SOLDER MASK DETAILS

4214862/A 04/2023

NOTES: (continued)

6. Publication IPC-7351 may have alternate designs.
7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.
8. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.
9. Size of metal pad may vary due to creepage requirement.

EXAMPLE STENCIL DESIGN

DGK0008A

TM VSSOP - 1.1 mm max height

SMALL OUTLINE PACKAGE

SOLDER PASTE EXAMPLE
SCALE: 15X

4214862/A 04/2023

NOTES: (continued)

11. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
12. Board assembly site may have different recommendations for stencil design.

重要声明和免责声明

TI“按原样”提供技术和可靠性数据（包括数据表）、设计资源（包括参考设计）、应用或其他设计建议、网络工具、安全信息和其他资源，不保证没有瑕疵且不做任何明示或暗示的担保，包括但不限于对适销性、某特定用途方面的适用性或不侵犯任何第三方知识产权的暗示担保。
