6 Detailed Description

6.1 Overview

The MAX232E is a dual driver and receiver that includes a capacitive voltage generator using four capacitors to supply TIA/EIA-232-F voltage levels from a single 5V supply. All RS-232 pins have 15kV HBM and IEC61000-4-2 Air-Gap discharge protection. RS-232 pins also have 8kV IEC61000-4-2 contact discharge protection. Each receiver converts TIA/EIA-232-F inputs to 5V TTL/CMOS levels. These receivers have shorted and open fail safe. The receiver can accept up to $\pm 30\text{V}$ inputs and decode inputs as low as $\pm 3\text{V}$. Each driver converts TTL/CMOS input levels into TIA/EIA-232-F levels. Outputs are protected against shorts to ground.

6.2 Functional Block Diagram

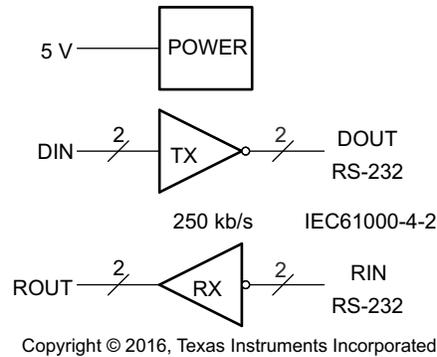

图 6-1. Logic Diagram (Positive Logic)

6.3 Feature Description

6.3.1 Power

The power block increases and inverts the 5V supply for the RS-232 driver using a charge pump that requires four $1\mu\text{F}$ external capacitors.

6.3.2 RS-232 Driver

Two drivers interface standard logic level to RS-232 levels. Internal pullup resistors on DIN inputs ensures a high input when the line is high impedance.

6.3.3 RS-232 Receiver

Two receivers interface RS-232 levels to standard logic levels. An open or shorted to ground input results in a high output on ROUT.

6.4 Device Functional Modes

6.4.1 V_{CC} Powered by 5V

The device is in normal operation.

6.4.2 V_{CC} Unpowered

When MAX232E is unpowered, it can be safely connected to an active remote RS-232 device.

7 Applications and Implementation

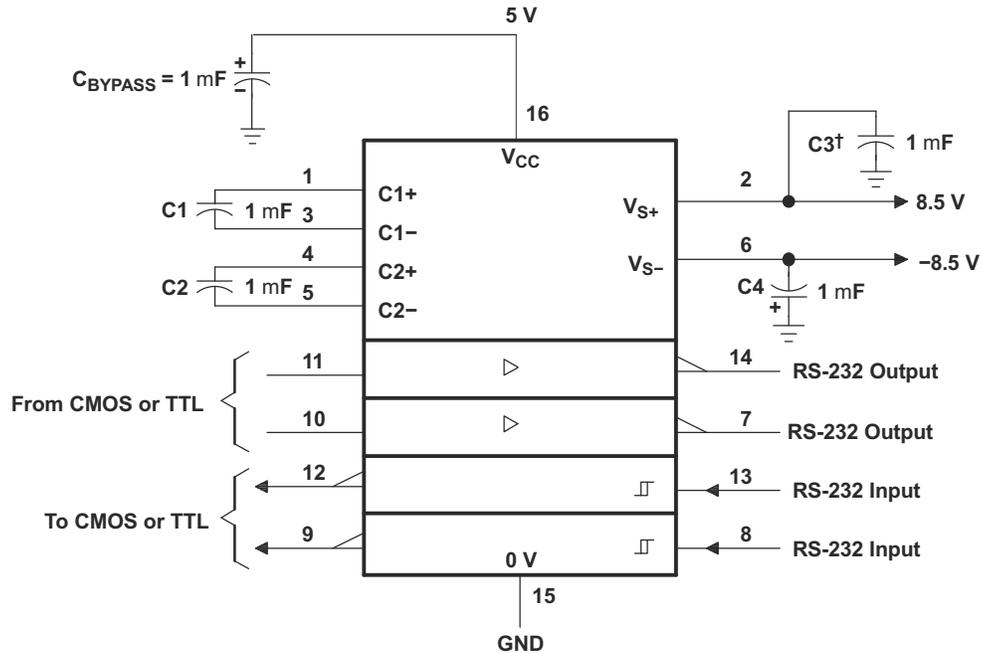

备注

以下应用部分中的信息不属于 TI 器件规格的范围，TI 不担保其准确性和完整性。TI 的客户应负责确定器件是否适用于其应用。客户应验证并测试其设计，以确保系统功能。

7.1 Application Information

For proper operation add capacitors as shown in 图 7-1. Pins 9 through 12 connect to UART or general purpose logic lines. RS-232 lines on pins 7, 8, 13, and 14 connect to a connector or cable.

7.2 Typical Application

† C3 can be connected to V_{CC} or GND.

Resistor values shown are nominal.

Nonpolarized ceramic capacitors are acceptable. If polarized tantalum or electrolytic capacitors are used, they should be connected as shown.

图 7-1. Typical Operating Circuit

7.2.1 Design Requirements

- V_{CC} minimum is 4.5V and maximum is 5.5V.
- Maximum recommended bit rate is 250kbit/s.

7.2.2 Detailed Design Procedure

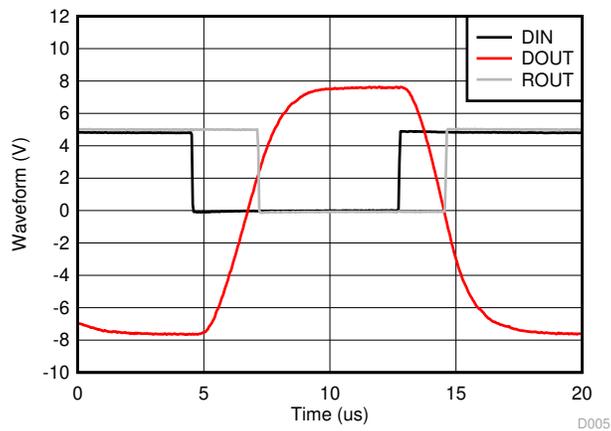

The capacitor type used for C1 - C4 is not critical for proper operation. The MAX232E requires 1 μ F capacitors, although capacitors up to 10 μ F can be used without harm. Ceramic dielectrics are suggested for capacitors. When using the minimum recommended capacitor values, make sure the capacitance value does not degrade excessively as the operating temperature varies. If in doubt, use capacitors with a larger (for example, 2 \times) nominal value. The capacitors' effective series resistance (ESR), which usually rises at low temperatures, influences the amount of ripple on V+ and V-.

Use larger capacitors (up to 10 μ F) to reduce the output impedance at V_{S+} and V_{S-}.

Bypass V_{CC} to ground with at least 1 μ F. In applications sensitive to power-supply noise generated by the charge pumps, decouple V_{CC} to ground with a capacitor the same size as (or larger than) the charge-pump capacitors (C1 - C4).

7.2.3 Application Curve

Loopback waveform connects DOUT to RIN.

Date Rate = 120 kbit/s, C_L = 1 nF

图 7-2. Loopback Waveforms

7.3 Power Supply Recommendations

The V_{CC} voltage should be connected to the same power source used for logic device connected to DIN and ROUT pins. V_{CC} should be between 4.5V and 5.5V.

7.4 Layout

7.4.1 Layout Guidelines

Keep the external capacitor traces short. This is more important on C1 and C2 nodes that have the fastest rise and fall times. Make the impedance from MAX232E ground pin and circuit board ground plane as low as possible for best ESD performance. Use wide metal and multiple vias on both sides of ground pin.

8.4 静电放电警告

静电放电 (ESD) 会损坏这个集成电路。德州仪器 (TI) 建议通过适当的预防措施处理所有集成电路。如果不遵守正确的处理和安装程序，可能会损坏集成电路。

ESD 的损坏小至导致微小的性能降级，大至整个器件故障。精密的集成电路可能更容易受到损坏，这是因为非常细微的参数更改都可能会导致器件与其发布的规格不相符。
