

REF35 超低功耗高精度电压基准

1 特性

- 超低静态电流：
 - 650nA (典型值)
- 初始精度： $\pm 0.05\%$ (最大值)
- 温度系数 (最大值)：
 - 12ppm/°C (−40°C 至 105°C, SOT23 封装)
 - 10ppm/°C (−40°C 至 85°C, WCSP 封装)
- 输出 1/f 噪声 (0.1Hz 至 10Hz)：3.3ppm_{p-p}
- NR 引脚可降低噪声
- EN 引脚可降低关断电流消耗
- 长期稳定性：1k 小时内为 40ppm
- 热迟滞：70ppm
- 工作温度范围：−55°C 至 +125°C
- 输出电流：+10mA, −5mA
- 输入电压： $V_{REF} + V_{DO}$ 至 6V
- 输出电压选项：
 - 1.024V、1.2V、1.25V、1.6V、1.8V、2.048V、2.5V、3.0V、3.3V、4.096V、5.0V
- 小型 6 引脚 SOT-23 封装
- 尺寸超小的 4 引脚 WCSP 封装

2 应用

- 流量变送器
- 血糖监控
- 伺服驱动器控制模块
- 电能质量分析仪
- 故障指示灯
- 示波器
- 过程分析
- 光学模块

3 说明

REF35 是毫微功耗、低漂移、高精度串联基准系列器件。REF35 系列具有 $\pm 0.05\%$ 的初始精度，典型功耗为 650nA。该器件的温度系数 (12ppm/°C) 和长期稳定性 (1000 小时内为 40ppm) 有助于提高系统稳定性和可靠性。凭借低功耗以及高精度规格，此器件适用于多种便携式应用和低电流应用。

REF35 可提供高达 10mA 电流，噪声为 3.3ppm_{p-p}，负载调整率为 20ppm/mA。借助这一功能集，REF35 可为精密传感器和 12 至 16 位数据转换器提供强大的低噪声高精度电源。

此系列的额定工作温度范围为 −40°C 至 105°C，并且在 −55°C 至 125°C 也可以正常运行。凭借宽温度范围，此系列适用于工业应用。

REF35 提供 1.024V 至 5.0V 的宽输出电压范围。该器件具有节省空间的 6 引脚 SOT-23 和 4 引脚 WCSP 封装选项。有关可用的电压和封装选项，请联系您当地的 TI 销售代表。

封装信息

器件型号	封装 (1)	本体尺寸 (标称值) (2)
REF35xxx	SOT-23 (6)	2.90mm × 1.60mm
	WCSP (4)	1.05mm × 0.84mm

- 如需了解所有可用电压选项和封装，请参阅数据表末尾的可订购产品附录。
- 封装尺寸 (长 × 宽) 为标称值，并包括引脚 (如适用)。

表 5-1. Pin Functions

PIN			TYPE	DESCRIPTION
NAME	SOT-23	WCSP		
GND	1	B1	Ground	Device ground connection. For DBV package pin 1 and pin 2 are internally short.
GND	2	-	Ground	Device ground connection.
EN	3	B2	Input	Enable connection. Enables or disables the device.
VIN	4	A2	Power	Input supply voltage connection.
NR	5	-	Output	Noise reduction pin. Connect a capacitor to reduce noise. This pin can be left floating.
VREF	6	A1	Output	Reference voltage output.

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted) ⁽¹⁾

		MIN	MAX	UNIT
Input voltage	IN	- 0.3	6.5	V
Enable voltage	EN	- 0.3	IN + 0.3 ⁽²⁾	V
Output voltage	V _{REF}	- 0.3	IN + 0.3 ⁽²⁾	V
Output short circuit current	I _{SC}		20	mA
Operating temperature range	T _A	- 55	125	°C
Storage temperature range	T _{stg}	- 65	170	°C

- (1) Operation outside the Absolute Maximum Ratings may cause permanent device damage. Absolute Maximum Ratings do not imply functional operation of the device at these or any other conditions beyond those listed under Recommended Operating Conditions. If used outside the Recommended Operating Conditions but within the Absolute Maximum Ratings, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.
- (2) IN + 0.3V or 6.5V, whichever is lower

6.2 ESD Ratings

			VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins ⁽¹⁾	±2000	V
		Charged device model (CDM), per ANSI/ESDA/JEDEC JS-002, all pins ⁽²⁾	±750	

- (1) JEDEC document JEP155 states that 500V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
IN	Input voltage ⁽¹⁾	V _{OUT} + V _{DO} ⁽²⁾		6	V
EN	Enable voltage	0		IN	V
I _L	Output current	- 5		10	mA
T _A	Operating temperature	- 40	25	125	°C

- (1) For V_{REF} = 1.024V to 1.5V, minimum V_{IN} = 1.7V
- (2) V_{DO} = Dropout voltage

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾		REF35		UNIT
		YBH (WCSP)	DBV (SOT-23)	
		4 PINS	6 PINS	
R _{θJA}	Junction-to-ambient thermal resistance	178.9	164.4	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance	1.1	102.5	°C/W
R _{θJB}	Junction-to-board thermal resistance	60.3	59.6	°C/W
Ψ _{JT}	Junction-to-top characterization parameter	0.5	44.0	°C/W
Ψ _{JB}	Junction-to-board characterization parameter	60.2	59.4	°C/W
R _{θJC(bot)}	Junction-to-case (bottom) thermal resistance	N/A	N/A	°C/W

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

6.5 Electrical Characteristics

At $V_{IN} = V_{REF} + 0.5V$, $V_{EN} = V_{IN}$, $C_L = 10\mu F$, $C_{IN} = 0.1\mu F$, $I_L = 0mA$, minimum and maximum specifications at $T_A = -40^\circ C$ to $125^\circ C$, typical specifications $T_A = 25^\circ C$; unless otherwise noted

PARAMETER		TEST CONDITION		MIN	TYP	MAX	UNIT
ACCURACY AND DRIFT							
	Output voltage accuracy	T _A = 25°C		- 0.05		0.05	%

7 Parameter Measurement Information

7.1 Solder Heat Shift

The materials used in the manufacture of the REF35 have differing coefficients of thermal expansion, resulting in stress on the device die when the part is heated. Mechanical and thermal stress on the device die can cause the output voltages to shift, degrading the initial accuracy specifications of the product. Reflow soldering is a common cause of this error.

To illustrate this effect, a total of 32 devices were soldered on one printed circuit board using lead-free solder paste and the paste manufacturer suggested reflow profile. 图 7-1 shows the reflow profile. The printed circuit board is comprised of FR4 material. The board thickness is 1.66mm and the area is 174mm × 135mm.

图 7-1. Reflow Profile

The reference output voltage is measured before and after the reflow process; 图 7-2 shows the typical shift. Although all tested units exhibit very low shifts (< 0.03%), higher shifts are also possible depending on the size, thickness, and material of the printed circuit board (PCB). An important note is that the histograms display the typical shift for exposure to a single reflow profile. Exposure to multiple reflows, as is common on PCBs with surface-mount components on both sides, causes additional shifts in the output bias voltage. If the PCB is exposed to multiple reflows, the device must be soldered in the last pass to minimize its exposure to thermal stress.

图 7-2. Solder Heat Shift Distribution, V_{REF} (%)

7.2 Temperature Coefficient

The REF35 is designed and tested for a low output voltage temperature coefficient. The temperature coefficient is defined as the change in output voltage over temperature. The temperature coefficient is calculated using the box method in which a box is formed by the minimum/maximum values for the nominal output voltage over the operating temperature range. REF35 has a low maximum temperature coefficient of 12ppm/°C from -40°C to +105°C. The box method specifies limits for the temperature error but does not specify the exact shape and slope of the device under test. Due to temperature curvature correction to achieve low-temperature drift, the temperature drift is expected to be non-linear. See TI's Analog Design Journal, [Precision voltage references](#), for more information on the box method. Use [方程式 1](#) for the box method.

$$\text{Drift} = \left(\frac{V_{\text{REF(MAX)}} - V_{\text{REF(MIN)}}}{V_{\text{REF(25°C)}} \times \text{Temperature Range}} \right) \times 10^6 \quad (1)$$

图 7-3 shows a typical voltage versus temperature curves for various reference voltages in SOT23 package. 图 7-4 shows the distribution of temperature coefficients for REF35250 devices in SOT23 package.

7.3 Long-Term Stability

One of the key performance parameters of the REF35 references is long-term stability also known as long-term drift. The long-term stability value is tested in a setup that reflects standard PCB board manufacturing practices. The boards are made of standard FR4 material and the board does not have special cuts or grooves around the devices to relieve the mechanical stress of the PCB. The devices and boards in this test do not undergo high temperature burn in post-soldering prior to testing. These conditions reflect a real world use case scenario and common manufacturing techniques.

During the long-term stability testing, precautions are taken to make sure that only the long-term stability drift is measured. The boards are maintained at 35°C in an oil bath. The oil bath makes sure that the temperature is constant across the device over time compared to an air oven. The measurements are captured every 30 minutes with a calibrated 8.5 digit multimeter.

The typical long-term stability characteristic is expressed as a deviation of the reference voltage output over time.

图 7-5 shows that the typical drift value for the REF35 6-pin SOT-23 package is 40ppm from 0 to 1000 hours and 55ppm from 0 to 2000 hours. It is important to understand that long-term stability is not ensured by design and that the value is typical. The REF35 will experience the highest drift in the initial 1000 hr. Subsequent deviation is typically lower than first 1000 hr.

WCSP Package
图 7-6. Long Term Stability - 2000 hours (V_{REF})

7.4 Thermal Hysteresis

Thermal hysteresis is measured with the REF35 soldered to a PCB, similar to a real-world application. Thermal hysteresis for the device is defined as the change in output voltage after operating the device at 25°C, cycling the device through the specified temperature range, and returning to 25°C. The PCB was baked at 150°C for 30 minutes before thermal hysteresis was measured. Use [方程式 2](#) to calculate the thermal hysteresis:

$$V_{HYST} = \left(\frac{|V_{PRE} - V_{POST}|}{V_{NOM}} \right) \times 10^6 \text{ (ppm)} \quad (2)$$

where

- V_{HYST} = thermal hysteresis (in units of ppm)
- V_{NOM} = the specified output voltage
- V_{PRE} = output voltage measured at 25°C pre-temperature cycling
- V_{POST} = output voltage measured after the device has cycled from 25°C through the specified temperature range of -40°C to +85°C or -40°C to +105°C and returns to 25°C.

The graphs below show the typical thermal hysteresis distribution across various temperature ranges in two cycles.

7.5 Noise Performance

The reference pin output noise is categorized as low frequency and broadband noise. The following sections describe these categories in detail.

7.5.1 Low-Frequency (1/f) Noise

Flicker noise, also known as 1/f noise, is a low-frequency noise that affects the device output voltage which can affect precision measurements in ADCs. This noise increases proportionally with output voltage and operating temperature. Noise is measured by filtering the output from 0.1Hz to 10Hz. The 1/f noise is an extremely low value, therefore the frequency of interest must be amplified and band-pass filtered. This is done by using a high-pass filter to block the DC voltage. The resulting noise is then amplified by a gain of 1000. The bandpass filter is created by a series of high-pass and low-pass filter that adds additional gain to make it more visible on a oscilloscope as shown in 图 7-11. 图 7-12 shows the effect of flicker noise over 10 second for REF35250. Flicker noise must be tested in a Faraday cage enclosure to block environmental noise.

图 7-11. Low-Frequency (1/f) Noise Test Setup

图 7-12. 0.1Hz to 10Hz Voltage Noise

图 7-13 shows the typical 1/f noise (0.1Hz to 10Hz) distribution across various load conditions. REF35 device also offers noise reduction functionality by adding an optional capacitor between NR (pin 5) and ground pins.

图 7-14 shows the typical 1/f noise (0.1Hz to 10Hz) distribution across REF35 devices with various capacitance between NR pin and GND.

图 7-13. 0.1Hz to 10Hz Noise Distribution vs Load Conditions

图 7-14. 0.1Hz to 10Hz Noise Distribution vs NR Capacitance

7.5.2 Broadband Noise

Broadband noise is a noise that appears at higher frequency compared to 1/f noise. The broadband noise is measured by high-pass filtering the output of the reference device, followed by a gain stage and measuring the result on a spectrum analyzer as shown in 图 7-15.

图 7-15. Broadband Noise Test Setup

For noise sensitive designs, a low-pass filter can be used to reduce broadband output noise. When designing a low-pass filter, take special care to make sure the output impedance of the filter does not degrade AC performance. This can occur in RC low-pass filters where a large series resistance can impact the load transients due to output current fluctuations. The REF35 device also offers noise reduction functionality by adding an optional capacitor between NR (pin 5) and ground pins. 图 7-16 和 图 7-17 show the noise spectrum for REF35250 and REF35500 devices respectively across various load capacitance.

图 7-16. Noise Spectrum 10Hz to 100kHz ($V_{REF} = 2.5V$)图 7-17. Noise Spectrum 10Hz to 100kHz ($V_{REF} = 5V$)

7.6 Power Dissipation

The REF35 voltage references are capable of source up to 10mA and sink up to 5mA of load current across the rated input voltage range. However, when used in applications subject to high ambient temperatures, the input voltage and load current must be carefully monitored to make sure that the device does not exceed its maximum power dissipation rating. The maximum power dissipation of the device can be calculated with 方程式 3:

$$T_J = T_A + P_D \times R_{\theta JA} \quad (3)$$

where

- P_D is the device power dissipation
- T_J is the device junction temperature
- T_A is the ambient temperature
- $R_{\theta JA}$ is the package (junction-to-air) thermal resistance

Because of this relationship, acceptable load current in high temperature conditions can be less than the maximum current-sourcing capability of the device. In no case must the device be operated outside of its maximum power rating because doing so can result in premature failure or permanent damage to the device.

8 Detailed Description

8.1 Overview

The REF35 is family of ultra-low current, low-noise, precision band-gap voltage references that are specifically designed for excellent initial voltage accuracy and drift. The [Functional Block Diagram](#) is a simplified block diagram of the REF35 showing basic band-gap topology.

8.2 Functional Block Diagram

8.3 Feature Description

8.3.1 Supply Voltage

The REF35 family of references features an extremely low dropout voltage. For 10mA loaded conditions, a maximum dropout voltage is 250mV. 图 6-34 shows a typical dropout voltage (V_{DO}) versus load current. The device supports operation with input voltage range from $V_{REF} + V_{DO}$ to 6V. The typical quiescent current is 650nA and maximum quiescent current over temperature is only 2.6 μ A. The low dropout voltage coupled with ultra-low current enable the operation across multiple battery powered applications.

8.3.2 EN Pin

The REF35 family supports device enable and disable functionality through logic level control on EN pin. The EN pin of REF35 does not use an internal pull-up resistor. Instead, the pin uses new 'clean EN' technology. This allows the EN pin to be in a no connect condition at start-up, and no extra current is drawn from the supply when the EN pin is pulled low in shutdown mode. When EN pin is pulled high or left unconnected at start-up, the device is in active mode. When EN pin is driven by an open-drain output, a pull-up resistor to VIN is required. The device must be in active mode for normal operation. The EN pin must not be pulled higher than VIN supply voltage.

The device can be placed in shutdown mode by pulling the EN pin low. When in shutdown mode, the output of the device becomes high impedance and the quiescent current of the device drops to 100nA at room temperature. When changing the device state from shutdown to active state, make sure the EN pin is not left floating.

Also note that for applications where EN pin is no-connect, total parasitic capacitance on EN pin must be restricted within 30pF.

See the [Electrical Characteristics](#) table for logic high and logic low voltage levels.

8.3.3 NR Pin

The REF35 pin allows access to the band-gap through the NR pin. Placing a capacitor from the NR pin to GND creates a low-pass filter in combination with the internal resistance of 60 k Ω . Leakage of the capacitance directly impacts the accuracy and temperature drift. If NR functionality is used, choose a low leakage capacitor. A capacitance of 1 μ F creates a low-pass filter with corner frequency around 2.7Hz. Such a filter decreases the overall noise on the VREF pin. Higher capacitance results in a lower filter cut off frequency, further reducing output noise. Please note, using the capacitor on NR pin also increases start-up time.

8.4 Device Functional Modes

8.4.1 Basic Connections

图 8-1 shows the typical connections for the REF35. TI recommends a supply bypass capacitor (C_{IN}) ranging from $0.1\ \mu\text{F}$ to $10\ \mu\text{F}$. A $0.1\ \mu\text{F}$ to $10\ \mu\text{F}$ output capacitor (C_L) must be connected from REF to GND. The equivalent series resistance (ESR) value of C_L must be lower than $400\text{m}\Omega$ to verify output stability.

图 8-1. Basic Connections

8.4.2 Start-Up

图 8-2 shows the start-up behavior of REF35250 device with $1\ \mu\text{F}$ load capacitance. REF35 device verifies the output voltage settles to the expected output voltage within specified accuracy without oscillations. The start-up time is dependent on the output voltage variant, output capacitance and NR pin capacitance. Higher capacitance leads to longer start-up time.

图 8-2. REF35250 Start-Up Behavior, $C_L = 1\ \mu\text{F}$

8.4.3 Output Transient Behavior

The REF35 output buffer is capable of sourcing 10mA load current as well as sink 5mA of load current. The output stage is designed using class AB architecture with ultra-low quiescent current. This architecture avoids the dead zone around the no load condition. The output buffer uses a fast start-up implementation to achieve 2ms typical turn-on time at $C_L = 1\ \mu\text{F}$ and no-load current condition.

图 8-3 and 图 8-4 show the output settling behavior for light load transient and high load transient respectively.

图 8-3. Load Transient Response 0 μ A to 100 μ A, $C_L = 1 \mu$ F

图 8-4. Load Transient Response 1mA to 10mA, $C_L = 1 \mu$ F

9 Application and Implementation

备注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

REF35 with low current consumption and class leading performance specifications is suitable reference for multiple applications. The device can also be used as a precision low noise power supply to sensor or data converter instead of traditional LDO or DC/DC based power supply. Basic applications includes positive/negative voltage reference and data acquisition systems. The table below shows the typical application of REF35 and its companion ADC/DAC.

表 9-1. Typical Applications and Companion ADC/DAC

APPLICATIONS	ADC/DAC
PLC - DCS	ADS7028, DAC8881, ADS1287, ADS7953
Rack Server	ADS7028, ADS7128, ADS7138
Field Transmitters - Pressure, Flow	ADS124S08
Optical Module, Optical Line Card	ADS7066, ADS7138
Power quality analyzer	ADC3662
Thermal imaging	ADC3541

9.2 Typical Applications

9.2.1 Negative Reference Voltage

For applications requiring a negative and positive reference voltage, the REF35 and OPA735 can be used to provide a dual-supply reference from a 5V supply. 图 9-1 shows the REF35250 used to provide a 2.5V supply reference voltage. The low drift performance of the REF35250 complements the low offset voltage and zero drift of the OPA735 to provide an accurate solution for split-supply applications. Take care to match the temperature coefficients of R1 and R2.

图 9-1. REF35 and OPA735 Create Positive and Negative Reference Voltages

9.2.2 Precision Power Supply and Reference

图 9-2 shows the basic configuration for the REF35 device as precision power supply to ADS7038 data converter which uses its power supply AVDD as reference. Connect bypass capacitors according to the guidelines in the [Input and Output Capacitors](#) section.

图 9-2. Basic Reference Connection

9.2.2.1 Design Requirements

A detailed design procedure is described based on a design example. For this design example, use the parameters listed in 表 9-2 as the input parameters.

表 9-2. Design Example Parameters

DESIGN PARAMETER	VALUE
Input voltage range V_{IN}	0V - 5V
Output resolution	12-bit
REF35 input capacitor	1µF
REF35 output capacitor	10µF

9.2.2.2 Detailed Design Procedure

9.2.2.2.1 Selection of Reference

The REF35500 reference is selected for this design. The REF35500 device operates of very low quiescent current while offering $\pm 0.05\%$ initial accuracy and very low noise. These parameters help improve system accuracy as compared to external LDO based power supply. The 5V reference voltage supports the 0V to 5V input range specification.

9.2.2.2.2 Input and Output Capacitors

A 1 µF to 10 µF electrolytic or ceramic capacitor can be connected to the input to improve transient response in applications where the supply voltage may fluctuate.

A ceramic capacitor of at least a $0.1\ \mu\text{F}$ must be connected to the output to improve stability and help filter out high frequency noise. Add an additional $10\ \mu\text{F}$ capacitor in parallel to improve transient performance in response to sudden changes in load current; however, keep in mind that doing so increases the start-up time of the device.

Best performance and stability is attained with low-ESR, low-inductance ceramic chip-type output capacitors (X5R, X7R, or similar). If using an electrolytic capacitor on the output, place a $0.1\ \mu\text{F}$ ceramic capacitor in parallel to reduce overall ESR on the output. Place the input and output capacitors as close as possible to the device.

9.2.2.2.3 Selection of ADC

ADS7038 12-bit 8 channel multiplexed ADC is chosen for this application. The ADC offers low current operation with averaging mode to increase the resolution to 16-bit with internal averaging modes while operating with slow sampling speed.

9.2.2.3 Application Curves

表 9-3 和 图 9-3 show the captured measurement results for various DC inputs. The ADC output is captured and analyzed for output accuracy error and code spread with REF35500 as power supply versus LDO as power supply.

REF35 offers better accuracy and lower noise than the LDO device at lower quiescent current. This results in lower error in measurement as well as lower ADC output code variation across various OSR settings.

表 9-3. DC Input Performance Test Results

INPUT V	ADC OSR SETTING	REF35500		LDO	
		ERROR	CODE SPREAD	ERROR	CODE SPREAD
1.0V	0	0.01mV	32 LSB	8.9mV	48 LSB
	8	0.3mV	10 LSB	9.21mV	16 LSB
	128	0.38mV	6 LSB	9.26mV	6 LSB
2.5V	0	0.69mV	32 LSB	22.89mV	64 LSB
	8	1.44mV	10 LSB	23.63mV	18 LSB
	128	1.17mV	3 LSB	23.41mV	5 LSB
4V	0	2.27mV	32 LSB	37.84mV	48 LSB
	8	3.01mV	24 LSB	38.62mV	24 LSB
	128	2.46mV	3 LSB	38.09mV	17 LSB

图 9-3. Error vs Input Voltage

9.3 Power Supply Recommendations

The REF35 family of references feature an extremely low-dropout voltage. These references can be operated with a supply of only 50mV above the output voltage at no load. TI recommends a supply bypass capacitor ranging between 0.1μF to 10μF.

9.4 Layout

9.4.1 Layout Guidelines

图 9-4 shows an example of a PCB layout for a data acquisition system using the REF35. Some key considerations are:

- Connect low-ESR, 0.1 μ F ceramic bypass capacitors at V_{IN} , V_{REF} of the REF35.
- Decouple other active devices in the system per the device specifications.
- Using a solid ground plane helps distribute heat and reduces electromagnetic interference (EMI) noise pickup.
- Place the external components as close to the device as possible.
- Do not run sensitive analog traces in parallel with digital traces. Avoid crossing digital and analog traces if possible, and only make perpendicular crossings when absolutely necessary.

图 9-5 shows the pin compatibility with TI REF30xx, REF31xx and REF33xx series references in the 3-pin SOT-23 package when using the REF35xxx family footprint. You must rotate the REF30xx, REF31xx and REF33xx reference devices by 180° before assembly.

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

SOT-23 - 1.45 mm max height

SMALL OUTLINE TRANSISTOR

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. Body dimensions do not include mold flash or protrusion. Mold flash and protrusion shall not exceed 0.25 per side.
4. Leads 1,2,3 may be wider than leads 4,5,6 for package orientation.
5. Reference JEDEC MO-178.

EXAMPLE BOARD LAYOUT

DBV0006A

SOT-23 - 1.45 mm max height

SMALL OUTLINE TRANSISTOR

LAND PATTERN EXAMPLE
EXPOSED METAL SHOWN
SCALE:15X

SOLDER MASK DETAILS

4214840/G 08/2024

NOTES: (continued)

6. Publication IPC-7351 may have alternate designs.

7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

EXAMPLE STENCIL DESIGN

DBV0006A

SOT-23 - 1.45 mm max height

SMALL OUTLINE TRANSISTOR

SOLDER PASTE EXAMPLE
BASED ON 0.125 mm THICK STENCIL
SCALE:15X

4214840/G 08/2024

NOTES: (continued)

8. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
9. Board assembly site may have different recommendations for stencil design.

重要通知和免责声明

TI“按原样”提供技术和可靠性数据（包括数据表）、设计资源（包括参考设计）、应用或其他设计建议、网络工具、安全信息和其他资源，不保证没有瑕疵且不做任何明示或暗示的担保，包括但不限于对适销性、与某特定用途的适用性或不侵犯任何第三方知识产权的暗示担保。

这些资源可供使用 TI 产品进行设计的熟练开发人员使用。您将自行承担以下全部责任：(1) 针对您的应用选择合适的 TI 产品，(2) 设计、验证并测试您的应用，(3) 确保您的应用满足相应标准以及任何其他安全、安保法规或其他要求。
