

2V_{RMS} DirectPath™, 具有 32 位、384kHz 脉冲编码调制 (PCM) 接口的 112/106/100dB 音频立体声数模转换器 (DAC)

查询样品: [PCM5100](#), [PCM5101](#), [PCM5102](#)

特性

- 市场领先的低带外噪声
- 可选数字滤波器延迟与性能
- 无需隔离直流电流的电容器
- 集成的负电荷泵
- 用于采样率变化或者时钟停止的内部无爆音控制
- 智能静噪系统: 针对带有无爆音操作 **120dB** 静噪信噪比 (SNR) 的软上升或下降斜坡和模拟静噪。
- 具有对于内部生成 **SCK** 的 **BCK** 参考的集成高性能音频锁相环路 (PLL)
- 小型 **20** 引脚 **TSSOP** 封装

典型性能 (电源为 **3.3V** 时)

参数	PCM5102/PCM5101/PCM5100
SNR	112/106/100dB
动态范围	112 / 106 / 100dB
总谐波失真 (THD)+N @ -1dBFS	-93/-92/-90dB
满刻度输出:	2.1V _{RMS} (GND 中心)
正常 8x 过度采样数字滤波器延迟:	20f _s
低延迟 8x 过度采样数字滤波器延迟:	3.5f _s
采样频率	8kHz 至 384kHz
系统时钟倍乘器 (f _{SCK}):	64, 128, 192, 256, 384, 512, 768, 1024, 1152, 1536, 2048, 3072; 高达 50MHz

图 1. PCM510x 功能方框图

其它关键特性

- 接受 **16**, **24**, 和 **32** 位音频数据
- **PCM** 数据样式: **I²S**, 左对齐
- 当 **LRCK** 和 **BCK** 被置为无效时, 自动进入省电模式
- **3.3V** 故障安全低压 **CMOS (LVCMOS)** 数字输入
- 硬件配置
- 单电源运行:
 - **3.3V** 模拟, **3.3V** 数字
- 集成加电复位

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

System Two Cascade, Audio Precision are trademarks of Audio Precision.

DirectPath is a trademark of Texas, Instruments, Inc..

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

应用范围

- **A/V 接收器**
- **DVD, BD 播放器**
- **HDTV 接收器**
- **需要 2V_{RMS} 音频输出的应用**

说明

此PCM510x器件是单片 CMOS 集成电路系列产品，它包括一个立体声数模转换器和采用薄型小外形尺寸 (TSSOP) 封装的附加支持电路。PCM510x使用 TI 的高级分段 DAC 架构的最新一代产品来实现出色的动态性能并提升了对时钟抖动的耐受度。

PCM510x 提供了 2.1V_{RMS} 接地中心输出，使得设计人员能够去除输出上的隔直电容器，以及与单电源线路驱动器相关的外部静噪电路。

集成的线路驱动器通过支持低至 1kΩ 的负载从而在性能上超过所有其它基于电荷泵的线路驱动器。通过支持低至 1kΩ 的负载，PCM510x实际能够驱动多达 10 个并行产品，诸如 LCD TV, DVDR, AV 接收器和其它器件。

器件上集成的 PLL 免除了对于系统时钟（通常称为主时钟）的需要，从而实现一个 3 线制 I²C 连接并减少了系统电磁干扰 (EMI)。

智能时钟误差和功率感应欠压保护利用一个两级静噪系统实现无爆音性能。发生时钟误差或者系统电源故障时，器件减弱数字数据（或者已知最后的正确数据），然后将模拟电路静噪。

PCM510x系列产品提供比现有 DAC 技术最多低 20dB 的带外噪声，减少了下行放大器 / ADC 中的 EMI 和失真。（从一直使用的传统 100kHz 噪声倍频带 (OBN) 测量到 3MHz 测量）

PCM510x 接受具有 16 至 32 位数据的工业标准音频数据格式。支持高达 384kHz 的采样率。

Table 1. PCM510x器件之间的差异

部件号	动态范围	SNR	THD
PCM5102	112dB	112dB	-93dB
PCM5101	106dB	106dB	-92dB
PCM5100	100dB	100dB	-90dB

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

APPLICATION INFORMATION

Reset and System Clock Functions

Power-On Reset Function

The PCM510x includes a power-on reset function shown in [Figure 11](#). With $V_{DD} > 2.8V$, the power-on reset function is enabled. After the initialization period, the PCM510x is set to its default reset state.

Figure 11. Power-On Reset Timing, DVDD = 3.3V

System Clock Input

The PCM510x requires a system clock to operate the digital interpolation filters and advanced segment DAC modulators. The system clock is applied at the SCK input (pin 12) and supports up to 50MHz. The PCM510x system-clock detection circuit automatically senses the system-clock frequency. Common audio sampling frequencies of 8kHz, 16kHz, 32kHz - 44.1kHz - 48kHz, 88.2kHz - 96kHz, 176.4kHz -192kHz, and 384kHz with $\pm 4\%$ tolerance are supported. The sampling frequency detector sets the clock for the digital filter, Delta Sigma Modulator (DSM) and the Negative Charge Pump (NCP) automatically. Table 3 shows examples of system clock frequencies for common audio sampling rates.

SCK rates that are not common to standard audio clocks, between 1MHz and 50MHz, are only supported in software mode, available only in the PCM512x and PCM514x devices, by configuring various PLL and clock-divider registers. Software mode allows the device to become a clock master and drive the host serial port with LRCK and BCK, from a non-audio related clock; for example, using 12MHz to generate 44.1kHz (LRCK) and 2.8224MHz (BCK).

Figure 12 shows the timing requirements for the system clock input. For optimal performance, it is important to use a clock source with low phase jitter and noise.

(1) This system clock rate is not supported for the given sampling frequency.

(2) This system clock rate is supported by PLL mode.

Figure 12. Timing Requirements for SCK Input

Table 4. Timing Requirements for SCK Input

	Parameters	Min	Max	Unit
t_{SCY}	System clock pulse cycle time	20	1000	ns
t_{SCKH}	System clock pulse width, High	9		ns
t_{SCKL}	System clock pulse width, Low	9		ns

System Clock PLL Mode

The system clock PLL mode allows designers to use a simple 3-wire I²S audio source when driving the DAC. The 3-wire source reduces the need for a high frequency SCK, making PCB layout easier, and reduces high frequency electromagnetic interference.

The device starts up expecting an external SCK input, but if BCK and LRCK start correctly while SCK remains at ground level for 16 successive LRCK periods, then the internal PLL starts, automatically generating an internal SCK from the BCK reference. The PCM510x disables the internal PLL when an external SCK is supplied; specific BCK rates are required to generate an appropriate master clock. Table 5 describes the minimum and maximum BCK per LRCK for the integrated PLL to automatically generate an internal SCK.

Table 5. BCK Rates (MHz) by LRCK Sample Rate for PCM510x PLL Operation

Sample f (kHz)	BCK (f _s)	
	32	64
8	-	-
16	-	1.024
32	1.024	2.048
44.1	1.4112	2.8224
48	1.536	3.072
96	3.072	6.144
192	6.144	12.288
384	12.288	24.576

Audio Data Interface

Audio Serial Interface

The audio interface port is a 3-wire serial port, including LRCK (pin 15), BCK (pin 13), and DIN (pin 14). BCK is the serial audio bit clock, used to clock the serial data present on DIN into the serial shift register of the audio interface. Serial data is clocked into the PCM510x on the rising edge of BCK. LRCK is the serial audio left/right word clock.

Table 6. PCM510x Audio Data Formats, Bit Depths and Clock Rates

CONTROL MODE	FORMAT	DATA BITS	MAX LRCK FREQUENCY [f _s]	SCK RATE [x f _s]	BCK RATE [x f _s]
Hardware Control	I ² S/LJ	32, 24, 20, 16	Up to 192kHz	128 – 3072 (≤50MHz)	64, 48, 32
			384kHz	64, 128	64, 48, 32

The PCM510x requires the synchronization of LRCK and system clock, but does not need a specific phase relation between LRCK and system clock.

If the relationship between LRCK and system clock changes more than ±5 SCK, internal operation is initialized within one sample period and analog outputs are forced to the bipolar zero level until resynchronization between LRCK and system clock is completed.

If the relationship between LRCK and BCK are invalid more than 4 LRCK periods, internal operation is initialized within one sample period and analog outputs are forced to the bipolar zero level until resynchronization between LRCK and BCK is completed.

PCM Audio Data Formats and Timing

The PCM510x supports industry-standard audio data formats, including standard I²S and left-justified. Data formats are selected using the FMT (pin 16), Low for I²S, and High for Left-justified.

All formats require binary 2s complement, MSB-first audio data. Figure 13 shows a detailed timing diagram for the serial audio interface.

Figure 13. PCM510x Serial Audio Timing - Slave

Table 7. Audio Interface Slave Timing

	Parameters	Min	Max	Units
t_{BCY}	BCK Pulse Cycle Time	40		ns
t_{BCL}	BCK Pulse Width LOW	16		ns
t_{BCH}	BCK Pulse Width HIGH	16		ns
t_{BL}	BCK Rising Edge to LRCK Edge	8		ns
t_{LB}	LRCK Edge to BCK Rising Edge	8		ns
t_{DS}	DATA Set Up Time	8		ns
t_{DH}	DATA Hold Time	8		ns
f_{BCK}	BCK frequency @ DVDD=3.3V		24.576	MHz

**Figure 14. Left Justified Audio Data Format****Figure 15. I²S Audio Data Format**

Function Descriptions

Interpolation Filter

The PCM510x provides 2 types of interpolation filter. Users can select which filter to use by using the FLT pin (pin11)

Table 8. Digital Interpolation Filter Options

FLT Pin	Description
0	FIR Normal x8/x4/x2/x1 Interpolation Filters
1	IIR Low Latency x8/x4/x2/x1 Interpolation Filters

The Normal x8/x4/x2/x1(bypass) Interpolation filter is programmed in 256 cycles in 1 sample time (t_s) for sample rates from 8kHz to 384kHz.

Table 9. Normal x8 Interpolation Filter

Parameter	Condition	Value (Typ)	Value (Max)	Units
Filter Gain Pass Band	0 $0.45f_s$		± 0.02	dB
Filter Gain Stop Band	$0.55f_s$ $7.455f_s$	-60		dB
Filter Group Delay		$22t_s$		s

Figure 16. Normal x8 Interpolation Filter Frequency Response

Figure 17. Normal x8 Interpolation Filter Impulse Response

Figure 18. Normal x8 Interpolation Filter Passband Ripple

The Normal x4/x2/x1(bypass) Interpolation filter is programmed in 256 cycles in 1 sample time (t_s) for sample rates from 8kHz to 384kHz.

Table 10. Normal x4 Interpolation Filter

Parameter	Condition	Value (Typ)	Value (Max)	Units
Filter Gain Pass Band	0 $0.45f_s$		± 0.02	dB

Zero Data Detect

The PCM510x has a zero-data detect function. When the device detects continuous zero data, it enters a full analog mute condition.

The PCM510x counts zero data over 1024LRCKs (21ms @ 48kHz) before setting analog mute.

Power Save Mode

When any kind of clock error (SCK, BCK, and LRCK) or clock halt is detected, the PCM510x enters Stand-by mode automatically. The current-segment DAC and Line driver are also powered down.

When BCK and LRCK halt to a low level for more than 1 second, the PCM510x enters Power down mode automatically. Power-down mode includes the negative charge pump and Bias/Reference circuit power-down in addition to stand-by.

Whenever expected Audio clocks (SCK, BCK, LRCK) are applied to the PCM510x, the device starts its powerup sequence automatically.

XSMT Pin (Soft Mute and Soft Un-Mute)

For external digital control of the PCM510x, the XSMT pin must be driven by an external digital host with a specific/minimum rise time (t_r) and fall time (t_f) for soft mute and soft un-mute. The PCM510x requires t_r/t_f times of less than 20ns. In the majority of applications, this shouldn't be a problem, however, traces with high capacitance may have issues.

When the XSMT pin is shifted from high to low (3.3V to 0V), a soft digital attenuation ramp is started. -1dB attenuation will be applied every $1t_s$ from 0dBFS to $-\infty$. This attenuation takes 104 sample times.

When the XSMT pin is shifted from low to high (0V to 3.3V), a soft digital “un-mute” is started. 1dB gain steps are applied every t_s from $-\infty$ to 0dBFS. This ramp-up takes 104 sample times.

Figure 34. XSMT Timing for Soft Mute and Soft Un-Mute

Table 15. XSMT Timing Parameters

Parameters	Min	Max	Unit
Rise time (t_r)		20	ns
Fall time (t_f)		20	ns

External Power Sense Undervoltage Protection mode (supported only when DVDD = 3.3V)

The XSMT pin can also be used to monitor a system voltage, such as the 24VDC LCD TV backlight, or 12VDC system supply using a potential divider created with two resistors. (See [Figure 35](#))

- If the XSMT pin makes a transition from 1 to 0 over 6ms or more, the device will switch into external under-voltage protection mode. In this mode, two trigger levels are used.
- When XSMT pin level reaches 2V, soft mute process begins.
- When XSMT pin level reaches 1.2V, analog mute will engage, regardless of digital audio level, and analog shut down will begin. (For example, DAC circuitry powers down).

A timing diagram to show this is shown in [Figure 36](#).

NOTE

The XSMT input pins voltage range is from -0.3V to $\text{DVDD} + 0.3\text{V}$. The ratio of external resistors must be considered within this input range. Any increase in power supply (such as power supply positive noise/ripple) can pull the XSMT pin higher than $\text{DVDD}+0.3\text{V}$.

For example, if the PCM510x is monitoring a 12V input, and dividing the voltage by 4, then the voltage at XSMT during ideal power supply conditions will be 3V. If the voltage spikes any higher than 14.4V, then XSMT will see a voltage in excess of 3.6V ($\text{DVDD}+0.3$), potentially damaging the device.

Providing the divider is set appropriately, any DC voltage can be monitored.

Figure 35. XSMT in External UVP Mode

Figure 36. XSMT Timing for Undervoltage Protection

Recommended Powerdown Sequence

With inadequate system design, the PCM510x can exhibit some pop on power down. Pops are caused by the device not having enough time to detect power loss and start the muting process.

The PCM510x evaluation board avoids audible pop with an electrolytic decoupling capacitor. This capacitor provides enough time between data loss from USB or S/PDIF and power supply loss for the muting process to take place.

The PCM510x has two auto-mute functions to mute the device upon power loss (intentional or unintentional).

XSMT = 0

When the XSMT pin is pulled low, the incoming PCM data is attenuated to 0, closely followed by a hard analog mute. This process takes $150t_s + 0.2\text{ms}$.

As this mute time is mainly dominated by the sampling frequency, systems sampling at 192kHz will mute much faster than a 48kHz system.

Clock Error Detect

When clock error is detected on the incoming data clock, the PCM510x family switches to an internal oscillator, and continues to drive the DAC, while attenuating the data from the last known value. Once this process is complete, the PCM510x outputs will be hard muted to ground.

Planned Shutdown

These auto-muting processes can be manipulated by system designs to mute before power loss in the following ways:

1. Assert XSMT low $150t_s + 0.2\text{ms}$ before power is removed.

2. Stop I²S clocks (SCK, BCK, LRCK) 3ms before powerdown as shown below:

Unplanned Shutdown

Many systems use a low-noise regulator to provide an AVDD 3.3V supply for the DAC. The XSMT Pin can take advantage of such a feature to measure the pre-regulated output from the system SMPS to mute the DAC before the entire SMPS discharges. [Figure 37](#) shows how to configure such a system to use the XSMT pin. The XSMT pin can also be used in parallel with a GPIO pin from the system microcontroller/DSP or Power Supply.

Figure 39. PCM510x PLL Operation, 3.3V

Recommended Output Filter for the PCM510x

The diagram in [Figure 40](#) shows the recommended output filter for the PCM510x. The new PCM510x next generation current segment architecture offers excellent out of band noise, making a traditional 20kHz low pass filter a thing of the past.

The RC settings below offer a -3dB filter point at 153kHz (approx), giving the DAC the ability to reproduce virtually all frequencies through to it's maximum sampling rate of 384kHz.

Figure 40. Recommended Output Lowpass Filter for 10kΩ Operation

REVISION HISTORY

Changes from Revision Initial Release (May 2011) to Revision A	Page
• Changed 头两页的布局	1
• Deleted "Device Power Dissipation" row	4
• Changed "VOOUT = -1 dB" to "-1 dBFS" in THD+N	5
• Changed reference to correct footnote	6
• Changed Updated plot	7
• Changed t_{SCKH} and t_{SCKL} values to 9ns.	11
• Removed 48kHz sample rate with PLL-generated clock	12
• Added BCK frequency max for convenience	13
• Added PCM510x application diagram, PLL Operation	26

REVISION HISTORY

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "-" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
