

SM74104 具有自适应延迟的高压半桥栅极驱动器

1 特性

- 可再生能源等级
- 可驱动高侧和低侧 N 沟道金属氧化物半导体场效应晶体管 (MOSFET)
- 具有可编程附加延迟的自适应上升沿和下降沿
- 单输入控制
- 自举电源电压高达 118VDC
- 短暂关断传播延迟 (典型值为 25ns)
- 可以 15ns 的上升和下降时间驱动 1000pF 负载
- 电源轨欠压锁定

2 典型应用

- 电流反馈推挽式电源转换器
- 高电压降压稳压器
- 有源钳位正激电源转换器
- 半桥和全桥转换器

3 说明

SM74104 高压栅极驱动器设计用于驱动采用同步降压配置的高侧和低侧 N 沟道 MOSFET。该悬空高侧驱动器能够在高达 100V 的电源电压下工作。高侧和低侧栅极驱动器由单个输入控制。该器件采用自适应方式来控制每一个状态变化，从而避免发生击穿。除了自适应转换时序之外，还可以添加与外部设置电阻成比例的附加延时。该器件集成了一个高压二极管，用于对高侧栅极驱动自举电容进行充电。稳健可靠的电平转换器同时拥有高运行速度和低功耗特性，并且可提供从控制逻辑到高侧栅极驱动器的干净电平转换。该器件在低侧和高侧电源轨上提供了欠压锁定功能。

5 Pin Configuration and Functions

Pin Functions

PIN			I/O	DESCRIPTION
NAME	NO.			
	D	DPR		
VDD	1	1	I	Positive supply voltage input.
HB	2	2	I	Positive connection for high-side bootstrap capacitor.
HO	3	3	O	High-side output to drive the top MOSFET.
HS	4	4	I	Switch node pin.
RT	5	7	I	Delay timer pin. The additional delay of the timer prevents lower and upper MOSFETs from conducting simultaneously, thereby preventing shoot-through. Timer delay is set with a resistor to ground.
IN	6	8	I	PWM control input for LO and HO outputs.
VSS	7	9	-	Ground pin.
LO	8	10	O	Low-side output to drive the bottom MOSFET.
N/C	-	5, 6	-	No connect.
Exposed Pad	-	Exposed Pad	-	The exposed die attach pad (DAP) on the 10-pin WSON package functions as a thermal connection and can be soldered to a copper plane under the device. The DAP has no direct electrical connection to any of the pins. It can be left floating, but it is recommended to connect this to V _{SS} .

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted) ⁽¹⁾

	MIN	MAX	UNIT
V_{DD} to V_{SS}	–0.3	18	V
V_{HB} to V_{HS}	–0.3	18	V
IN to V_{SS}	–0.3	$V_{DD} + 0.3$	V
LO Output	–0.3	$V_{DD} + 0.3$	V
HO Output	$V_{HS} - 0.3$	$V_{HB} + 0.3$	V
V_{HS} to V_{SS}	–1	100	V
V_{HB} to V_{SS}		118	V
RT to V_{SS}	–0.3	5	V
T_{stg} Storage Temperature Range	–55	150	°C
Maximum Junction Temperature		150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

6.2 ESD Ratings

		VALUE	UNIT
$V_{(ESD)}$ Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	All pins except 2, 3, and 4 ±2000	V
		Pins 2, 3, and 4 ±500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process. Manufacturing with less than 500-V HBM is possible with the necessary precautions.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

	MIN	MAX	UNIT
V_{DD}	9	14	V
HS	–1	100	V
HB	$V_{HS} + 8$	$V_{HS} + 14$	V
HS Slew Rate		50	V/ns
Junction Temperature	–40	125	°C

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾		SM74104		UNIT
		D	DPR	
		8 PINS	10 PINS

Feature Description (continued)

Figure 16. Application Timing Waveforms

A falling transition on the PWM signal (IN) initiates the turn-off of the upper MOSFET and turn-on of the lower MOSFET. A short propagation delay (t_p) is encountered before the upper gate voltage begins to fall. Again, the adaptive shoot-through circuitry and the programmable deadtime TIMER delays the lower gate turn-on time. The upper MOSFET gate voltage is monitored and the deadtime delay generator is triggered when the upper MOSFET gate voltage with respect to ground drops below an internally set threshold ($\approx V_{dd}/2$). The lower gate drive is momentarily disabled by the timer and turns on the lower MOSFET after the deadtime delay expires ($t_p + T_{RT}$).

7.3.2 Setting the Delay Timer with RT

The RT pin is biased at 3V and current limited to 1mA. It is designed to accommodate a resistor between 5K and 100K, resulting in an effective dead-time proportional to RT and ranging from 90ns to 200ns. RT values below 5K will saturate the timer and are not recommended.

7.4 Device Functional Modes

7.4.1 Startup and UVLO

Both top and bottom drivers include under-voltage lockout (UVLO) protection circuitry which monitors the supply voltage (V_{DD}) and bootstrap capacitor voltage ($V_{HB} - V_{HS}$) independently. The UVLO circuit inhibits each driver until sufficient supply voltage is available to turn-on the external MOSFETs, and the built-in hysteresis prevents chattering during supply voltage transitions. When the supply voltage is applied to V_{DD} pin of SM74104, the top and bottom gates are held low until V_{DD} exceeds UVLO threshold, typically about 6.9V. Any UVLO condition on the bootstrap capacitor will disable only the high side output (HO).

7.5 Power Dissipation Considerations

The total IC power dissipation is the sum of the gate driver losses and the bootstrap diode losses. The gate driver losses are related to the switching frequency (f), output load capacitance on LO and HO (C_L), and supply voltage (V_{DD}) and can be roughly calculated as:

$$P_{DGATES} = 2 \cdot f \cdot C_L \cdot V_{DD}^2 \quad (1)$$

There are some additional losses in the gate drivers due to the internal CMOS stages used to buffer the LO and HO outputs. The following plot shows the measured gate driver power dissipation versus frequency and load capacitance. At higher frequencies and load capacitance values, the power dissipation is dominated by the power losses driving the output loads and agrees well with the above equation. This plot can be used to approximate the power losses due to the gate drivers.

Figure 17. Gate Driver Power Dissipation (LO + HO)
 $V_{CC} = 12V$, Neglecting Diode Losses

The bootstrap diode power loss is the sum of the forward bias power loss that occurs while charging the bootstrap capacitor and the reverse bias power loss that occurs during reverse recovery. Since each of these events happens once per cycle, the diode power loss is proportional to frequency. Larger capacitive loads require more current to recharge the bootstrap capacitor resulting in more losses. Higher input voltages (V_{IN}) to the half bridge result in higher reverse recovery losses. The following plot was generated based on calculations and lab measurements of the diode recovery time and current under several operating conditions. This can be useful for approximating the diode power dissipation.

Power Dissipation Considerations (continued)

Figure 18. Diode Power Dissipation $V_{IN} = 80V$

Figure 19. Diode Power Dissipation $V_{IN} = 40V$

The total IC power dissipation can be estimated from the above plots by summing the gate drive losses with the bootstrap diode losses for the intended application. Because the diode losses can be significant, an external diode placed in parallel with the internal bootstrap diode (refer to [Figure 20](#)) can be helpful in removing power from the IC. For this to be effective, the external diode must be placed close to the IC to minimize series inductance and have a significantly lower forward voltage drop than the internal diode.

8 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

The SM74104 can drive both a high-side and a low-side MOSFET using only one PWM input control signal. The internal level shifter provides a means for the control input to drive the high-side MOSFET. The SM74104 prevents shoot-through issues through adaptive transition timing and an additional time delay can be added by use of an external resistor at the RT pin.

8.2 Typical Application

The SM74104 is used to drive MOSFETs connected in a synchronous buck configuration as shown in Figure 20. A single control signal from an external PWM controller provides the control input to drive both the high-side and low-side MOSFET. The HO and LO outputs of the SM74104 can provide very fast switching of the MOSFETs, thereby reducing switching losses and improving the overall efficiency of the system.

Figure 20. Typical Application

8.2.1 Design Requirements

The RT resistor should be sized such that the appropriate time delay is added between the switching transitions of the top and bottom MOSFETs. The exact RT value will depend on the selected MOSFETs, their switching speeds, and the desired delay time needed to prevent shoot-through. An optional external fast recovery diode should be placed between the VDD and HB pins to minimize the stress on the internal bootstrap diode and decrease the average power dissipation in the IC. An R_{GATE} resistor and a parallel diode may also be placed in the path of the MOSFET gates. The R_{GATE} resistor will decrease the ON switching speed of the MOSFET and can help damp possible oscillations on the line. The parallel diode will provide a current path around R_{GATE} during the OFF switching of the MOSFET, which can ensure fast shut off of the MOSFET to further prevent shoot-through.

Typical Application (continued)

8.2.2 Detailed Design Procedure

See [Power Supply Recommendations](#), [Layout](#), and [Power Dissipation Considerations](#) for key design considerations regarding the input supply, grounding, component placement, and power calculations specific to the SM74104.

8.2.3 Application Curve

An adaptive circuit in the SM74104 monitors the gate voltages of the top and bottom MOSFETs and triggers a programmable delay generator to prevent both MOSFETs from conducting simultaneously. The timer delay, T_{RT} , can be programmed with a resistor placed between RT and VSS . The value of T_{RT} will vary with the RT resistor value as shown in [Figure 21](#).

Figure 21. Turn On Delay vs RT Resistor Value

9 Power Supply Recommendations

A low ESR/ESL capacitor must be connected as close as possible to the IC between V_{DD} and V_{SS} pins and between HB and HS pins to support high peak currents being drawn from V_{DD} during turn-on of the external MOSFET. Also, to prevent large voltage transients at the drain of the top MOSFET, a low ESR electrolytic capacitor must be connected between MOSFET drain and ground (V_{SS}). In both cases, the traces should be as short as possible to reduce the series resistance.

10 Layout

10.1 Layout Guidelines

The optimum performance of high and low side gate drivers cannot be achieved without taking due considerations during circuit board layout. The following points are emphasized.

1. In order to avoid large negative transients on the switch node (HS) pin, the parasitic inductances in the source of top MOSFET and in the drain of the bottom MOSFET (synchronous rectifier) must be minimized.
2. Grounding considerations:
 - The first priority in designing grounding connections is to confine the high peak currents from charging and discharging the MOSFET gate in a minimal physical area. This will decrease the loop inductance and minimize noise issues on the gate terminal of the MOSFET. The MOSFETs should be placed as close as possible to the gate driver.
 - The second high current path includes the bootstrap capacitor, the bootstrap diode, the local ground referenced bypass capacitor and low side MOSFET body diode. The bootstrap capacitor is recharged on a cycle-by-cycle basis through the bootstrap diode from the ground referenced V_{DD} bypass capacitor. The recharging occurs in a short time interval and involves high peak current. Minimizing this loop length and area on the circuit board is important to ensure reliable operation.
3. The resistor on the RT pin must be placed very close to the IC and separated from high current paths to avoid noise coupling to the time delay generator which could disrupt timer operation.

10.2 Layout Example

[Figure 22](#) shows an example layout for the SM74104 in the 8-pin SOIC package option.

(1) **Status:** For more details on status, see our [product life cycle](#).

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) Part marking: There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

4218856/B 01/2021

NOTES: (continued)

- This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/slua271).

EXAMPLE STENCIL DESIGN

DPR0010A

WSN - 0.8 mm max height

PLASTIC SMALL OUTLINE - NO LEAD

SOLDER PASTE EXAMPLE
BASED ON 0.125 mm THICK STENCIL

EXPOSED PAD 11:
77% PRINTED SOLDER COVERAGE BY AREA
SCALE:20X

4218856/B 01/2021

NOTES: (continued)

5. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.

D0008A

PACKAGE OUTLINE

SOIC - 1.75 mm max height

SMALL OUTLINE INTEGRATED CIRCUIT

4214825/C 02/2019

NOTES:

1. Linear dimensions are in inches [millimeters]. Dimensions in parenthesis are for reference only. Controlling dimensions are in inches. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed .006 [0.15] per side.
4. This dimension does not include interlead flash.
5. Reference JEDEC registration MS-012, variation AA.

EXAMPLE BOARD LAYOUT

D0008A

SOIC - 1.75 mm max height

SMALL OUTLINE INTEGRATED CIRCUIT

LAND PATTERN EXAMPLE
EXPOSED METAL SHOWN
SCALE:8X

SOLDER MASK DETAILS

4214825/C 02/2019

NOTES: (continued)

6. Publication IPC-7351 may have alternate designs.

7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

EXAMPLE STENCIL DESIGN

D0008A

SOIC - 1.75 mm max height

SMALL OUTLINE INTEGRATED CIRCUIT

SOLDER PASTE EXAMPLE
BASED ON .005 INCH [0.125 MM] THICK STENCIL
SCALE:8X

4214825/C 02/2019

NOTES: (continued)

8. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
9. Board assembly site may have different recommendations for stencil design.

重要通知和免责声明

TI“按原样”提供技术和可靠性数据（包括数据表）、设计资源（包括参考设计）、应用或其他设计建议、网络工具、安全信息和其他资源，不保证没有瑕疵且不做任何明示或暗示的担保，包括但不限于对适销性、与某特定用途的适用性或不侵犯任何第三方知识产权的暗示担保。

这些资源可供使用 TI 产品进行设计的熟练开发人员使用。您将自行承担以下全部责任：(1) 针对您的应用选择合适的 TI 产品，(2) 设计、验证并测试您的应用，(3) 确保您的应用满足相应标准以及任何其他安全、安保法规或其他要求。

这些资源如有变更，恕不另行通知。TI 授权您仅可将这些资源用于研发本资源所述的 TI 产品的相关应用。严禁以其他方式对这些资源进行复制或展示。您无权使用任何其他 TI 知识产权或任何第三方知识产权。对于因您对这些资源的使用而对 TI 及其代表造成的任何索赔、损害、成本、损失和债务，您将全额赔偿，TI 对此概不负责。

TI 提供的产品受 [TI 销售条款](#)、[TI 通用质量指南](#) 或 [ti.com](#) 上其他适用条款或 TI 产品随附的其他适用条款的约束。TI 提供这些资源并不会扩展或以其他方式更改 TI 针对 TI 产品发布的适用的担保或担保免责声明。除非德州仪器 (TI) 明确将某产品指定为定制产品或客户特定产品，否则其产品均为按确定价格收入目录的标准通用器件。
