(6) This pin is configurable as reset or NMI and resides on the DVIO supply domain. When driven from external, input swing levels from DVSS to DVIO are required.

(7) When this pin is configured as reset, the internal pullup resistor is enabled by default.

(8) When in crystal bypass mode, XT2IN can be configured so that it can support an input digital waveform with swing levels from DVSS to DVCC or DVSS to DVIO. In this case, it is required that the pin be configured properly for the intended input swing.

5 Specifications

All graphs in this section are for typical conditions, unless otherwise noted.

Typical (TYP) values are specified at $V_{CC} = 3.3\text{ V}$ and $T_A = 25^\circ\text{C}$, unless otherwise noted.

5.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

	MIN	MAX	UNIT
Voltage applied at V_{CC} to V_{SS}	−0.3	4.1	V
Voltage applied at V_{IO} to V_{SS}	−0.3	2.2	V
Voltage applied to any pin (excluding V _{CORE} and V_{IO} pins) ⁽²⁾	−0.3	$V_{CC} + 0.3$	V
Voltage applied to V_{IO} pins	−0.3	$V_{IO} + 0.2$	V
Diode current at any device pin		±2	mA
Storage temperature, T_{stg} ⁽³⁾	−55	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltages referenced to V_{SS} . V_{CORE} is for internal device use only. No external DC loading or voltage should be applied.
- (3) Higher temperature may be applied during board soldering according to the current JEDEC J-STD-020 specification with peak reflow temperatures not higher than classified on the device label on the shipping boxes or reels.

5.2 ESD Ratings

		VALUE	UNIT
$V_{(ESD)}$ Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±1000	V
	Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±250	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process. Pins listed as ±1000 V may actually have higher performance.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process. Pins listed as ±250 V may actually have higher performance.

5.3 Recommended Operating Conditions

		MIN	NOM	MAX	UNIT

		PMMCOREVx = 0, 1		3.6	
		PMMCOREVx = 0, 1, 2		3.6	
		PMMCOREVx = 0, 1, 2, 3		3.6	
V_{IO}	Supply voltage applied to DVIO referenced to V_{SS} ⁽²⁾	1.62		1.98	V
V_{SS}	Supply voltage ($AVSS = DVSS$)		0		V
T_A	Operating free-air temperature	−40		85	°C
T_J	Operating junction temperature	−40		85	°C
C_{VCORE}	Recommended capacitor at V _{CORE} ⁽⁴⁾		470		nF
C_{DVCC}/C_{VCORE}	Capacitor ratio of DVCC to V _{CORE}	10			

- (1) TI recommends powering AVCC and DVCC from the same source. A maximum difference of 0.3 V between AVCC and DVCC can be tolerated during power up and operation.
- (2) During V_{CC} and V_{IO} power up, it is required that $V_{IO} \geq V_{CC}$ during the ramp up phase of V_{IO} . During V_{CC} and V_{IO} power down, it is required that $V_{IO} \geq V_{CC}$ during the ramp down phase of V_{IO} (see [Figure 5-1](#)).
- (3) The minimum supply voltage is defined by the supervisor SVS levels when it is enabled. See the [Section 5.28](#) threshold parameters for the exact values and further details.
- (4) A capacitor tolerance of ±20% or better is required.

Recommended Operating Conditions (continued)

		MIN	NOM	MAX	UNIT
f_{SYSTEM}	Processor frequency (maximum MCLK frequency) ⁽⁵⁾ (see Figure 5-3)				MHz
				0	
				12	
				20	
				0	
				25	

(5) Modules may have a different maximum input clock specification. See the specification of the respective module in this data sheet.

NOTE: The device supports continuous operation with $V_{CC} = V_{SS}$ while V_{IO} is fully within its specification. During this time, the general-purpose I/Os that reside on the V_{IO} supply domain are configured as inputs and pulled down to V_{SS} through their internal pulldown resistors. $\overline{RST}/NMI$ is high impedance. $BSLEN$ is configured as an input and is pulled down to V_{SS} through its internal pulldown resistor. When V_{CC} reaches above the BOR threshold, the general-purpose I/Os become high-impedance inputs (no resistor enabled), $\overline{RST}/NMI$ becomes an input pulled up to V_{IO} through its internal pullup resistor, and $BSLEN$ remains pulled down to V_{SS} through its internal pulldown resistor.

NOTE: Under certain conditions during the rising transition of V_{CC} , the general-purpose I/Os residing on the V_{IO} supply domain may actively transition high momentarily before settling to high-impedance inputs. These voltage transitions are temporary (typically resolving to high-impedance inputs when V_{CC} exceeds approximately 0.9 V) and are bounded by the V_{IO} supply.

Figure 5-1. V_{CC} and V_{IO} Power Sequencing

NOTE: The device remains in reset based on the conditions of the $\overline{RSTDVCC}$ and $\overline{RST}$ pins and the voltage present on DV_{CC} voltage supply. If $\overline{RSTDVCC}$ or $\overline{RST}$ is held at a logic low or if DV_{CC} is below the $SVSH_+$ minimum threshold, the device remains in its reset condition; that is, these conditions form a logical OR with respect to device reset.

- (1) To improve EMI on the XT1 oscillator, the following guidelines should be observed.
 - Keep the trace between the device and the crystal as short as possible.
 - Design a good ground plane around the oscillator pins.
 - Prevent crosstalk from other clock or data lines into oscillator pins XIN and XOUT.
 - Avoid running PCB traces underneath or adjacent to the XIN and XOUT pins.
 - Use assembly materials and processes that avoid any parasitic load on the oscillator XIN and XOUT pins.
 - If conformal coating is used, make sure that it does not induce capacitive or resistive leakage between the oscillator pins.
- (2) When XT1BYPASS is set, XT1 circuits are automatically powered down. Input signal is a digital square wave with parametrics defined in the [Schmitt-Trigger Inputs](#) section of this data sheet. When in crystal bypass mode, XIN can be configured so that it can support an input digital waveform with swing levels from DVSS to DVCC (XT1BYPASSLV = 0) or DVSS to DVIO (XT1BYPASSLV = 1). In this case, the pin must be configured properly for the intended input swing.
- (3) Maximum frequency of operation of the entire device cannot be exceeded.
- (4) Oscillation allowance is based on a safety factor of 5 for recommended crystals. The oscillation allowance is a function of the XT1DRIVE_x settings and the effective load. In general, comparable oscillator allowance can be achieved based on the following guidelines, but each application should be evaluated based on the actual crystal selected:
 - For XT1DRIVE_x = 0, C_{L,eff} ≤ 6 pF
 - For XT1DRIVE_x = 1, 6 pF ≤ C_{L,eff} ≤ 9 pF
 - For XT1DRIVE_x = 2, 6 pF ≤ C_{L,eff} ≤ 10 pF
 - For XT1DRIVE_x = 3, C_{L,eff} ≥ 6 pF
- (5) Includes parasitic bond and package capacitance (approximately 2 pF per pin). Because the PCB adds additional capacitance, verify the correct load by measuring the ACLK frequency. For a correct setup, the effective load capacitance should always match the specification of the used crystal.
- (6) Requires external capacitors at both terminals. Values are specified by crystal manufacturers.
- (7) Frequencies below the MIN specification set the fault flag. Frequencies above the MAX specification do not set the fault flag. Frequencies between the MIN and MAX specifications might set the flag.
- (8) Measured with logic-level input frequency but also applies to operation with crystals.

(1) Requires external capacitors at both terminals. Values are specified by crystal manufacturers.

(2) To improve EMI on the XT2 oscillator the following guidelines should be observed.

- Keep the traces between the device and the crystal as short as possible.
- Design a good ground plane around the oscillator pins.
- Prevent crosstalk from other clock or data lines into oscillator pins XT2IN and XT2OUT.
- Avoid running PCB traces underneath or adjacent to the XT2IN and XT2OUT pins.
- Use assembly materials and processes that avoid any parasitic load on the oscillator XT2IN and XT2OUT pins.
- If conformal coating is used, make sure that it does not induce capacitive or resistive leakage between the oscillator pins.

(3) This represents the maximum frequency that can be input to the device externally. Maximum frequency achievable on the device operation is based on the frequencies present on ACLK, MCLK, and SMCLK cannot be exceed for a given range of operation.

(4) When XT2BYPASS is set, the XT2 circuit is automatically powered down. Input signal is a digital square wave with parametrics defined in the Schmitt-trigger Inputs section of this data sheet. When in crystal bypass mode, XT2IN can be configured so that it can support an input digital waveform with swing levels from DVSS to DVCC (XT2BYPASSLV = 0) or DVSS to DVIO (XT2BYPASSLV = 1). In this case, it is required that the pin be configured properly for the intended input swing.

(5) Oscillation allowance is based on a safety factor of 5 for recommended crystals.

(6) Includes parasitic bond and package capacitance (approximately 2 pF per pin).

Because the PCB adds additional capacitance, verify the correct load by measuring the ACLK frequency. For a correct setup, the effective load capacitance should always match the specification of the used crystal.

- (1) When selecting the proper DCO frequency range (DCORSELx), the target DCO frequency, f_{DCO} , should be set to reside within the range of $f_{\text{DCO}(n,0),\text{MAX}} \leq f_{\text{DCO}} \leq f_{\text{DCO}(n,31),\text{MIN}}$, where $f_{\text{DCO}(n,0),\text{MAX}}$ represents the maximum frequency specified for the DCO frequency, range n, tap 0 (DCOx = 0) and $f_{\text{DCO}(n,31),\text{MIN}}$ represents the minimum frequency specified for the DCO frequency, range n, tap 31 (DCOx = 31). This ensures that the target DCO frequency resides within the range selected. It should also be noted that if the actual f_{DCO} frequency for the selected range causes the FLL or the application to select tap 0 or 31, the DCO fault flag is set to report that the selected range is at its minimum or maximum tap setting.

- (1) The external reference is used during ADC conversion to charge and discharge the capacitance array. The input capacitance (C_I) is also the dynamic load for an external reference during conversion. The dynamic impedance of the reference supply should follow the recommendations on analog-source impedance to allow the charge to settle for 10-bit accuracy.
- (2) The accuracy limits the minimum positive external reference voltage. Lower reference voltage levels may be applied with reduced accuracy requirements.
- (3) The accuracy limits the maximum negative external reference voltage. Higher reference voltage levels may be applied with reduced accuracy requirements.
- (4) The accuracy limits minimum external differential reference voltage. Lower differential reference voltage levels may be applied with reduced accuracy requirements.
- (5) Two decoupling capacitors, 10 μF and 100 nF, should be connected to VREF to decouple the dynamic current required for an external reference source if it is used for the ADC10_A. See also the [MSP430F5xx and MSP430F6xx Family User's Guide](#).

- (1) The leakage current is defined in the leakage current table with P6.x/Ax parameter.
- (2) The internal reference current is supplied from terminal AVCC. Consumption is independent of the ADC10ON control bit, unless a conversion is active. The REFON bit enables to settle the built-in reference before starting an analog-to-digital conversion.
- (3) Calculated using the box method: (MAX(−40°C to 85°C) − MIN(−40°C to 85°C)) / MIN(−40°C to 85°C)/(85°C − (−40°C)).
- (4) The sensor current I_{SENSOR} is consumed if (ADC10ON = 1 and REFON = 1) or (ADC10ON = 1 and INCH = 0Ah and sample signal is high). When REFON = 1, I_{SENSOR} is already included in I_{REF+}.
- (5) The temperature sensor offset can be significant. TI recommends a single-point calibration to minimize the offset error of the built-in temperature sensor.
- (6) The typical equivalent impedance of the sensor is 51 kΩ. The sample time required includes the sensor-on time t_{SENSOR(on)}.
- (7) The on-time t_{V_{MID}(on)} is included in the sampling time t_{V_{MID}(sample)}; no additional on time is needed.
- (8) The condition is that the error in a conversion started after t_{REFON} is less than ±0.5 LSB.

6 Detailed Description

6.1 CPU ([Link to user's guide](#))

The MSP430 CPU has a 16-bit RISC architecture that is highly transparent to the application. All operations, other than program-flow instructions, are performed as register operations in conjunction with seven addressing modes for source operand and four addressing modes for destination operand.

The CPU is integrated with 16 registers that provide reduced instruction execution time. The register-to-register operation execution time is one cycle of the CPU clock.

Four of the registers, R0 to R3, are dedicated as program counter, stack pointer, status register, and constant generator, respectively. The remaining registers are general-purpose registers (see [Figure 6-1](#)).

Peripherals are connected to the CPU using data, address, and control buses. Peripherals can be handled with all instructions.

The instruction set consists of the original 51 instructions with three formats and seven address modes and additional instructions for the expanded address range. Each instruction can operate on word and byte data.

6.3 Interrupt Vector Addresses

The interrupt vectors and the power-up start address are in the address range 0FFFFh to 0FF80h (see [Table 6-1](#)). The vector contains the 16-bit address of the appropriate interrupt-handler instruction sequence.

6.5 Bootloader (BSL)

The BSL enables users to program the flash memory or RAM using a UART serial interface. Access to the device memory by the BSL is protected by an user-defined password. Because the F522x and F521x have split I/O power domains, it is possible to interface with the BSL from either the DVCC or DVIO supply domains. This is useful when the MSP430 is interfacing to a host on the DVIO supply domain. The BSL interface on the DVIO supply domain (see [Table 6-3](#)) uses the USCI_A0 module configured as a UART. The BSL interface on the DVCC supply domain (see [Table 6-4](#)) uses a timer-based UART.

NOTE

Devices from TI come factory programmed with the timer-based UART BSL only. If the USCI-based BSL is preferred, it is also available, but it must be programmed by the user.

When using the DVIO supply domain for the BSL, entry to the BSL requires a specific sequence on the $\overline{\text{RST}}/\text{NMI}$ and BSLLEN pins. [Table 6-3](#) shows the required pins and their functions. For further details on interfacing to development tools and device programmers, see the [MSP430 Hardware Tools User's Guide](#). For a complete description of the features of the BSL and its implementation, see the [MSP430 Flash Device Bootloader \(BSL\) User's Guide](#). The BSL on the DVIO supply domain uses the USCI_A0 module configured as a UART.

NOTE

To invoke the BSL from the DVIO domain, the $\overline{\text{RST}}/\text{NMI}$ and BSLLEN pins must be used for the entry sequence (see [Section 5.49](#)). It is critical not to confuse the $\overline{\text{RST}}/\text{NMI}$ pin with the $\overline{\text{RSTDVCC}}/\text{SBWTDIO}$ pin. In other MSP430 devices, SBWTDIO is shared with the $\overline{\text{RST}}/\text{NMI}$ pin and $\overline{\text{RSTDVCC}}$ does not exist. Additional information can be found in [Designing With MSP430F522x and MSP430F521x Devices](#).

BSLEN	Enable BSL
P3.3	Data transmit
P3.4	Data receive
DVCC, AVCC	Device power supply
DVIO	I/O power supply
DVSS	Ground supply

For applications in which it is desirable to have BSL communication based on the DVCC supply domain, entry to the BSL requires a specific sequence on the $\overline{\text{RSTDVCC}}/\text{SBWTDIO}$ and TEST/SBWTDIO pins. [Table 6-4](#) shows the required pins and their function.

NOTE

To invoke the BSL from the DVCC domain, the $\overline{\text{RSTDVCC}}/\text{SBWTDIO}$ and TEST/SBWTDIO pins must be used for the entry sequence. It is critical not to confuse the $\overline{\text{RST}}/\text{NMI}$ pin with the $\overline{\text{RSTDVCC}}/\text{SBWTDIO}$ pin. In other MSP430 devices, SBWTDIO is shared with the $\overline{\text{RST}}/\text{NMI}$ pin and $\overline{\text{RSTDVCC}}$ does not exist. Additional information can be found in [Designing With MSP430F522x and MSP430F521x Devices](#).

6.6 JTAG Operation

6.6.1 JTAG Standard Interface

The MSP430 family supports the standard JTAG interface which requires four signals for sending and receiving data. The JTAG signals are shared with general-purpose I/O. The TEST/SBWTK pin is used to enable the JTAG signals. In addition to these signals, the $\overline{\text{RSTDVCC}}/\text{SBWTDIO}$ is required to interface with MSP430 development tools and device programmers. The JTAG pin requirements are shown in [Table 6-5](#). For further details on interfacing to development tools and device programmers, see the [MSP430 Hardware Tools User's Guide](#). For a complete description of the features of the JTAG interface and its implementation, see [MSP430 Programming With the JTAG Interface](#). Additional information can be found in [Designing With MSP430F522x and MSP430F521x Devices](#).

NOTE

All JTAG I/O pins are supplied by DVCC.

NOTE

On other MSP430 devices, the $\overline{\text{RST}}/\text{NMI}$ pin has been used for SBWTDIO, so care must be taken not to mistakenly use the incorrect pin. On the F522x and F521x series of devices, $\overline{\text{RSTDVCC}}$ is used for SBWTDIO as shown in [Table 6-5](#). Additional information can be found in [Designing With MSP430F522x and MSP430F521x Devices](#).

6.6.2 Spy-Bi-Wire Interface

In addition to the standard JTAG interface, the MSP430 family supports the 2-wire Spy-Bi-Wire interface. Spy-Bi-Wire can be used to interface with MSP430 development tools and device programmers. The Spy-Bi-Wire interface pin requirements are shown in [Table 6-6](#). For further details on interfacing to development tools and device programmers, see the [MSP430 Hardware Tools User's Guide](#). For a complete description of the features of the JTAG interface and its implementation, see [MSP430 Programming With the JTAG Interface](#). Additional information can be found in [Designing With MSP430F522x and MSP430F521x Devices](#).

NOTE

All SBW I/O pins are supplied by DVCC.

NOTE

On other MSP430 devices, the $\overline{\text{RST}}/\text{NMI}$ pin has been used for SBWTDIO, so care must be taken not to mistakenly use the incorrect pin. On the F522x and F521x series of devices, RSTDVCC is used for SBWTDIO as shown in [Table 6-6](#). Additional information can be found in [Designing With MSP430F522x and MSP430F521x Devices](#).

6.7 Flash Memory ([Link to user's guide](#))

The flash memory can be programmed through the JTAG port, Spy-Bi-Wire (SBW), the BSL, or in-system by the CPU. The CPU can perform single-byte, single-word, and long-word writes to the flash memory. Features of the flash memory include:

- Flash memory has n segments of main memory and four segments of information memory (A to D) of 128 bytes each. Each segment in main memory is 512 bytes in size.
- Segments 0 to n may be erased in one step, or each segment may be individually erased.
- Segments A to D can be erased individually. Segments A to D are also called *information memory*.
- Segment A can be locked separately.

6.8 RAM ([Link to user's guide](#))

The RAM is made up of n sectors. Each sector can be completely powered down to reduce leakage; however, all data is lost during power down. Features of the RAM include:

- RAM has n sectors. The sizes of the sectors can be found in [Section 6.4](#).
- Each sector 0 to n can be complete disabled; however, all data in a sector is lost when it is disabled.
- Each sector 0 to n automatically enters low-power retention mode when possible.

6.9 Peripherals

Peripherals are connected to the CPU through data, address, and control buses. Peripherals can be managed using all instructions. For complete module descriptions, see the [MSP430F5xx and MSP430F6xx Family User's Guide](#).

6.9.1 Digital I/O ([Link to user's guide](#))

- All individual I/O bits are independently programmable.
- Any combination of input, output, and interrupt conditions is possible.
- Pullup or pulldown on all ports is programmable.
- Drive strength on all ports is programmable.
- Edge-selectable interrupt and LPM4.5 wakeup input capability is available for all bits of ports P1 and P2.
- Read and write access to port-control registers is supported by all instructions.
- Ports can be accessed byte-wise or word-wise in pairs.

6.9.2 Port Mapping Controller ([Link to user's guide](#))

The port mapping controller allows the flexible and reconfigurable mapping of digital functions to port P4. [Table 6-7](#) lists the valid settings.

6.9.3 Oscillator and System Clock ([Link to user's guide](#))

The clock system in the MSP430F522x and MSP430F521x family of devices is supported by the Unified Clock System (UCS) module, which includes support for a 32-kHz watch crystal oscillator (XT1 LF mode) (XT1 HF mode is not supported), an internal very-low-power low-frequency oscillator (VLO), an internal trimmed low-frequency oscillator (REFO), an integrated internal digitally controlled oscillator (DCO), and a high-frequency crystal oscillator (XT2). The UCS module is designed to meet the requirements of both low system cost and low power consumption. The UCS module features digital frequency locked loop (FLL) hardware that, in conjunction with a digital modulator, stabilizes the DCO frequency to a programmable multiple of the selected FLL reference frequency. The internal DCO provides a fast turnon clock source and stabilizes in 3.5 μ s (typical). The UCS module provides the following clock signals:

- Auxiliary clock (ACLK), sourced from a 32-kHz watch crystal (XT1), a high-frequency crystal (XT2), the internal low-frequency oscillator (VLO), the trimmed low-frequency oscillator (REFO), or the internal digitally controlled oscillator DCO.
- Main clock (MCLK), the system clock used by the CPU. MCLK can be sourced by same sources made available to ACLK.
- Sub-Main clock (SMCLK), the subsystem clock used by the peripheral modules. SMCLK can be sourced by same sources made available to ACLK.
- ACLK/n, the buffered output of ACLK, ACLK/2, ACLK/4, ACLK/8, ACLK/16, ACLK/32.

6.9.4 Power-Management Module (PMM) ([Link to user's guide](#))

The PMM includes an integrated voltage regulator that supplies the core voltage to the device and contains programmable output levels to provide for power optimization. The PMM also includes supply voltage supervisor (SVS) and supply voltage monitoring (SVM) circuitry, and brownout protection. The brownout circuit is implemented to provide the proper internal reset signal to the device during power-on and power-off. The SVS and SVM circuitry detects if the supply voltage drops below a user-selectable level and supports both supply voltage supervision (the device is automatically reset) and supply voltage monitoring (the device is not automatically reset). SVS and SVM circuitry is available on the primary supply and core supply.

6.9.5 Hardware Multiplier ([Link to user's guide](#))

The multiplication operation is supported by a dedicated peripheral module. The module performs operations with 32-, 24-, 16-, and 8-bit operands. The module supports signed and unsigned multiplication as well as signed and unsigned multiply-and-accumulate operations.

6.9.6 Real-Time Clock (RTC_A) ([Link to user's guide](#))

The RTC_A module can be used as a general-purpose 32-bit counter (counter mode) or as an integrated real-time clock (RTC) (calendar mode). In counter mode, the RTC_A also includes two independent 8-bit timers that can be cascaded to form a 16-bit timer or counter. Both timers can be read and written by software. Calendar mode integrates an internal calendar that compensates for months with less than 31 days and includes leap year correction. The RTC_A also supports flexible alarm functions and offset-calibration hardware.

6.9.7 Watchdog Timer (WDT_A) ([Link to user's guide](#))

The primary function of the WDT_A module is to perform a controlled system restart after a software problem occurs. If the selected time interval expires, a system reset is generated. If the watchdog function is not needed in an application, the module can be configured as an interval timer and can generate interrupts at selected time intervals.

6.9.8 System Module (SYS) ([Link to user's guide](#))

The SYS module handles many of the system functions within the device. These include power-on reset (POR) and power-up clear (PUC) handling, NMI source selection and management, reset interrupt vector generators, bootloader (BSL) entry mechanisms, and configuration management (device descriptors). It also includes a data exchange mechanism when using JTAG that is called a JTAG mailbox and that can be used in the application. [Table 6-9](#) lists the SYS module interrupt vector registers.

6.9.9 DMA Controller [\(Link to user's guide\)](#)

The DMA controller allows movement of data from one memory address to another without CPU intervention. For example, the DMA controller can be used to move data from the ADC10_A conversion memory to RAM. Using the DMA controller can increase the throughput of peripheral modules. The DMA controller reduces system power consumption by allowing the CPU to remain in sleep mode, without having to awaken to move data to or from a peripheral. [Table 6-10](#) lists the trigger assignments.

6.9.10 Universal Serial Communication Interface (USCI) (Links to user's guide: [UART Mode](#), [SPI Mode](#), [I²C Mode](#))

The USCI modules are used for serial data communication. The USCI module supports synchronous communication protocols such as SPI (3- or 4-pin) and I²C, and asynchronous communication protocols such as UART, enhanced UART with automatic baudrate detection, and IrDA. Each USCI module contains two portions, A and B.

The USCI_An module provides support for SPI (3- or 4-pin), UART, enhanced UART, or IrDA.

The USCI_Bn module provides support for SPI (3- or 4-pin) or I²C.

The MSP430F522x and MSP430F521x series include two complete USCI modules (n = 0, 1).

6.9.11 TA0 [\(Link to user's guide\)](#)

TA0 is a 16-bit timer/counter (Timer_A type) with five capture/compare registers. TA0 can support multiple captures or compares, PWM outputs, and interval timing (see [Table 6-11](#)). TA0 also has extensive interrupt capabilities. Interrupts may be generated from the counter on overflow conditions and from each of the capture/compare registers.

6.9.15 Comparator_B ([Link to user's guide](#))

The primary function of the Comparator_B module is to support precision slope analog-to-digital conversions, battery voltage supervision, and monitoring of external analog signals.

6.9.16 ADC10_A ([Link to user's guide](#))

The ADC10_A module supports fast 10-bit analog-to-digital conversions. The module implements a 10-bit SAR core, sample select control, reference generator, and a conversion result buffer. A window comparator with lower and upper limits allows CPU-independent result monitoring with three window comparator interrupt flags.

6.9.17 CRC16 ([Link to user's guide](#))

The CRC16 module produces a signature based on a sequence of entered data values and can be used for data checking purposes. The CRC16 module signature is based on the CRC-CCITT standard.

6.9.18 REF Voltage Reference ([Link to user's guide](#))

The REF is responsible for generation of all critical reference voltages that can be used by the various analog peripherals in the device.

6.9.19 Embedded Emulation Module (EEM) (S Version) ([Link to user's guide](#))

The EEM supports real-time in-system debugging. The S version of the EEM has the following features:

- Three hardware triggers or breakpoints on memory access
- One hardware trigger or breakpoint on CPU register write access
- Up to four hardware triggers can be combined to form complex triggers or breakpoints
- One cycle counter
- Clock control on module level

(5) Setting the P5SEL.1 bit disables the output driver and the input Schmitt trigger to prevent parasitic cross currents when applying analog signals. An external voltage can be applied to VeREF- and used as the reference for the ADC10_A. Channel A9, when selected with the INCHx bits, is connected to the VeREF- pin.

7.2 Device Nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all MSP MCU devices. Each MSP MCU commercial family member has one of two prefixes: MSP or XMS. These prefixes represent evolutionary stages of product development from engineering prototypes (XMS) through fully qualified production devices (MSP).

XMS – Experimental device that is not necessarily representative of the final device's electrical specifications

MSP – Fully qualified production device

XMS devices are shipped against the following disclaimer:

"Developmental product is intended for internal evaluation purposes."

MSP devices have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

Predictions show that prototype devices (XMS) have a greater failure rate than the standard production devices. TI recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

TI device nomenclature also includes a suffix with the device family name. This suffix indicates the temperature range, package type, and distribution format. [图 7-1](#) provides a legend for reading the complete device name.

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
