DS90CR286AT-Q1 3.3V 上升沿数据选通信号 LVDS 接收器 28 位 Channel Link 66MHz

1 特性

- 20MHz 至 66MHz 移位时钟支持
- 接收器输出时钟的占空比为 50%
- 接收端输出拥有出色的建立和保持时间
- 66MHz（最差情况下）时的接收功耗 < 270mW（典型值）
- 接收端省电模式 < 200μW（最大值）
- 静电放电 (ESD) 额定值：4kV (HBM)，1kV (CDM)
- 锁相环 (PLL) 无需外部组件
- 与 TIA/EIA-644 LVDS 标准兼容
- 薄型 56 引脚 DGG (TSSOP) 封装
- 工作温度范围：−40°C 至 +105°C
- 符合汽车类 AEC-Q100 2 级标准

2 应用

- 视频显示
- 车用信息娱乐
- 工业用打印机和成像
- 数字视频传输
- 机器视觉
- OpenLDI 至 RGB 桥接器

3 说明

DS90CR286AT-Q1 接收器可将四条 LVDS（低压差分信令）数据流转换回 28 位并行 LVCMOS 数据。接收器数据在输出时钟的上升沿输出选通信号。

接收器 LVDS 时钟的工作速率为 20MHz 至 66MHz。DS90CR286AT-Q1 会锁相至输入 LVDS 时钟、对 LVDS 数据线路上的串行位流进行采样、然后将其转换为 28 位并行输出数据。在 66MHz 的传入时钟速率下，每条 LVDS 输入线路均以 462Mbps 的位速率运行，最大吞吐量达 1.848Gbps。

DS90CR286AT-Q1 器件的接收器输出拥有更长的数据有效时间，相比上一代接收器有显著提升。DS90CR286AT-Q1 针对 PCB 电路板芯片间 OpenLDI 至 RGB 桥接转化而设计。对于这款器件，不建议通过电缆互连的方式传输 LVDS 数据。

用户使用兼容的 OpenLDI 发送器和 DS90CR286AT-Q1 接收器设计子系统时，需要确保偏差裕度预算 (RSKM) 在可接受的范围内。有关 RSKM 的详细信息，可参见“应用信息”部分。

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted) (1)

	MIN	MAX	UNIT
Supply Voltage (V_{CC})	−0.3	4	V
LVCMOS Output Voltage	−0.3	(V_{CC} + 0.3)	V
LVDS Receiver Input Voltage	−0.3	(V_{CC} + 0.3)	V
Operating Junction Temperature		150	°C
Lead Temperature (Soldering, 4 sec)		260	°C
Storage temperature, T_{stg}	−65	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

6.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per AEC Q100-002 (1)	±4000	V
		Charged-device model (CDM), per AEC Q100-011	±1000	

(1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

	MIN	NOM	MAX	UNIT
Supply Voltage (V_{CC})	3.0	3.3	3.6	V
Operating Free Air Temperature (T_A)	−40	25	105	°C
Receiver Input Range	0		2.4	V
Supply Noise Voltage (V_{Noise})			100	mVp-p

6.4 Thermal Information

THERMAL METRIC (1)		DS90CR286AT-Q1 DGG (TSSOP) 56 PINS	UNIT
$R_{\theta JA}$	Junction-to-ambient thermal resistance	64.6	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	20.6	
$R_{\theta JB}$	Junction-to-board thermal resistance	33.3	
ψ_{JT}	Junction-to-top characterization parameter	1.0	
ψ_{JB}	Junction-to-board characterization parameter	33.0	

(1) For more information about traditional and new thermal metrics, see the *IC Package Thermal Metrics* application report, SPRA953.

6.5 Electrical Characteristics(1)(2)

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS		MIN	TYP	MAX	UNIT

RPDD	Receiver Power Down Delay (Figure 7)				1	µs

(1) Total latency for the channel link chipset is a function of clock period and gate delays through the transmitter (TCCD) and receiver (RCCD). The total latency for the DS90CR285 transmitter and DS90CR286AT-Q1 receiver is: (T + TCCD) + (2*T + RCCD), where T = Clock period. If another transmitter is used, the alternative transmitter's TCCD must be used to calculate total latency.

7 Detailed Description

7.1 Overview

The DS90CR286AT-Q1 is an AEC-Q100 Grade 2 receiver that converts four LVDS (Low Voltage Differential Signaling) data streams back into parallel 28 bits of LVCMOS data (24 bits of RGB and 4 bits of HSYNC, VSYNC, DE, and CNTL). An internal PLL locks to the incoming LVDS clock ranging from 20 to 66 MHz. The locked PLL then ensures a stable clock to sample the output LVCMOS data on the Receiver Clock Out rising edge. The DS90CR286AT-Q1 features a $\overline{\text{PWR DWN}}$ pin to put the device into low power mode when there is no active input data.

7.2 Functional Block Diagram

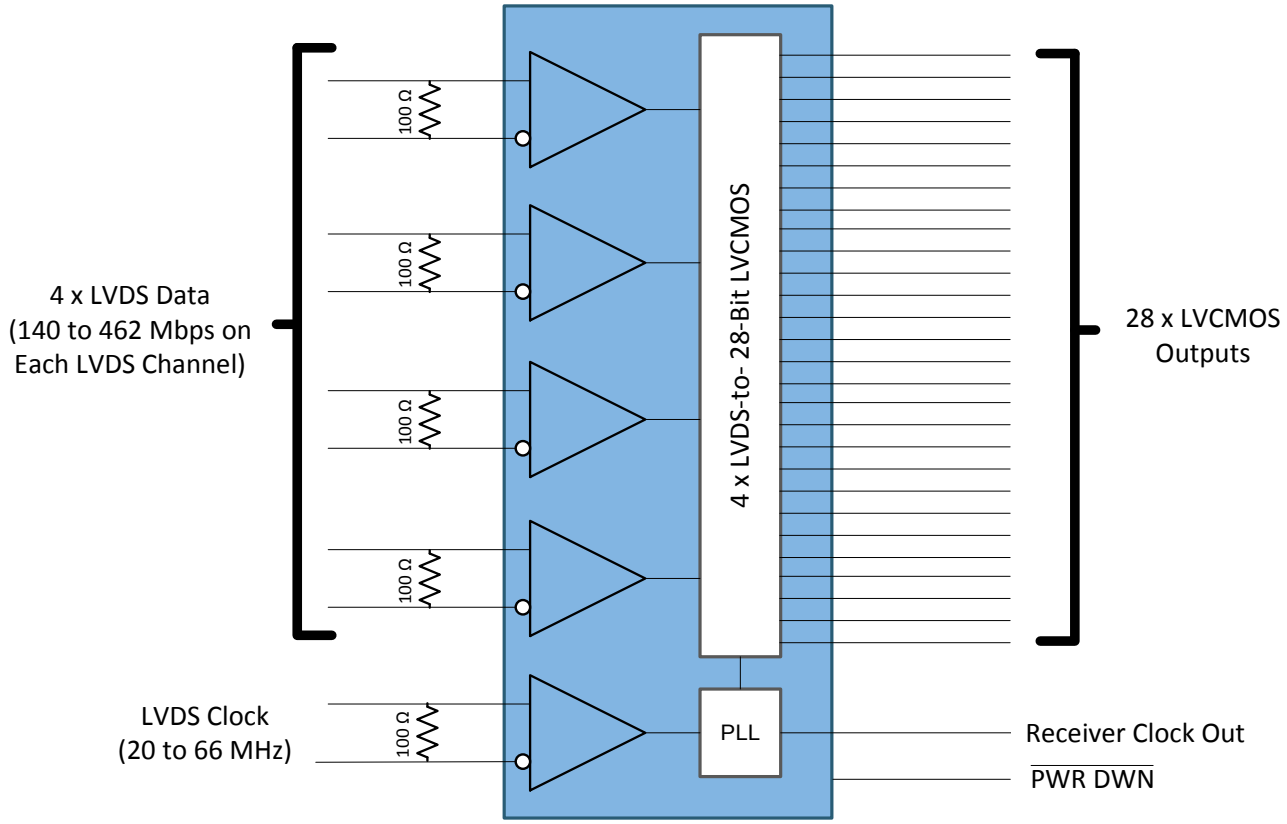

Figure 20. DS90CR286AT-Q1 Block Diagram

7.3 Feature Description

The DS90CR286AT-Q1 consists of several key blocks:

- LVDS Receivers
- Phase Locked Loop (PLL)
- Serial LVDS-to-Parallel LVCMOS Converter
- LVCMOS Drivers

7.3.1 LVDS Receivers

There are five differential LVDS inputs to the DS90CR286AT-Q1. Four of the LVDS inputs contain serialized data originating from a 28-bit source transmitter. The remaining LVDS input contains the LVDS clock associated with the data pairs.

Feature Description (continued)

7.3.1.1 Input Termination

The DS90CR286AT-Q1 requires a single 100 Ω terminating resistor across the positive and negative lines on each differential pair of the receiver input. To prevent reflections due to stubs, this resistor should be placed as close to the device input pins as possible. Figure 21 shows an example.

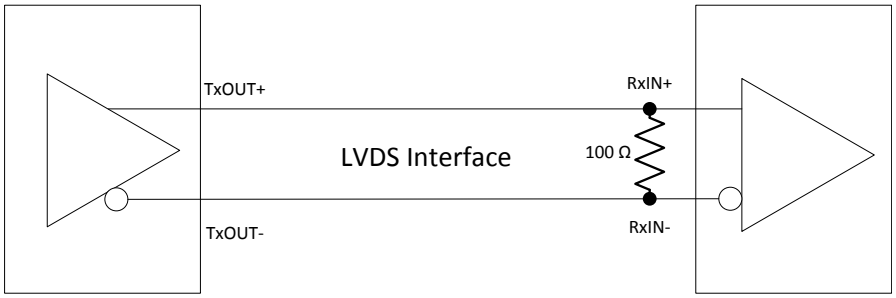

Figure 21. LVDS Serialized Link Termination

7.3.2 Phase Locked Loop (PLL)

The Channel Link I devices use an internal PLL to recover the clock transmitted across the LVDS interface. The recovered clock is then used as a reference to determine the sampling position of the seven serial bits received per clock cycle. The width of each bit in the serialized LVDS data stream is one-seventh the clock period. Differential skew (Δt within one differential pair), interconnect skew (Δt of one differential pair to another), and clock jitter will all reduce the available window for sampling the LVDS serial data streams. Individual bypassing of each V_{CC} to ground will minimize the noise passed on to the PLL, thus creating a low jitter LVDS clock to improve the overall jitter budget.

7.3.3 Serial LVDS-to-Parallel LVCMOS Converter

After the PLL locks to the incoming LVDS clock, the receiver deserializes each LVDS differential data pair into seven parallel LVCMOS data outputs per clock cycle. For the DS90CR286AT-Q1, the LVDS data inputs map to LVCMOS outputs according to Figure 6.

7.3.4 LVCMOS Drivers

The LVCMOS outputs from the DS90CR286AT-Q1 are the deserialized single-ended data from the serialized LVDS data pairs. Each LVCMOS output is clocked by the PLL and should be strobed on the RxCLKOUT rising edge by the endpoint device. All unused DS90CR286AT-Q1 RxOUT outputs can be left floating.

7.4 Device Functional Modes

7.4.1 Power Down Mode

The DS90CR286AT-Q1 receiver may be placed into a power down mode at any time by asserting the $\overline{\text{PWR DWN}}$ pin (active low). The DS90CR286AT-Q1 is also designed to protect from accidental loss of power to either the transmitter or receiver. If power to the transmitter is lost, the receiver clocks (input and output) stop. The data outputs (RxOUT) retain the states they were in when the clocks stopped. When the receiver loses power, the receiver inputs are shorted to V_{CC} through an internal diode. Current is limited to 5 mA per input, thus avoiding the potential for latch-up when powering the device.

8 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

The DS90CR286AT-Q1 is designed for a wide variety of data transmission applications. The use of serialized LVDS data lines in these applications allows for efficient signal transmission over a narrow bus width, thereby reducing cost, power, and space. The DS90CR286AT-Q1 is designed for PCB board chip-to-chip OpenLDI-to-RGB (LVDS-to-parallel) bridge conversion. LVDS data transmission over cable interconnect is not recommended for this device. Users designing a sub-system with a compatible OpenLDI transmitter and DS90CR286AT-Q1 receiver must ensure an acceptable skew margin budget (RSKM).

8.2 Typical Application

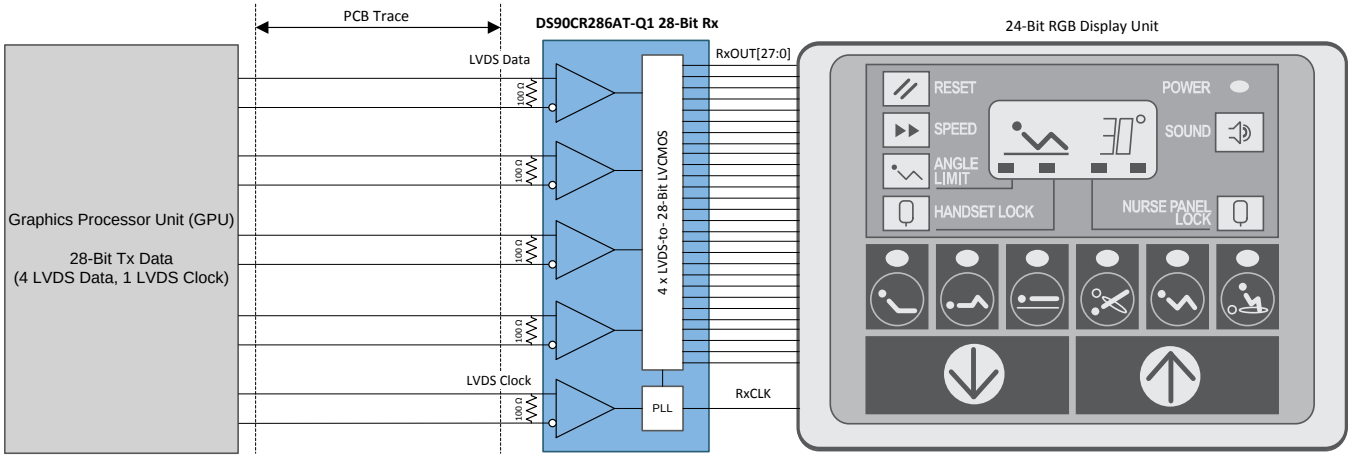

Figure 22. Typical DS90CR286AT-Q1 Application Block Diagram

8.2.1 Design Requirements

For this design example, ensure that the following requirements are observed.

Table 1. DS90CR286AT-Q1 Design Parameters

DESIGN PARAMETER	DESIGN REQUIREMENTS
Operating Frequency	LVDS clock must be within 20-66 MHz.
Bit Resolution	No higher than 24 bpp. The maximum supported resolution is 8-bit RGB.
Bit Data Mapping	Determine the appropriate mapping required by the panel display following the DS90CR286AT-Q1 outputs.
RSKM (Receiver Skew Margin)	Ensure that there is acceptable margin between Tx pulse position and Rx strobe position.
Input Termination for RxIN±	100 Ω ± 10% resistor across each LVDS differential pair. Place as close as possible to IC input pins.
RxIN± Board Trace Impedance	Design differential trace impedance with 100 Ω ± 5%.
LVCMOS Outputs	If unused, leave pins floating. Series resistance on each LVCMOS output optional to reduce reflections from long board traces. If used, 33 Ω series resistance is typical.
DC Power Supply Coupling Capacitors	Use a 0.1 µF capacitor to minimize power supply noise. Place as close as possible to Vcc pins.

8.2.2 Detailed Design Procedure

To begin the design process with the DS90CR286AT-Q1, determine the following:

- Operating Frequency
- Bit Resolution of the Panel
- Bit Mapping from Receiver to Endpoint Panel Display
- RSKM Interoperability with Transmitter Pulse Position Margin

8.2.2.1 Bit Resolution and Operating Frequency Compatibility

The bit resolution of the endpoint panel display reveals whether there are enough bits available in the DS90CR286AT-Q1 to output the required data per pixel. The DS90CR286AT-Q1 has 28 parallel LVCMOS outputs and can therefore provide a bit resolution up to 24 bpp (bits per pixel). In each clock cycle, the remaining bits are the three control signals (HSync, VSync, DE) and one spare bit.

The number of pixels per frame and the refresh rate of the endpoint panel display indicate the required operating frequency of the receiver clock. To determine the required clock frequency, refer to the following formula:

$$f\_Clk = [H\_Active + H\_Blank] \times [V\_Active + V\_Blank] \times f\_Vertical$$

where

- H_Active = Active Display Horizontal Lines
- H_Blank = Blanking Period Horizontal Lines
- V_Active = Active Display Vertical Lines
- V_Blank = Blanking Period Vertical Lines
- f_Vertical = Refresh Rate (in Hz)
- f_Clk = Operating Frequency of LVDS clock (1)

In each frame, there is a blanking period associated with horizontal rows and vertical columns that are not actively displayed on the panel. These blanking period pixels must be included to determine the required clock frequency. Consider the following example to determine the required LVDS clock frequency:

- H_Active = 640
- H_Blank = 40
- V_Active = 480
- V_Blank = 41
- f_Vertical = 59.95 Hz

Thus, the required operating frequency is determined below:

$$[640 + 40] \times [480 + 41] \times 59.95 = 21239086 \text{ Hz} \approx 21.24 \text{ MHz} \quad (2)$$

Since the operating frequency for the PLL in the DS90CR286AT-Q1 ranges from 20-66 MHz, the DS90CR286AT-Q1 can support a panel display with the aforementioned requirements.

If the specific blanking interval is unknown, the number of pixels in the blanking interval can be approximated to 20% of the active pixels. The following formula can be used as a conservative approximation for the operating LVDS clock frequency:

$$f\_Clk \approx H\_Active \times V\_Active \times f\_Vertical \times 1.2 \quad (3)$$

Using this approximation, the operating frequency for the example in this section is estimated below:

$$640 \times 480 \times 59.95 \times 1.2 = 22099968 \text{ Hz} \approx 22.10 \text{ MHz} \quad (4)$$

8.2.2.2 Data Mapping between Receiver and Endpoint Panel Display

Ensure that the LVCMOS outputs are mapped to align with the endpoint display RGB mapping requirements following the deserializer. Two popular mapping topologies for 8-bit RGB data are shown below:

1. LSBs are mapped to RxIN3±.
2. MSBs are mapped to RxIN3±.

The following tables depict how these two popular topologies can be mapped to the DS90CR286AT-Q1 outputs.

Table 2. 8-Bit Color Mapping with LSBs on RxIN3±

LVDS INPUT CHANNEL	LVDS BIT STREAM POSITION	LVCMOS OUTPUT CHANNEL	COLOR MAPPING	COMMENTS
RxIN0	TxIN0	RxOUT0	R2

	TxIN18	RxOUT18	B1	

Table 3. 8-Bit Color Mapping with MSBs on RxIN3± (continued)

LVDS INPUT CHANNEL	LVDS BIT STREAM POSITION	LVCMOS OUTPUT CHANNEL	COLOR MAPPING	COMMENTS
RxIN2	TxIN19	RxOUT19	B2	
	TxIN20	RxOUT20	B3	
	TxIN21	RxOUT21	B4	
	TxIN22	RxOUT22	B5	
	TxIN24	RxOUT24	HSYNC	Horizontal Sync
	TxIN25	RxOUT25	VSYNC	Vertical Sync
	TxIN26	RxOUT26	DE	Data Enable
RxIN3	TxIN27	RxOUT27	R6	
	TxIN5	RxOUT5	R7	MSB
	TxIN10	RxOUT10	G6	
	TxIN11	RxOUT11	G7	MSB
	TxIN16	RxOUT16	B6	
	TxIN17	RxOUT17	B7	MSB
	TxIN23	RxOUT23	GP	General Purpose

In situations where the DS90CR286AT-Q1 must support 18 bpp, Table 2 is commonly used. With this mapping, MSBs of RGB data are retained on RXIN0±, RXIN1±, and RXIN2± while the two LSBs for the original 8-bit RGB resolution are ignored from RxIN3±.

8.2.2.3 RSKM Interoperability

One of the most important factors when designing the receiver into a system application is assessing how much RSKM (Receiver Skew Margin) is available. In each LVDS clock cycle, the LVDS data stream carries seven serialized data bits. Ideally, the Transmit Pulse Position for each bit will occur every (n x T)/7 seconds, where n = Bit Position and T = LVDS Clock Period. Likewise, ideally the Receive Strobe Position for each bit will occur every ((n + 0.5) x T)/7 seconds. However, due to the effects of clock jitter and ISI, both LVDS transmitter and receiver in real systems will have a minimum and maximum pulse and strobe position, respectively, for each bit position. This concept is illustrated in Figure 23:

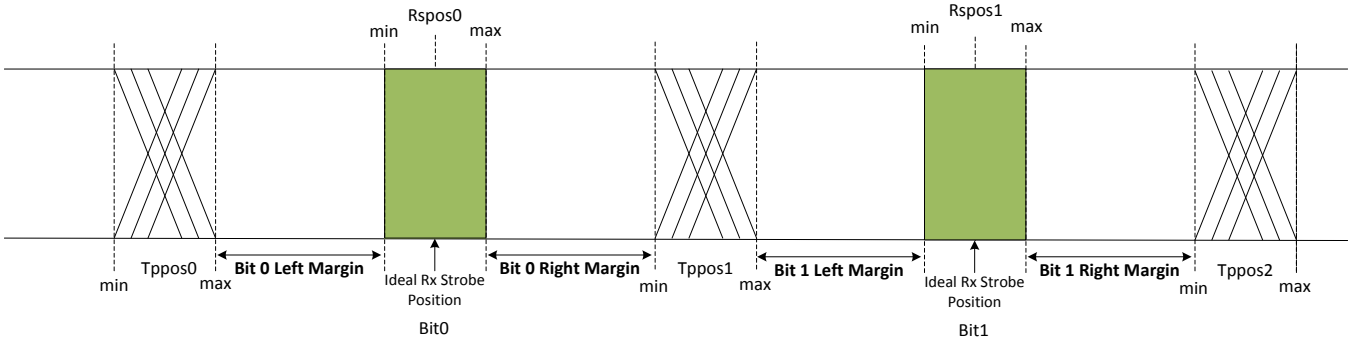

Figure 23. RSKM Measurement Example

All left and right margins for Bits 0-6 must be considered in order to determine the absolute minimum for the whole LVDS bit stream. This absolute minimum corresponds to the RSKM.

To improve RSKM performance between LVDS transmitter and receiver, designers may either advance or delay the LVDS clock compared to the LVDS data. Moving the LVDS clock compared to the LVDS data can improve the Rx strobe position compared to the Tx pulse position of the transmitter.

If there is less left bit margin than right bit margin, the LVDS clock can be delayed so that the Rx strobe position for incoming data appears to be delayed. If there is less right bit margin than left bit margin, all the LVDS data pairs can be delayed uniformly so that the LVDS clock and Rx strobe position for incoming data appear to advance. To delay an LVDS data or clock pair, designers can either add more PCB trace length or install a capacitor between the LVDS transmitter and receiver. It is important to note that when using these techniques, all serialized bit positions are shifted right or left uniformly.

When designing the DS90CR286AT-Q1 receiver with a third-party OpenLDI transmitter, users must calculate the skew margin budget (RSKM) based on the Tx pulse position and the Rx strobe position to ensure error-free transmission. For more information about calculating RSKM, refer to Application Note SNLA249.

8.2.3 Application Curves

The following application curves are examples taken with a DS90C385 serializer interfacing to a DS90CR286AT-Q1 deserializer in nominal temperature (25ºC) at an operating frequency of 66 MHz.

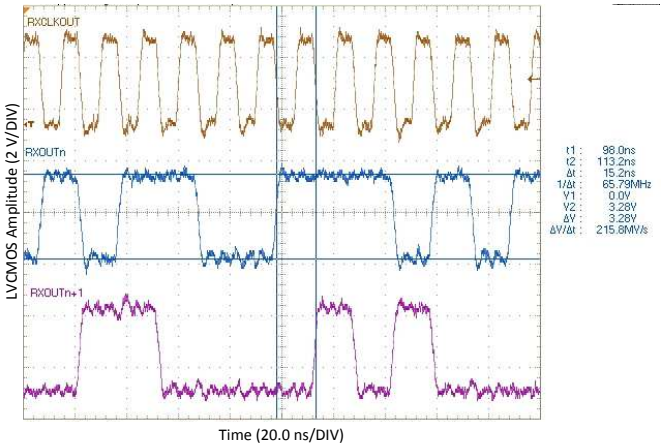

Figure 27. PRBS-7 Output on RxOUT Channels

9 Power Supply Recommendations

Proper power supply decoupling is important to ensure a stable power supply with minimal power supply noise. Bypassing capacitors are needed to reduce the impact of switching noise which could limit performance. For a conservative approach, three parallel-connected decoupling capacitors (Multi-Layered Ceramic type in surface mount form factor) between each V_{CC} and the ground plane(s) are recommended. The three capacitor values are 0.1 µF, 0.01 µF and 0.001 µF. The preferred capacitor size is 0402. An example is shown in Figure 28. The designer should place bypass capacitors as close as possible to the V_{CC} pins and ensure each capacitor has its own via to connect the ground plane. If board space is limiting the number of bypass capacitors, the PLL V_{CC} should receive the most filtering or bypassing. Next would be the LVDS V_{CC} pins and finally the logic V_{CC} pins.

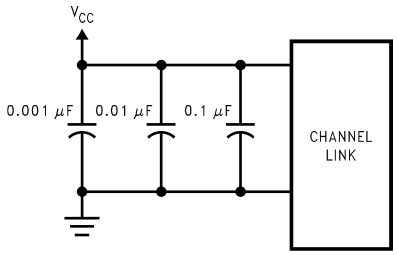

Figure 28. Recommended Bypass Capacitor Decoupling Configuration

10 Layout

10.1 Layout Guidelines

As with any high speed design, board designers must maximize signal integrity by limiting reflections and crosstalk that can adversely affect high frequency and EMI performance. The following practices are recommended layout guidelines to optimize device performance.

- Ensure that differential pair traces are always closely coupled to eliminate noise interference from other signals and take full advantage of the common mode noise canceling effect of the differential signals.
- Maintain equal length on signal traces for a given differential pair.
- Limit impedance discontinuities by reducing the number of vias on signal traces.
- Eliminate any 90º angles on traces and use 45º bends instead.
- If a via must exist on one signal polarity, mirror the via implementation on the other polarity of the differential pair.
- Match the differential impedance of the selected physical media. This impedance should also match the value of the termination resistor that is connected across the differential pair at the receiver's input.
- When possible, use short traces for LVDS inputs.

10.2 Layout Example

The following images show an example layout of the DS90CR286AT-Q1. Traces in blue correspond to the top layer and the traces in green correspond to the bottom layer. Note that differential pair inputs to the DS90CR286AT-Q1 are tightly coupled and close to the connector pins. In addition, observe that the power supply decoupling capacitors are placed as close as possible to the power supply pins with through vias in order to minimize inductance.

Layout Example (continued)

This glossary lists and explains terms, acronyms, and definitions.

12 机械、封装和可订购信息

以下页中包括机械、封装和可订购信息。这些信息是针对指定器件可提供的最新数据。这些数据会在无通知且不对本文档进行修订的情况下发生改变。要获得这份数据表的浏览器版本，请查阅左侧的导航栏。

PACKAGING INFORMATION

Orderable part number	Status (1)	Material type (2)	Package | Pins	Package qty | Carrier	RoHS (3)	Lead finish/ Ball material (4)	MSL rating/ Peak reflow (5)	Op temp (°C)	Part marking (6)
DS90CR286ATDGGQ1	Active	Production	TSSOP (DGG) | 56	34 | TUBE	Yes	SN	Level-2-260C-1 YEAR	-40 to 105	DS90CR286ATQ DGG
DS90CR286ATDGGQ1.B	Active	Production	TSSOP (DGG) | 56	34 | TUBE	Yes	SN	Level-2-260C-1 YEAR	-40 to 105	DS90CR286ATQ DGG
DS90CR286ATDGGRQ1	Active	Production	TSSOP (DGG) | 56	2000 | LARGE T&R	Yes	SN	Level-2-260C-1 YEAR	-40 to 105	DS90CR286ATQ DGG
DS90CR286ATDGGRQ1.B	Active	Production	TSSOP (DGG) | 56	2000 | LARGE T&R	Yes	SN	Level-2-260C-1 YEAR	-40 to 105	DS90CR286ATQ DGG

(1) **Status:** For more details on status, see our product life cycle.

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

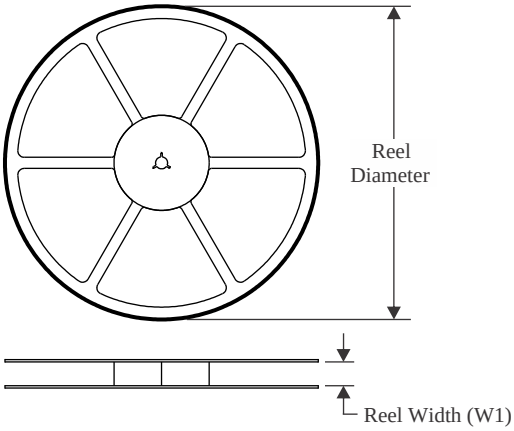
(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

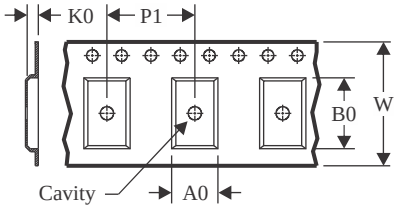
Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

TAPE AND REEL INFORMATION

REEL DIMENSIONS

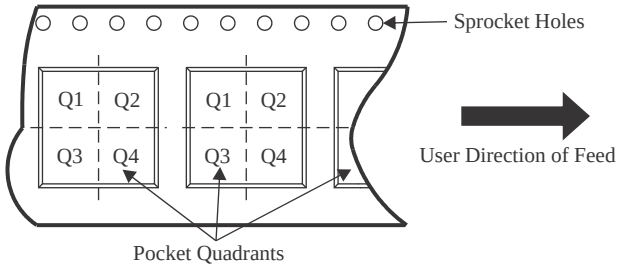


TAPE DIMENSIONS



A0	Dimension designed to accommodate the component width
B0	Dimension designed to accommodate the component length
K0	Dimension designed to accommodate the component thickness
W	Overall width of the carrier tape
P1	Pitch between successive cavity centers

QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE



*All dimensions are nominal
