

ISO732x-Q1 耐用 EMC 低功耗双通道数字隔离器

1 特性

- 符合汽车应用要求
- 具有符合 AEC-Q100 的下列结果：
 - 器件温度 1 级：-40°C 至 +125°C 的环境运行温度范围
 - 器件人体模型 (HBM) 分类等级 3A
 - 器件充电器件模型 (CDM) 分类等级 C6
- 信号传输速率：25Mbps
- 输入时使用集成噪声滤波器
- 默认输出高电平和低电平选项
- 低功耗：每通道的 I_{CC} 典型值（1Mbps 时）：
 - ISO7320-Q1：1.2mA（5V 电源），0.9mA（3.3V 电源）
 - ISO7321-Q1：1.7mA（5V 电源），1.2mA（3.3V 电源）
- 低传播延迟：典型值 33ns（5V 电源）
- 3.3V 和 5V 电平转换
- 65kV/ μ s 瞬态抗扰度，典型值（5V 电源）
- 优异的电磁兼容性 (EMC)
 - 系统级静电放电 (ESD)、瞬态放电 (EFT) 以及抗浪涌保护
 - 低辐射
- 隔离栅寿命：> 25 年
- 由 3.3V 和 5V 电源供电
- 窄体小尺寸集成电路 (SOIC)-8 封装
- 安全及管理批准：
 - 符合 DIN V VDE V 0884-10 和 DIN EN 61010-1 标准的 4242 V_{PK} 隔离中的 4242 VPK 部分
 - 符合 UL 1577 标准且长达 1 分钟的 3000 V_{RMS} 隔离
 - CSA 组件接受通知 5A，IEC 60950-1、IEC 60601-1 和 IEC 61010-1 标准中 CSA 组件接受列表项的“（审批正在审理中）”
 - 已通过符合 GB4943.1-2011 的 CQC 认证

2 应用

- 在下列使用中的光电耦合器替代产品：
 - 工业用 FieldBus
 - ProfiBus
 - ModBus
 - DeviceNet™ 数据总线
 - 伺服控制接口
 - 电机控制

- 电源
- 电池组

3 说明

ISO732x-Q1 系列器件可提供符合 UL 1577 标准的长达 1 分钟且高达 3000 V_{RMS} 的电流隔离，以及符合 VDE V 0884-10 标准的 4242 V_{PK} 隔离。这些器件具有两个隔离通道，其逻辑输入和输出缓冲器由二氧化硅 (SiO_2) 绝缘栅分离开来。

ISO7320-Q1 的两个通道方向相同，而 ISO7321-Q1 的两个通道方向相反。如果出现输入功率或信号损失，默认输出低电平（器件的订购部件号带有后缀 F）或高电平（器件的订购部件号不带后缀 F）。更多信息，请参见 *Device Functional Modes*。与隔离式电源一起使用时，这些器件有助于防止数据总线或者其他电路上的噪声电流进入本地接地或对敏感电路造成干扰或损坏。ISO734x-Q1 系列器件已针对恶劣工业环境集成了噪声滤波器。在此类环境下，器件的输入引脚上可能会出现短噪声脉冲。ISO732x-Q1 系列器件具有晶体管-晶体管逻辑电路 (TTL) 输入阈值，工作电压范围为 3V 到 5.5V。

凭借创新的芯片设计和布线技术，ISO732x-Q1 系列器件的电磁兼容性得到了显著增强，可确保提供系统级 ESD、EFT 和浪涌保护并符合辐射标准。

8 Detailed Description

8.1 Overview

The isolator in Figure 14 is based on a capacitive isolation barrier technique. The I/O channel of the device consists of two internal data channels, a high-frequency (HF) channel with a bandwidth from 100 kbps up to 25 Mbps, and a low-frequency (LF) channel covering the range from 100 kbps down to DC.

In principle, a single-ended input signal entering the HF channel is split into a differential signal via the inverter gate at the input. The following capacitor-resistor networks differentiate the signal into transient pulses, which then are converted into CMOS levels by a comparator. The transient pulses at the input of the comparator can be either above or below the common mode voltage V_{REF} depending on whether the input bit transitions from 0 to 1 or 1 to 0. The comparator threshold is adjusted based on the expected bit transition. A decision logic (DCL) at the output of the HF channel comparator measures the durations between signal transients. If the duration between two consecutive transients exceeds a certain time limit, (as in the case of a low-frequency signal), the DCL forces the output-multiplexer to switch from the high-frequency to the low-frequency channel.

8.2 Functional Block Diagram

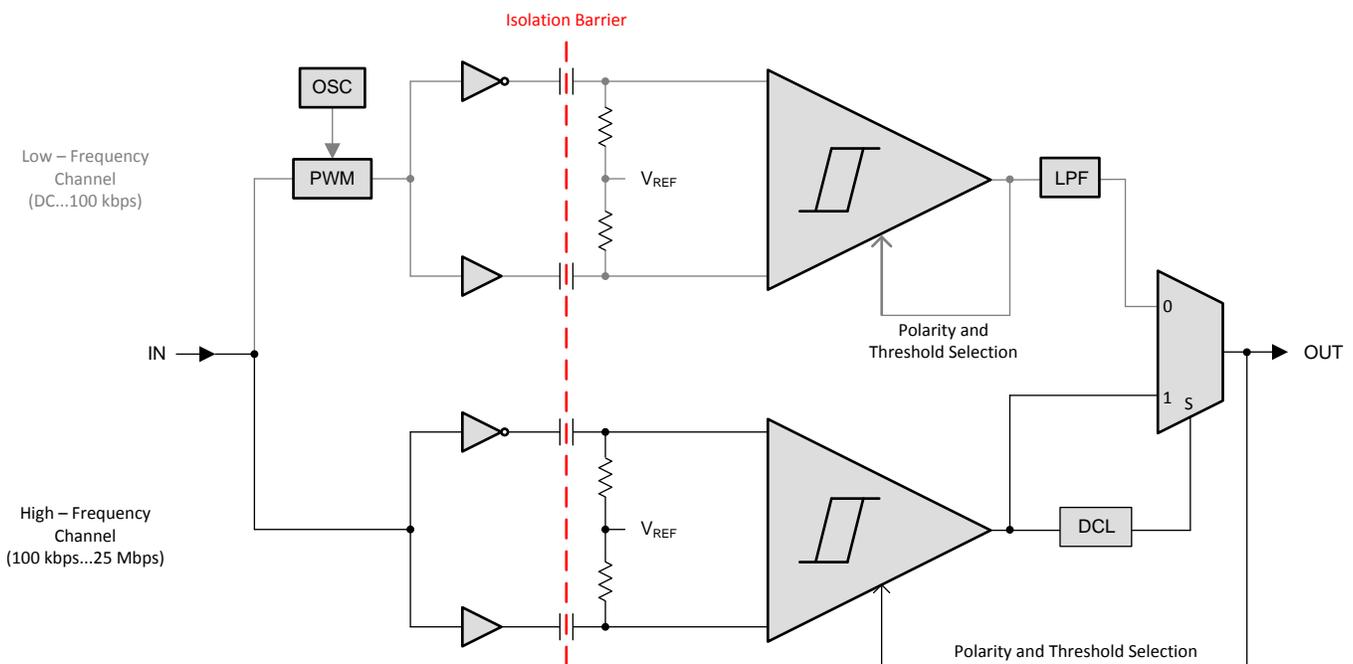

Figure 14. Conceptual Block Diagram of a Digital Capacitive Isolator

Because low-frequency input signals require the internal capacitors to assume prohibitively large values, these signals are pulse-width modulated (PWM) with the carrier frequency of an internal oscillator, thus creating a sufficiently high frequency, capable of passing the capacitive barrier. As the input is modulated, a low-pass filter (LPF) is required to remove the high-frequency carrier from the actual data before passing it on to the output multiplexer.

(1) All pins on each side of the barrier tied together creating a two-terminal device.

(2) Measured from input pin to ground.

NOTE

Creepage and clearance requirements should be applied according to the specific equipment isolation standards of an application. Care should be taken to maintain the creepage and clearance distance of a board design to ensure that the mounting pads of the isolator on the printed-circuit board do not reduce this distance.

Creepage and clearance on a printed-circuit board become equal in certain cases. Techniques such as inserting grooves, ribs, or both on a printed circuit board are used to help increase these specifications.

8.3.1.4 Safety Limiting Values

Safety limiting intends to minimize potential damage to the isolation barrier upon failure of input or output circuitry. A failure of the I/O can allow low resistance to ground or the supply and, without current limiting, dissipate sufficient power to overheat the die and damage the isolation barrier, potentially leading to secondary system failures.

I _S	Safety input, output, or supply current	R _{θJA} = 121 °C/W, V _I = 5.5 V, T _J = 150°C, T _A = 25°C			188	mA
		R _{θJA} = 121 °C/W, V _I = 3.6 V, T _J = 150°C, T _A = 25°C			287	
T _S	Maximum safety temperature				150	°C

The safety-limiting constraint is the absolute-maximum junction temperature specified in the [Absolute Maximum Ratings](#) table. The power dissipation and junction-to-air thermal impedance of the device installed in the application hardware determines the junction temperature. The assumed junction-to-air thermal resistance in the [Thermal Information](#) table is that of a device installed on a High-K Test Board for Leaded Surface-Mount Packages. The power is the recommended maximum input voltage times the current. The junction temperature is then the ambient temperature plus the power times the junction-to-air thermal resistance.

9 Application and Implementation

NOTE

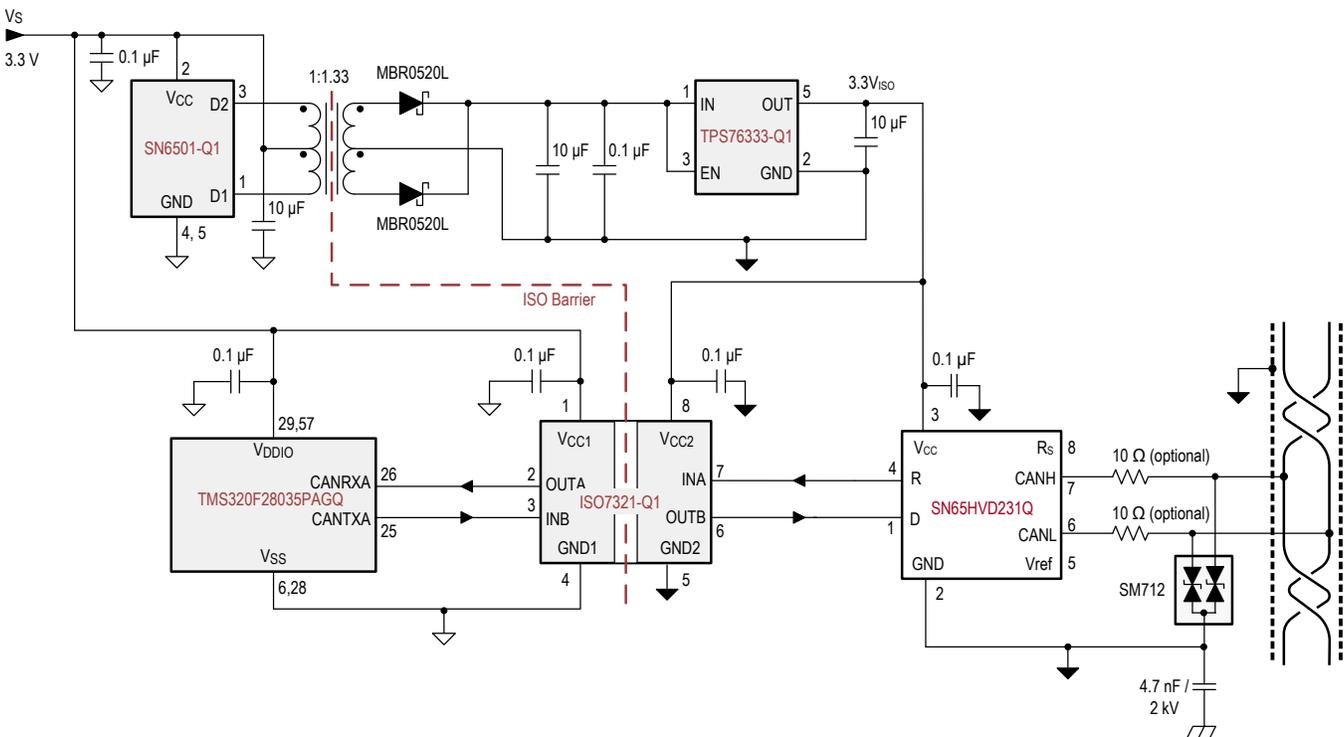

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

The ISO732x-Q1 family of devices uses single-ended TTL-logic switching technology. The supply voltage range is from 3 V to 5.5 V for both supplies, V_{CC1} and V_{CC2} . When designing with digital isolators, keep in mind that because of the single-ended design structure, digital isolators do not conform to any specific interface standard and are only intended for isolating single-ended CMOS or TTL digital signal lines. The isolator is typically placed between the data controller (essentially, μC or UART), and a data converter or a line transceiver, regardless of the interface type or standard.

9.2 Typical Application

The ISO7321-Q1 device can be used with Texas Instruments' Piccolo™ microcontroller, CAN transceiver, transformer driver, and voltage regulator to create an isolated CAN interface.

Multiple pins and discrete components omitted for clarity purpose.

9.2.1 Design Requirements

9.2.1.1 Typical Supply Current Equations

For the equations in this section, the following is true:

- I_{CC1} and I_{CC2} are typical supply currents measured in mA
- f is the data rate measured in Mbps
- C_L is the capacitive load measured in pF

9.2.1.1.1 ISO7320-Q1

At $V_{CC1} = V_{CC2} = 5\text{ V}$

$$I_{CC1} = 0.3838 + (0.0431 \times f) \quad (1)$$

$$I_{CC2} = 2.74567 + (0.08433 \times f) + (0.01 \times f \times C_L) \quad (2)$$

At $V_{CC1} = V_{CC2} = 3.3\text{ V}$

$$I_{CC1} = 0.2394 + (0.02355 \times f) \quad (3)$$

$$I_{CC2} = 2.10681 + (0.04374 \times f) + (0.007045 \times f \times C_L) \quad (4)$$

9.2.1.1.2 ISO7321-Q1

At $V_{CC1} = V_{CC2} = 5\text{ V}$

$$I_{CC1} \text{ and } I_{CC2} = 1.5877 + (0.066 \times f) + (0.00123 \times f \times C_L) \quad (5)$$

At $V_{CC1} = V_{CC2} = 3.3\text{ V}$

$$I_{CC1} \text{ and } I_{CC2} = 1.187572 + (0.019399 \times f) + (0.0019029 \times f \times C_L) \quad (6)$$

9.2.2 Detailed Design Procedure

9.2.2.1 Electromagnetic Compatibility (EMC) Considerations

Many applications in harsh industrial environment are sensitive to disturbances such as electrostatic discharge (ESD), electrical fast transient (EFT), surge and electromagnetic emissions. These electromagnetic disturbances are regulated by international standards such as IEC 61000-4-x and CISPR 22. Although system-level performance and reliability depends, to a large extent, on the application board design and layout, the ISO732x-Q1 family of devices incorporates many chip-level design improvements for overall system robustness. Some of these improvements include:

- Robust ESD protection cells for input and output signal pins and inter-chip bond pads.
- Low-resistance connectivity of ESD cells to supply and ground pins.
- Enhanced performance of high voltage isolation capacitor for better tolerance of ESD, EFT and surge events.
- Bigger on-chip decoupling capacitors to bypass undesirable high energy signals through a low impedance path.
- PMOS and NMOS devices isolated from each other by using guard rings to avoid triggering of parasitic SCRs.
- Reduced common mode currents across the isolation barrier by ensuring purely differential internal operation.

Typical Application (continued)

9.2.3 Application Curves

The following typical eye diagrams of the ISO732x-Q1 family of devices indicate low jitter and wide open eye at the maximum data rate of 25 Mbps.

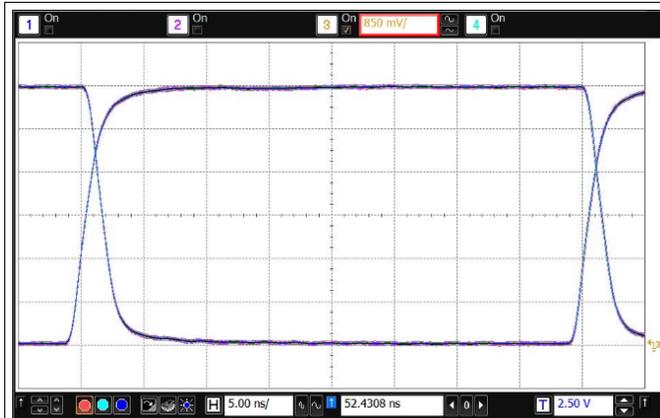

Figure 18. Eye Diagram at 25 Mbps, 5 V and 25°C

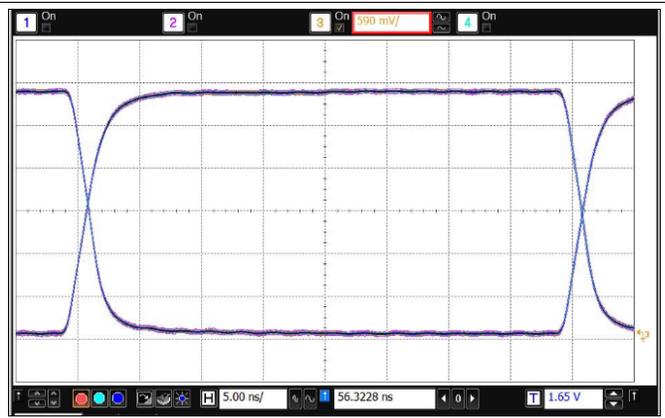

Figure 19. Eye Diagram at 25 Mbps, 3.3 V and 25°C

10 Power Supply Recommendations

To help ensure reliable operation at data rates and supply voltages, a 0.1- μ F bypass capacitor is recommended at the input and output supply pins (V_{CC1} and V_{CC2}). The capacitors should be placed as close to the supply pins as possible. If only a single primary-side power supply is available in an application, isolated power can be generated for the secondary-side with the help of a transformer driver such as Texas Instruments' [SN6501-Q1](#). For such applications, detailed power supply design and transformer selection recommendations are available in the [SN6501-Q1](#) datasheet ([SLLSEF3](#)).

11 Layout

11.1 Layout Guidelines

A minimum of four layers is required to accomplish a low EMI PCB design (see [Figure 20](#)). Layer stacking should be in the following order (top-to-bottom): high-speed signal layer, ground plane, power plane and low-frequency signal layer.

- Routing the high-speed traces on the top layer avoids the use of vias (and the introduction of their inductances) and allows for clean interconnects between the isolator and the transmitter and receiver circuits of the data link.
- Placing a solid ground plane next to the high-speed signal layer establishes controlled impedance for transmission line interconnects and provides an excellent low-inductance path for the return current flow.
- Placing the power plane next to the ground plane creates additional high-frequency bypass capacitance of approximately 100 pF/in².
- Routing the slower speed control signals on the bottom layer allows for greater flexibility as these signal links usually have margin to tolerate discontinuities such as vias.

If an additional supply voltage plane or signal layer is needed, add a second power or ground plane system to the stack to keep it symmetrical. This makes the stack mechanically stable and prevents it from warping. Also the power and ground plane of each power system can be placed closer together, thus increasing the high-frequency bypass capacitance significantly.

For detailed layout recommendations, see the application note, *Digital Isolator Design Guide*, [SLLA284](#).

Layout Guidelines (continued)

11.1.1 PCB Material

For digital circuit boards operating below 150 Mbps, (or rise and fall times higher than 1 ns), and trace lengths of up to 10 inches, use standard FR-4 UL94V-0 printed circuit board. This type of PCB is preferred over cheaper alternatives because of lower dielectric losses at high frequencies, less moisture absorption, greater strength and stiffness, and self-extinguishing flammability-characteristics.

(1) **Status:** For more details on status, see our [product life cycle](#).

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) Part marking: There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "-" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
