ZHCSCM6G – MAY 2014 – REVISED OCTOBER 2019

具有 ±12kV IEC ESD 的 SN65HVD7x 3.3V 全双工 RS-485 收发器

1 特性

- 提供 1/8 单元负载选项
  - 一条总线上多达 256 个节点
- 总线 I/O 保护
  - > ±30kV 人体放电模式 (HBM) 保护
  - > ±12kV IEC61000-4-2 接触放电
  - > ±4kV IEC61000-4-4 快速瞬变脉冲
- 工业工作温度范围：
  –40°C 至 125°C
- 用于噪声抑制的较大接收器滞后 (70mV)
- 低功耗
  - 运行期间静态电流 < 1.1mA
  - 低待机电源电流：10nA（典型值），
    < 5μA（最大值）
- 针对热插拔应用的无干扰加电和断电 保护
- 与 3.3V 或 5V 控制器兼容的 5V 耐压逻辑输入
- 优化了以下信号传输速率：
  400kbps（70、71）、20Mbps（73、74）、
  50Mbps（76、77）

2 应用

- 电子式电表
- 工业自动化
- 楼宇自动化
- 安防和监控
- 编码器和解码器

3 说明

这些器件扩展了 RS-485 产品组合，其中包括一系列具有坚固耐用的 3.3V 驱动器和接收器以及高级 ESD 保护的全双工收发器。ESD 保护包括 > ±30kV 的 HBM 和 > ±12kV 的 IEC61000-4-2 接触放电。SN65HVD7x 器件的较大接收器滞后能够抑制传导差模噪声，其工作温度范围广，在恶劣的工作环境下能够保持可靠性。SN65HVD7x 器件采用标准 SOIC 封装以及小型 MSOP 封装。

这些器件的每一个都组装有一个差分驱动器和一个差分接收器，这两个器件由一个 3.3V 单电源供电运行。每个驱动器和接收器都具有用于全双工总线通信设计的独立输入和输出引脚。这些器件均具有宽共模电压范围，因此非常适合长电缆上的多点 应用 。

SN65HVD71、SN65HVD74 和 SN65HVD77 器件均完全启用，无需外部的使能引脚。

SN65HVD70、SN65HVD73 和 SN65HVD76 器件均具有高电平有效的驱动器使能端和低电平有效的接收器使能端。禁用驱动器和接收器后可获得低于 5μA 的低待机电流。

这些器件额定运行温度范围为 -40°C 至 125°C。

器件信息(1)

器件型号	封装	封装尺寸（标称值）
SN65HVD71 SN65HVD74 SN65HVD77	MSOP (8)	3.00mm × 3.00mm
	SOIC (8)	4.90mm × 3.91mm
SN65HVD70 SN65HVD73 SN65HVD76	MSOP (10)	3.00mm x 3.00mm
	SOIC (14)	8.65mm x 3.91mm

(1) 如需了解所有可用封装，请参阅数据表末尾的可订购产品附录。

目录

4 修订历史记录

注：之前版本的页码可能与当前版本有所不同。

Changes from Revision F (April 2019) to Revision G — **Page**

- Changed device numbers to the 8-Pin DGK package image ... 4
- Changed device numbers to the 10-Pin DGS package image ... 5

Changes from Revision E (October 2014) to Revision F — **Page**

- Changed the *Pin Configuration* images ... 4
- Changed the Supply Voltage MAX value From: 5.5 V To 5 V in the *Absolute Maximum Ratings* ... 7
- Moved Storage Temperature From the ESD table to the *Absolute Maximum Ratings* ... 7
- Changed the Hadleing Ratings table to *ESD Ratings* ... 7
- Added Note: to Supply voltage in the *Recommended Operating Conditions* ... 7

Changes from Revision D (August 2014) to Revision E — **Page**

- Updated the MSOP–10 logic diagram ... 5

Changes from Revision C (July 2014) to Revision D — **Page**

- Updated the *Device Comparison Table* ... 3

Changes from Revision B (July 2014) to Revision C — **Page**

- Updated SN65HVD70 and SN65HVD71 specifications to production values ... 3

Changes from Revision A (June 2014) to Revision B **Page**

- Updated the *Device Comparison Table*..... 3
- SN65HVD74 device status changed from *Product Preview* to *Production Data*..... 3

Changes from Original (May 2014) to Revision A **Page**

- 已更改 器件状态从*产品预览*更改为*生产数据*（混合状态）..... 1

5 Device Comparison Table

PART NUMBER(1)	SIGNALING RATE	DUPLEX	ENABLES	PACKAGE	NODES
SN65HVD70	up to 400 kbps	Full	DE, $\overline{RE}$	SOIC-14 MSOP-10	256

(1) Pin 6 and pin 7 are connected internally.
(2) Pin 13 and pin 14 are connected internally.

7 Specifications

7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)(1)

		MIN	MAX	UNIT
Supply voltage	V_{CC}	–0.5	5	V
Voltage	Range at any bus pin (A, B, Y, or Z)	–13	16.5	V
Input voltage	Range at any logic pin (D, DE, or $\overline{RE}$)	–0.3	5.7	V
	Voltage input range, transient pulse, any bus pin (A, B, Y, or Z) through 100 Ω	–100	100	V
Output current	Receiver output	–24	24	mA
Junction temperature, T_J			170	°C
Storage temperature range, T_{stg}		–65	150	°C
Continuous total power dissipation		See the *Thermal Information* table		

(1) Stresses beyond those listed under *absolute maximum ratings* may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under *recommended operating conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

7.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per JEDEC specification JESD22-A114, all pins	±8000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins	±1500	V
		Machine model (MM), all pins	±300	V
		IEC 61000-4-2 ESD (Air-Gap Discharge), bus pins and GND(1)(2)	±12000	V
		IEC 61000-4-2 ESD (Contact Discharge), bus pins and GND	±12000	V
		IEC 61000-4-4 EFT (Fast transient or burst), bus pins and GND	±4000	V
		IEC 60749-26 ESD (Human Body Model), bus pins and GND(2)	±30000	V

(1) By inference from contact-discharge results, see the *Application and Implementation* section
(2) Limited by tester capability.

7.3 Recommended Operating Conditions

			MIN	NOM	MAX	UNIT
V_{CC}	Supply voltage (1)		3	3.3	3.6	V
V_I	Input voltage at any bus pin (separately or common mode) (2)		–7		12	V
V_{IH}	High-level input voltage (Driver, driver enable, and receiver enable inputs)		2		V_{CC}	V
V_{IL}	Low-level input voltage (Driver, driver enable, and receiver enable inputs)		0		0.8	V
V_{ID}	Differential input voltage		–12		12	V
I_O	Output current, Driver		–60		60	mA
I_O	Output current, Receiver		–8		8	mA
R_L	Differential load resistance		54	60		Ω
C_L	Differential load capacitance			50		pF
$1/t_{UI}$	Signaling rate	HVD70, HVD71			400	kbps
		HVD73, HVD74			20	Mbps
		HVD76, HVD77			50	
T_A (3)	Operating free-air temperature (See the *Application and Implementation* for thermal information)		–40		125	°C
T_J	Junction Temperature		–40		150	°C

(1) Exposure to conditions beyond the recommended operation maximum for extended periods may affect device reliability.
(2) The algebraic convention, in which the least positive (most negative) limit is designated as minimum is used in this data sheet.
(3) Operation is specified for internal (junction) temperatures up to 150°C. Self-heating because of internal power dissipation should be considered for each application. Maximum junction temperature is internally limited by the thermal shut-down (TSD) circuit which disables the driver outputs when the junction temperature reaches 170°C.

7.4 Thermal Information — D Packages

THERMAL METRIC		D (8 PINS)	D (14 PINS)	Unit
$R_{\theta JA}$	Junction-to-ambient thermal resistance	110.7	83.3	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	54.7	42.9	
$R_{\theta JB}$	Junction-to-board thermal resistance	51.3	37.8	
ψ_{JT}	Junction-to-top characterization parameter	9.2	9.3	
ψ_{JB}	Junction-to-board characterization parameter	50.7	37.5	
$T_{J(TSD)}$	Thermal shut-down junction temperature	170		°C

7.5 Thermal Information — DGS and DGK Packages

THERMAL METRIC		DGS (10 PINS)	DGK (8 PINS)	Unit
$R_{\theta JA}$	Junction-to-ambient thermal resistance	165.5	168.7	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	37.7	62.2	
$R_{\theta JB}$	Junction-to-board thermal resistance	86.4	89.5	
ψ_{JT}	Junction-to-top characterization parameter	1.4	7.4	
ψ_{JB}	Junction-to-board characterization parameter	84.8	87.9	
$T_{J(TSD)}$	Thermal shut-down junction temperature	170		°C

7.6 Power Dissipation

PARAMETER			TEST CONDITIONS		VALUE	UNITS
PD	Power Dissipation driver and receiver enabled, V_{CC} = 3.6 V, T_J = 150°C 50% duty cycle square-wave signal at signaling rate: • HVD70 and HVD71 at 400 kbps • HVD73 and HVD74 at 20 Mbps • HVD76 and HVD77 at 50 Mbps	Unterminated	R_L = 300 Ω, C_L = 50 pF (driver)	HVD70, HVD71	150	mW
				HVD73, HVD74	180	
				HVD76, HVD77	220	
		RS-422 load	R_L = 100 Ω, C_L = 50 pF (driver)	HVD70, HVD71	190	mW
				HVD73, HVD74	220	
				HVD76, HVD77	250	
		RS-485 load	R_L = 54 Ω, C_L = 50 pF (driver)	HVD70, HVD71	230	mW
				HVD73, HVD74	255	
				HVD76, HVD77	285	

7.7 Electrical Characteristics

over recommended operating range (unless otherwise specified)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
$\lvert V_{OD}\rvert$	Driver differential output voltage magnitude	R_L = 60 Ω, 375 Ω on each output to –7 V to 12 V, See 图 15	1.5	2		V
		R_L = 54 Ω (RS-485), See 图 16	1.5	2		V
		R_L = 100 Ω (RS-422) T_J ≥ 0°C, V_{CC} ≥ 3.2 V, See 图 16	2			V
$\Delta\lvert V_{OD}\rvert$	Change in magnitude of driver differential output voltage	R_L = 54 Ω, C_L = 50 pF, See 图 16	–50	0	50	mV
$V_{OC(SS)}$	Steady-state common-mode output voltage	Center of two 27-Ω load resistors, See 图 16	1	V_{CC} / 2	3	V
ΔV_{OC}	Change in differential driver output common-mode voltage		–50	0	50	mV
$V_{OC(PP)}$	Peak-to-peak driver common-mode output voltage			500		mV
C_{OD}	Differential output capacitance			15		pF
V_{IT+}	Positive-going receiver differential input voltage threshold		See (1)	-70	–20	mV
$V_{IT–}$	Negative-going receiver differential input voltage threshold		–200	-140	See (1)	mV
V_{hys}	Receiver differential input voltage threshold hysteresis ($V_{IT+} – V_{IT–}$)		40	70		mV

(1) Under any specific conditions, V_{IT+} is assured to be at least V_{hys} higher than $V_{IT–}$.

Electrical Characteristics (continued)

over recommended operating range (unless otherwise specified)

PARAMETER			TEST CONDITIONS			MIN	TYP	MAX	UNIT
V_{OH}	Receiver high-level output voltage		I_{OH} = –8 mA			2.4	V_{CC}–0.3		V
V_{OL}	Receiver low-level output voltage		I_{OL} = 8 mA				0.2	0.4	V
I_I	Driver input, driver enable, and receiver enable input current					–3		3	µA
I_{OZ}	Receiver output high-impedance current	HVD70, HVD73, HVD76	V_O = 0 V or V_{CC}, $\overline{RE}$ = V_{CC}			–1		1	µA
I_{OS}	Driver short-circuit output current					–150		150	mA
I_I	Bus input current (disabled driver)		V_{CC} = 0 to ROC (max), DE = GND	HVD70, HVD73	V_I = 12 V		75	125	µA
					V_I = –7 V	–100	–40		
				HVD76	V_I = 12 V		240	333	
					V_I = –7 V	–267	–180		
I_{CC}	Supply current (quiescent)		Driver and receiver enabled	DE = V_{CC}, $\overline{RE}$ = GND, No load			750	1100	µA
			Driver enabled, receiver disabled	DE = V_{CC}, $\overline{RE}$ = V_{CC}, No load			350	650	µA
			Driver disabled, receiver enabled	DE = GND, $\overline{RE}$ = GND, No load			650	800	µA
			Driver and receiver disabled	DE = GND, D = open, $\overline{RE}$ = V_{CC}, No load			0.1	5	µA
	Supply current (dynamic)		See the *Typical Characteristics* section						
T_{sd}	Thermal Shut-down junction temperature							170	°C

7.8 Switching Characteristics — 400 kbps

400-kbps devices (SN65HVD70, SN65HVD71) bit time ≥ 2 µs (over recommended operating conditions)

PARAMETER			TEST CONDITIONS		MIN	TYP	MAX	UNIT
DRIVER								
t_r, t_f	Driver differential output rise/fall time		R_L = 54 Ω, C_L = 50 pF	See 图 17	100	400	750	ns
t_{PHL}, t_{PLH}	Driver propagation delay					350	550	ns
$t_{SK(P)}$	Driver pulse skew, $\lvert t_{PHL} - t_{PLH} \rvert$						40	ns
t_{PHZ}, t_{PLZ}	Driver disable time	HVD70		See 图 18 and 图 19		50	200	ns

9 Detailed Description

9.1 Overview

The SN65HVD70, SN65HVD71, SN65HVD73, SN65HVD74, SN65HVD76, and SN65HVD77 devices are low-power, full-duplex RS-485 transceivers available in three speed grades suitable for data transmission up to 400 kbps, 20 Mbps, and 50 Mbps.

The SN65HVD71, SN65HVD74, and SN65HVD77 are fully enabled with no external enabling pins. The SN65HVD70, SN65HVD73, and SN65HVD76 have active-high driver enables and active-low receiver enables. A standby current of less than 5 µA can be achieved by disabling both driver and receiver.

9.2 Functional Block Diagram

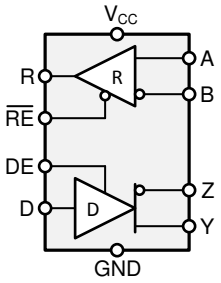

图 23. Block Diagram
SN65HVD70, SN65HVD73, and SN65HVD76

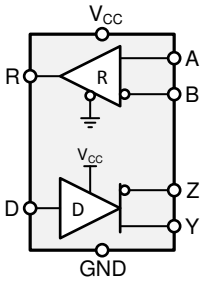

图 24. Block Diagram
SN65HVD71, SN65HVD74, and SN65HVD77

9.3 Feature Description

Internal ESD protection circuits protect the transceiver against Electrostatic Discharges (ESD) according to IEC61000-4-2 of up to ±12 kV, and against electrical fast transients (EFT) according to IEC61000-4-4 of up to ±4 kV.

The SN65HVD7x full-duplex family provides internal biasing of the receiver input thresholds in combination with large input-threshold hysteresis. At a positive input threshold of V_{IT+} = –20 mV and an input hysteresis of V_{hys} = 40 mV, the receiver output remains logic high under a bus-idle or bus-short condition even in the presence of 120 mV_{PP} differential noise without the need for external failsafe biasing resistors.

Device operation is specified over a wide temperature range from –40°C to 125°C.

9.4 Device Functional Modes

For the SN65HVD70, SN65HVD73, and SN65HVD76, when the driver enable pin, DE, is logic high, the differential outputs Y and Z follow the logic states at data input D. A logic high at D causes Y to turn high and Z to turn low. In this case the differential output voltage defined as $V_{OD} = V_{(Y)} – V_{(Z)}$ is positive. When D is low, the output states reverse, Z turns high, Y becomes low, and V_{OD} is negative.

When DE is low, both outputs turn high-impedance. In this condition the logic state at D is irrelevant. The DE pin has an internal pulldown resistor to ground, thus when left open the driver is disabled (high-impedance) by default. The D pin has an internal pullup resistor to V_{CC}, thus, when left open while the driver is enabled, output Y turns high and Z turns low.

表 1. Driver Function Table SN65HVD70, SN65HVD73, SN65HVD76

INPUT	ENABLE	OUTPUTS		FUNCTION
D	DE	Y	Z	
H	H	H	L	Actively drives the bus high
L	H	L	H	Actively drives the bus low
X	L	Z	Z	Driver disabled
X	OPEN	Z	Z	Driver disabled by default
OPEN	H	H	L	Actively drives the bus high by default

When the receiver enable pin, $\overline{RE}$, is logic low, the receiver is enabled. When the differential input voltage defined as $V_{ID} = V_{(A)} – V_{(B)}$ is positive and higher than the positive input threshold, V_{IT+}, the receiver output, R, turns high. When V_{ID} is negative and less than the negative and lower than the negative input threshold, $V_{IT–}$, the receiver output, R, turns low. If V_{ID} is between V_{IT+} and $V_{IT–}$ the output is indeterminate.

When $\overline{RE}$ is logic high or left open, the receiver output is high-impedance and the magnitude and polarity of VID are irrelevant. Internal biasing of the receiver inputs causes the output to go failsafe-high when the transceiver is disconnected from the bus (open-circuit), the bus lines are shorted (short-circuit), or the bus is not actively driven (idle bus).

表 2. Receiver Function Table SN65HVD70, SN65HVD73, SN65HVD76

DIFFERENTIAL INPUT	ENABLE	OUTPUT	FUNCTION
$V_{ID} = V_{(A)} – V_{(B)}$	$\overline{RE}$	R	
$V_{IT+} < V_{ID}$	L	H	Receives valid bus High
$V_{IT–} < V_{ID} < V_{IT+}$	L	?	Indeterminate bus state
$V_{ID} < V_{IT–}$	L	L	Receives valid bus Low
X	H	Z	Receiver disabled
X	OPEN	Z	Receiver disabled by default
Open-circuit bus	L	H	Fail-safe high output
Short-circuit bus	L	H	Fail-safe high output
Idle (terminated) bus	L	H	Fail-safe high output

For the SN65HVD71, HVD74, and HVD77, the driver and receiver are fully enabled, thus the differential outputs Y and Z follow the logic states at data input D at all times. A logic high at D causes Y to turn high and Z to turn low. In this case the differential output voltage defined as $V_{OD} = V_{(Y)} – V_{(Z)}$ is positive. When D is low, the output states reverse, Z turns high, Y becomes low, and V_{OD} is negative. The D pin has an internal pullup resistor to V_{CC}, thus, when left open while the driver is enabled, output Y turns high and Z turns low.

表 3. Driver Function Table SN65HVD71, SN65HVD74, SN65HVD77

INPUT	OUTPUTS		FUNCTION
D	Y	Z	
H	H	L	Actively drives the bus High
L	L	H	Actively drives the bus Low
OPEN	H	L	Actively drives the bus High by default

When the differential input voltage defined as $V_{ID} = V_{(A)} – V_{(B)}$ is positive and higher than the positive input threshold, V_{IT+}, the receiver output, R, turns high. When V_{ID} is negative and less than the negative input threshold, $V_{IT–}$, the receiver output, R, turns low. If V_{ID} is between V_{IT+} and $V_{IT–}$ the output is indeterminate. Internal biasing of the receiver inputs causes the output to go failsafe-high when the transceiver is disconnected from the bus (open-circuit), the bus lines are shorted (short-circuit), or the bus is not actively driven (idle bus).

表 4. Receiver Function Table SN65HVD71, SN65HVD74, SN65HVD77

DIFFERENTIAL INPUT	OUTPUT	FUNCTION
$V_{ID} = V_{(A)} – V_{(B)}$	R	
$V_{IT+} < V_{ID}$	H	Receives valid bus High
$V_{IT–} < V_{ID} < V_{IT+}$	?	Indeterminate bus state
$V_{ID} < V_{IT–}$	L	Receives valid bus Low
Open-circuit bus	H	Fail-safe high output
Short-circuit bus	H	Fail-safe high output
Idle (terminated) bus	H	Fail-safe high output

10 Application and Implementation

注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

10.1 Application Information

The SN65HVD7x family consists of full-duplex RS-485 transceivers commonly used for asynchronous data transmissions. Full-duplex implementation requires two signal pairs (four wires), and allows each node to transmit data on one pair while simultaneously receiving data on the other pair.

To eliminate line reflections, each cable end is terminated with a termination resistor, $R_{(T)}$, whose value matches the characteristic impedance, Z_0, of the cable. This method, known as parallel termination, allows for higher data rates over longer cable length.

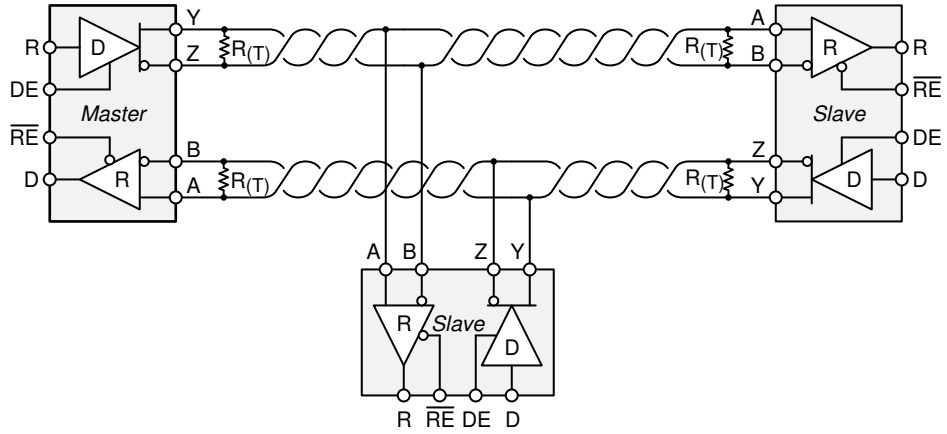

图 30. Typical RS-485 Network With SN65HVD7x Full-Duplex Transceivers

10.2 Typical Application

A full-duplex RS-485 network consists of multiple transceivers connecting in parallel to two bus cables. On one signal pair, a master driver transmits data to multiple slave receivers. The master driver and slave receivers may remain fully enabled at all times. On the other signal pair, multiple slave drivers transmit data to the master receiver. To avoid bus contention, the slave drivers must be intermittently enabled and disabled such that only one driver is enabled at any time, as in half-duplex communication. The master receiver may remain fully enabled at all times.

Because the driver may not be disabled, only one driver should be connected to the bus when using the SN65HVD71, SN65HVD74, or SN65HVD77 device.

图 31. Full-Duplex Transceiver Configurations

Typical Application (接下页)

10.2.1 Design Parameters

RS-485 is a robust electrical standard suitable for long-distance networking that may be used in a wide range of applications with varying requirements, such as distance, data rate, and number of nodes.

10.2.1.1 Data Rate and Bus Length

There is an inverse relationship between data rate and cable length, which means the higher the data rate, the short the cable length; and conversely, the lower the data rate, the longer the cable length. While most RS-485 systems use data rates between 10 kbps and 100 kbps, some applications require data rates up to 250 kbps at distances of 4000 ft and longer. Longer distances are possible by allowing for small signal jitter of up to 5 or 10%.

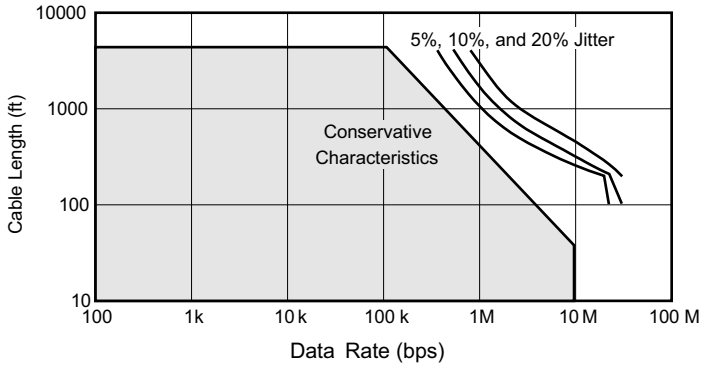

图 32. Cable Length vs Data Rate Characteristic

10.2.1.2 Stub Length

When connecting a node to the bus, the distance between the transceiver inputs and the cable trunk, known as the stub, should be as short as possible. Stubs present a non-terminated piece of bus line which can introduce reflections as the length of the stub increases. As a general guideline, the electrical length, or round-trip delay, of a stub should be less than one-tenth of the rise time of the driver, thus giving a maximum physical stub length as shown in 公式 1.

$$L_{(STUB)} \leq 0.1 \times t_r \times v \times c \quad (1)$$

where

- t_r is the 10/90 rise time of the driver
- v is the signal velocity of the cable or trace as a factor of c
- c is the speed of light (3×10^8 m/s)

Per 公式 1, 表 5 lists the maximum cable-stub lengths for the minimum-driver output rise-times of the SN65HVD7x full-duplex family of transceivers for a signal velocity of 78%.

表 5. Maximum Stub Length

DEVICE	MINIMUM DRIVER OUTPUT RISE TIME (ns)	MAXIMUM STUB LENGTH	
		(m)	(ft)
SN65HVD70	100	2.34	7.7
SN65HVD71	100	2.34	7.7
SN65HVD73	4	0.1	0.3
SN65HVD74	4	0.1	0.3
SN65HVD76	2	0.05	0.15
SN65HVD77	2	0.05	0.15

10.2.1.3 Bus Loading

The RS-485 standard specifies that a compliant driver must be able to driver 32 unit loads (UL), where 1 unit load represents a load impedance of approximately 12 kΩ. Because the SN65HVD7x family consists of 1/8 UL transceivers, connecting up to 256 receivers to the bus is possible.

10.2.1.4 Receiver Failsafe

The differential receivers of the SN65HVD7x family are *failsafe* to invalid bus states caused by the following:

- Open bus conditions, such as a disconnected connector
- Shorted bus conditions, such as cable damage shorting the twisted-pair together
- Idle bus conditions that occur when no driver on the bus is actively driving

In any of these cases, the differential receiver will output a failsafe logic high state so that the output of the receiver is not indeterminate.

Receiver failsafe is accomplished by offsetting the receiver thresholds such that the *input indeterminate* range does not include zero volts differential. In order to comply with the RS-422 and RS-485 standards, the receiver output must output a high when the differential input V_{ID} is more positive than 200 mV, and must output a Low when V_{ID} is more negative than –200 mV. The receiver parameters which determine the failsafe performance are V_{IT+}, $V_{IT–}$, and V_{hys} (the separation between V_{IT+} and $V_{IT–}$). As shown in the Electrical Characteristics table, differential signals more negative than –200 mV will always cause a low receiver output, and differential signals more positive than 200 mV will always cause a high receiver output.

When the differential input signal is close to zero, it is still above the V_{IT+} threshold, and the receiver output will be High. Only when the differential input is more than V_{hys} below V_{IT+} will the receiver output transition to a Low state. Therefore, the noise immunity of the receiver inputs during a bus fault conditions includes the receiver hysteresis value, V_{hys}, as well as the value of V_{IT+}.

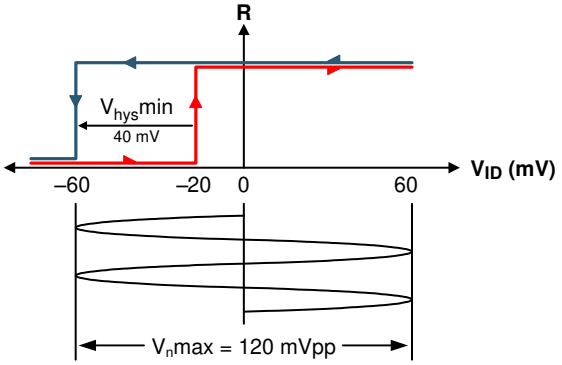

图 33. SN65HVD7x Noise Immunity Under Bus Fault Conditions

10.2.1.5 Transient Protection

The bus pins of the SN65HVD7x full-duplex transceiver family include on-chip ESD protection against ±30-kV HBM and ±12-kV IEC 61000-4-2 contact discharge. The International Electrotechnical Commission (IEC) ESD test is far more severe than the HBM ESD test. The 50% higher charge capacitance, $C_{(S)}$, and 78% lower discharge resistance, $R_{(D)}$, of the IEC model produce significantly higher discharge currents than the HBM model.

As stated in the IEC 61000-4-2 standard, contact discharge is the preferred transient protection test method. Although IEC air-gap testing is less repeatable than contact testing, air discharge protection levels are inferred from contact discharge test results.

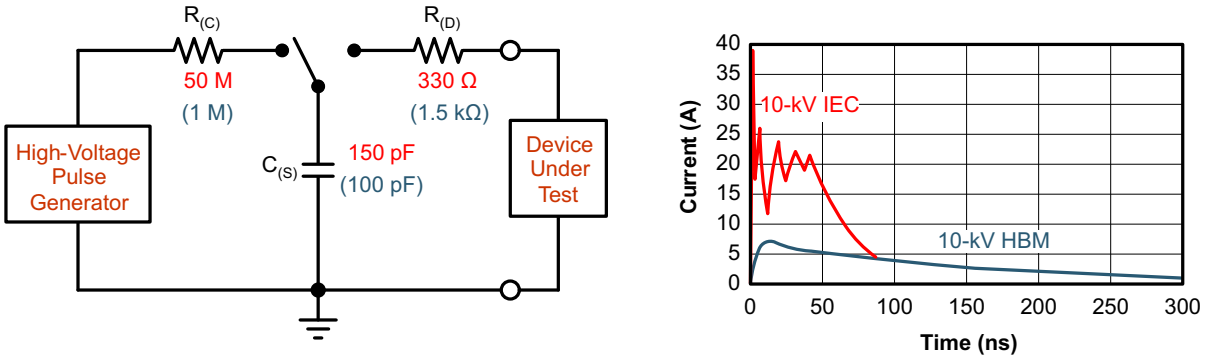

图 34. HBM and IEC ESD Models and Currents in Comparison (HBM Values in Parenthesis)

The on-chip implementation of IEC ESD protection significantly increases the robustness of equipment. Common discharge events occur because of human contact with connectors and cables. Designers may choose to implement protection against longer duration transients, typically referred to as surge transients.

EFTs are generally caused by relay-contact bounce or the interruption of inductive loads. Surge transients often result from lightning strikes (direct strike or an indirect strike which induce voltages and currents), or the switching of power systems, including load changes and short circuit switching. These transients are often encountered in industrial environments, such as factory automation and power-grid systems.

图 35 compares the pulse-power of the EFT and surge transients with the power caused by an IEC ESD transient. The left hand diagram shows the relative pulse-power for a 0.5kV surge transient and 4-kV EFT transient, both of which dwarf the 10-kV ESD transient visible in the lower-left corner. 500-V surge transients are representative of events that may occur in factory environments in industrial and process automations.

The right hand diagram shows the pulse-power of a 6-kV surge transient, relative to the same 0.5-kV surge transient. 6-kV surge transients are most likely to occur in power generation and power-grid systems.

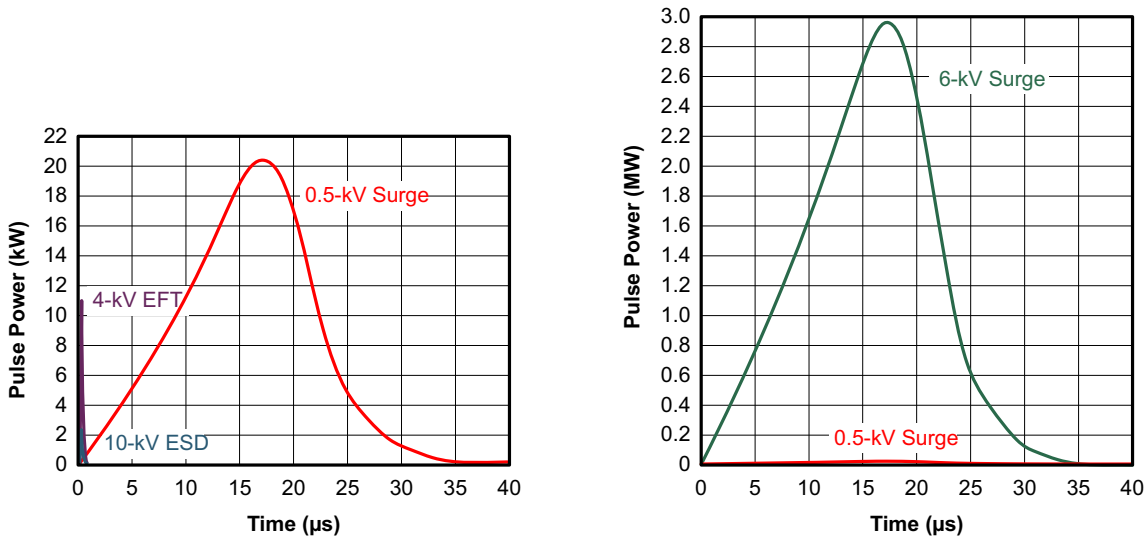

图 35. Power Comparison of ESD, EFT, and Surge Transients

In the case of surge transients, high-energy content is characterized by long pulse duration and slow decaying pulse power. The electrical energy of a transient that is dumped into the internal protection cells of a transceiver is converted into thermal energy, which heats and destroys the protection cells, thus destroying the transceiver. 图 36 shows the large differences in transient energies for single ESD, EFT, surge transients, and an EFT pulse train that is commonly applied during compliance testing.

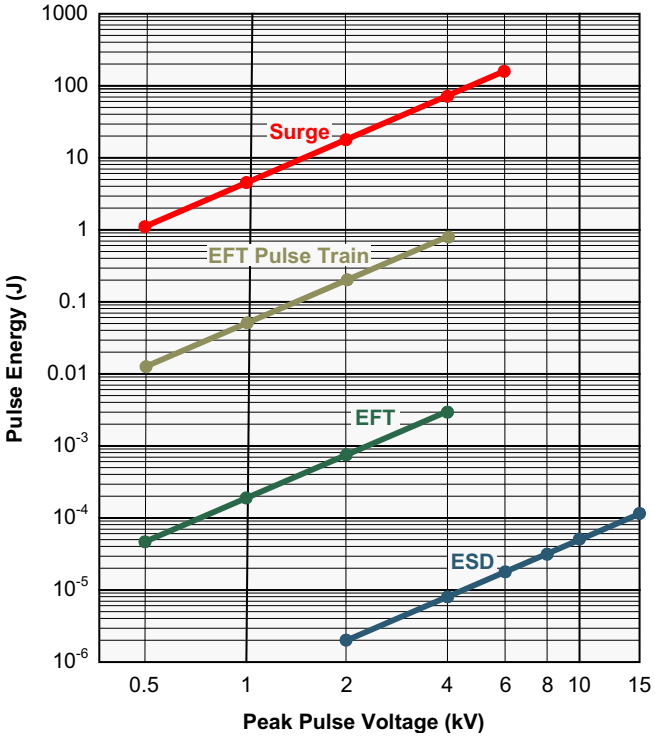

图 36. Comparison of Transient Energies

10.2.2 Detailed Design Procedure

In order to protect bus nodes against high-energy transients, the implementation of external transient protection devices is therefore necessary. 图 37 shows a protection circuit against 16-kV ESD, 4-kV EFT, and 1-kV surge transients.

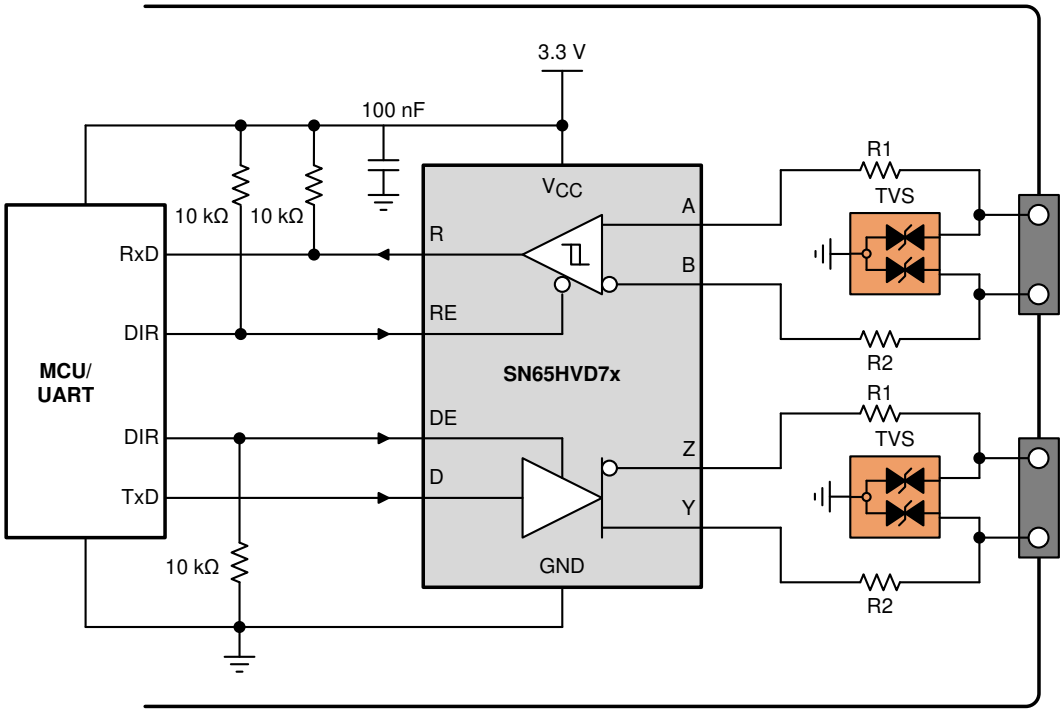

图 37. Transient Protection Against ESD, EFT, and Surge transients

11 Power Supply Recommendations

To ensure reliable operation at all data rates and supply voltages, each supply should be buffered with a 100-nF ceramic capacitor located as close to the supply pins as possible. The TPS76333 is a linear voltage regulator suitable for the 3.3-V supply.

12 Layout

12.1 Layout Guidelines

On-chip IEC-ESD protection is good for laboratory and portable equipment but never sufficient for EFT and surge transients occurring in industrial environments. Therefore robust and reliable bus node design requires the use of external transient protection devices.

Because ESD and EFT transients have a wide frequency bandwidth from approximately 3-MHz to 3-GHz, high-frequency layout techniques must be applied during PCB design.

For successful PCB design, begin with the design of the protection circuit (see 图 41).

1. Place the protection circuitry close to the bus connector to prevent noise transients from penetrating your board.
2. Use V_{CC} and ground planes to provide low-inductance. Note that high-frequency currents follow the path of least inductance and not the path of least impedance.
3. Design the protection components into the direction of the signal path. Do not force the transient currents to divert from the signal path to reach the protection device.
4. Apply 100-nF to 220-nF bypass capacitors as close as possible to the V_{CC}-pins of transceiver, UART, controller ICs on the board (see 图 41).
5. Use at least two vias for V_{CC} and ground connections of bypass capacitors and protection devices to minimize effective via-inductance (see 图 41).
6. Use 1-kΩ to 10-kΩ pullup and pulldown resistors for enable lines to limit noise currents in theses lines during transient events (see 图 41).
7. Insert pulse-proof resistors into the A and B bus lines if the TVS clamping voltage is higher than the specified maximum voltage of the transceiver bus pins. These resistors limit the residual clamping current into the transceiver and prevent it from latching up (see 图 41).
8. While pure TVS protection is sufficient for surge transients up to 1 kV, higher transients require metal-oxide varistors (MOVs) which reduce the transients to a few hundred volts of clamping voltage, and transient blocking units (TBUs) that limit transient current to less than 1 mA.

(1) **Status:** For more details on status, see our product life cycle.

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

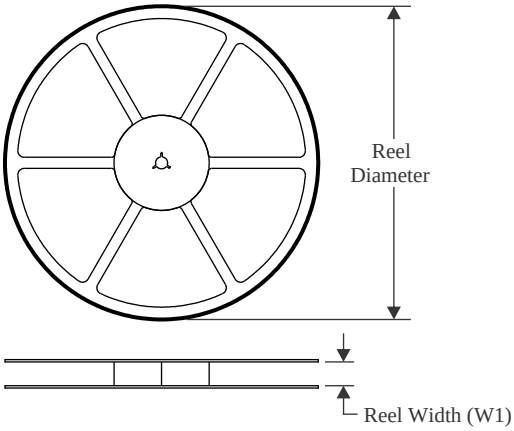
(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

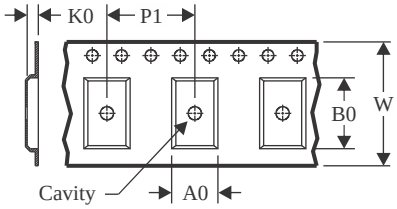
In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

TAPE AND REEL INFORMATION

REEL DIMENSIONS



TAPE DIMENSIONS



A0	Dimension designed to accommodate the component width
B0	Dimension designed to accommodate the component length
K0	Dimension designed to accommodate the component thickness
W	Overall width of the carrier tape
P1	Pitch between successive cavity centers

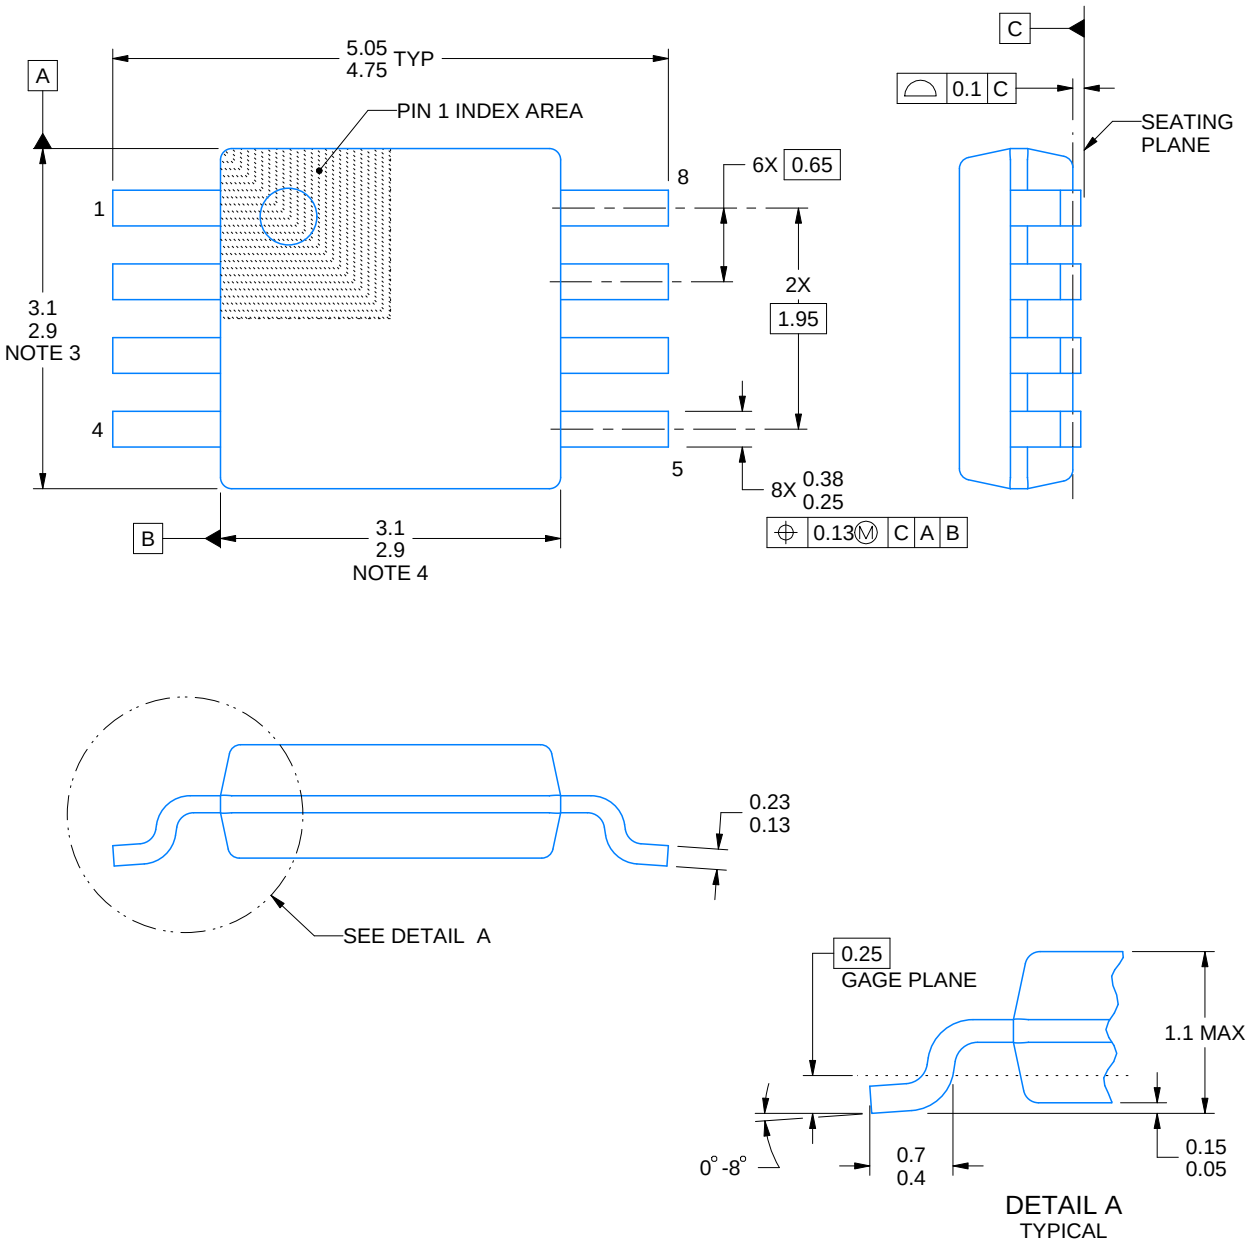
PACKAGE OUTLINE

DGK0008A

VSSOP - 1.1 mm max height

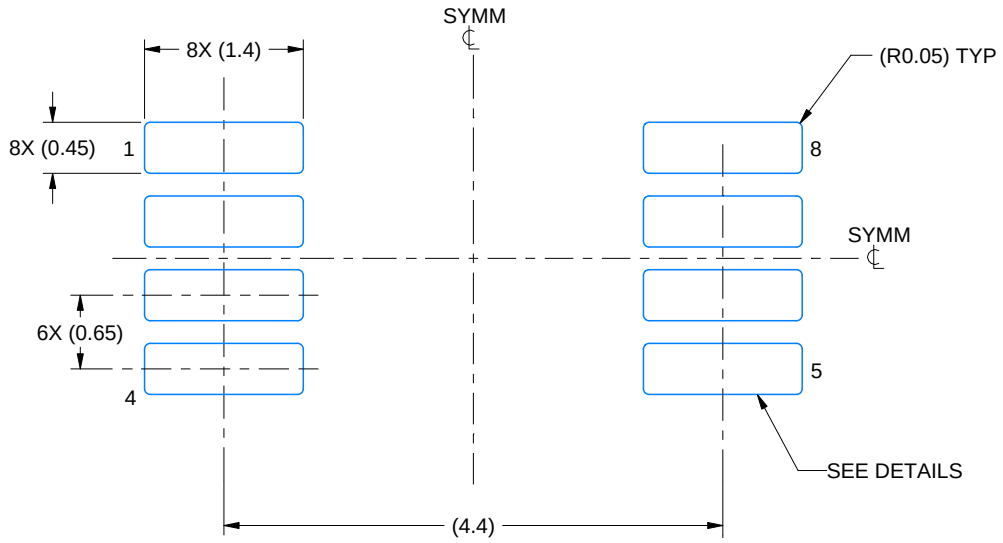
SMALL OUTLINE PACKAGE



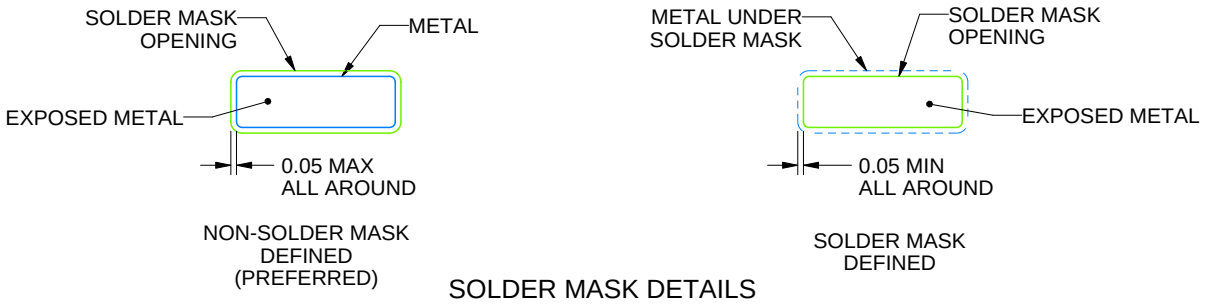
PowerPAD is a trademark of Texas Instruments.

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 mm per side.
4. This dimension does not include interlead flash. Interlead flash shall not exceed 0.25 mm per side.
5. Reference JEDEC registration MO-187.



LAND PATTERN EXAMPLE
EXPOSED METAL SHOWN
SCALE: 15X



SOLDER MASK DETAILS

4214862/A 04/2023

NOTES: (continued)

6. Publication IPC-7351 may have alternate designs.
7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.
8. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.
9. Size of metal pad may vary due to creepage requirement.
