

Technical documentation

**TPS62912, TPS62913** 

ZHCSLR3B - AUGUST 2020 - REVISED MARCH 2021

具有集成式铁氧体磁珠滤波器补偿的 TPS6291x 3V 至 17V、2A/3A 低噪声和低 纹波降压转换器

# 1 特性

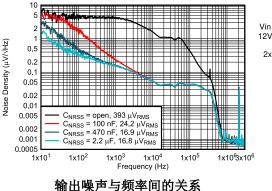

Texas

INSTRUMENTS

- 低输出 1/f 噪声 < 20µV<sub>RMS</sub> (100Hz 至 100kHz)
- 采用铁氧体磁珠后,低输出电压纹波 < 10µV<sub>BMS</sub>
- 大于 65dB 的高 PSRR (高达 100kHz)
- 2.2MHz 或 1MHz 定频峰值电流模式控制
- 可与外部时钟同步(可选)
- 集成环路补偿支持铁氧体磁珠,适用于具有 30dB 衰减的二阶 L-C 滤波器 (可选)
- 展频调制(可选)
- 3.0V 至 17V 输入电压范围
- 0.8V 至 5.5V 输出电压范围
- 57m Ω /20m Ω R<sub>DSon</sub>
- 输出电压精度为 ±1%
- 精密使能输入可实现
  - 用户定义的欠压锁定
  - 准确排序
- 可调节软启动
- 电源正常状态输出
- 输出放电(可选)
- -40°C 至 150°C 的结温范围
- 2.0mm × 2.0mm QFN. 间距为 0.5mm
- 使用 TPS6291x 并借助 WEBENCH<sup>®</sup> Power Designer 创建定制设计方案

## 2 应用

- 电信基础设施
- 测试和测量
- 航天和国防(雷达/航空电子设备)
- 医疗

## 3 说明

TPS6291x 器件是一系列高效低噪声和低纹波电流模式 同步降压转换器。这些器件非常适合通常使用 LDO 实 现后置稳压的噪声敏感型应用,例如高速 ADC、时钟 和抖动清除器、串行器、解串器和雷达应用。

器件在 2.2MHz 或 1MHz 的固定开关频率下工作,并 可与外部时钟同步。

为了进一步减小输出电压纹波,器件集成了环路补偿, 可与可选的第二级铁氧体磁珠 L-C 滤波器一起工作。 从而将输出电压纹波降至 10µV<sub>BMS</sub> 以下。

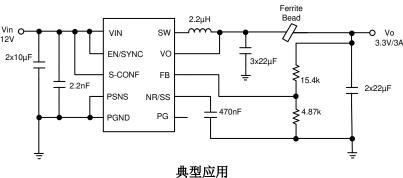

通过用连接到 NR/SS 引脚的电容器过滤内部电压基 准,可实现接近低噪声 LDO 的低频噪声水平。

可选展频调制方案扩展了更宽范围内的直流/直流开关 频率,从而降低了混合毛刺。

器件信息

器件名称	输出电流	封装 <sup>(1)</sup>	封装尺寸(标称值)
TPS62912	2A	QFN (10)	2 0mm × 2 0mm
TPS62913	3A		2.0000 ^ 2.00000

## **5** Pin Configuration and Functions

# 图 5-1. 10-Pin QFN RPU Package (Top View)

#### 表 5-1. Pin Functions

	PIN		PIN		PIN		DESCRIPTION
NO.	NAME	I/O	DESCRIPTION				
1	EN/SYNC	I	Enable/Disable pin including threshold-comparator. Connect to logic low to disable the device. Pull high to enable the device. This pin has an internal pulldown resistor of typically 500 k $\Omega$ when the device is disabled. Apply a clock to this pin to synchronize the device.				
2	SW	I/O	Switch pin of the power stage				
3	3 VO I Output voltage sense pin. This pin needs to be connected directly after the first inductor.		Output voltage sense pin. This pin needs to be connected directly after the first inductor.				
4	PGND		Power ground connection				
5	PG	0	Open-drain power-good output. This pin is pulled to GND when V <sub>OUT</sub> is below the power-good threshold. It requires a pullup resistor to output a logic high. It can be left open or tied to GND if not used.				
6	VIN	I	Power supply input voltage pin				
7	PSNS	I	Power sense ground. Connect directly to the ground plane.				
8	NR/SS	0	A capacitor connected to this pin sets the soft-start time and low frequency noise level of the device.				
9	9 FB I Feedback pin of the device		Feedback pin of the device				
10	S-CONF	0	Smart Configuration pin. This pin configures the operation modes of the device. See $ eq$ 7-1.				

## 6 Specifications

#### 6.1 Absolute Maximum Ratings

over operating junction temperature range (unless otherwise noted)<sup>(1)</sup>

		MIN	MAX	UNIT
	VIN, EN/SYNC, PG, S-CONF	- 0.3	18	V
	SW (DC)	- 0.3	V <sub>IN</sub> + 0.3	V
Voltage <sup>(2)</sup>	SW (AC, less than 10ns) <sup>(3)</sup>	- 2.5	21	V
	VO, FB, NR/SS	- 0.3	6	V
	PSNS	- 0.3	0.3	V
Sink Current	PG		10	mA
TJ	Junction temperature	- 40	150	°C
T <sub>stg</sub>	Storage temperature	- 65	150	°C

(1) Stresses beyond those listed under Absolute Maximum Rating may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under Recommended Operating Condition. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

(2) All voltage values are with respect to the network ground terminal

(3) While switching

## 6.2 ESD Ratings

			VALUE	UNIT
	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins <sup>(1)</sup>	±2000	V
V <sub>(ESD)</sub>	Liectiostatic discharge	Charged device model (CDM), per JEDEC specification JESD22-C101, all pins <sup>(2)</sup>	±500	v

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

## 6.3 Recommended Operating Conditions

over operating junction temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V <sub>IN</sub>	Input voltage	3.0		17	V
V <sub>OUT</sub>	Output voltage	0.8		5.5	V
C <sub>IN</sub>	Effective input capacitance	5	10		μF
L <sub>1</sub>	Effective output inductance	-30%	2.2 / 4.7	20%	μH
C <sub>OUT</sub>	Effective output capacitance	40	47	80	μF
L <sub>f</sub>	Effective filter inductance	0	10	50	nH
C <sub>f</sub>	Effective filter capacitance	20	40	160	μF
C <sub>OUT</sub> + C <sub>f</sub>	Effective total output capacitance, including first and second L-C filter	40		200	μF
I <sub>OUT</sub>	Output current for TPS62913	0		3	А
I <sub>OUT</sub>	Output current for TPS62912	0		2	А
T <sub>J</sub> <sup>(1)</sup>	Junction temperature	- 40		150	°C

(1) Operating lifetime is derated at junction temperatures above 125°C.

#### 6.4 Thermal Information

		TPS		
	THERMAL METRIC <sup>(1)</sup>	RPU 10	UNIT	
		JEDEC 51-7 PCB	TPS6291xEVM-077	
R <sub>0 JA</sub>	Junction-to-ambient thermal resistance	87.7	56.6	°C/W
R <sub>0</sub> JC(top)	Junction-to-case (top) thermal resistance	61.9	n/a <sup>(2)</sup>	°C/W
R <sub>0 JB</sub>	Junction-to-board thermal resistance	22.2	n/a <sup>(2)</sup>	°C/W
Ψ <sub>JT</sub>	Junction-to-top characterization parameter	1.9	1.3	°C/W
Y <sub>JB</sub>	Junction-to-board characterization parameter	22.2	22.7	°C/W

## 6.6 Typical Characteristics

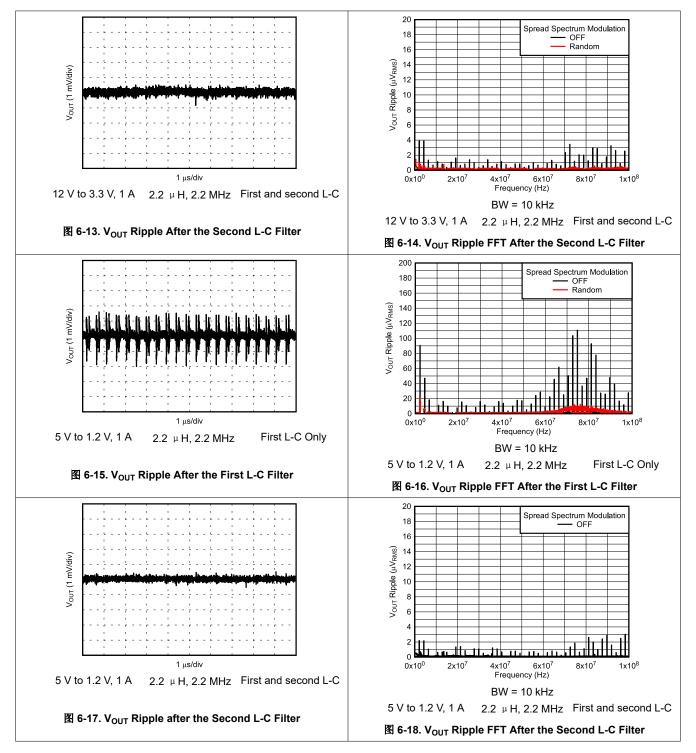

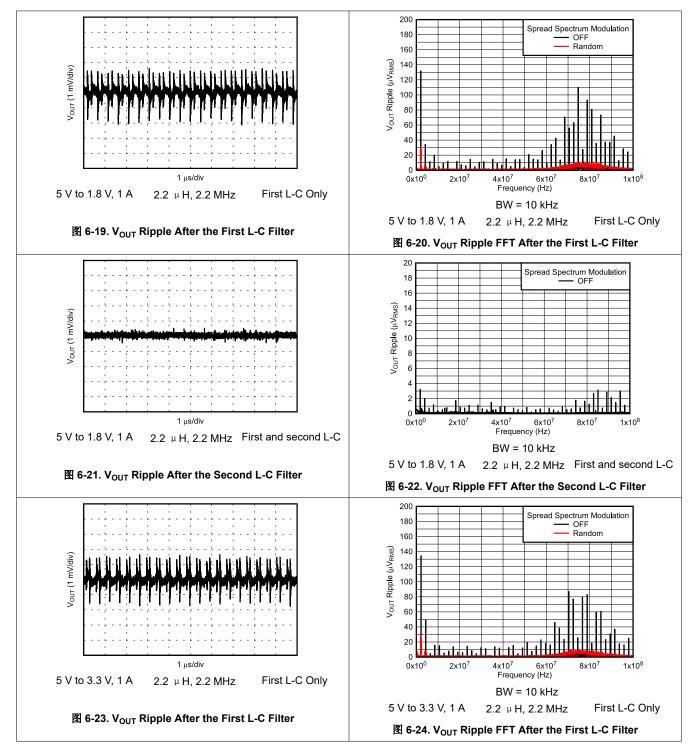

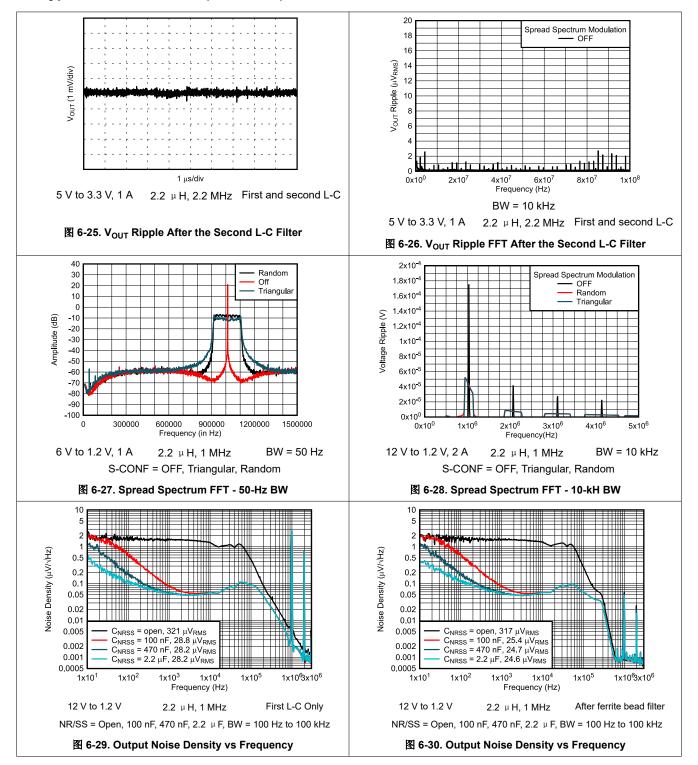

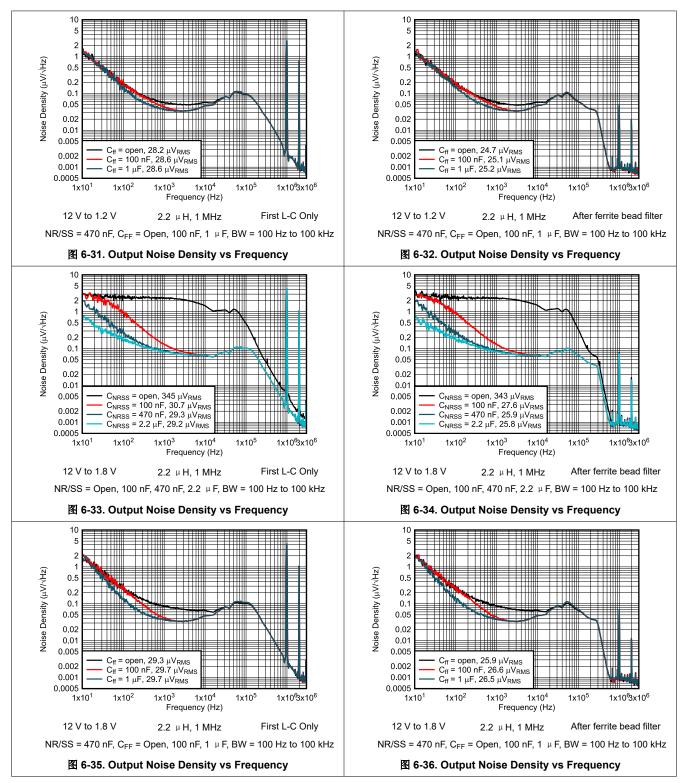

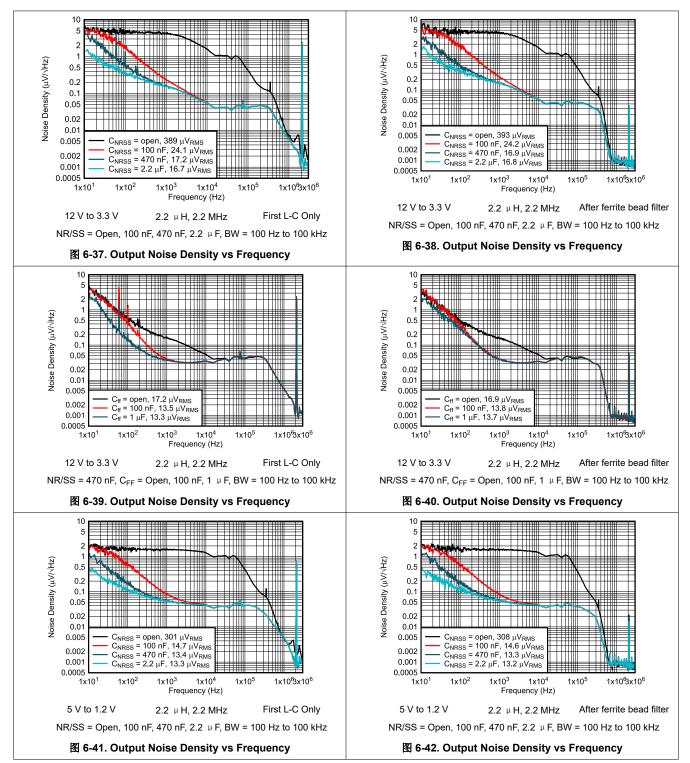

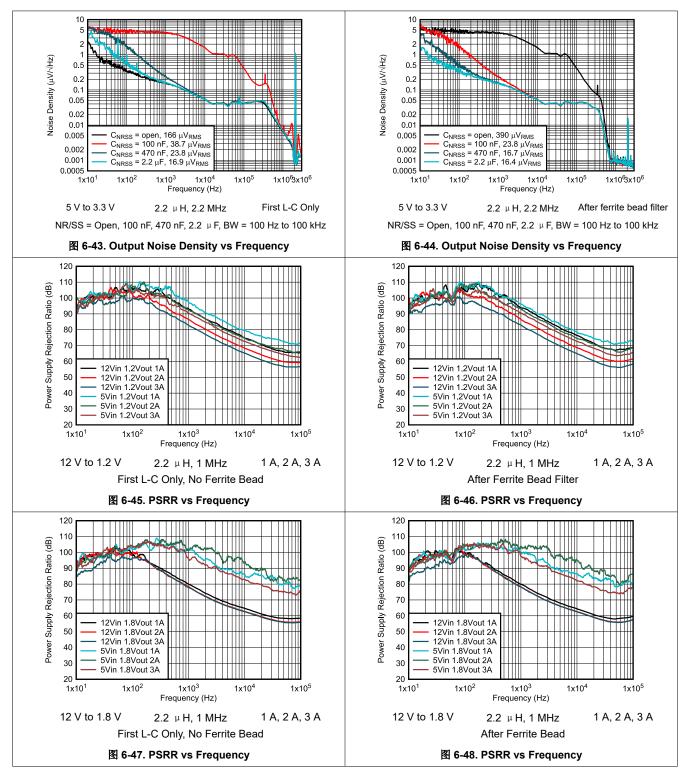

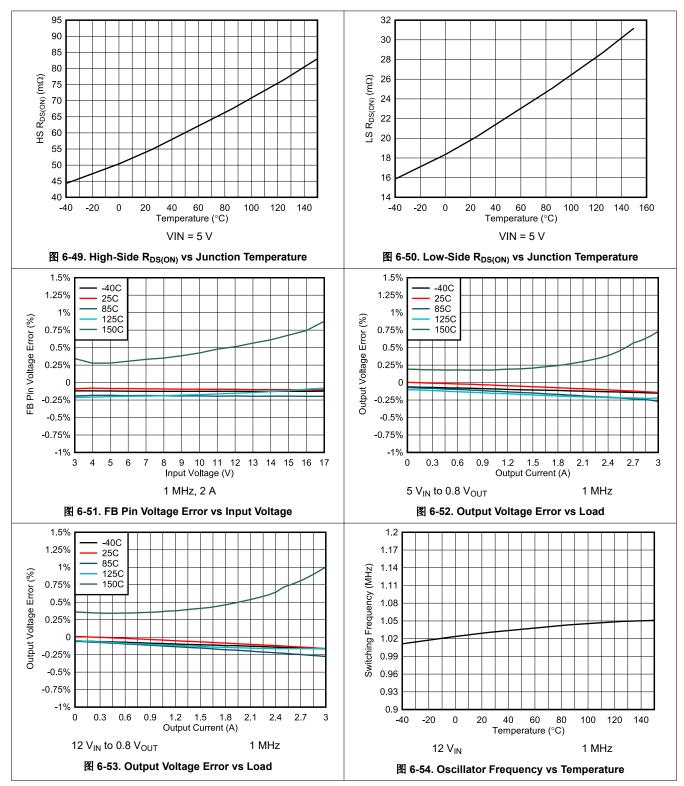

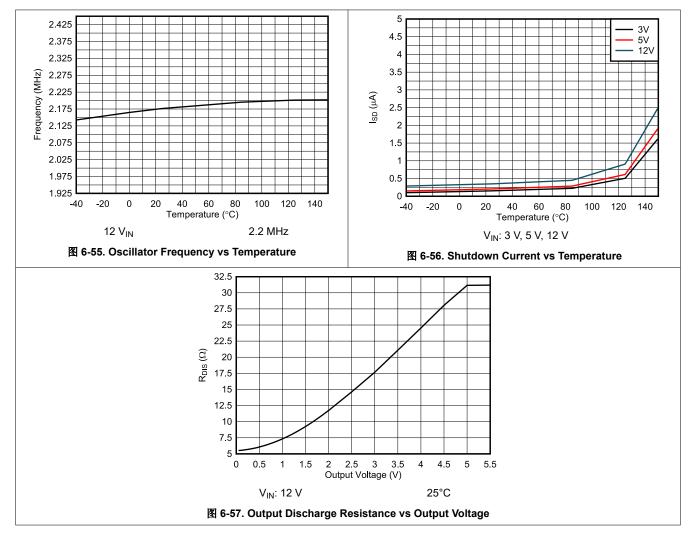

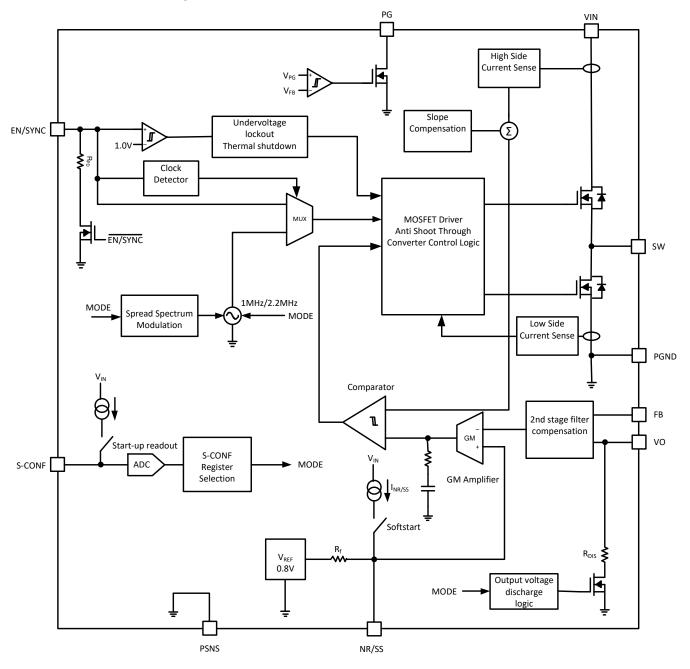

# 7 Detailed Description

## 7.1 Overview

The TPS6291x low-noise, low-ripple synchronous buck converter is a fixed frequency current mode converter. The converter has a filtered internal reference to achieve a low-noise output similar to low-noise LDOs. The converter achieves lower output voltage ripple by using a switching frequency of either 2.2 MHz or 1 MHz and a larger inductance. The output voltage ripple can be further reduced by adding a small second stage L-C filter to the output. This can be a ferrite bead or a small inductor, followed by an output capacitor. Internal compensation maintains stability with an external filter inductor up to 50 nH. To avoid voltage drops across this second stage filter, the device regulates the output voltage after the filter. The TPS6291x family supports an optional spread spectrum modulation. For example, when powering ADCs, spread spectrum modulation reduces the mixing spurs. Switching frequency, spread spectrum modulation, and output discharge are set using the S-CONF pin.

### 7.2 Functional Block Diagram

## 7.3 Feature Description

## 7.3.1 Smart Config (S-CONF)

This S-CONF pin configures the device based on the resistor value. This pin is read after EN/SYNC goes high. The device configuration cannot be changed during operation. The S-CONF value is re-read if EN is pulled below 200 mV or if VIN falls below UVLO. 表 7-1 shows the configuration options of the following:

- Switching frequency
- Spread spectrum modulation
- Output discharge
- Synchronization

S-CONF	SWITCHING FREQUENCY	SPREAD SPECTRUM	OUTPUT DISCHARGE	SYNCHRONIZATION
VIN	2.2 MHz	OFF	OFF	No
GND	1 MHz	OFF	OFF	No
<b>4.87 k</b> Ω	2.2 MHz	OFF	OFF	1.9 MHz to 2.42 MHz
6.04k Ω	2.2MHz	Triangle	OFF	No
7.5 k Ω	2.2 MHz	Random	OFF	No
9.31 k Ω	1 MHz	OFF	OFF	0.9 MHz to 1.2 MHz
11.5k Ω	1MHz	Triangle	OFF	No
14.3 k Ω	1 MHz	Random	OFF	No
			Discharge On	
18.2 k Ω	2.2 MHz	OFF	ON	No
22.1 k Ω	1 MHz	OFF	ON	No
27.4 k Ω	2.2 MHz	OFF	ON	1.9 MHz to 2.42 MHz
<b>34k</b> Ω	2.2MHz	Triangle	ON	No
<b>42.2 k</b> Ω	2.2 MHz	Random	ON	No
52.3 k Ω	1 MHz	OFF	ON	0.9 MHz to 1.2 MHz
<b>64.9k</b> Ω	1MHz	Triangle	ON	No
<b>80.6 k</b> Ω	1 MHz	Random	ON	No

### 表 7-1. S-CONF Device Configuration Modes

## 7.3.2 Device Enable (EN/SYNC)

The device is enabled by pulling the EN/SYNC pin high, and has an accurate rising threshold voltage of typically 1.01 V. Once the device is enabled, the operation mode is set by the configuration of the S-CONF pin. This occurs during the device start-up delay time  $t_{delay}$ . Once  $t_{delay}$  expires, the internal soft-start circuitry ramps up the output voltage over the soft-start time set by the C<sub>NR/SS</sub> capacitor. The start-up delay time  $t_{delay}$  varies depending on the selected S-CONF value. It is shortest with smaller S-CONF resistors.

The EN/SYNC pin has an active pulldown resistor  $R_{PD}$ . This prevents an uncontrolled start-up of the device, in case the EN/SYNC pin cannot be driven to a low level. The pulldown resistor is disconnected after start-up. With EN set to a low level, the device enters shutdown and the pulldown resistor is activated again.

## 7.3.3 Device Synchronization (EN/SYNC)

The EN/SYNC pin is also used for device synchronization. Once a clock signal is applied to this pin, the device is enabled and reads the configuration of the S-CONF pin. The external clock frequency must be within the clock synchronization frequency range set by the S-CONF pin. When the clock signal changes from a clock to a static high, then the device switches from external clock to internal clock. To shutdown the device when using an external clock, EN/SYNC must go low for at least 10  $\mu$ s.

The clock signal can be a logic signal with a logic level as specified in the electrical table, and can be applied directly to the EN/SYNC pin. External logic, such as an AND gate, can be used to combine separate enable and clock inputs, as shown in [8] 7-1.

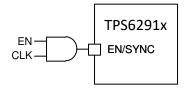

图 7-1. Synchronization with Separate Enable Signal (optional)

#### 7.3.4 Spread Spectrum Modulation

Using the S-CONF pin enables or disables spread spectrum modulation. DC/DC converters generate an output voltage ripple at the switching frequency. When powering ADCs or an analog front end (AFE), the switching frequency generates high frequency mixing spurs as well as a low frequency spur in the output frequency spectrum. Using the optional second stage L-C filter reduces the ripple of the converter and spurs by up to 30 dB.

The device has integrated two different spread spectrum modulation (SSM) schemes that are selected by the resistor connected to the S-CONF pin acording to  $\cancel{R}$  7-1. It is possible to select random or triangle modulation to spread the switching frequency over a larger frequency range. The triangular SSM is modulated based on the switching frequency, and results in 1.9 kHz for 1 MHz switching frequency and 4.3 kHz for 2.2 MHz switching frequency. The modulation spread is  $\pm 10\%$  of the device switching frequency. This SSM provides high attenuation when the receiver bandwidth is less than the modulation frequency, typically the case for systems using Fast Fourier Transforms (FFT) post processing as in high speed ADC applications. For applications sensitive to noise at the modulation frequency, random SSM is used. Using a random spread spectrum modulation also reduces the spurs in the output spectrum as shown in  $\boxed{8}$  6-2. The random SSM operates with the same frequency spread and modulation period as the triangular SSM. The randomized modulation uses a Fibonacci Linear-Feedback Shift Register (LFSR) so that every tone is generated once during the pseudo-random generation period. The frequency spreading is shown in  $\boxed{8}$  7-2. The attenuation using random or triangle SSM is shown in  $\boxed{8}$  6-28.

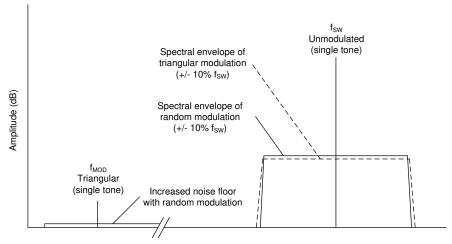

图 7-2. Spread Spectrum Modulation

#### 7.3.5 Output Discharge

Output discharge is enabled or disabled, depending on the S-CONF setting. With output discharge enabled, the output voltage is pulled low by a discharge resistor  $R_{DIS}$  of typically 7  $\Omega$ . The output discharge function is enabled during thermal shutdown, UVLO, or when EN/SYNC is pulled low.

#### 7.3.6 Undervoltage Lockout (UVLO)

To avoid mis-operation of the device at low input voltages, the device is enabled once the input voltage is above the undervoltage lockout threshold. The device is disabled once the input voltage falls below the undervoltage threshold.

#### 7.3.7 Power-Good Output

The device has a power-good output. The PG pin goes high impedance once the FB pin voltage is above 95% of the nominal voltage, and is driven low once the voltage falls below typically 90% of the nominal voltage. 7-2 shows the typical PG pin logic. The PG pin is an open-drain output and is specified to sink up to 10 mA. The power-good output requires a pullup resistor connecting to any voltage rail less than 18 V. The PG signal can be used for sequencing of multiple rails by connecting to the EN pin of other converters. If not used, the PG pin can be left floating or connected to GND. PG has a deglitch time of typically 8  $\mu$  s before going low.

	DEVICE STATE	PG LOGIC STATUS					
	DEVICE STATE	HIGH IMPEDANCE	LOW				
Enabled (EN/SYNC = High)	$V_{FB} \ge V_{PG}$	$\checkmark$					
	V <sub>FB</sub> < V <sub>PG</sub> after t <sub>PG</sub>		$\checkmark$				
Shutdown (EN/SYNC = Low)			$\checkmark$				
UVLO	0.7 V < V <sub>IN</sub> < V <sub>UVLO</sub>		$\checkmark$				
Thermal Shutdown	T <sub>J</sub> > T <sub>JSD</sub>		$\checkmark$				
Power Supply Removal	V <sub>IN</sub> < 0.7 V	$\checkmark$					

#### 7.3.8 Noise Reduction and Soft-Start Capacitor (NR/SS)

A capacitor connected to this pin reduces the low frequency noise of the converter and sets the soft-start time. The larger the capacitor, the lower the noise and the longer the start-up time of the converter. A 470-nF capacitor is typically connected to this pin for a start-up time of 5 ms, although longer and shorter start-up times can be used. During soft start with a light load, the device skips switching pulses as needed to not discharge the output voltage. The device can start into a pre-biased output voltage.

The device achieves low noise by adding an R-C filter to the reference voltage, as shown in # 7.2. During startup, the NR/SS capacitor is charged with a constant current of 75  $\mu$ A (typ) to 0.8 V. Larger NR/SS capacitors provide for lower low frequency noise, as shown in  $\mathbb{K}$  6-29. The maximum NR/SS cap is 3.3  $\mu$ F for a start-up time of 35 ms. The minimum start-up time is set internally to 0.7 ms, which occurs when there is a small NR/SS capacitor or no NR/SS capacitor.

#### 7.3.9 Current Limit and Short Circuit Protection

The device is protected against short circuits and overcurrent. The switch current limit prevents the device from high inductor current and from drawing excessive current from the input voltage rail. Excessive current can occur with a shorted/saturated inductor or a heavy load/shorted output circuit condition. If the inductor current reaches the threshold  $I_{SWpeak}$ , the high-side MOSFET is turned off and the low-side MOSFET is turned on to ramp down the inductor current. The high-side MOSFET is turned on again only when the low-side current is below the low-side sourcing current limit  $I_{SWvalley}$ .

Due to internal propagation delay, the actual current can exceed the static current limit, especially if the input voltage is high and very small inductances are used. The dynamic current limit is calculated as follows:

$$I_{peak(typ)} = I_{SWpeak} + \left(\frac{V_L}{L}\right) \times t_{PD}$$

where

•  $I_{SWpeak}$  is the static current limit, specified in # 6.5

(1)

- L is the inductance
- V<sub>L</sub> is the voltage across the inductor (VIN VOUT)
- t<sub>PD</sub> is the internal propagation delay, typically 50 ns

The low-side MOSFET also contains a negative current limit to prevent excessive current from flowing back through the inductor to the input. If the low-side sinking current limit is exceeded, the low-side MOSFET is turned off. In this scenario, both MOSFETs are off until the start of the next cycle.

#### 7.3.10 Thermal Shutdown

The device goes into thermal shutdown once the junction temperature exceeds typically 170°C with a 20°C hysteresis.

#### 7.4 Device Functional Modes

#### 7.4.1 Fixed Frequency Pulse Width Modulation

To minimize output voltage ripple, the device operates in fixed frequency PWM operation down to no load. The switching frequency of 1 MHz or 2.2 MHz is selected using the S-CONF pin.

#### 7.4.2 Low Duty Cycle Operation

For high input voltages or low output voltages, the 70-nsec minimum on-time limits the maximum input to output voltage difference and the switching frequency selected. When the minimum on-time is reached, the output voltage rises above the regulation point. Refer to  $\frac{1}{8}$  8-2 for detailed design recommendations.

#### 7.4.3 High Duty Cycle Operation (100% Duty Cycle)

The device offers a low input-to-output voltage differential by entering 100% duty cycle mode. In this mode, the high-side MOSFET switch is constantly turned on. The minimum input voltage to maintain output voltage regulation, depending on the load current and the output voltage level, is calculated as:

$$V_{IN(\min)} = V_{OUT(\min)} + I_{OUT} \times (R_{DS(ON)} + R_L)$$

where

- V<sub>OUT(min)</sub> is the minimum output voltage the load can accept
- I<sub>OUT</sub> is the output current
- R<sub>DS(ON)</sub> is the R<sub>DS(ON)</sub> of the high-side MOSFET
- R<sub>L</sub> is the DC resistance of the inductor used

To maintain fixed frequency switching, the device requires a minimum off-time of 50 ns (typ), 60 ns (max). If this limit is reached during a switching pulse, the device skips switching pulses to maintain output voltage regulation. If the input voltage decreases further, the device enters 100% mode.

#### 7.4.4 Second Stage L-C Filter Compensation (Optional)

Most low-noise and low-ripple applications use a ferrite bead and bypass capacitor before the load. Using a second L-C filter is especially useful for low-noise and low-ripple applications with constant load current such as ADCs, DACs, and Jitter Cleaner. The second stage L-C filter is optional, and the device can be used without this filter. Without the filter, the device has a low output voltage noise of typically 16.9  $\mu$  V<sub>RMS</sub> shown in  $\boxtimes$  6-37 with an output voltage ripple of 280  $\mu$  V<sub>RMS</sub> shown in  $\boxtimes$  6-12. The second stage L-C filter attenuates the output voltage ripple by another approximately 30 dB shown in  $\boxtimes$  6-14. To improve load regulation, the device can remote sense the output voltage after the second stage L-C filter and is internally compensated for the additional double pole generated by the L-C filter.

To keep the second stage L-C filter as small as possible, the internal compensation is optimized for a 10-nH to 50-nH inductance. A small ferrite bead or even a PCB trace provides sufficient inductance for output voltage ripple filtering. See # 8.2.2.2.4 for details.

## 8 Application and Implementation

#### Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

## 8.1 Application Information

The TPS6291x family of devices are optimized for low noise and low output voltage ripple.

#### 8.2 Typical Applications

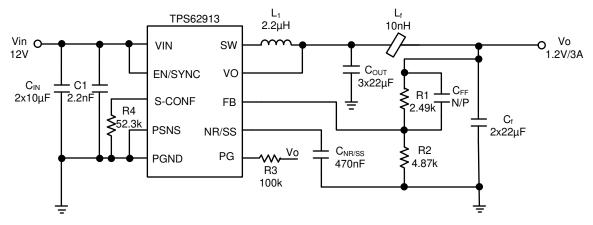

图 8-1. Typical Schematic

 $\pm$  8-1 shows the list of components for the application curves in # 8.2.3, unless otherwise noted.

REFERENCE	PART NUMBER	DESCRIPTION	MANUFACTURER <sup>(1)</sup>			
TPS62913	TPS62913	Low Noise and low ripple buck converter	Texas Instruments			
L <sub>1</sub>	XGL4030-222MEC or XGL4030-472MEC	Inductor: 2.2 $\mu$ H or 4.7 $\mu$ H	Coilcraft			
C <sub>IN</sub>	C2012X7S1E106K125AC	Ceramic capacitors: 2 × 10 µF ±10% 25-V ceramic capacitor X7S 0805	TDK			
C <sub>OUT</sub>	C2012X7S1A226M125AC	Ceramic capacitors: 3 × 22 μF, 10 V, ±20%, X7S, 0805	TDK			
L <sub>f</sub>	BLE18PS080SN1	Ferrite Bead	MuRata			
C <sub>f</sub>	C2012X7S1A226M125AC	Ceramic capacitor: 2 × 22 µF, 10 V, ±20%, X7S, 0805	TDK

#### 表 8-1. List of Components

(1) See the *Third-Party Porducts Disclaimer* 

#### 8.2.1 Design Requirements

The external components have to fulfill the needs of the application, but also meet the stability criteria of the control loop of the device. The device is optimized to work within a range of external components, and can be optimized for the following:

- Efficiency
- Output ripple
- Component count
- Lowest 1/f noise

Typical applications that have input voltages of  $\leq$  6 V use a 2.2-µH inductor with a 2.2-MHz switching frequency. Applications that have input voltages > 6 V can be optimized for efficiency using a 2.2-µH inductor with a 1-MHz switching frequency. In this case, the output voltage ripple doubles compared to the use of a 4.7-µH inductor, which is typically acceptable when powering high speed ADCs. Optimization for powering clock and PLL circuits that need a 3.3-V output use a 2.2-µH inductor with 2.2-MHz switching frequency, minimizing output voltage ripple and low frequency noise.

For the application cases that are not found in  $\frac{1}{8}$  8-2, there are two methods to design the TPS6291x circuit.  $\frac{1}{7}$  8.2.2.1 uses Webench to design the circuit automatically or the calculations in  $\frac{1}{7}$  8.2.2.2 can be used instead.

A 0-2. Typical olingle L-0 Titler Design Recommendations								
DESIGN GOAL	V <sub>IN</sub>	V <sub>OUT</sub>	F <sub>SW</sub>	INDUCTOR <sup>(2)</sup>	OUTPUT CAPACITORS <sup>(3)</sup>			
Typical	12 V <sup>(1)</sup>	$\leq$ 2.0 V <sup>(1)</sup>	1 MHz	2.2 µH	3 × 22 µF, 10 V, 0805			
Typical	12 V	$2.0 \text{ V} < \text{V}_{\text{OUT}} \leqslant 3.3 \text{ V}$	1 MHz	4.7 µH	3 × 22 µF, 10 V, 0805			
Typical	12 V	> 3.3 V	2.2 MHz	2.2 µH	1 × 47 μF, 1210 and 2 × 22 μF, 10 V, 0805			
Higher Efficiency (with higher ripple and noise)	12 V	$2.0 \text{ V} < \text{V}_{\text{OUT}} \leqslant 3.3 \text{ V}$	1 MHz	2.2 μH <sup>(4)</sup>	3 × 22 μF, 10 V, 0805			
Low ripple/noise PLL and Clock Supply	12 V	$2.6~V \leqslant V_{OUT} \leqslant 3.3 \\ V$	2.2 MHz	2.2 µH	3 × 22 µF, 10V, 0805			
Typical	5 V	≤ 3.3 V	2.2 MHz	2.2 µH	3 × 22 µF, 10 V, 0805			
Typical	5 V	> 3.3V	2.2 MHz	2.2 µH	1 × 47 μF, 1210 and 2 × 22 μF, 10 V, 0805			

表 8-2. Typical Single L-C Filter Design Recommendations

(1) The maximum input to output voltage difference is limited by the device maximum minimum on-time of 70 ns. This is especially important for input voltages above 12 V or output voltages below 1 V. See #8.2.2.2.1.

(2) For inductor part numbers, see  $\frac{1}{8}$  8-4.

(3) For output capacitor part numbers, see  $\frac{1}{8}$  8-5.

(4) The TPS62913 requires a 4.7-μH inductor when using the 1-MHz switching frequency to supply more than 2.5-A load current when the output voltage is greater than 2.0 V.

The second stage L-C filter is optional, as the device can be used without this filter to achieve below 20-  $\mu$  V<sub>RMS</sub> noise typically. A second stage filter is added to provide additional attenuation of the output ripple voltage. The output voltage is sensed after the second L-C filter by connecting the FB resistors to the second stage L-C filter capacitor. This provides remote sense, minimizing output voltage drop due to the ferrite bead. Refer to  $\ddagger$  8-3 for second stage L-C filter recommendations based on the output voltage.

V <sub>OUT</sub> (V)	FERRITE BEAD IMPEDANCE (AT 100 MHZ) <sup>(2)</sup>	OUTPUT CAPACITORS (1)
≤ 3.3 V	8 to 20 Ω	2 × 22 μF, 10 V, 0805
> 3.3 V	8 to 20 Ω	3 × 22 µF, 10 V, 0805

(1) For output capacitor part numbers, see  $\frac{1}{8}$  8-5.

(2) For second stage L-C filter part numbers, see  $\frac{1}{8}$  8-6.

#### 8.2.2 Detailed Design Procedure

If the specific design is not found in the  $\frac{1}{2}$  8-2 section, WEBENCH is recommended to generate the design. Alternatively, the manual design procedure in *External Component Selection* can be followed.

## 8.2.2.1 Custom Design With WEBENCH® Tools

Click here to create a custom design using the TPS6291x device with the WEBENCH® Power Designer.

- 1. Start by entering the input voltage (V<sub>IN</sub>), output voltage (V<sub>OUT</sub>), and output current (I<sub>OUT</sub>) requirements.
- 2. Optimize the design for key parameters such as efficiency, footprint, and cost.
- 3. Open the advanced tab to optimize for output voltage ripple.
- 4. Once in a TPS6291x design, you can enable the second stage L-C filter and change other settings from the drop-down on the left.

The WEBENCH Power Designer provides a customized schematic along with a list of materials with real-time pricing and component availability.

In most cases, these actions are available:

- · Run electrical simulations to see important waveforms and circuit performance
- Export customized schematic and layout into popular CAD formats
- Print PDF reports for the design, and share the design with colleagues

Get more information about WEBENCH tools at www.ti.com/WEBENCH.

#### 8.2.2.2 External Component Selection

#### 8.2.2.2.1 Switching Frequency Selection

The switching frequency can be chosen to optimize efficiency (1 MHz) or ripple/noise (2.2 MHz). Using the 2.2-MHz setting increases the gain of the feedback loop and can result in lower output noise. However, additional considerations for minimum on-time and duty cycle must also be considered. First, calculate the duty cycle using 方程式 3. Higher efficiency results in a shorter on-time, so a conservative approach is to use a higher efficiency than expected in the application.

$$D = \frac{V_{OUT}}{V_{IN} \times \eta} \tag{3}$$

where

 $\eta$  is the estimated efficiency (use the value from the efficiency curves or 0.9 as an conservative assumption)

Then, calculate the on-time with both 1 MHz and 2.2 MHz using 方程式 4. The on-time must always remain above the minimum on-time of 70 nsec. Use the maximum input voltage and maximum efficiency to determine the minimum duty cycle,  $\mathsf{D}_{min}.$  Use the maximum switching frequency for  $\mathsf{f}_{\mathsf{SW}}.$ 

$$t_{ON\_\min} = \frac{D_{\min}}{f_{SW\_\max}}$$
(4)

then

24

- If  $t_{ON min}$  min < 70 ns with 2.2 MHz, use 1 MHz.
- If  $t_{ON min}$  min < 70 ns with 1 MHz, reduce the maximum input voltage.
- If  $t_{ON,min}$  min  $\ge$  70 ns for both cases, use 1 MHz for highest efficiency, or 2.2 MHz for lowest noise and ripple.

#### 8.2.2.2.2 Inductor Selection for the First L-C Filter

The inductor selection is dependent on the selected switching frequency and the duty cycle. When using the 2.2-MHz frequency, only use a 2.2-µH inductor. When using the 1-MHz frequency, calculate the maximum duty cycle using the minimum input voltage. If D<sub>max</sub> is above 45%, only use a 4.7-µH inductor. If D<sub>max</sub> is below 45% and the output voltage is 2 V or less, use only a 2.2-µH inductor. If D<sub>max</sub> is below 45% and the output voltage is above 2 V, use a 4.7-µH inductor to achieve the full output current or a 2.2-µH inductor for higher efficiency with a reduced maximum output current.

The inductor also has to be rated for the appropriate saturation current. 方程式 5 and 方程式 6 calculate the maximum inductor current under static load conditions. The formula takes the converter efficiency into account. The calculation must be done for the maximum input voltage where the peak switch current is highest.

$$\Delta I_{L} = \frac{\frac{V_{OUT}}{\eta} \times \left(1 - \frac{V_{OUT}}{V_{IN} \times \eta}\right)}{f_{SW} \times L}$$

$$I_{PEAK} = I_{OUT} + \frac{\Delta I_{L}}{2}$$
(6)

where

- $f_{SW}$  is the switching frequency (typically 1 MHz or 2.2 MHz)
- L is inductance
- $\eta$  is estimated efficiency (use the value from the efficiency curves or 0.9 as an conservative assumption)

Note	
The calculation must be done for the maximum input voltage of the application.	

Calculating the maximum inductor current using the actual operating conditions gives the minimum saturation current. A margin of 20% is recommended to be added to cover for load transients during operation.

See  $\frac{1}{8}$  8-4 for typical inductors.

INDUCTOR VALUE	MANUFACTURER	PART NUMBER	SIZE (L X W X H IN mm)	ISAT/DCR (30% DROP)		
2.2 µH	Coilcraft	XGL4020-222	4 × 4 × 2.1	6.2 A / 19.5 m Ω

# 事 9.4 Inductor Soloction

#### 8.2.2.3 Output Capacitor Selection

The effective output capacitance can range from 40 µ F (minimum) up to 200 µ F (maximum) for a single L-C system design. When using a second L-C filter, the first L-C filter must have output capacitance between 40 µF and 80 µF, the second stage L-C filter (if used) must have at least 20 µF of capacitance, and the total capacitance for both L-C filters must be less than 200 µF. Load transient testing and measuring the bode plot are good ways to verify stability.

Ceramic capacitors (X5R or X7R) are recommended. Ceramic capacitors have a DC-Bias effect, which has a strong influence on the final effective capacitance. Choose the right capacitor carefully in combination with considering its package size and voltage rating. The ESR and ESL of the output capacitor are also important considerations in selecting the output capacitors for low noise applications. Smaller package sizes typically have lower ESL and ESR. 0805 or smaller packages are recommended, as long as they provide the required capacitance and voltage rating for stable operation. 表 8-5 lists recommended output capacitors.

表 8-5. Recommended C	Dutput Capacitors
----------------------	-------------------

CAPACITOR TYPE	CAPACITOR VALUE	MANUFACTURER	VOLTAGE (V)	PACKAGE
Bulk Capacitor	22 μ F, X7S	TDK C2012X7S1A226M125AC	10	0805
Bulk Capacitor	47 μ F, X7R	Murata GRM32ER71A476ME15L	10	1210

#### 8.2.2.2.4 Ferrite Bead Selection for Second L-C Filter

Using a ferrite bead for the second stage L-C filter minimizes the external component count because most of the noise sensitive circuits use a RF bead for high frequency attenuation as a default component at their inputs.

It is important to select a ferrite bead with sufficiently high inductance at full load, and with low DC resistance (below 10 m $\Omega$ ) to keep the converter efficiency as high as possible. The ferrite bead inductance decreases with increased load current. Therefore, the ferrite bead should have a current rating much higher than the desired load current.

The recommendation is to choose a ferrite bead with an impedance of 8  $\Omega$  to 20  $\Omega$  at 100 MHz. Refer to  $\frac{1}{8}$  8-6 for possible ferrite beads.

PART NUMBER	MANUFACTURER	SIZE	100 MHZ	INDUCTANCE AT 100 MHz (CALCULATED)	DC RESISTANCE	CURRENT RATING
BLE18PS080SN1	MuRata	0603	8.5 Ω	13.5 nH	<b>4 m</b> Ω	5 A
74279221100	Wurth Elektronik	1206	<b>10</b> Ω	15.9 nH	<b>3 m</b> Ω	10.5 A
7427922808	Wurth Electronik	0603	8 Ω	12.7 nH	5 m Ω	9.5 A

#### 表 8-6. Recommended Ferrite Beads

The internal compensation has been designed to be stable with up to 50 nH of inductance in the second stage filter. To achieve low ripple, the second L-C filter requires only 5-nH to 10-nH inductance. The inductance can be estimated from the ferrite bead impedance specification at 100 MHz, with the assumption that the inductance is similar at the selected converter switching frequency of 1 MHz or 2.2 MHz, and can be verified through tools available on some manufacturer websites. The inductance of a ferrite bead is calculated using 方程式 7:

$$L = \frac{Z}{\left(2 \times \pi \times f\right)} \tag{7}$$

#### where

- Z is the impedance of the ferrite bead in ohms at the specified frequency (usually 100 MHz)
- f is the specified frequency (usually 100 MHz)

#### 8.2.2.5 Input Capacitor Selection

For the best output and input voltage filtering, X5R or X7R ceramic capacitors are recommended. The input bulk capacitor minimizes input voltage ripple, suppresses input voltage spikes, and provides a stable system rail for the device. A 10-  $\mu$  F or larger input capacitor is recommended. Having two in parallel further improves the input voltage ripple filtering, minimizing noise coupling into adjacent circuits. The voltage rating of the cap must also be taken into consideration, and must provide the required 5-  $\mu$  F minimum effective capacitance after DC bias derating.

In addition to the bulk input cap, a smaller cap must be placed directly from the VIN pin to the PGND pin to minimize input loop parasitic inductance, thereby minimizing the high frequency noise of the device. The input cap placement affects the output noise, so care needs to be taken in placing both the bulk cap and bypass caps as shown in  $\frac{\pi}{10.2}$ .  $\frac{10.2}{10.2}$  k 8-7 lists recommended input capacitors.

A 0-7. Recommended input Capacitors						
INPUT CAP TYPE	CAPACITOR VALUE	MANUFACTURER	VOLTAGE RATING (V)	PACKAGE SIZE		
Bulk Cap	10 µ F, X7S	TDK C2012X7S1E106K125AC	25	0805		
Bypass Cap	2.2 nF, X7R	Murata GRM155R71E222KA01D	25	0402		

## 表 8-7. Recommended Input Capacitors

#### 8.2.2.2.6 Setting the Output Voltage

$$R1 = R2 \times \left(\frac{V_{OUT}}{V_{FB}} - 1\right) = R2 \times \left(\frac{V_{OUT}}{0.8V} - 1\right)$$
(8)

A feedforward capacitor ( $C_{FF}$ ) is not required for proper operation, but can further improve output noise. However, care must be taken in choosing the  $C_{FF}$ , since the power good (PG) function may not be valid with a large  $C_{FF}$  during start-up, and can cause spurious triggering of the PG pin during a large load transient. The noise performance with various  $C_{FF}$  is shown in 8 6-31. Refer to the *Pros and Cons Using a Feedforward Capacitor with a Low Dropout Regulator Application Report* for a discussion of the pros and cons of using a feedforward capacitor.

#### 8.2.2.2.7 NR/SS Capacitor Selection

As described in # 7.3.8, the NR/SS cap affects both the total noise and the soft-start time. The recommended value for a 5-ms soft-start time and good noise performance is 470 nF. The maximum NR/SS cap is 3.3  $\mu$  F for a start-up time of 35 ms. Values greater than 1  $\mu$  F have minimal improvement in noise performance. Use % 2 and % 2 and

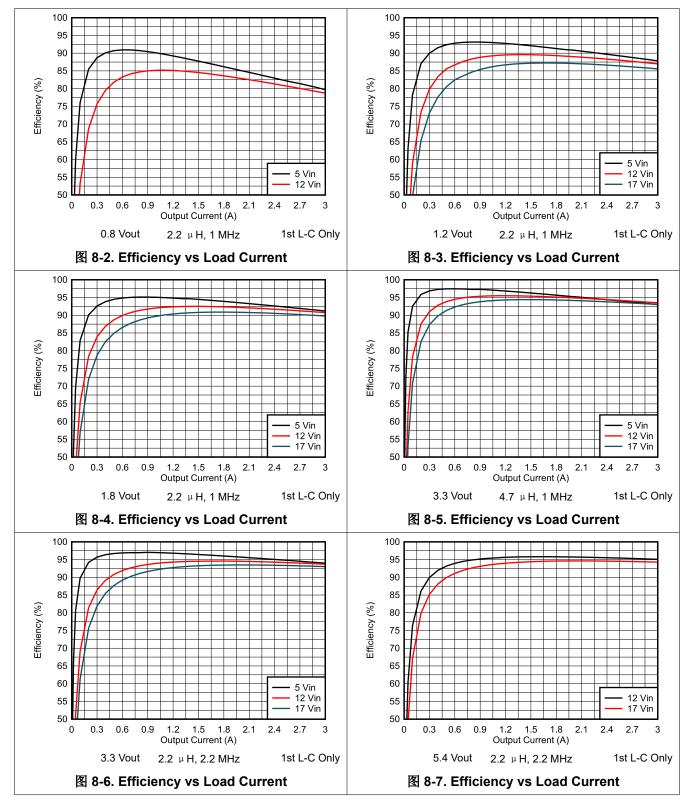

$$t_{SS}(s) = \left(\frac{C_{NRSS} * 0.8}{I_{NRSS}}\right)$$

$$C_{NRSS}(F) = \frac{\left(I_{NRSS} \times t_{SS}\right)}{0.8}$$
(9)
(10)

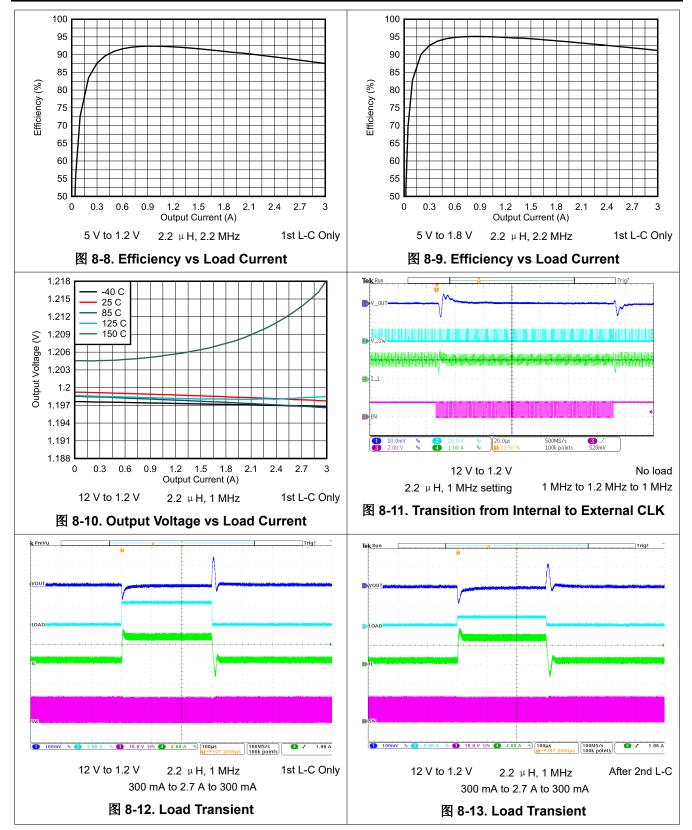

#### 8.2.3 Application Curves

V<sub>IN</sub>=12 V, V<sub>OUT</sub>=1.2 V, T<sub>A</sub>=25°C, BOM = 表 8-1, (unless otherwise noted)

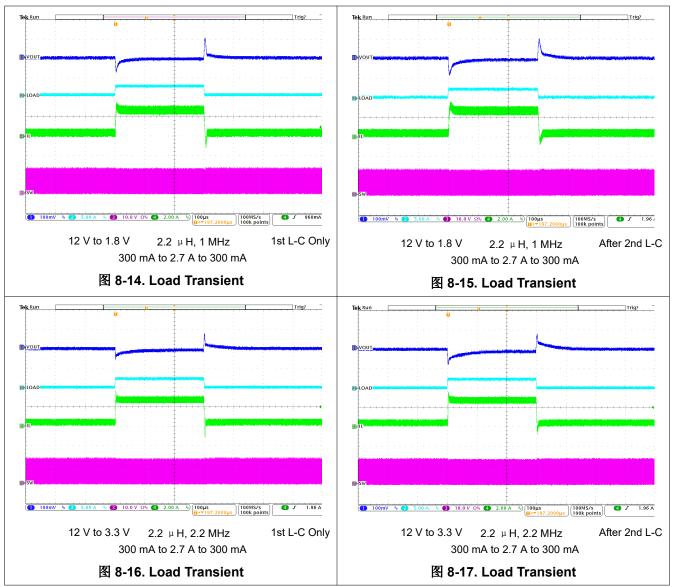

TPS62912, TPS62913 ZHCSLR3B - AUGUST 2020 - REVISED MARCH 2021

# 9 Power Supply Recommendations

The power supply to the TPS6291x needs to have a current rating according to the supply voltage, output voltage, and output current of the TPS6291x.

## 10 Layout

## **10.1 Layout Guidelines**

A proper layout is critical for the operation of any switched mode power supply, especially at high switching frequencies. Therefore, the PCB layout of the TPS6291x demands careful attention to ensure best performance. A poor layout can lead to issues like bad line and load regulation, instability, increased EMI radiation, and noise sensitivity. Refer to the *Five Steps to a Great PCB Layout for a Step-Down Converter Technical Brief* for a detailed discussion of general best practices. Specific recommendations for the device are listed below.

- The input capacitor or capacitors should be placed as close as possible to the VIN and PGND pins of the device. This is the most critical component placement. Route the input capacitors directly to the VIN and PGND pins avoiding vias.
- Place the inductor close to the SW pin. Minimize the copper area at the switch node.

- Place the output capacitor ground close to the PGND pin and route it directly avoiding vias. Minimize the length of the connection from the inductor to the output capacitor.
- Connect the VO pin directly to the first output capacitor, C<sub>OUT</sub>.
- Sensitive traces, such as the connections to the NR/SS, VO, and FB pins need to be connected with short traces and be routed away from any noise source, such as the SW pin.
- · Connect the PSNS pin directly to the system GND plane with a via.
- Place the second L-C filter, L<sub>f</sub> and C<sub>f</sub>, near the load to reduce any radiated coupling around the second L-C filter
- Avoid placing the ferrite bead in the keep out region as shown in 图 10-2
- Place the FB resistors, R1 and R2, close to the FB pin and route the VOUT connection from R1 to the load as a remote sense trace. If a second L-C filter is used, this connection should be made after L<sub>f</sub>.
- The recommended layout is implemented on the EVM and shown in its User's Guide, *TPS6291xEVM-077* User's Guide, as well as in 图 10-2.

#### **10.2 Layout Example**

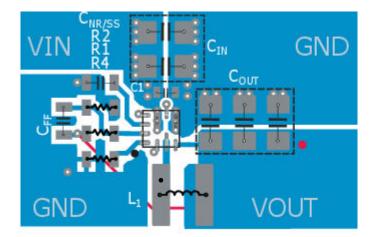

图 10-1. Recommended Layout for Single L-C Filter

#### Note

The start winding of the inductor, as shown in the figures as a black dot, needs to be connected to the DC/DC converter switch pin, SW, to minimize capacitive coupling to the surrounding area.

#### Note

The red dot indicates where the feedback sense should be placed for the best DC regulation. For a single L-C configuration, it is placed near the VOUT capacitors. For a second L-C filter design, the feedback sense is placed near the load after the VOUT FILT capacitors.

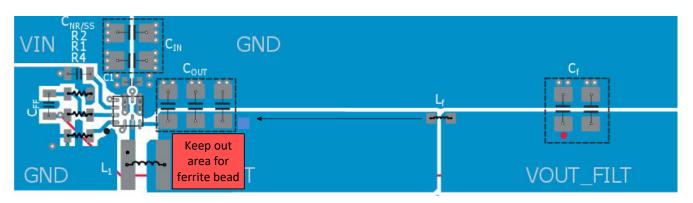

图 10-2. Recommended Layout for Design with Second L-C Filter

#### Note

The ferrite bead can be placed closer to the device as long as it is outside the keep out area, as shown in the figure as a red rectangular area. This placement avoids capacitive and electromagnetic coupling to the output of the ferrite bead. If the ferrite bead is placed in the keep out area, the filtering effect of the ferrite bead is greatly reduced. If the ferrite bead is routed through a via to the back side of the board, ensure adequate ground plane between the layers if the ferrite bead will be in this area.

<sup>(1)</sup> The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

<sup>(2)</sup> RoHS: TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (CI) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

<sup>(3)</sup> MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

<sup>(4)</sup> There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

<sup>(5)</sup> Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

<sup>(6)</sup> Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

# PACKAGE OPTION ADDENDUM

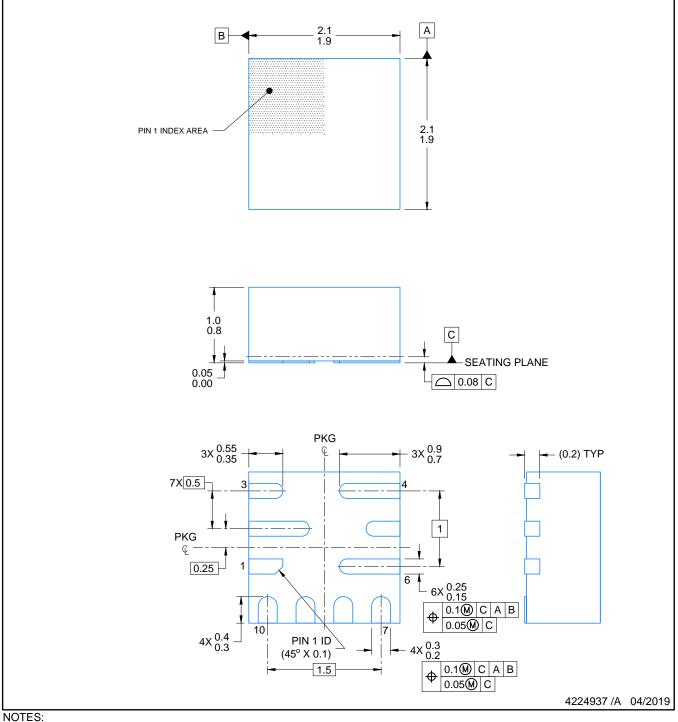

1-Apr-2021

# **RPU0010A**

# **PACKAGE OUTLINE**

# VQFN-HR - 1 mm max height

PLASTIC QUAD FLAT PACK-NO LEAD

- 1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
- 2. This drawing is subject to change without notice.

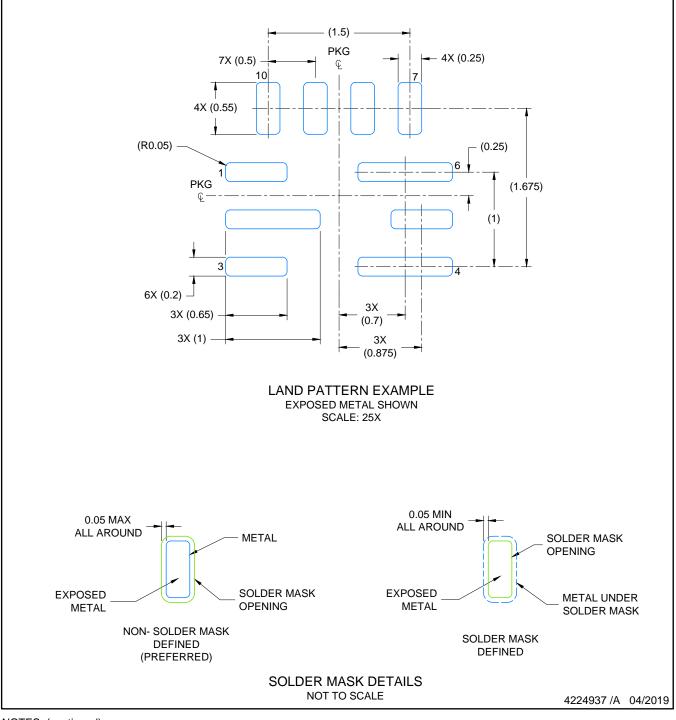

# **RPU0010A**

# **EXAMPLE BOARD LAYOUT**

# VQFN-HR - 1 mm max height

PLASTIC QUAD FLAT PACK-NO LEAD

NOTES: (continued)

- 3. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/slua271).
- 4. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

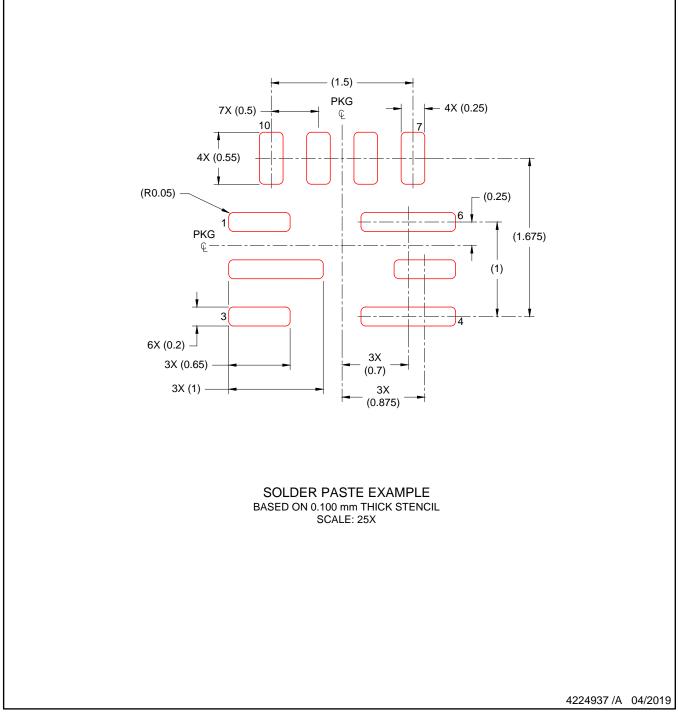

# **RPU0010A**

# **EXAMPLE STENCIL DESIGN**

# VQFN-HR - 1 mm max height

PLASTIC QUAD FLAT PACK-NO LEAD

NOTES: (continued)

5. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
