### 3 说明

TLVH431 和 TLVH432 器件是低电压 3 端子可调节电压基准，在适用的工业和商业级温度范围内具有额定热稳定性。可以通过两个外部电阻器将输出电压设置为介于  $V_{REF}$  (1.24V) 和 18V 之间的任何值 (请参阅图 6-2)。这些器件具有比广泛使用的 TL431 和 TL1431 并联稳压器基准电压更低的工作电压 (1.24V)。

与光耦合器配合使用时，TLVH431 和 TLVH432 器件是适用于 3V 至 3.3V 开关模式电源的隔离式反馈电路中的理想电压基准。这些器件的输出阻抗典型值为 0.25 $\Omega$ 。有源输出电路提供非常快速的导通特性，因此 TLVH431 和 TLVH432 器件非常适合替代许多应用中的低压齐纳二极管，包括板载稳压和可调节电源。

TLVH432 器件与 TLVH431 器件相同，但 3 引脚 SOT-23 和 SOT-89 封装的引脚排列不同。

Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) Voltage values are with respect to the anode terminal, unless otherwise noted.

### 5.2 ESD Ratings

- (1) Maximum power dissipation is a function of T<sub>J(max)</sub>, θ<sub>JA</sub>, and T<sub>A</sub>. The maximum allowable power dissipation at any allowable ambient temperature is P<sub>D</sub> = (T<sub>J(max)</sub> - T<sub>A</sub>) / θ<sub>JA</sub>. Operating at the absolute maximum T<sub>J</sub> of 150°C can affect reliability.

- (1) Full temperature ranges are -40°C to +125°C for TLVH431Q, -40°C to +85°C for TLVH431I, and 0°C to 70°C for TLVH431C.  
 (2) The deviation parameters V<sub>REF(dev)</sub> and I<sub>ref(dev)</sub> are defined as the differences between the maximum and minimum values obtained over the rated temperature range. The average full-range temperature coefficient of the reference input voltage, α<sub>VREF</sub>, is defined as:

$$|\alpha_{V_{REF}}| \left( \frac{\text{ppm}}{^{\circ}\text{C}} \right) = \frac{\left( \frac{V_{REF(dev)}}{V_{REF}(T_A = 25^{\circ}\text{C})} \right) \times 10^6}{\Delta T_A}$$

where ΔT<sub>A</sub> is the rated operating free-air temperature range of the device.

α<sub>VREF</sub> can be positive or negative, depending on whether minimum V<sub>REF</sub> or maximum V<sub>REF</sub>, respectively, occurs at the lower temperature.

- (3) The dynamic impedance is defined as:

$$|z_{ka}| = \frac{\Delta V_{KA}}{\Delta I_K}$$

When the device is operating with two external resistors (see 图 6-2), the total dynamic impedance of the circuit is defined as:

$$|z_{ka}|' = \frac{\Delta V}{\Delta I} \approx |z_{ka}| \times \left( 1 + \frac{R1}{R2} \right)$$

(2) The deviation parameters  $V_{REF(\text{dev})}$  and  $I_{ref(\text{dev})}$  are defined as the differences between the maximum and minimum values obtained over the rated temperature range. The average full-range temperature coefficient of the reference input voltage,  $\alpha_{V_{REF}}$ , is defined as:

$$|\alpha_{V_{REF}}| \left( \frac{\text{ppm}}{^\circ\text{C}} \right) = \frac{\left( \frac{V_{REF(\text{dev})}}{V_{REF}(T_A = 25^\circ\text{C})} \right) \times 10^6}{\Delta T_A}$$

where  $\Delta T_A$  is the rated operating free-air temperature range of the device.

$\alpha_{V_{REF}}$  can be positive or negative, depending on whether minimum  $V_{REF}$  or maximum  $V_{REF}$ , respectively, occurs at the lower temperature.

- (3) The dynamic impedance is defined as:

$$|z_{ka}| = \frac{\Delta V_{KA}}{\Delta I_K}$$

When the device is operating with two external resistors (see 图 6-2), the total dynamic impedance of the circuit is defined as:

$$|z_{ka}|' = \frac{\Delta V}{\Delta I} \approx |z_{ka}| \times \left( 1 + \frac{R1}{R2} \right)$$

## 7 Detailed Description

### 7.1 Overview

TLVH431 is a low power counterpart to TL431, having lower reference voltage (1.24V versus 2.5V) for lower voltage adjustability and lower minimum cathode current ( $I_{k(\min)} = 100\mu\text{A}$  versus 1mA). Like TL431, TLVH431 is used in conjunction with the key components to behave as a single voltage reference, error amplifier, voltage clamp or comparator with integrated reference.

TLVH431 is also a higher voltage counterpart to TLV431, with cathode voltage adjustability from 1.24V to 18V, making this part optimum for a wide range of end equipments in industrial, auto, telecom and computing. For this device to behave as a shunt regulator or error amplifier,  $>100\mu\text{A}$  ( $I_{\min(\max)}$ ) must be supplied in to the cathode pin. Under this condition, feedback can be applied from the Cathode and Ref pins to create a replica of the internal reference voltage.

Various reference voltage options can be purchased with initial tolerances (at 25°C) of 0.5%, 1%, and 1.5%. These reference options are denoted by B (0.5%), A (1.0%) and blank (1.5%) after the TLVH431.

The TLVH431xC devices are characterized for operation from 0°C to 70°C, the TLVH431xl devices are characterized for operation from -40°C to +85°C, and the TLVH431xQ devices are characterized for operation from -40°C to +125°C.

### 7.3 Feature Description

TLVH431 consists of an internal reference and amplifier that outputs a sink current base on the difference between the reference pin and the virtual internal pin. The sink current is produced by an internal Darlington pair.

When operated with enough voltage headroom ( $\geq 1.24\text{V}$ ) and cathode current ( $I_{ka}$ ), TLVH431 forces the reference pin to  $1.24\text{V}$ . However, the reference pin can not be left floating, as it needs  $I_{ref} \geq 0.5\mu\text{A}$  (see 节 5). This is because the reference pin is driven into an NPN, which needs base current in order operate properly.

When feedback is applied from the Cathode and Reference pins, TLVH431 behaves as a Zener diode, regulating to a constant voltage dependent on current being supplied into the cathode. This is due to the internal amplifier and reference entering the proper operating regions. The same amount of current needed in the above feedback situation must be applied to this device in open loop, servo or error amplifying implementations for it to be in the proper linear region giving TLVH431 enough gain.

Unlike many linear regulators, TLVH431 is internally compensated to be stable without an output capacitor between the cathode and anode. However, if it is desired to use an output capacitor 图 5-15, 图 5-16, and 图 5-17 can be used as a guide to assist in choosing the correct capacitor to maintain stability.

## 7.4 Device Functional Modes

### 7.4.1 Open Loop (Comparator)

When the cathode/output voltage or current of TLVH431 is not being fed back to the reference/input pin in any form, this device is operating in open loop. With proper cathode current ( $I_{ka}$ ) applied to this device, TLVH431 has the characteristics shown in [Figure 5-4](#). With such high gain in this configuration, the TLVH431 device is typically used as a comparator. With the reference integrated makes TLVH431 the preferred choice when users are trying to monitor a certain level of a single signal.

### 7.4.2 Closed Loop

When the cathode/output voltage or current of TLVH431 is being fed back to the reference/input pin in any form, this device is operating in closed loop. The majority of applications involving TLVH431 use it in this manner to regulate a fixed voltage or current. The feedback enables this device to behave as an error amplifier, computing a portion of the output voltage and adjusting it to maintain the desired regulation. This is done by relating the output voltage back to the reference pin in a manner to make it equal to the internal reference voltage, which can be accomplished through resistive or direct feedback.

### 8.1 Application Information

图 8-1 显示了 TLVH431, TLVH431A, 或 TLVH431B 用于 3.3-V 隔离式反激电源。输出电压  $V_O$  可以低至参考电压  $V_{REF}$  ( $1.24V \pm 1\%$ )。调节器的输出，加上光耦 LED 的正向导压降 ( $1.24 + 1.4 = 2.64V$ )，决定了在隔离式电源配置中可以调节的最小电压。在图 8-1 所示的拓扑结构中，低至 2.7 Vdc 的稳压电压是可能的。

TLVH431 系列器件在这些应用中很普遍，因此设计者通常会选择用于二次侧调节。由于这种普遍性，本节解释了操作和设计，既包括 TLVH431 在此应用中将看到的开环（比较器 +  $V_{REF}$ ）和闭环（分流调节器）。

#### 8.2.1.2 Detailed Design Procedure

When using TLVH431 as a comparator with reference, determine the following:

- Input voltage range
- Reference voltage accuracy
- Output logic input high and low level thresholds
- Current source resistance

##### 8.2.1.2.1 Basic Operation

In the configuration shown in 图 8-2, TLVH431 behaves as a comparator, comparing the  $V_{\text{ref}}$  pin voltage to the internal virtual reference voltage. When provided a proper cathode current ( $I_k$ ), TLVH431 will have enough open loop gain to provide a quick response. With the TLVH431's max Operating Current ( $I_{\text{min}}$ ) being 100  $\mu$ A and up to 150  $\mu$ A over temperature, operation below that could result in low gain, leading to a slow response.

### 8.2.1.2.2 Overdrive

Slow or inaccurate responses can also occur when the reference pin is not provided enough overdrive voltage. This is the amount of voltage that is higher than the internal virtual reference. The internal virtual reference voltage will be within the range of  $1.24V \pm(0.5\%, 1.0\% \text{ or } 1.5\%)$  depending on which version is being used.

The more overdrive voltage provided, the faster the TLVH431 will respond. See figures [图 8-3](#) and [图 8-4](#), for the output responses to various input voltages.

For applications where TLVH431 is being used as a comparator, it is best to set the trip point to greater than the positive expected error (that is, +1.0% for the A version). For fast response, setting the trip point to > 10% of the internal  $V_{ref}$  should suffice.

For minimal voltage drop or difference from  $V_{in}$  to the ref pin, it is recommended to use an input resistor  $<10\text{ k}\Omega$  to provide  $I_{ref}$ .

### 8.2.1.2.3 Output Voltage and Logic Input Level

For TLVH431 to properly be used as a comparator, the logic output must be readable by the receiving logic device. This is accomplished by knowing the input high and low level threshold voltage levels, typically denoted by  $V_{IH}$  and  $V_{IL}$ .

As shown in [图 8-3](#) and [图 8-4](#), TLVH431's output low level voltage in open-loop/comparator mode is approximately 1V, which is sufficient for some 3.3V supplied logic. However, does not work for 2.5V and 1.8V supplied logic. To accommodate this a resistive divider can be tied to the output to attenuate the output voltage to a voltage legible to the receiving low voltage logic device.

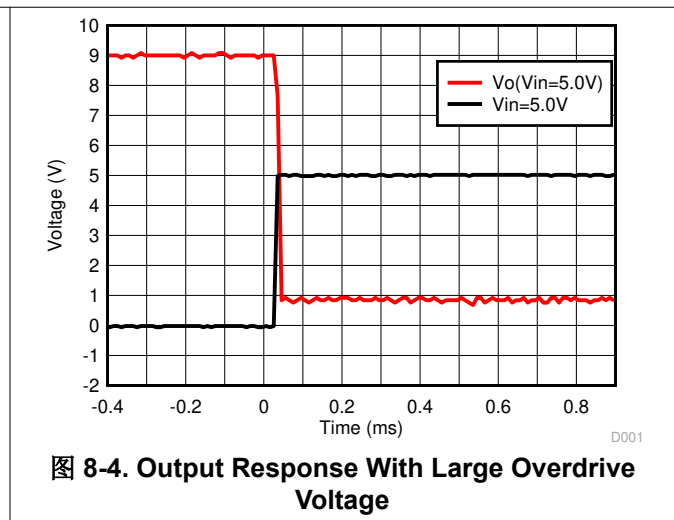

TLVH431's output high voltage is approximately  $V_{SUP}$  due to TLVH431 being open-collector. If  $V_{SUP}$  is much higher than the receiving logic's maximum input voltage tolerance, the output must be attenuated to accommodate the outgoing logic's reliability.

When using a resistive divider on the output, be sure to make the sum of the resistive divider ( $R_1$  and  $R_2$  in [图 8-2](#)) is much greater than  $R_{SUP}$  to not interfere with TLVH431's ability to pull close to  $V_{SUP}$  when turning off.

#### 8.2.1.2.3.1 Input Resistance

TLVH431 requires an input resistance in this application to source the reference current ( $I_{REF}$ ) needed from this device to be in the proper operating regions while turning on. The actual voltage seen at the ref pin is  $V_{REF} = V_{IN} - I_{REF} \times R_{IN}$ . Because  $I_{REF}$  can be as high as  $0.5\mu A$ , TI recommends to use a resistance small enough that mitigates the error that  $I_{REF}$  creates from  $V_{IN}$ .

For this design example, use the parameters listed in 表 8-2 as the input parameters.

### 8.2.2.2 Detailed Design Procedure

When using TLVH431 as a Shunt Regulator, determine the following:

- Input voltage range
- Temperature range
- Total accuracy
- Cathode current
- Reference initial accuracy
- Output capacitance

#### 8.2.2.2.1 Programming Output/Cathode Voltage

To program the cathode voltage to a regulated voltage a resistive bridge must be shunted between the cathode and anode pins with the mid point tied to the reference pin. This can be seen in 图 8-5, with R1 and R2 being the resistive bridge. The cathode/output voltage in the shunt regulator configuration can be approximated by the equation shown in 图 8-5. The cathode voltage can be more accurately determined by taking in to account the cathode current:

$$V_O = (1 + R1/R2) \times V_{REF} - I_{REF} \times R1$$

In order for this equation to be valid, TLVH431 must be fully biased so that it has enough open loop gain to mitigate any gain error. This can be done by meeting the I<sub>min</sub> spec denoted in 节 5.

### 8.2.2.2.2 Total Accuracy

When programming the output above unity gain ( $V_{KA}=V_{REF}$ ), TLVH431 is susceptible to other errors that may effect the overall accuracy beyond  $V_{REF}$ . These errors include:

- R1 and R2 accuracies
- $V_{I(dev)}$  - Change in reference voltage over temperature
- $\Delta V_{ref} / \Delta V_{KA}$  - Change in reference voltage to the change in cathode voltage
- $|z_{KA}|$  - Dynamic impedance, causing a change in cathode voltage with cathode current

Worst case, cathode voltage can be determined taking all of the variables in to account. The application note *Setting the Shunt Voltage on an Adjustable Shunt Regulator*, [SLVA445](#), assists designers in setting the shunt voltage to achieve optimum accuracy for this device.

### 8.2.2.2.3 Stability

Though TLVH431 is stable with no capacitive load, the device that receives the shunt regulator's output voltage can present a capacitive load that is within the TLVH431 region of stability, shown in [图 5-15](#), [图 5-16](#) and [图 5-17](#). Also, designers can use capacitive loads to improve the transient response or for power supply decoupling.

TI recommends to choose capacitors that give a phase margin  $> 5^\circ$  to maintain stability of the TLVH431.

### 8.2.2.3 Application Curve

## 8.3 Power Supply Recommendations

When using TLVH431 as a Linear Regulator to supply a load, designers will typically use a bypass capacitor on the output/cathode pin. When doing this, be sure that the capacitance is within the stability criteria shown in [图 5-15](#), [图 5-16](#), and [图 5-17](#).

To not exceed the maximum cathode current, be sure that the supply voltage is current limited. Also, limit the current being driven into the Ref pin, as not to exceed its absolute maximum rating.

For applications shunting high currents, pay attention to the cathode and anode trace lengths, adjusting the width of the traces to have the proper current density.

## 8.4 Layout

### 8.4.1 Layout Guidelines

Place decoupling capacitors as close to the device as possible. Use appropriate widths for traces when shunting high currents to avoid excessive voltage drops.

### 9.5 静电放电警告

静电放电 (ESD) 会损坏这个集成电路。德州仪器 (TI) 建议通过适当的预防措施处理所有集成电路。如果不遵守正确的处理和安装程序，可能会损坏集成电路。

ESD 的损坏小至导致微小的性能降级，大至整个器件故障。精密的集成电路可能更容易受到损坏，这是因为非常细微的参数更改都可能会导致器件与其发布的规格不相符。

(1) **Status:** For more details on status, see our [product life cycle](#).

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
