PCM1794A 24 位、192kHz 采样、高级分段、音频立体声数模转换器

1 特性

- 24 位分辨率
- 模拟性能：
  - 动态范围：
    - 132dB（9V RMS，单声道）
    - 129dB（4.5V RMS，立体声）
    - 127dB（2V RMS，立体声）
  - 总谐波失真 + 噪声 (THD+N)：0.0004%
- 差分电流输出：7.8mA p-p
- 8× 过采样数字滤波器：
  - 阻带衰减：–130dB
  - 通带纹波：±0.00001dB
- 采样频率：10kHz 至 200kHz
- 系统时钟：128、192、256、384、512 或 768 f_S，带自动检测功能
- 接受 16 位和 24 位音频数据
- 脉冲编码调制 (PCM) 数据格式：标准、I^2S 和左对齐
- 可供外部数字滤波器或数字信号处理器 (DSP) 选用的接口
- 数字去加重功能
- 数字滤波器衰减：急剧或缓慢
- 软静音
- 零标记
- 双电源支持：5V 模拟、3.3V 数字
- 5V 耐压数字输入
- 小型 28 引脚紧缩小外形 (SSOP) 封装

2 应用

- A/V 接收器
- DVD 播放器
- 乐器
- 车载音频系统
- 其他需要 24 位音频的应用

3 说明

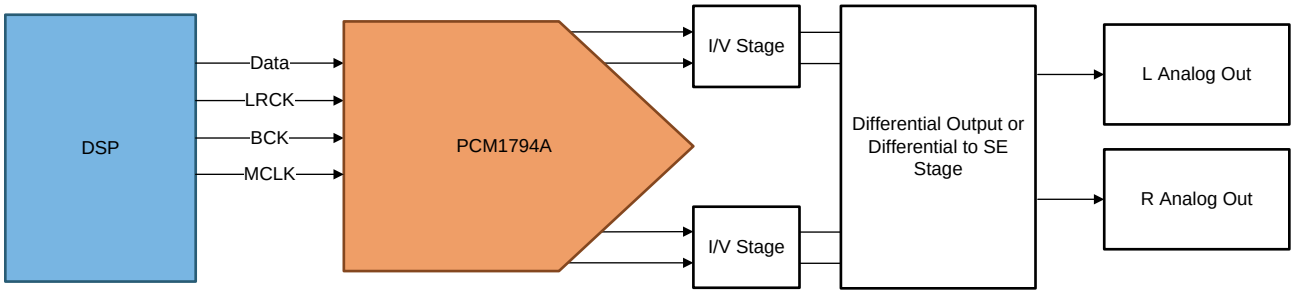

PCM1794A 器件是一款单片 CMOS 集成电路，由立体声数模转换器 (DAC) 和采用小型 28 引脚 SSOP 封装的支持电路组成。数据转换器采用德州仪器 (TI) 的高级分段 DAC 架构，拥有出色的动态性能和增强的时钟抖动耐受性。PCM1794A 器件提供均衡电流输出，允许用户从外部优化模拟性能。最高支持 200kHz 的采样速率。

器件信息(1)

器件型号	封装	封装尺寸（标称值）
PCM1794A	SSOP (28)	10.20mm x 5.30mm

(1) 要了解所有可用封装，请见数据表末尾的可订购产品附录。

简化的应用示意图

An IMPORTANT NOTICE at the end of this data sheet addresses availability, warranty, changes, use in safety-critical applications, intellectual property matters and other important disclaimers. PRODUCTION DATA.

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted) (1)

		MIN	MAX	UNIT
Supply Voltage	$V_{CC}1$, $V_{CC}2L$, $V_{CC}2R$	–0.3	6.5	V
	V_{DD}	–0.3	4	
Supply voltage differences: $V_{CC}1$, $V_{CC}2L$, $V_{CC}2R$			±0.1	V
Ground voltage differences: AGND1, AGND2, AGND3L, AGND3R, DGND			±0.1	V
Digital input voltage	LRCK, DATA, BCK, SCK, FMT1, $\overline{\text{FMT0}}$, MONO, CHSL, DEM, MUTE, $\overline{\text{RST}}$	–0.3	6.5	V
	ZERO	–0.3	(V_{DD} + 0.3 V) < 4	
Analog input voltage		–0.3	(V_{CC} + 0.3 V) < 6.5	V
Input current (any pins except supplies)			±10	mA
Ambient temperature under bias		–40	125	°C
Junction temperature			150	°C
Lead temperature (soldering, 5 s)			260	°C
Package temperature (IR reflow, peak)			250	°C
Storage temperature, T_{stg}		–55	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

6.2 ESD Ratings

		VALUE	UNIT
$V_{(ESD)}$ Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 (1)	±2500	V
	Charged-device model (CDM), per JEDEC specification JESD22-C101 (2)	±1500	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
Supply voltage	V_{DD}	3	3.3	3.6	VDC
	$V_{CC}1$ $V_{CC}2L$ $V_{CC}2R$	4.75	5	5.25	VDC
T_J Operation temperature		—25		85	°C

6.4 Thermal Information

THERMAL METRIC(1)		PCM1794A DB (SSOP) 28 PINS	UNIT
$R_{\theta JA}$	Junction-to-ambient thermal resistance	66.4	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	25.4	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	27.5	°C/W
ψ_{JT}	Junction-to-top characterization parameter	2.3	°C/W
ψ_{JB}	Junction-to-board characterization parameter	27.1	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	—	°C/W

(1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report, SPRA953.

6.5 Electrical Characteristics

all specifications at T_A = 25°C, $V_{CC}1 = V_{CC}2L = V_{CC}2R$ = 5 V, V_{DD} = 3.3 V, f_S = 44.1 kHz, system clock = 256 f_S, and 24-bit data, unless otherwise noted

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
DATA FORMAT						
f_S	Sampling frequency		10		200	kHz
	System clock frequency			128, 192, 256, 384, 512, 768		f_S
DIGITAL INPUT/OUTPUT						
	Logic family			TTL compatible		
V_{IH}	Input logic level high		2			VDC
V_{IL}	Input logic level low				0.8	VDC
I_{IH}	Input logic current high	$V_{IN} = V_{DD}$			10	µA
I_{IL}	Input logic current low	V_{IN} = 0 V			–10	µA
V_{OH}	Output logic level high	I_{OH} = –2 mA	2.4			VDC
V_{OL}	Output logic level low	I_{OL} = 2 mA			0.4	VDC
DYNAMIC PERFORMANCE (2-V RMS OUTPUT)(1)(2)						
	THD+N at V_{OUT} = 0 dB	f_S = 44.1 kHz		0.0004%	0.0008%	
		f_S = 96 kHz		0.0008%		
		f_S = 192 kHz		0.0015%		
	Dynamic range	EIAJ, A-weighted, f_S = 44.1 kHz	123	127		dB
		EIAJ, A-weighted, f_S = 96 kHz		127		
		EIAJ, A-weighted, f_S = 192 kHz		127		

(1) Filter condition:
(a) THD+N: 20-Hz HPF, 20-kHz apogee LPF
(b) Dynamic range: 20-Hz HPF, 20-kHz AES17 LPF, A-weighted
(c) Signal-to-noise ratio: 20-Hz HPF, 20-kHz AES17 LPF, A-weighted
(d) Channel separation: 20-Hz HPF, 20-kHz AES17 LPF
(e) Analog performance specifications are measured using the System Two Cascade audio measurement system by Audio Precision™ in the averaging mode.

(2) Dynamic performance and dc accuracy are specified at the output of the postamplifier as shown in Figure 25.

7 Detailed Description

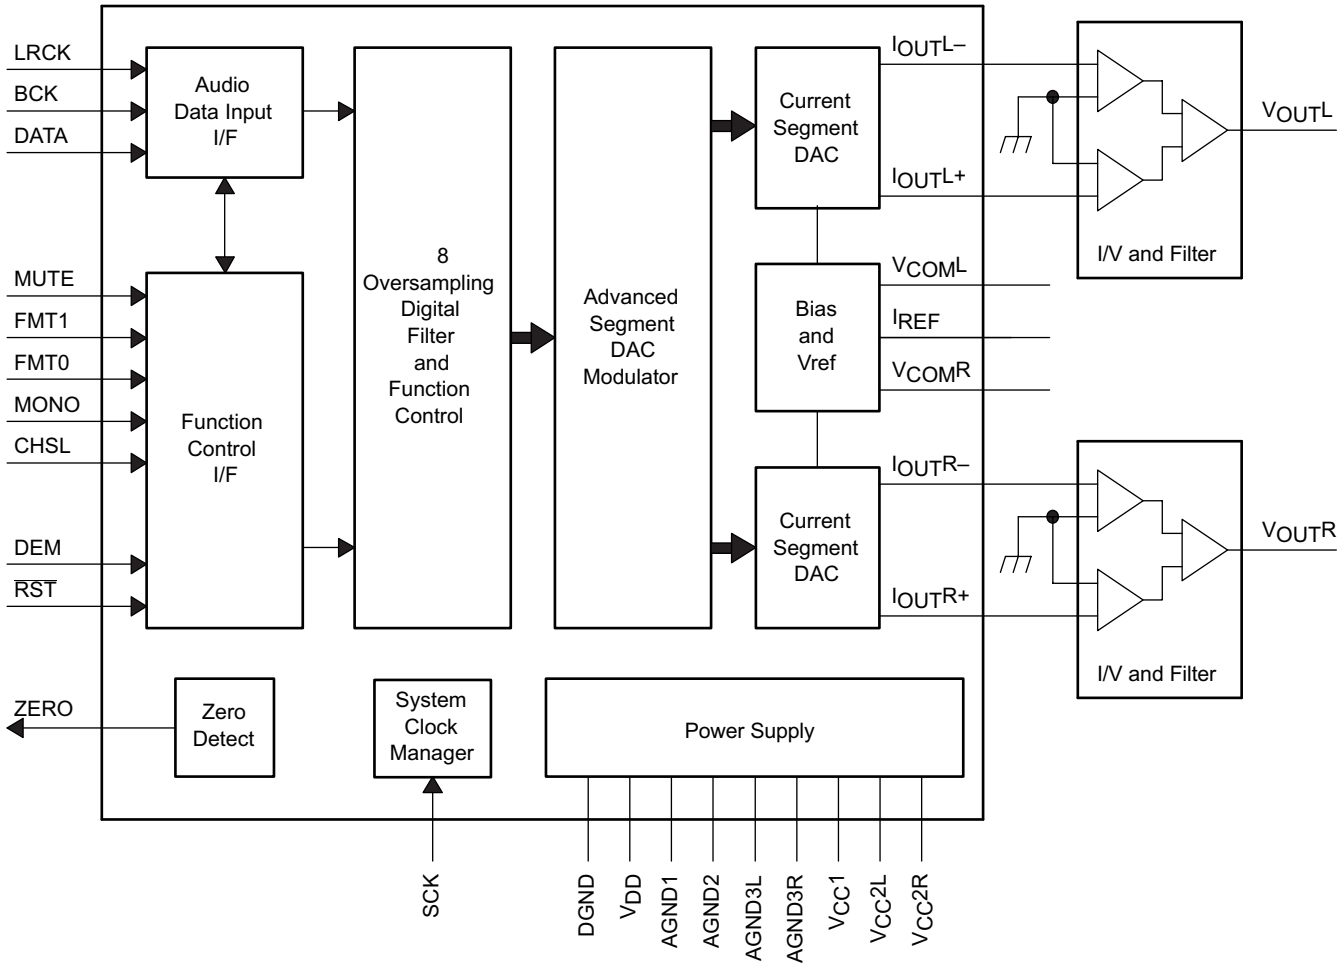

7.1 Overview

The PCM1794A device is a 24-bit, 192-kHz, differential-current, output digital-to-analog converter (DAC) that comes in a 28-pin SSOP package. The PCM1794AA device is hardware controlled and uses the advanced-segment DAC architecture from TI to perform with a Stereo Dynamic Range of 129 dB (132 dB Mono) and with a THD of 0.0004% at 44.1 kHz. The PCM1794AA device uses the SCK input as the system clock and automatically detects the sampling rate of the Digital Audio input when valid BCK and LRCK clocks are supplied. To bypass the internal filter, use an external digital filter.

Table 1. Device Features

FEATURE	DESCRIPTION
Resolution	24 bits
Audio data interface format	Standard, I^2S, left justified
Audio data bit length	16-bit, 24-bit selectable
Audio data format	MSB first, two's complement

7.2 Functional Block Diagram

Copyright © 2004–2015, Texas Instruments Incorporated

7.3 Feature Description

7.3.1 System Clock Input

The PCM1794A device requires a system clock for operating the digital interpolation filters and advanced segment DAC modulators. The system clock is applied at the SCK input (pin 7). The PCM1794A device has a system clock detection circuit that automatically senses the frequency at which the system clock is operating. Table 2 shows examples of system clock frequencies for common audio-sampling rates.

The *Timing Requirements* table lists and Figure 1 shows the timing requirements for the system clock input. For optimal performance, use a clock source with low-phase jitter and noise. One of the Texas Instruments PLL1700 family of multiclock generators is an excellent selection for providing the PCM1794A system clock.

Table 2. System Clock Rates for Common Audio Sampling Frequencies

SAMPLING FREQUENCY	SYSTEM CLOCK FREQUENCY (f_{SCK}) (MHz)					
	128 f_S	192 f_S	256 f_S	384 f_S	512 f_S	768 f_S
32 kHz	4.096	6.144	8.192	12.288	16.384	24.576
44.1 kHz	5.6488	8.4672	11.2896	16.9344	22.5792	33.8688
48 kHz	6.144	9.216	12.288	18.432	24.576	36.864
96 kHz	12.288	18.432	24.576	36.864	49.152	73.728
192 kHz	24.576	36.864	49.152	73.728	See (1)	See (1)

(1) This system clock rate is not supported for the given sampling frequency.

7.3.2 Power-On and External Reset Functions

The PCM1794A device includes a power-on reset function. Figure 21 shows the operation of this function. With V_{DD} > 2 V, the power-on reset function is enabled. The initialization sequence requires 1024 system clocks from the time V_{DD} > 2 V.

The PCM1794A device also includes an external reset capability using the $\overline{RST}$ input (pin 14), which allows an external controller or master reset circuit to force the PCM1794A device to initialize to its default reset state.

The *Timing Requirements* table lists and Figure 2 shows the external reset operation and timing. The $\overline{RST}$ pin is set to logic 0 for a minimum of 20 ns. The $\overline{RST}$ pin is then set to a logic 1 state to start the initialization sequence, which requires 1024 system clock periods. The external reset is useful in applications with a delay between the PCM1794A power-up and system clock activation.

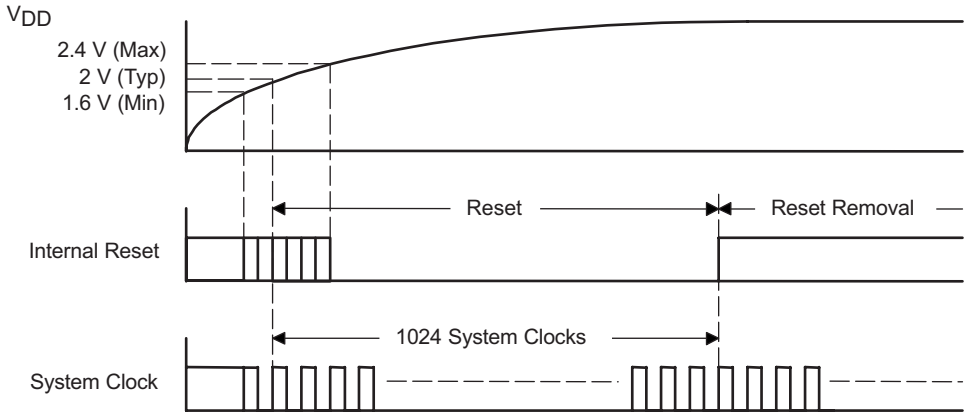

Figure 21. Power-On Reset Timing

7.3.3 Audio Data Interface

7.3.3.1 Audio Serial Interface

The audio interface port is a 3-wire serial port that includes LRCK (pin 4), BCK (pin 6), and DATA (pin 5). BCK is the serial audio bit clock, and used to clock the serial data present on DATA into the serial shift register of the audio interface. Serial data is clocked into the PCM1794A device on the rising edge of BCK. LRCK is the serial audio left/right word clock.

The PCM1794A device requires the synchronization of LRCK and the system clock, but does not require a specific phase relation between LRCK and the system clock.

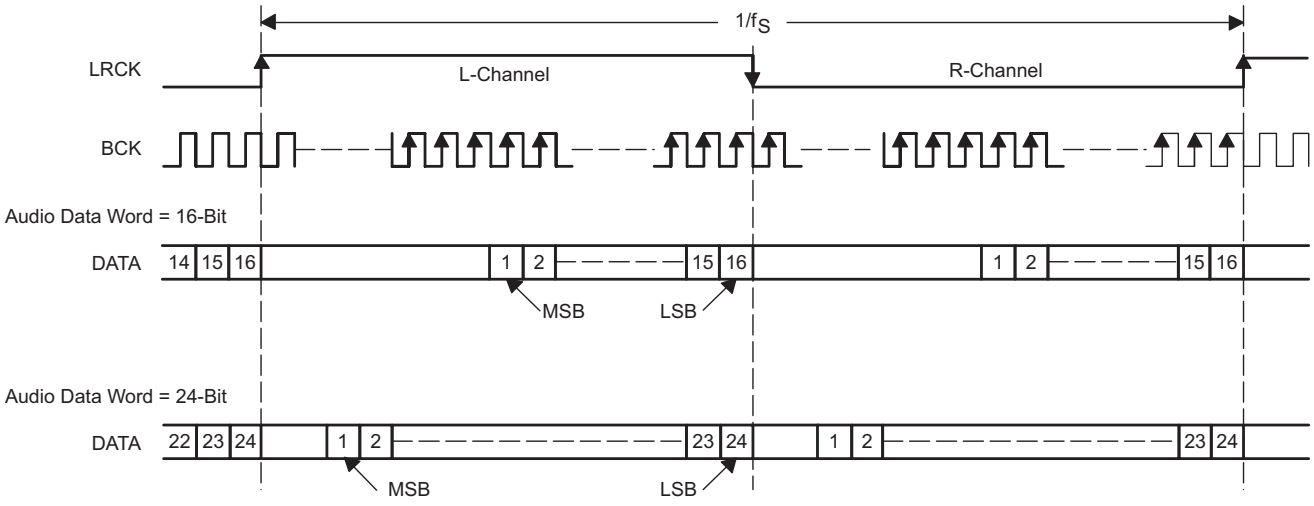

If the relationship between LRCK and the system clock changes more than ±6 BCK, internal operation is initialized within $1/f_S$, and the analog outputs are forced to the bipolar zero level until resynchronization between LRCK and the system clock is completed.

7.3.3.2 PCM Audio Data Formats and Timing

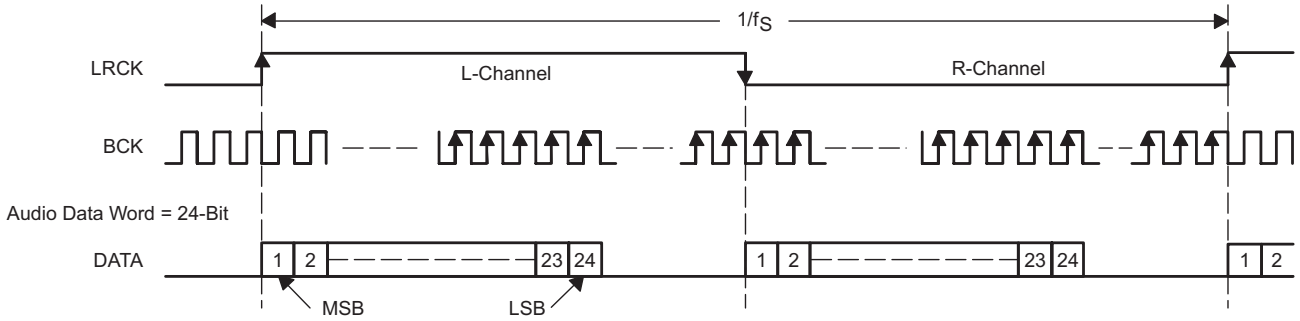

The PCM1794A device supports industry-standard audio data formats, including standard right-justified, I^2S, and left-justified. The data formats are shown in Figure 22. Data formats are selected using the format bits, FMT1 (pin 12), and FMT0 (pin 11) as shown in Table 3. All formats require binary twos-complement, MSB-first audio data. The *Timing Requirements* table lists and Figure 3 shows a detailed timing diagram for the serial audio interface.

Copyright © 2004–2015, Texas Instruments Incorporated

(1) Standard Data Format (Right Justified); L-Channel = HIGH, R-Channel = LOW

(2) Left Justified Data Format; L-Channel = HIGH, R-Channel = LOW

(3) I 2S Data Format; L-Channel = LOW, R-Channel = HIGH

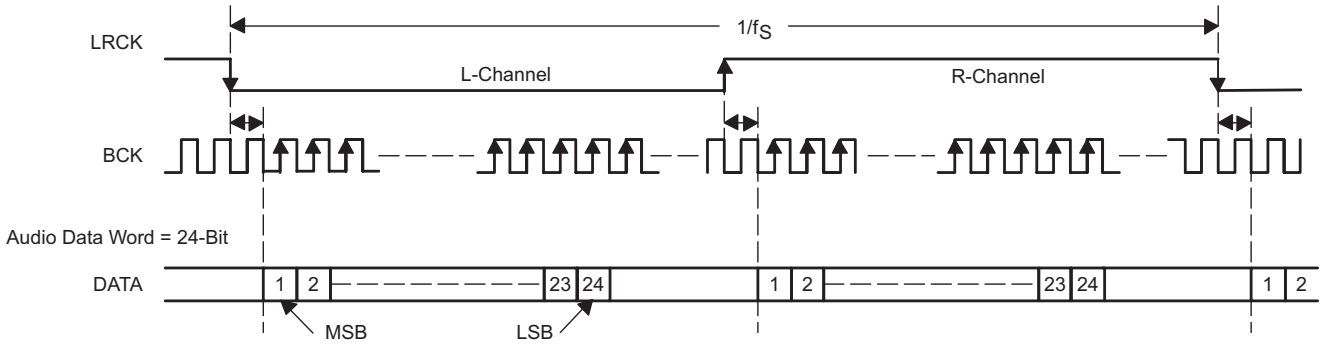

Figure 22. Audio Data Input Formats

7.3.4 Audio Data Format

Audio format is selected using FMT0 (pin 11) and FMT1 (pin 12). The PCM1794A device also supports monaural mode and DF bypass mode using MONO (pin 1) and CHSL (pin 2). The PCM1794A device can select the DF rolloff characteristics.

Table 3. Audio Data Format Select

MONO	CHSL	FMT1	GMT0	FORMAT	STEREO/MONO	DF ROLLOFF
0	0	0	0	I^2S	Stereo	Sharp
0	0	0	1	Left-justified format	Stereo	Sharp
0	0	1	0	Standard, 16-bit	Stereo	Sharp
0	0	1	1	Standard, 24-bit	Stereo	Sharp
0	1	0	0	I^2S	Stereo	Slow
0	1	0	1	Left-justified format	Stereo	Slow
0	1	1	0	Standard, 16-bit	Stereo	Slow
0	1	1	1	Digital filter bypass	Mono	—
1	0	0	0	I^2S	Mono, L-channel	Sharp
1	0	0	1	Left-justified format	Mono, L-channel	Sharp
1	0	1	0	Standard, 16-bit	Mono, L-channel	Sharp
1	0	1	1	Standard, 24-bit	Mono, L-channel	Sharp
1	1	0	0	I^2S	Mono, R-channel	Sharp
1	1	0	1	Left-justified format	Mono, R-channel	Sharp
1	1	1	0	Standard, 16-bit	Mono, R-channel	Sharp
1	1	1	1	Standard, 24-bit	Mono, R-channel	Sharp

7.3.5 Soft Mute

The PCM1794A device supports mute operation. When MUTE (pin 10) is set to HIGH, both analog outputs transition to the bipolar zero level in –0.5-dB steps with a transition speed of $1/f_S$ per step. The mute operation system provides pop-free muting of the DAC output.

7.3.6 De-Emphasis

The PCM1794A device has a de-emphasis filter for the sampling frequency of 44.1 kHz. The de-emphasis filter is controlled using DEM (pin 3).

7.3.7 Zero Detect

When the PCM1794A device detects that the audio input data in the L-channel and the R-channel is continuously zero for 1024 LRCKs in the PCM mode, or that the audio input data is continuously zero for 1024 WDCKs in the external filter mode, the PCM1794A device sets ZERO (pin 13) to HIGH.

7.3.8 Advanced Segment DAC

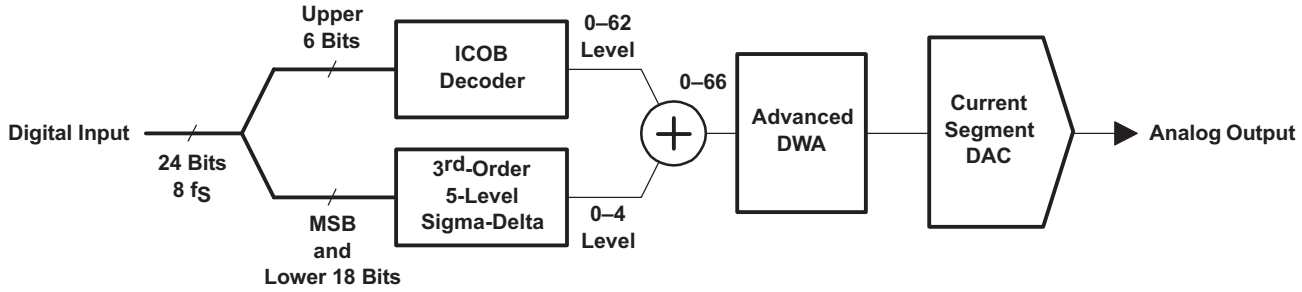

Figure 23. Advanced Segment DAC

Copyright © 2004–2015, Texas Instruments Incorporated

The PCM1794A device uses TI's advanced segment DAC architecture to achieve excellent dynamic performance and improved tolerance to clock jitter. The PCM1794A device provides balanced current outputs.

Digital input data using the digital filter is separated into 6 upper bits and 18 lower bits. The 6 upper bits are converted to inverted complementary offset binary (ICOB) code. The lower 18 bits, associated with the MSB, are processed by a five-level, third-order delta-sigma modulator operated at 64 f_S by default. The 1 level of the modulator is equivalent to the 1 LSB of the ICOB code converter. The data groups processed in the ICOB converter and third-order delta-sigma modulator are summed together to create an up-to-66-level digital code, and then processed by data-weighted averaging (DWA) to reduce the noise produced by element mismatch. The data of up to 66 levels from the DWA is converted to an analog output in the differential-current segment section.

This architecture has overcome the various drawbacks of conventional multibit processing, and also achieves excellent dynamic performance.

7.3.9 Analog Output

Table 4 and Figure 24 show the relationship between the digital input code and analog output.

Table 4. Digital Input Code and Analog Output

	800000 (–FS)	000000 (BPZ)	7FFFFF (+FS)
$I_{OUT}N$ [mA]	–2.3	–6.2	–10.1
$I_{OUT}P$ [mA]	–10.1	–6.2	–2.3
$V_{OUT}N$ [V](1)	–1.725	–4.65	–7.575
$V_{OUT}P$ [V](1)	–7.575	–4.65	–1.725
V_{OUT} [V](1)	–2.821	0	2.821

(1) $V_{OUT}N$ is the output of U1, $V_{OUT}P$ is the output of U2, and V_{OUT} is the output of U3 in the measurement circuit of Figure 25.

7.4 Device Functional Modes

7.4.1 Device Control

The PCM1794A device is a hardware controlled by external pins. These pins can be tied high or low directly to GND or to V_{DD}. These pins can also be controlled by the GPIO of a host controller.

7.4.2 Audio Input Modes

The PCM1794A device accepts PCM audio in I2S, Right justified (standard), or Left justified formats. The PCM1794 device has an internal digital filter that has the option of a slow or sharp roll off. Use an external digital filter to bypass the internal digital filter. External filter mode is explained more in the *Interfacing With an External Digital Filter* section.

7.4.3 Audio Output Modes

With the use of the MONO pin, the PCM1794A can output either differential stereo audio, or differential mono audio. Figure 25 shows an example of stereo output. Figure 27 shows an example of mono mode.

8 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

The design of the application circuit lets the user realize the high signal-to-noise (S/N) ratio of the PCM1794A device, as noise and distortion generated in an application circuit are not negligible.

In the circuit of Figure 25, the output level is 2-V_{RMS}, and 127-dB S/N is achieved. The circuit of Figure 26 should result in the highest performance. In this case the output level is set to 4.5-V_{RMS}, and 129-dB S/N is achieved (stereo mode). In monaural mode, if the output of the L-channel and R-channel is used as a balanced output, 132-dB S/N is achieved (see Figure 27).

Application Information (continued)

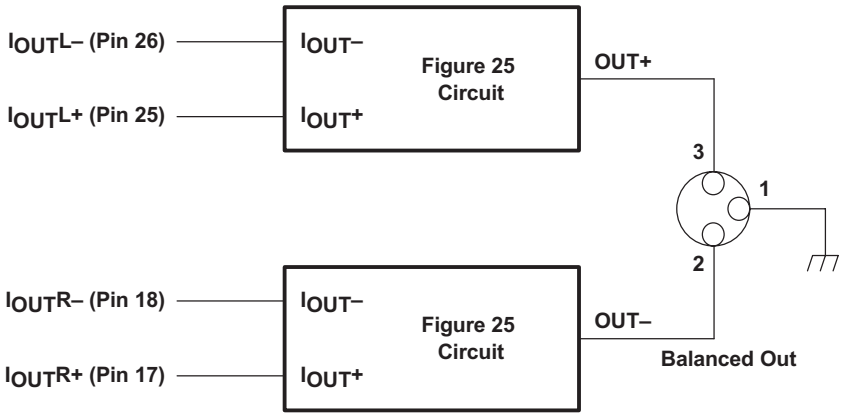

Figure 27. Measurement Circuit for Monaural Mode

8.1.1 I/V Section

The current of the PCM1794A device on each of the output pins ($I_{OUT}L+$, $I_{OUT}L–$, $I_{OUT}R+$, $I_{OUT}R–$) is 7.8 mA p-p at 0 dB (full scale). Use Equation 1 to calculate the voltage output level of the I/V converter (Vi).

$$Vi = 7.8 \text{ mA p–p} \times R_f \quad (1)$$

where

- R_f is the feedback resistance of I/V converter

An NE5534 operational amplifier is recommended for the I/V circuit to obtain the specified performance. Dynamic performance such as the gain bandwidth, settling time, and slew rate of the operational amplifier affects the audio dynamic performance of the I/V section.

8.1.2 Differential Section

The PCM1794A voltage outputs are followed by differential amplifier stages, which sum the differential signals for each channel, creating a single-ended I/V op-amp output. In addition, the differential amplifiers provide a low-pass filter function.

The operational amplifier recommended for the differential circuit is the Linear Technology LT1028, because the input noise is low.

8.1.3 Interfacing With an External Digital Filter

For some applications, using a programmable digital signal processor as an external digital filter to perform the interpolation function may be necessary. The following pin settings enable the external digital filter application mode:

- MONO (pin 1) = LOW
- CHSL (pin 2) = HIGH
- FMT0 (pin 11) = HIGH
- FMT1 (pin 12) = HIGH

The pins that provide the serial interface for the external digital filter are shown in the connection diagram of Figure 28. The word clock (WDCK) must be operated at 8× or 4× the desired sampling frequency, f_S.

Application Information (continued)

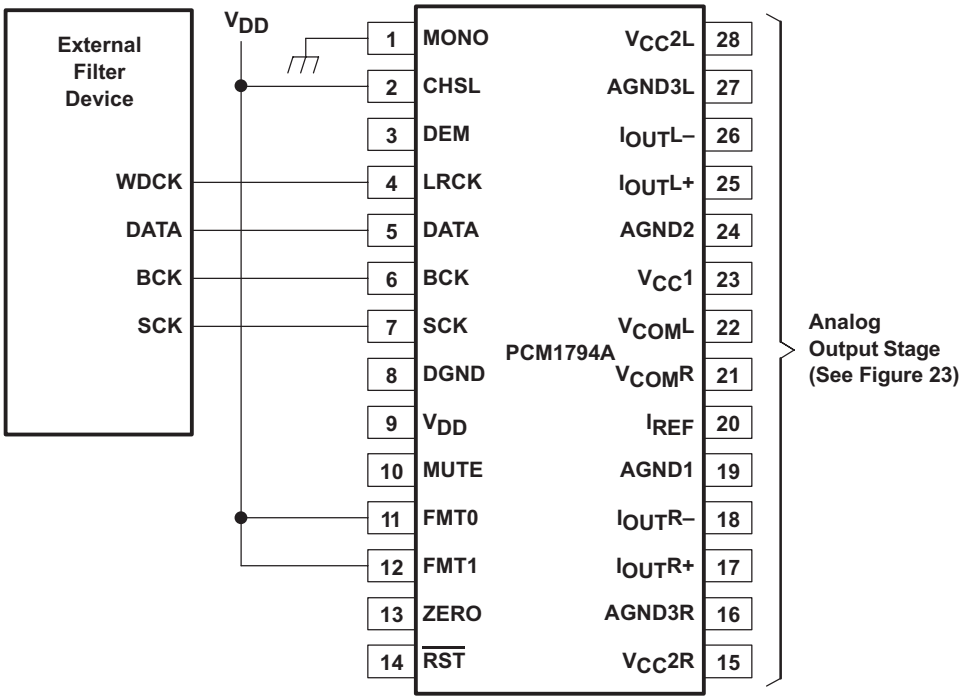

Figure 28. Connection Diagram for External Digital Filter (Internal DF Bypass Mode) Application

8.1.3.1 System Clock (SCK) and Interface Timing

In an application using an external digital filter, the PCM1794A device requires the synchronization of WDCK and the system clock. The system clock is phase-free with respect to WDCK. Interface timing among WDCK, BCK, and DATA is shown in Figure 29.

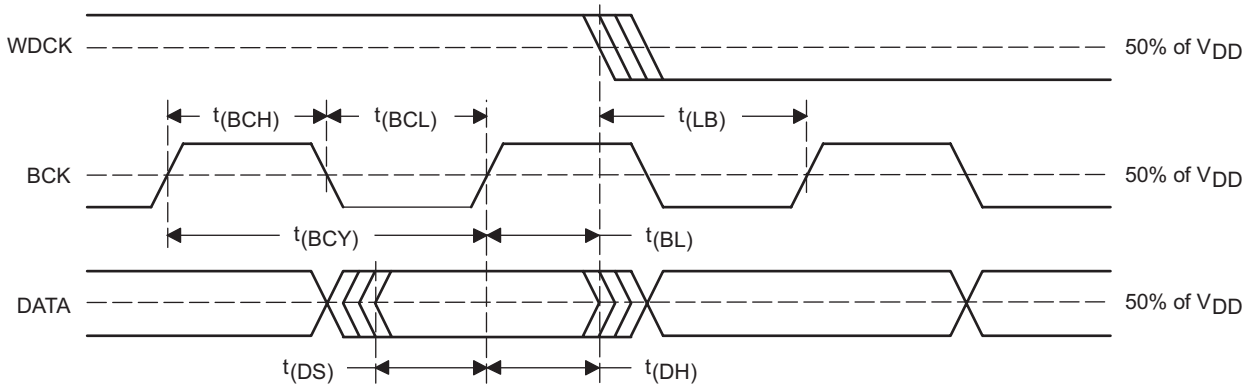

Figure 29. Audio Interface Timing for External Digital Filter (Internal DF Bypass Mode) Application

Table 5 shows the timing requirements for an application using an external digital filter in internal DF bypass mode.

Copyright © 2004–2015, Texas Instruments Incorporated

Application Information (continued)

Table 5. External Digital Filter Application Timing Requirements

		MIN	MAX	UNIT
$t_{(BCY)}$	BCK pulse-cycle time	20		ns
$t_{(BCL)}$	BCK pulse duration, LOW	7		ns
$t_{(BCH)}$	BCK pulse duration, HIGH	7		ns
$t_{(BL)}$	BCK rising edge to WDCK falling edge	5		ns
$t_{(LB)}$	WDCK falling edge to BCK rising edge	5		ns
$t_{(DS)}$	DATA setup time	5		ns
$t_{(DH)}$	DATA hold time	5		ns

8.1.3.2 Audio Format

The PCM1794A device in the external digital filter interface mode supports right-justified audio formats, including 24-bit audio data, as shown in Figure 30.

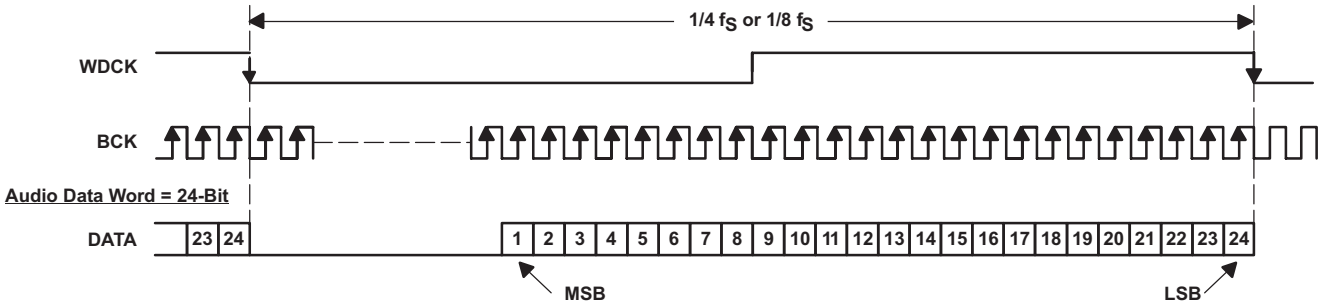

Figure 30. Audio Data Input Format for External Digital Filter (Internal DF Bypass Mode) Application

Copyright © 2004–2015, Texas Instruments Incorporated

8.2 Typical Application

This application is using the GPIO of a host controller to manipulate the hardware control pins. A PCM audio source is supplying digital audio and the output is single-ended stereo audio.

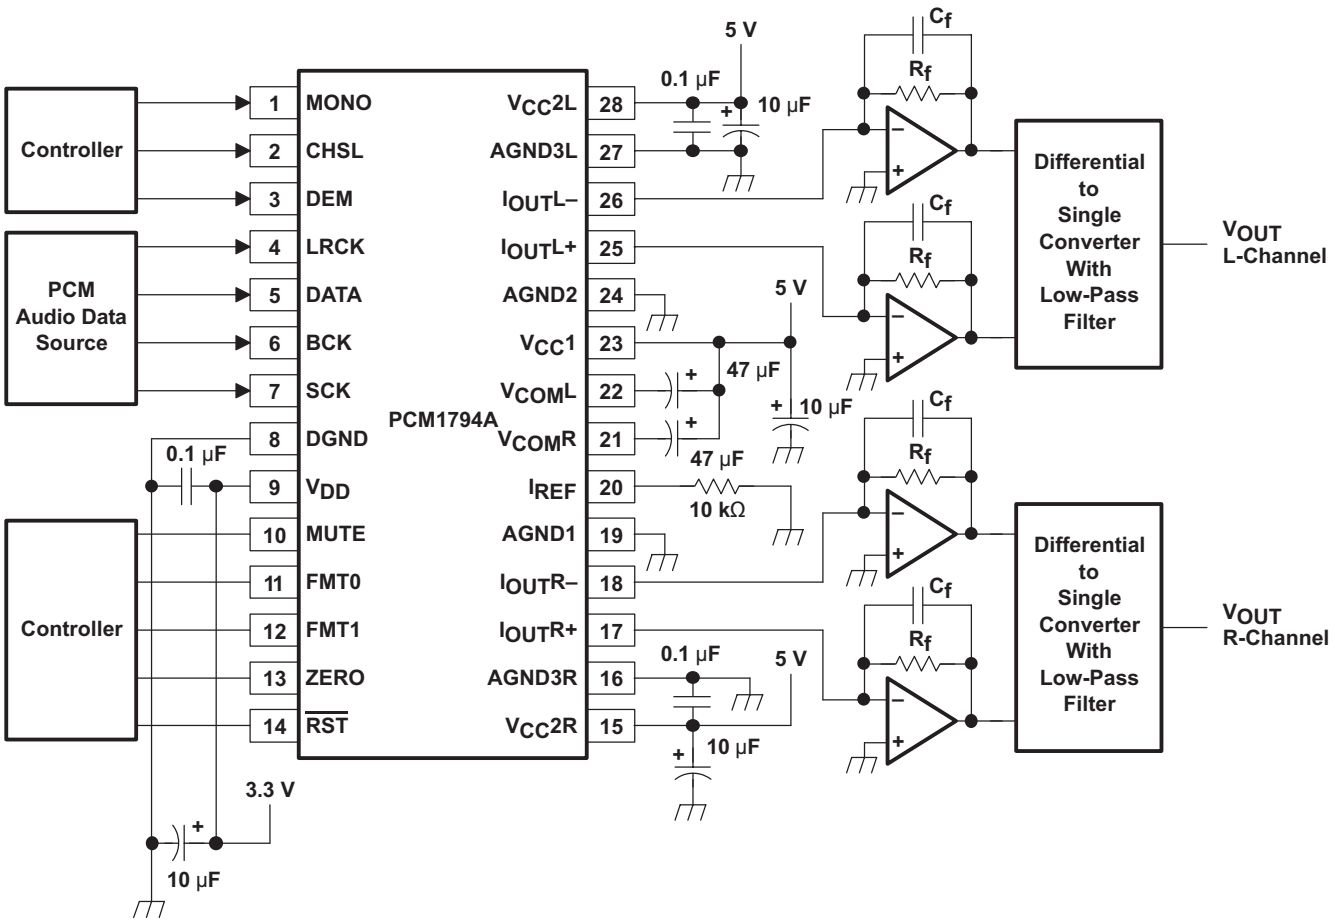

Figure 31. Typical Application Circuit

8.2.1 Design Requirements

For the typical application example, use the parameters listed in Table 6.

Table 6. Design Parameters

DESIGN PARAMETER	EXAMPLE
Audio Input	Digital PCM
Audio Output	Single-Ended Stereo Analog
Control	Host GPIO
Filter	Internal Filter

8.2.2 Detailed Design Procedure

8.2.2.1 Audio Input or Output

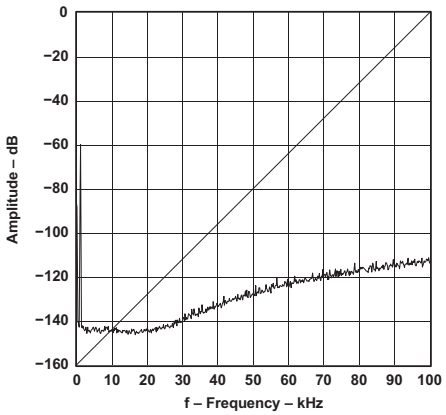

In this application, a PCM audio source is supplied to the device. A current output is produced and then converted to a voltage output in the I/V stage. The next stage in the output is a differential to single-ended amplifier stage with a low pass filter to reduce out of band noise. The f_c of the example circuits (Figure 26 and Figure 27) are shown in the example figures. Use Equation 2 to calculate the value of f_c.

$$f_c = 1 / (2 \times \pi \times R_f \times C_f) \quad (2)$$

–60-db Output Spectrum, BW = 100 kHz

Figure 32. Amplitude vs Frequency

V_{CC} = 5 V
V_{DD} = 3.3 V
Measurement circuit is Figure 26
f_S = 48 kHz, T_A = 25°C

Figure 33. Total Harmonic Distortion + Noise vs Input Level

9 Power Supply Recommendations

The PCM1794A device requires 5-V (nominal) supplies. A 5-V supply is required for the analog circuitry powered by the VCC1, VCC2L, and VCC2R pins. A second 5-V supply is for the digital circuitry powered by the V_{DD} pin. These pins can be powered by the same 5-V rail but separating the supplies can assist with getting the target SNR and THD in some cases. Place the decoupling capacitors for the power supplies close to the device terminals.

10 Layout

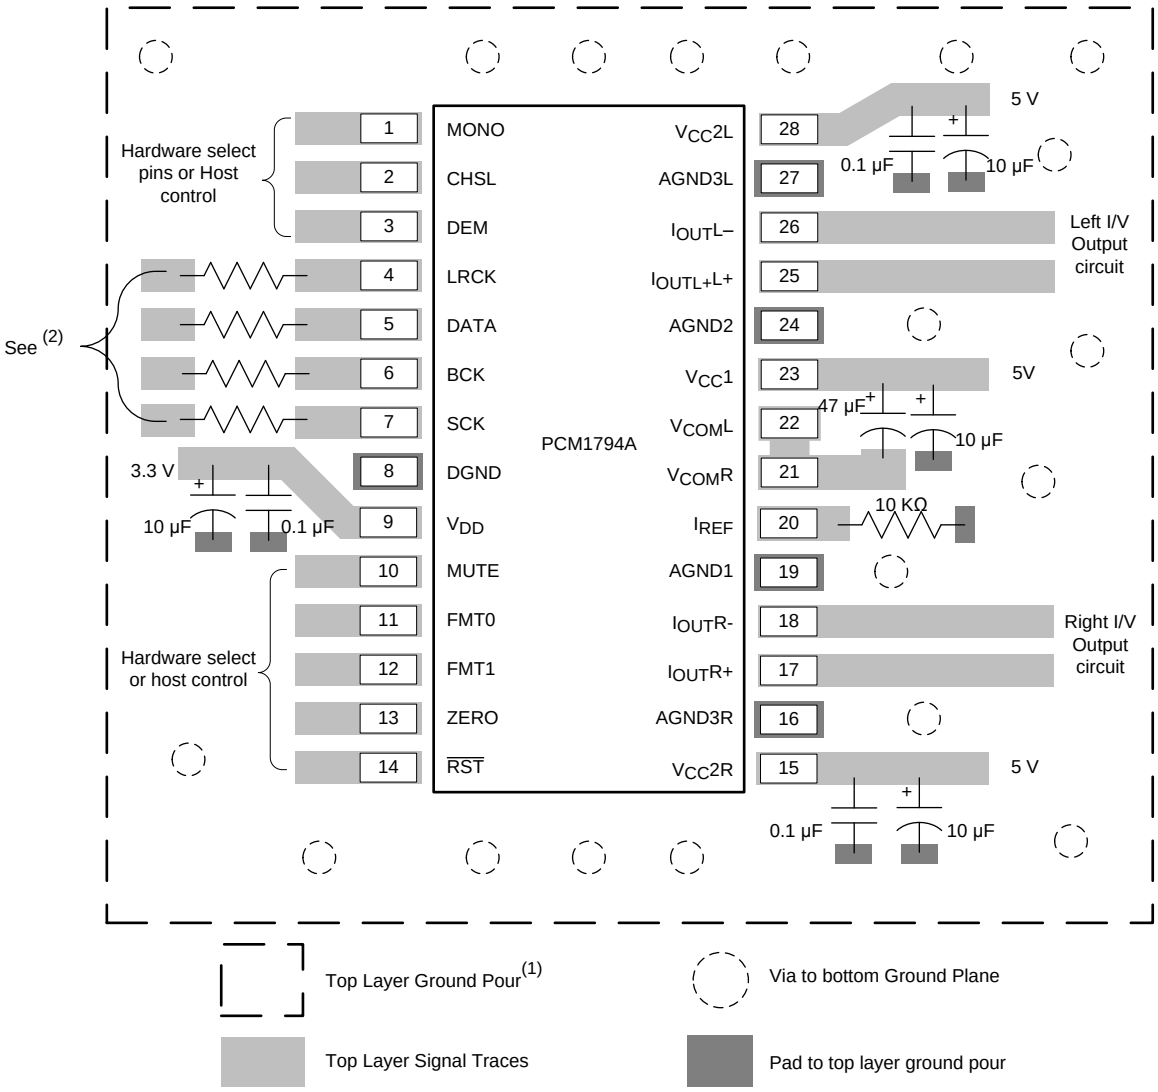

10.1 Layout Guidelines

TI recommends using the same ground between AGND and DGND to avoid any potential voltage difference between them. Ensure the return currents for digital signals avoid the AGND pin or the input signals to the I/V stage. Avoid running high frequency clock and control signals near AGND, or any of the I_{OUT} pins where possible. The pin layout of the PCM1794A partitions into two parts: an analog section and a digital section. If the system is partitioned in such a way that digital signals are routed away from the analog sections, then no digital return currents (for example, clocks) should be generated in the analog circuitry.

Place the decoupling capacitors as close to the Vcc1, V_{CC}2L, V_{CC}2R, V_{COM}L, V_{COM}R, and V_{DD} pins as possible. See Figure 34 for additional guidelines.

Copyright © 2004–2015, Texas Instruments Incorporated

10.2 Layout Example

(1) TI recommends to place a top layer ground pour for shielding around device and connect it to the lower main PCB ground plane with multiple vias.

(2) These resistors help prevent overshoot and reduce coupling. Begin with a value of 10 Ω for the MCLK resistor and 27 Ω for the other resistors.

PCM1794ADBR.B	Active	Production	SSOP (DB) | 28	2000 | LARGE T&R	Yes	NIPDAU	Level-1-260C-UNLIM	-25 to 85	PCM1794 A

(1) **Status:** For more details on status, see our product life cycle.

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
