

## CDx4HCT20 双路 4 输入与非门

## 1 特性

- 兼容 LSTTL 输入逻辑
  - $V_{IL(max)} = 0.8V$ ,  $V_{IH(min)} = 2V$
- 兼容 CMOS 输入逻辑
  - 在电压为  $V_{OL}$ 、 $V_{OH}$  时,  $I_l \leq 1\mu A$
- 缓冲输入
- 工作电压为 4.5 V 至 5.5 V
- 宽工作温度范围 : -55°C 至 +125°C
- 支持多达 10 个 LSTTL 负载的扇出
- 与 LSTTL 逻辑 IC 相比, 可显著降低功耗

## 2 应用

- 警报/篡改检测电路
- S-R 锁存器

## 3 说明

该器件包含两个独立的 4 输入与非门。每个逻辑门以正逻辑执行布尔函数  $Y = \overline{A \bullet B \bullet C \bullet D}$ 。

V <sub>cc</sub>	14	—	Positive Supply

## 6 Specifications

### 6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

			MIN	MAX	UNIT
V <sub>CC</sub>	Supply voltage		- 0.5	7	V
I <sub>IK</sub>	Input clamp current <sup>(2)</sup>	V <sub>I</sub> < - 0.5 V or V <sub>I</sub> > V <sub>CC</sub> + 0.5 V		±20	mA
I <sub>OK</sub>	Output clamp current <sup>(2)</sup>	V <sub>O</sub> < - 0.5 V or V <sub>O</sub> > V <sub>CC</sub> + 0.5 V		±20	mA
I <sub>O</sub>	Continuous output current	V <sub>O</sub> > - 0.5 V or V <sub>O</sub> < V <sub>CC</sub> + 0.5 V		±25	mA
	Continuous current through V <sub>CC</sub> or GND			±50	mA
T <sub>J</sub>	Junction temperature <sup>(3)</sup>			150	°C
	Lead temperature (soldering 10s)	Lead temperature (soldering 10s)		300	°C
T <sub>stg</sub>	Storage temperature		- 65	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Rating* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Condition*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

(2) The input and output voltage ratings may be exceeded if the input and output current ratings are observed.

(3) Guaranteed by design.

### 6.2 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

			MIN	NOM	MAX	UNIT
V <sub>CC</sub>	Supply voltage		4.5	5.5	V	
V <sub>IH</sub>	High-level input voltage	V <sub>CC</sub> = 4.5 V to 5.5 V	2		V	
V <sub>IL</sub>	Low-level input voltage	V <sub>CC</sub> = 4.5 V to 5.5 V		0.8	V	
V <sub>I</sub>	Input voltage		0	V <sub>CC</sub>	V	
V <sub>O</sub>	Output voltage		0	V <sub>CC</sub>	V	
t <sub>t</sub>	Input transition rise and fall time	V <sub>CC</sub> = 4.5 V		500		ns
		V <sub>CC</sub> = 5.5 V		400		
T <sub>A</sub>	Operating free-air temperature		- 55	125	°C	

### 6.3 Thermal Information

THERMAL METRIC <sup>(1)</sup>		CD74HCT20		UNIT
		N (PDIP)	D (SOIC)	
		14 PINS	14 PINS	
R <sub>θ JA</sub>	Junction-to-ambient thermal resistance	65.2	102.6	°C/W
R <sub>θ JC(top)</sub>	Junction-to-case (top) thermal resistance	52.9	59.1	°C/W
R <sub>θ JB</sub>	Junction-to-board thermal resistance	44.9	58.5	°C/W
Ψ <sub>JT</sub>	Junction-to-top characterization parameter	32.5	20.2	°C/W
Ψ <sub>JB</sub>	Junction-to-board characterization parameter	44.7	58.1	°C/W
R <sub>θ JC(bot)</sub>	Junction-to-case (bottom) thermal resistance	N/A	N/A	°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

## 6.4 Electrical Characteristics

over operating free-air temperature range; typical values measured at  $T_A = 25^\circ\text{C}$  (unless otherwise noted).

PARAMETER	TEST CONDITIONS	V <sub>CC</sub>	Operating free-air temperature ( $T_A$ )									UNIT	
			25°C			-40°C to 85°C			-55°C to 125°C				
			MIN	TYP	MAX	MIN	TYP	MAX	MIN	TYP	MAX		
V <sub>OH</sub>	High-level output voltage	V <sub>I</sub> = V <sub>IH</sub> or V <sub>IL</sub>	I <sub>OH</sub> = -20 $\mu\text{A}$	4.5 V	4.4			4.4			4.4	V	
			I <sub>OH</sub> = -4 mA	4.5 V	3.98			3.84			3.7		
V <sub>OL</sub>	Low-level output voltage	V <sub>I</sub> = V <sub>IH</sub> or V <sub>IL</sub>	I <sub>OL</sub> = 20 $\mu\text{A}$	4.5 V	0.1			0.1			0.1	V	
			I <sub>OL</sub> = 4 mA	4.5 V	0.26			0.33			0.4		
I <sub>I</sub>	Input leakage current	V <sub>I</sub> = V <sub>CC</sub> and GND	I <sub>O</sub> = 0	5.5 V	±0.1			±1			±1	μA	
I <sub>CC</sub>	Supply current	V <sub>I</sub> = V <sub>CC</sub> or GND	I <sub>O</sub> = 0	5.5 V	2			20			40	μA	
Δ I <sub>CC</sub> (1)	Additional Quiescent Device Current Per Input Pin	V <sub>I</sub> = V <sub>CC</sub> - 2.1		4.5 V to 5.5 V	100	360		450		490		μA	
C <sub>i</sub>	Input capacitance			5 V	10			10			10	pF	

(1) For dual-supply systems theoretical worst case ( $V_I = 2.4 \text{ V}$ ,  $V_{CC} = 5.5 \text{ V}$ ) specification is 1.8 mA.

## 6.5 Switching Characteristics

over operating free-air temperature range; typical values measured at  $T_A = 25^\circ\text{C}$  (unless otherwise noted).

PARAMETER	FROM	TO	TEST CONDITIONS	V <sub>CC</sub>	Operating free-air temperature ( $T_A$ )									UNIT		
					25°C			-40°C to 85°C			-55°C to 125°C					
					MIN	TYP	MAX	MIN	TYP	MAX	MIN	TYP	MAX			
t <sub>pd</sub>	Propagation delay	A, B, C, or D	Y	C <sub>L</sub> = 50 pF	4.5 V	28			35			42			ns	
			Y	C <sub>L</sub> = 15 pF	5 V	11										
t <sub>t</sub>	Transition-time		Y	C <sub>L</sub> = 50 pF	4.5 V	15			19			22			ns	

## 6.6 Operating Characteristics

over operating free-air temperature range; typical values measured at  $T_A = 25^\circ\text{C}$  (unless otherwise noted).

PARAMETER	TEST CONDITIONS	V <sub>CC</sub>	MIN	TYP	MAX	UNIT	
C <sub>pd</sub>	Power dissipation capacitance per gate	No load	5 V	38			pF

## 6.7 Typical Characteristics

$T_A = 25^\circ\text{C}$

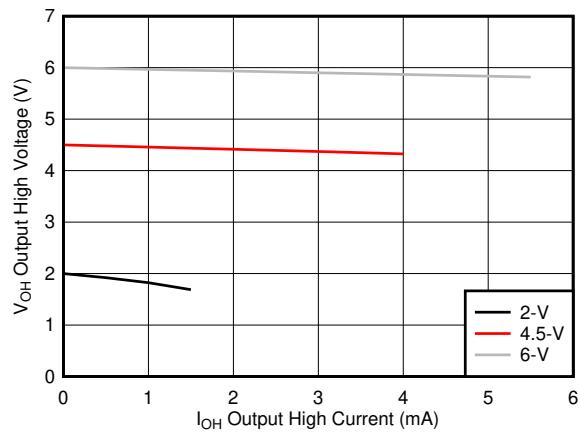

图 6-1. Typical output voltage in the high state ( $V_{OH}$ )

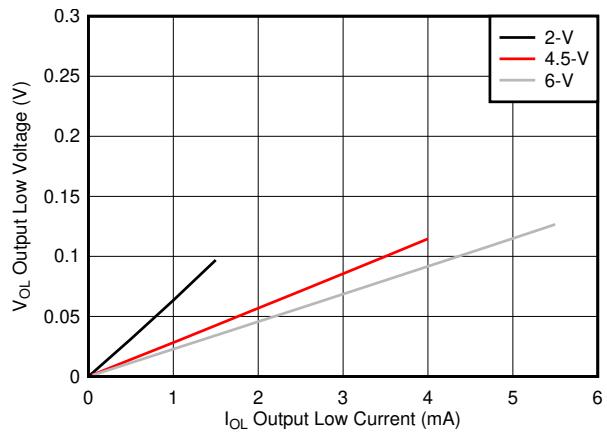

图 6-2. Typical output voltage in the low state ( $V_{OL}$ )

## 7 Parameter Measurement Information

- Phase relationships between waveforms were chosen arbitrarily. All input pulses are supplied by generators having the following characteristics: PRR  $\leq 1$  MHz,  $Z_O = 50 \Omega$ ,  $t_t < 6$  ns.
- The outputs are measured one at a time, with one input transition per measurement.

A.  $C_L = 50$  pF and includes probe and jig capacitance.

图 7-1. Load Circuit

A.  $t_l$  is the greater of  $t_r$  and  $t_f$ .

图 7-2. Voltage Waveforms Transition Times

A. The maximum between  $t_{PLH}$  and  $t_{PHL}$  is used for  $t_{pd}$ .

图 7-3. Voltage Waveforms Propagation Delays

## 8 Detailed Description

### 8.1 Overview

This device contains two independent 4-input NAND gates. Each gate performs the Boolean function  $Y = \overline{A \bullet B \bullet C \bullet D}$  in positive logic.

### 8.2 Functional Block Diagram

### 8.3 Feature Description

#### 8.3.1 Balanced CMOS Push-Pull Outputs

A balanced output allows the device to sink and source similar currents. The drive capability of this device may create fast edges into light loads so routing and load conditions should be considered to prevent ringing. Additionally, the outputs of this device are capable of driving larger currents than the device can sustain without being damaged. It is important for the output power of the device to be limited to avoid damage due to over-current. The electrical and thermal limits defined in the [#6.1](#) must be followed at all times.

The CD74HCT20 can drive a load with a total capacitance less than or equal to the maximum load listed in the [#6.5](#) connected to a high-impedance CMOS input while still meeting all of the datasheet specifications. Larger capacitive loads can be applied, however it is not recommended to exceed the provided load value. If larger capacitive loads are required, it is recommended to add a series resistor between the output and the capacitor to limit output current to the values given in the [#6.1](#).

#### 8.3.2 TTL-Compatible CMOS Inputs

TTL-Compatible CMOS inputs are high impedance and are typically modeled as a resistor from the input to ground in parallel with the input capacitance given in the [#6.4](#). The worst case resistance is calculated with the maximum input voltage, given in the [#6.1](#), and the maximum input leakage current, given in the [#6.4](#), using ohm's law ( $R = V \div I$ ).

Signals applied to the inputs need to have fast edge rates, as defined by  $\Delta t / \Delta v$  in the [#6.2](#) to avoid excessive current consumption and oscillations. If a slow or noisy input signal is required, a device with a Schmitt-trigger input should be used to condition the input signal prior to the TTL-compatible CMOS input.

TTL-Compatible CMOS inputs have a lower threshold voltage than standard CMOS inputs to allow for compatibility with older bipolar logic devices. See the [#6.2](#) for the valid input voltages for the CD74HCT20.

### 8.3.3 Clamp Diode Structure

The inputs and outputs to this device have both positive and negative clamping diodes as depicted in [图 8-1](#).

#### CAUTION

Voltages beyond the values specified in the [节 6.1](#) table can cause damage to the device. The recommended input and output voltage ratings may be exceeded if the input and output clamp-current ratings are observed.

[图 8-1. Electrical Placement of Clamping Diodes for Each Input and Output](#)

### 8.4 Device Functional Modes

[表 8-1. Function Table](#)

INPUTS				OUTPUT
A	B	C	D	Y
H	H	H	H	L
L	X	X	X	H
X	L	X	X	H
X	X	L	X	H
X	X	X	L	H

## 9 Application and Implementation

### 备注

以下应用部分中的信息不属于 TI 器件规格的范围，TI 不担保其准确性和完整性。TI 的客户应负责确定器件是否适用于其应用。客户应验证并测试其设计，以确保系统功能。

### 9.1 Application Information

In this application, two 4-input NAND gates are used to create an active-low SR latch as shown in [图 9-1](#). Unused inputs can be tied together or to  $V_{CC}$ .

This device is used to drive the tamper indicator LED and provide one bit of data to the system controller. When the tamper switch outputs LOW, the output Q becomes HIGH. This output remains HIGH until the system controller addresses the event and sends a LOW signal to the R input which returns the Q output back to LOW.

### 9.2 Typical Application

### 9.2.1.2 Input Considerations

Unused inputs must be terminated to either  $V_{CC}$  or ground. These can be directly terminated if the input is completely unused, or they can be connected with a pull-up or pull-down resistor if the input is to be used sometimes, but not always. A pull-up resistor is used for a default state of HIGH, and a pull-down resistor is used for a default state of LOW. The resistor size is limited by drive current of the controller, leakage current into the CD74HCT20, as specified in the [# 6.4](#), and the desired input transition rate. A 10-k $\Omega$  resistor value is often used due to these factors.

Refer to the [# 8.3](#) for additional information regarding the inputs for this device.

### 9.2.1.3 Output Considerations

The positive supply voltage is used to produce the output HIGH voltage. Drawing current from the output will decrease the output voltage as specified by the  $V_{OH}$  specification in the [# 6.4](#). Similarly, the ground voltage is used to produce the output LOW voltage. Sinking current into the output will increase the output voltage as specified by the  $V_{OL}$  specification in the [# 6.4](#).

Unused outputs can be left floating. Do not connect outputs directly to  $V_{CC}$  or ground.

Refer to [# 8.3](#) for additional information regarding the outputs for this device.

### 9.2.2 Detailed Design Procedure

1. Add a decoupling capacitor from  $V_{CC}$  to GND. The capacitor needs to be placed physically close to the device and electrically close to both the  $V_{CC}$  and GND pins. An example layout is shown in the [# 11](#).
2. Ensure the capacitive load at the output is  $\leq 70$  pF. This is not a hard limit, however it will ensure optimal performance. This can be accomplished by providing short, appropriately sized traces from the CD74HCT20 to the receiving device.
3. Ensure the resistive load at the output is larger than  $(V_{CC} / I_{O(max)}) \Omega$ . This will ensure that the maximum output current from the [# 6.1](#) is not violated. Most CMOS inputs have a resistive load measured in megaohms; much larger than the minimum calculated above.
4. Thermal issues are rarely a concern for logic gates, however the power consumption and thermal increase can be calculated using the steps provided in the application report, [CMOS Power Consumption and Cpd Calculation](#)

### 9.2.3 Application Curves

图 9-2. Typical application timing diagram

## 10 Power Supply Recommendations

The power supply can be any voltage between the minimum and maximum supply voltage rating located in the [Fig 6.2](#). Each  $V_{CC}$  terminal should have a bypass capacitor to prevent power disturbance. A  $0.1\text{-}\mu\text{F}$  capacitor is recommended for this device. It is acceptable to parallel multiple bypass caps to reject different frequencies of noise. The  $0.1\text{-}\mu\text{F}$  and  $1\text{-}\mu\text{F}$  capacitors are commonly used in parallel. The bypass capacitor should be installed as close to the power terminal as possible for best results, as shown in [Fig 11-1](#).

## 11 Layout

### 11.1 Layout Guidelines

When using multiple-input and multiple-channel logic devices inputs must not ever be left floating. In many cases, functions or parts of functions of digital logic devices are unused; for example, when only two inputs of a triple-input AND gate are used. Such unused input pins must not be left unconnected because the undefined voltages at the outside connections result in undefined operational states. All unused inputs of digital logic devices must be connected to a logic high or logic low voltage, as defined by the input voltage specifications, to prevent them from floating. The logic level that must be applied to any particular unused input depends on the function of the device. Generally, the inputs are tied to GND or  $V_{CC}$ , whichever makes more sense for the logic function or is more convenient.

### 11.2 Layout Example

图 11-1. Example layout for the CD74HCT20

## 12 Device and Documentation Support

### 12.1 Documentation Support

#### 12.1.1 Related Documentation

For related documentation see the following:

- [Designing with Logic](#)

### 12.2 支持资源

[TI E2E™ 支持论坛](#)是工程师的重要参考资料，可直接从专家获得快速、经过验证的解答和设计帮助。搜索现有解答或提出自己的问题可获得所需的快速设计帮助。

链接的内容由各个贡献者“按原样”提供。这些内容并不构成 TI 技术规范，并且不一定反映 TI 的观点；请参阅 TI 的《使用条款》。

### 12.3 Trademarks

TI E2E™ is a trademark of Texas Instruments.

所有商标均为其各自所有者的财产。

### 12.4 静电放电警告

静电放电 (ESD) 会损坏这个集成电路。德州仪器 (TI) 建议通过适当的预防措施处理所有集成电路。如果不遵守正确的处理和安装程序，可能会损坏集成电路。

ESD 的损坏小至导致微小的性能降级，大至整个器件故障。精密的集成电路可能更容易受到损坏，这是因为非常细微的参数更改都可能会导致器件与其发布的规格不相符。

### 12.5 术语表

[TI 术语表](#) 本术语表列出并解释了术语、首字母缩略词和定义。

## 13 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

**PACKAGING INFORMATION**

<sup>(1)</sup> **Status:** For more details on status, see our [product life cycle](#).

<sup>(2)</sup> **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

<sup>(3)</sup> **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

<sup>(4)</sup> **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

<sup>(5)</sup> **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

<sup>(6)</sup> **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative
