

## **bq500511 适用于 WPC v1.2 A11 发送器的 低成本 5V 无线电源发送器控制器**

### **1 特性**

- 符合无线充电联盟 v1.2 A11 规范的数字控制器
- 专为与 bq50002 模拟前端搭配使用而设计
- 适用于无线充电联盟 (WPC) 和 5V 专用无线电源发送器
- 支持高达 5W 的接收功率
- 双芯片解决方案实现了效率超过 75% 的高效发送器设计
- 超低待机功耗，即使在数字 Ping 过程中也可实现 (< 30mW)
- 动态电源限制 (DPL)™ 通过功率受限的输入源实现正常运行
- 系统发光二极管 (LED) 指示充电状态和故障状态
- 精准的外来物体检测方法 (FOD) 可防止发送器和接收器线圈之间的物体过热

### **2 应用**

- 适用于智能手机和可穿戴应用且符合 WPC 标准的无线充电器
- 专用无线充电器
- 医疗和工业应用
- 汽车及其他车辆配件
- 有关 TI 无线电源解决方案的更多信息，请访问 [www.ti.com/wirelesspower](http://www.ti.com/wirelesspower)

### **3 说明**

bq500511 是一款无线电源发送器控制器。在与 bq50002 模拟前端器件搭配使用时，该器件集成了创建符合 Qi 标准或 5V 专用发送器所需的全部功能。bq500511 和 bq50002 共同构成一款紧凑型无线充电器解决方案。bq500511 对周围环境执行 ping 操作来寻找需要供电的接收器器件，之后会与 Rx 器件安全接合、接收充电器传输的通信数据包以及根据 WPC v1.2 规范管理功率传输。

bq500511 特有的 Dynamic Power Limiting™ (DPL) 功能可最大限度地提升无线电源控制应用的灵活性。对于功率受限的输入电源，DPL 对其可用功率进行无缝优化来改善用户体验。

通过持续监测已建立电源传输的效率，该系统支持外来物体检测 (FOD)，以防因在无线电源传输场中错误放置金属物体而产生功率损耗。如果在电源传输过程中出现任何异常情况，bq500511 将对其进行处理并提供指示输出。综合状态和故障监视特性可实现一款经 Qi 认证的低成本且稳健耐用的无线电源系统设计方案。

bq500511 采用 6mm x 6mm 耐热增强型 40 引脚超薄四方扁平无引线 (VQFN) 封装。

#### **器件信息(1)**

## 5 Pin Configuration and Functions

**Pin Functions**

PIN		I/O	DESCRIPTION
NAME	NO.		
AVCC	40	—	Analog I power supply.
AVSS	36, 39	—	Analog ground.
BUZZ	15	O	DC buzzer output. A 400-ms DC pulse when charging begins. This could also be connected to an LED via 1-kΩ resistor.
CLK_IN	21	I	CLK_OUT signal from the internal oscillator of the bq50002 Analog Front End.
COMM1	22	I	Communication channel 1. Typically generated by the bq50002 Analog Front End.
COMM2	23	I	Communication channel 2. Typically generated by the bq50002 Analog Front End.
DRV_EN	37	O	Driver enable.
DVCC	32	—	Digital power supply.
DVSS	31	—	Digital ground.
FLIM	33	I	Leave floating to conform to the WPC specification 205-kHz maximum operating frequency. Pull down with a 10-kΩ resistor to limit the maximum frequency to 190 kHz.
FOD_CAL	10	I	FOD calibration.
FOD_THR	35	I	FOD threshold.

### Pin Functions (continued)

PIN		I/O	DESCRIPTION
NAME	NO.		
ISENSE	3	I	Input current sense.
LED_A	11	O	Connect to a LED via 1-kΩ resistor for status indication. Typically GREEN.
LED_B	12	O	Connect to a LED via 1-kΩ resistor for status indication. Typically RED.
LED_C	14	O	Connect to a LED via 1-kΩ resistor for status indication. Typically ORANGE.
LED_MODE	34	I	LED mode selection.
MODE	16	O	MODE is an output intended for use by the bq50002 Analog Front End indicating whether adjustments should be made using frequency (when MODE is low) or duty-cycle (when MODE is high).
PWM1 / CLK_OUT	1	O	If PWM_CTRL is high, this pin outputs PWM1 signal. If PWM_CTRL is low, this pin outputs clock signal. The rising edge of the clock is used to adjust frequency (MODE low) or duty cycle (MODE high) output of the bq50002 Analog Front End.
PWM_CTRL	38	O	PWM_CTRL is an output intended for use by the bq50002 Analog Front End to select whether its PWM outputs are generated internally within the bq50002 itself (PWM_CTRL HIGH), or whether they are simply passed through from external signals (PWM_CTRL LOW).
PWM2 / UP_DOWN	2	O	If PWM_CTRL is high, this pin outputs PWM2 signal. If PWM_CTRL is low, this pin is used to adjust the frequency (MODE low) or duty cycle (MODE high) of the external PWM output. If this signal is high, it decrease frequency or increase duty cycle. If this signal is low, it increases frequency or decreases duty cycle output of the bq50002 Analog Front End.
Reserved	4	I	Leave this pin open.
Reserved	5	I	Unused
Reserved	19	I	Reserved. Leave this pin open.
Reserved	20	I/O	Reserved. Leave this pin open.
SCL	29	I/O	10-kΩ pull-up resistor to 3-V supply. I <sup>2</sup> C Clock.
SDA	28	I/O	10-kΩ pull-up resistor to 3-V supply. I <sup>2</sup> C Data.
TSENSE	13	I	Temperature sensing for safety shutdown. Connect to 3 V via 10-kΩ resistor if unused.
Unused	6	I	Leave this pin open.
Unused	7	I/O	Leave this pin open.
Unused	17, 18, 24–27	I/O	Leave this pin open.
VCORE	30	—	Regulated internal core power supply. Connect via 0.4-μF capacitor to ground.
VPEAK	8	I	Peak coil voltage.
VSENSE	9	I	Input voltage sense.

## 6 Specifications

### 6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

		MIN	MAX	UNIT
Voltage	Applied at VCC to VSS	–0.3	4.1	V
	Applied to any pin (excluding V <sub>CORE</sub> ) <sup>(2)</sup>	–0.3	VCC + 0.3	V
Diode current at any device pin		–2	2	mA
Maximum junction temperature, T <sub>J</sub>			95 <sup>(3)</sup>	°C
Storage temperature, T <sub>stg</sub>		–55	95	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltages referenced to V<sub>SS</sub>. V<sub>CORE</sub> is for internal device use only. No external DC loading or voltage should be applied.
- (3) It is recommended to follow the current JEDEC J-STD-020 specification with peak reflow temperatures not higher than classified on the device label on the shipping boxes or reels. In general, hand soldering is not recommended. However, if hand soldering is required for application prototyping, peak temperature must not exceed 250°C for longer than 30 seconds durations. In addition, during storage, the maximum storage temperature of 95°C should not be exceeded.

### 6.2 ESD Ratings

		VALUE	UNIT
V <sub>(ESD)</sub> Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	1000	V
	Charged-device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup>	250	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V <sub>CC</sub>	Supply voltage during program execution and FRAM programming (AVCC = DVCC) <sup>(1)</sup>	2		3.6	V
V <sub>SS</sub>	Supply voltage (AVSS = DVSS)		0		V
T <sub>A</sub>	Operating free-air temperature	–40		85	°C
T <sub>J</sub>	Operating free-air temperature	–40		85	°C
C <sub>(V<sub>CORE</sub>)</sub>	Required capacitor at V <sub>CORE</sub> <sup>(2)</sup>		470		nF
C <sub>(VCC)/C<sub>(V<sub>CORE</sub>)</sub></sub>	Capacitor ratio of VCC to V <sub>CORE</sub>	10			nF

- (1) It is recommended to power AVCC and DVCC from the same source. A maximum difference of 0.3 V between AVCC and DVCC can be tolerated during power up and operation.
- (2) A capacitor tolerance of ±20% or better is required.

## 6.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		bq500511	UNIT
		RHA (VQFN)	
		40 PINS	
R <sub>θJA</sub>	Junction-to-ambient thermal resistance	31.8	°C/W
R <sub>θJC(top)</sub>	Junction-to-case (top) thermal resistance	18.5	°C/W
R <sub>θJB</sub>	Junction-to-board thermal resistance	6.8	°C/W
ψ <sub>JT</sub>	Junction-to-top characterization parameter	0.2	°C/W
ψ <sub>JB</sub>	Junction-to-board characterization parameter	6.7	°C/W
R <sub>θJC(bot)</sub>	Junction-to-case (bottom) thermal resistance	1.8	°C/W

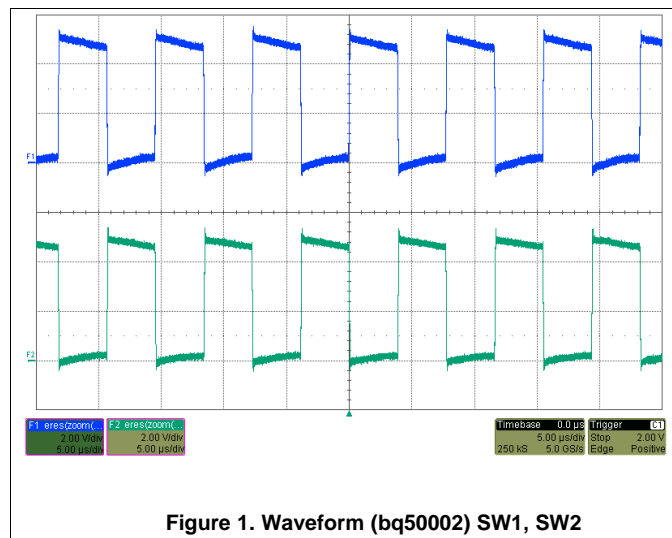

(1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report, [SPRA953](#).

## 6.5 Electrical Characteristics

over operating free-air temperature range (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
I <sub>(AM)</sub> Active Mode Supply Current into V <sub>CC</sub>	3 V		3.45	4.3	mA
L <sub>(LPM)</sub> Low-Power Mode Supply Current into V <sub>CC</sub>	3 V		274		μA
	–40°C		285	340	μA
	25°C		315		μA
	60°C		340	455	μA
	85°C				μA

## 6.6 Typical Characteristics

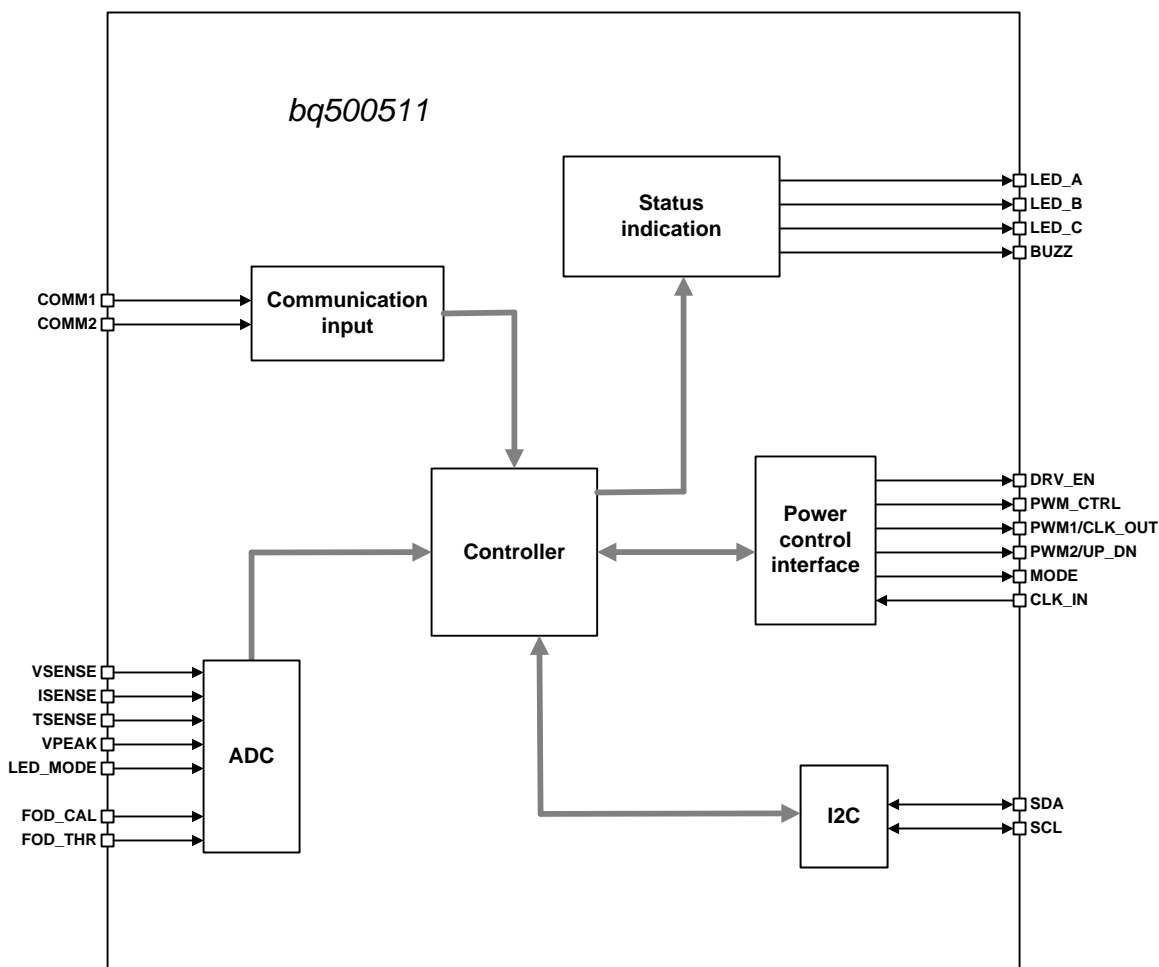

## 7 Detailed Description

### 7.1 Overview

The principle of wireless power transfer is simply an open-cored transformer consisting of transmitter and receiver coils. The transmitter coil and electronics are typically built into a charger pad and the receiver coil and electronics are typically built into a portable device, such as a cell phone. When the receiver coil is positioned on the transmitter coil, magnetic coupling occurs when the transmitter coil is driven. The flux is coupled into the secondary coil, which induces a voltage and current flows. The secondary voltage is rectified, and power can be transferred effectively to a load, wirelessly. Power transfer can be managed through various closed loop control schemes.

After power is applied and the transmitter device comes out of reset, it will automatically begin the process of detecting and powering a receiver. The bq500511 sends a ping to detect the presence of a receiver on the pad. After a receiver is detected, the bq500511 attempts to establish communication and begin power transfer. The bq500511 is designed to operate with the bq50002 Wireless Power Transmitter Analog Front End to control a full-bridge power stage to drive the primary coil. Through a simple interface the bq500511 instructs the bq50002 how much to increase or decrease power. The full bridge power stage allows for higher power delivery for a given supply voltage.

### 7.2 Functional Block Diagram

## 7.3 Feature Description

### 7.3.1 A11 Coil Specification

The bq500511 controller supports the A11 transmitter coil type for which the coil and matching capacitor specification has been established by the WPC Standard although the device can be used in a proprietary (non-WPC) system. This is fixed and cannot be changed on the transmitter side.

For a current list of coil vendors, see *bqTESLA Transmitter Coil Vendors*, [SLUA649](#).

### 7.3.2 Option Select Pins

There are three option select pins on the bq500511. Two (FOD\_CAL and FOD\_THR) are used to calibrate the foreign object detection algorithm. The third (LED\_MODE) selects the LED output behavior. The voltages on these pins will be read by bq500511 at power-up.

For LED\_MODE, the selected bin determines the LED behavior based on [Table 1](#).

See section [Foreign Object Detection \(FOD\) and FOD Calibration](#) for more information on the remaining option select pins.

### 7.3.3 LED Modes

The bq500511 can directly drive three LED outputs (pin 11, pin 12, and pin 14) through a simple current limit resistor (typically 470  $\Omega$ ), based on the mode selected. The three current limit resistors can be individually adjusted to tune or match the brightness of the LEDs. Do not exceed the maximum output current rating of the device.

Several predefined LED display schemes are selectable via the voltage on the LED\_MODE pin at startup. Any means of setting the LED\_MODE voltage can be used; if a resistor divider between 3 V and ground is used as shown in [Figure 3](#), relatively large values should be used to minimize the idle power loss. With 100 k $\Omega$  used for the upper resistor values for the lower resistor, R<sub>LED</sub> selects one of the desired LED indication schemes presented in [Table 1](#).

**Figure 3. LED\_MODE Selection**

**Table 1. LED Control**

LED CONTROL OPTION	R <sub>LED</sub> SELECTION RESISTOR (k $\Omega$ )	DESCRIPTION	LED	OPERATIONAL STATES					
				STANDBY	POWER TRANSFER <sup>(1)</sup>	CHARGE COMPLETE	FAULT <sup>(1)(2)</sup>	FOD WARNING <sup>(2)</sup>	DPL <sup>(1)</sup>
1	24.9	2-LED option #1	LED_A (green)	off	blink slow	on	off	off	blink slow
			LED_B (red)	off	off	off	on	blink fast	blink slow
			LED_C (orange)	–	–	–	–	–	–
2	36.5	2-LED option Standby LED's	LED_A (green)	on	blink slow	on	off	off	blink slow
			LED_B (red)	on	off	off	on	blink fast	blink slow
			LED_C (orange)	–	–	–	–	–	–
3	49.9	Single LED option	LED_A (green)	off	on	off	blink fast	on	on
			LED_B (red)	–	–	–	–	–	–
			LED_C (orange)	–	–	–	–	–	–

(1) blink slow = 1.25 Hz

(2) blink fast = 5 Hz

## Feature Description (continued)

**Table 1. LED Control (continued)**

LED CONTROL OPTION	R <sub>LED</sub> SELECTION RESISTOR (kΩ)	DESCRIPTION	LED	OPERATIONAL STATES					
				STANDBY	POWER TRANSFER <sup>(1)</sup>	CHARGE COMPLETE	FAULT <sup>(1)(2)</sup>	FOD WARNING <sup>(2)</sup>	DPL <sup>(1)</sup>
4	66.5	2-LED option #2	LED_A (green)	off	on	off	off	off	–
			LED_B (red)	off	off	off	on	blink fast	blink slow
			LED_C (orange)	–	–	–	–	–	–

10	392	2-LED option #5	LED_A (green)	off	on	off	blink fast	on	blink slow
			LED_B (red)	off	off	on	off	off	off
			LED_C (orange)	–	–	–	–	–	–

### 7.3.4 Foreign Object Detection (FOD) and FOD Calibration

The bq500511 supports FOD in order to meet the requirements of the WPC v1.2 specification and to protect against the heating of metal objects between coils. Continuously monitoring input power, known losses, and the value of power reported by the receiver device being charged, the bq500511 can estimate how much power is unaccounted for and presumed lost due to metal objects placed in the wireless power transfer path. If this unexpected loss exceeds the threshold set by the FOD resistors, a fault is indicated and power transfer is halted.

As the default, the FOD resistors should set a threshold of 400 mW which has been empirically determined using standard WPC FOD test objects (disc, ring and foil). Some tuning might be required as every system will be slightly different. This tuning is best done by trial and error: increase or decrease the loss threshold and retry the system with the standard test objects. The ultimate goal of the FOD feature is safety; to protect misplaced metal objects from becoming hot. Reducing the loss threshold and making the system too sensitive may lead to a false object detection and a bad user experience. Find the balance which best suits the application.

If the application requires disabling FOD, it is possible by tying the FOD\_THR pin to 3 V.

#### NOTE

Disabling FOD results in a TX solution that is not WPC v1.2 compliant.

The FOD\_CAL input, can be used to compensate for any load-dependent effect on the power loss. Using a calibrated FOD reference receiver with no foreign objects present, FOD\_CAL should be selected such that the calculated loss across the load range is substantially constant (within approximately 100 mW). After correcting for the load dependence, the FOD thresholds should be re-set above the resulting average by approximately 400 mW for the transmitter to satisfy the WPC requirements on tolerated heating.

Similarly to the LED\_MODE selection, FOD\_THR and FOD\_CAL are set based on the voltage of their inputs (pins 35 and 10 respectively) measured when the device is powered up.

$$\text{FOD\_threshold} = \text{FOD\_THR} \times 400 \quad (1)$$

Where:

FOD\_threshold is the maximum allowed loss in mW, above which a FOD fault is triggered.

FOD\_THR is the voltage on pin 35 in volts (between 0 and 2.5 Volts).

For example, to set the recommended starting threshold of 400 mW, 1 V should be applied to FOD\_THR; this could be accomplished with a resistor divider between 3 V and ground consisting of 200 kΩ over 100 kΩ.

The value for FOD\_CAL is calculated with an offset to allow a correction which either increases or decreases with load.

$$\text{FOD\_correction} = -1000 + \text{FOD\_CAL} \times 800 \quad (2)$$

Where:

FOD\_correction is load dependent correction in mW/Amp.

FOD\_CAL is the voltage on pin 10 in volts (between 0 and 2.5 Volts).

For both the FOD\_THR and FOD\_CAL inputs, an internal analog to digital converter with a range of 0 V – 2.5 V is used to measure the input. The combined range and gain provide attainable ranges of 0 mW to 1000 mW for FOD\_threshold, and –1000 mW/A to +1000 mW/A for FOD\_correction.

**Contact TI for the TX tuning tool to set appropriate FOD\_THR and FOD\_CAL values for your design.**

### 7.3.5 Shut Down Through External Thermal Sensor or Trigger

Typical applications of the bq500511 do not require additional thermal protection. This shutdown feature is provided for enhanced applications and is not limited to thermal shutdown. The key parameter is the 1 V threshold on pin 13, TSENSE. Voltage below 1 V on pin 13 causes the device to shut down. The application of thermal monitoring through a negative temperature coefficient (NTC) sensor, for example, is straightforward. The NTC forms the lower leg of a temperature-dependent voltage divider. The NTC leads are connected to the bq500511 device, pin 13 and GND. The threshold on pin 13 is set to 1 V, below which the system shuts down and indicates a fault (indication depending on LED mode chosen).

To implement this feature follow these steps:

1. Consult the NTC data sheet and find the resistance versus temperature curve.
2. Determine the actual temperature where the NTC will be placed by using a thermal probe.
3. Read the NTC resistance at that temperature in the NTC datasheet, that is R\_NTC.
4. Use the following formula to determine the upper leg resistor (R\_Setpoint):

$$\text{R\_Setpoint} = 2.3 \times \text{R\_NTC} \quad (3)$$

The system restores normal operation after approximately five minutes or if the receiver is removed. If the feature is not used, this pin must be pulled high.

#### NOTE

Pin 13, TSENSE, must always be terminated; otherwise, erratic behavior may occur.

**Figure 4. NTC Application (optional)**

### 7.3.6 Fault Handling and Indication

Table 2 shows end power transfer (EPT) packet responses, fault conditions, and the duration of how long the condition lasts until a retry is attempted. The LED mode selected determines how the LED indicates the condition or fault.

**Table 2. Fault Handling and Indication**

CONDITION	DURATION <sup>(1)</sup> (before retry)	COMMENTS IMMEDIATE <sup>(2)</sup>
EPT-00		unknown
EPT-01	5 seconds	charge complete
EPT-02	Infinite	internal fault
EPT-03	5 minutes	over temperature
EPT-04	Immediate	over voltage
EPT-05	Immediate	over current
EPT-06	Infinite	battery failure
EPT-07	Not applicable	reconfigure
EPT-08	Immediate	no response
OVP	Immediate	TX over voltage
NTC	5 minutes	TX over temperature
FOD warning	12 seconds	buzzer and LED
FOD trip	5 minutes	same as over temp

- (1) After a FAULT, the magnetic field is re-characterized to improve the ability to detect the removal of the at-fault receiver. If the receiver is removed in the first second immediately following the detection of this fault (before the re-characterization is complete), the field corresponding to an empty pad may be associated with the faulty receiver and the LED indication may continue to indicate a fault state even though no receiver is present. This indication persists until either the HOLDOFF time expires or a new receiver disturbs the field, at which time normal operation, with proper LED indication, is resumed.
- (2) "Immediate" is less than 1 second.

### 7.3.7 Power Transfer Start Signal

The bq500511 provides an output signal to indicate that power transfer has begun. Pin 15, BUZZ, outputs a 400-ms duration, 4-kHz square wave appropriate to drive a low cost AC type ceramic buzzers. If not used, this pin should be left open.

### 7.3.8 Power-On Reset

The bq500511 has an integrated power-on reset (POR) circuit which monitors the supply voltage and handles the correct device startup sequence. Additional supply voltage supervisor or reset circuits are not needed.

### **7.3.9 Trickle Charge and CS100**

The WPC specification provides an EPT message (EPT-01) to indicate charge complete. Upon receipt of the charge complete message, the bq500511 disables the output and changes the LED indication. The exact indication depends on the LED\_MODE chosen. In some battery charging applications, there is a benefit to continue the charging process in trickle-charge mode to top off the battery. The WPC specification provides for an informational 'Charge Status' packet that conveys the level of battery charger. The bq500511 uses this command to enable top-off charging. The bq500511 changes the LED indication to reflect charge complete when a Charge Status message indicating 100% is received, but unlike the response to an EPT, it will not halt power transfer even though the LED indicates charge complete. The mobile device can use a CS100 packet to enable trickle charge mode. If the reported charge status drops below 90%, normal charging indication is resumed.

## **7.4 Device Functional Modes**

### **7.4.1 Power Transfer**

Power transfer efficiency and robustness depends on coil coupling. Coupling depends on the distance between coils, alignment, coil dimensions, coil materials, number of turns, magnetic shielding, impedance matching, frequency, and duty cycle. Most importantly, the receiver and transmitter coils must be aligned for best coupling and efficient power transfer. The smaller the space between the coils is, the better the coupling. Shielding is added as a backing to both the transmitter and receiver coils to direct the magnetic field to the coupled zone. Magnetic fields outside the coupled zone do not transfer power. Thus, shielding also serves to contain the fields to avoid coupling to other adjacent system components.

Regulation can be achieved by controlling any one of the coil coupling parameters. However, for WPC compatibility, the transmitter-side coils and capacitance are specified and the resonant frequency point is fixed. Power transfer is regulated by changing the operating frequency between 110 kHz to 205 kHz. The higher the frequency, the further from resonance and the lower the power. Duty cycle remains constant at 50% throughout the power band and is reduced only once 205 kHz is reached.

#### **7.4.1.1 Dynamic Power Limiting™**

Dynamic Power Limiting™ (DPL) allows operation from a 5-V supply with limited current capability (such as a USB port). When the input voltage is observed drooping, the output power is dynamically limited to reduce the load and provides margin relative to the supply's capability.

Anytime the DPL control loop is regulating the operating point of the transmitter, the LED will indicate that DPL is active. The LED color and flashing pattern are determined by the LED Table. If the receiver sends a Control Error Packet (CEP) with a negative value, (for example, to reduce power to the load), the bq500511 in DPL mode will return to normal operation and respond to this CEP via the standard WPC control loop behavior.

#### **7.4.1.2 Operating Frequency Limiting**

Pin-33, FLIM, can be used to set an upper operating frequency limit of 190 kHz by pulling down with a 10-kΩ resistor. Regulatory bodies in some countries have proposed that wireless power transmitters limit operation at this point. While not required anywhere today, this forward looking option provides the means for a simple design modification to address that possible future requirement. A weak internal pull-up allows normal operation without any applied bias.

Note that this feature may prevent WPC certification.

### **7.4.2 Communication**

Communication within the WPC v1.2 specification is from the receiver to the transmitter. For example, in order to regulate the output of the transmitter, the receiver sends messages requesting the transmitter to increase or decrease power. The receiver communicates by modulating the rectifier voltage and using amplitude modulation (AM) sends packets of information to the transmitter. A packet is comprised of a preamble, a header, the actual message, and a checksum, as defined by the WPC standard.

## Device Functional Modes (continued)

The receiver sends a packet by modulating an impedance network. This AM signal reflects back as a change in the voltage amplitude on the transmitter coil. In the bq500511/bq50002 system, the bq50002 performs the demodulation function and passes a digitized version of the message to the bq500511 where the message is decoded and processed. For example in response to a Control Error Packet, the bq500511 calculates the required change in output power and in turn controls the bq50002 through the CLK\_OUT, UP\_DOWN, and MODE pins to adjust the operating point and thus its output power.

The modulation impedance network on the receiver can either be resistive or capacitive. Figure 5 shows the resistive modulation approach, where a resistor is periodically added to the load, resulting in an amplitude change in the transmitter voltage. Figure 6 shows the corresponding capacitive modulation approach.

## 8 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 8.1 Application Information

The bq500511 device is a wireless power transmitter controller designed for 5W WPC compliant applications when paired with the bq50002. The pair integrates all functions required to control wireless power transfer to a WPC v1.2 compliant receiver. Several tools are available for the design of the system. See the product folder on [www.ti.com](http://www.ti.com) for more details. The following sections highlight some of the system design considerations.

**Figure 7. bq500511 System Block Diagram**

The I<sup>2</sup>C port is accessed by the FOD tuning tool and can provide a level of system monitoring and evaluation.

The SDA and SCL lines of the I<sup>2</sup>C bus must be pulled up (as shown in the [Figure 8](#)) if the I<sup>2</sup>C port is utilized. They may be left floating if no I<sup>2</sup>C function is required. The logic reference generated by the bq50002 Analog Front End is 3 V, so care should be taken to ensure that if the Master I<sup>2</sup>C device also has pull-up resistors to a higher reference, that the 3-V reference to the bq500511 is not affected. Specifically, only one set of pull-up resistors should be populated, either on the I<sup>2</sup>C Master bus or on the bq500511 system board, but not both.

**Additional details on I<sup>2</sup>C use and capabilities can be obtained by contacting TI.**

### 8.2 Typical Application

The bq500511 controller, when paired with bq50002 integrated Analog Front End device, requires a minimum of external components to implement a WPC 1.2 Wireless Power Transmitter system.

As shown in the application schematic, external components are used to implement the following functions:

- Resonant tank circuit
- Demodulator input signal conditioning
- Human interface (LED and Buzzer)
- Current sensing
- Voltage sensing
- Temperature sensing
- System Configuration: Foreign Objection Detection (FOD) threshold and calibration, LED mode

## 8.2.1 Design Requirements

DESIGN PARAMETER	VALUE
WPC coil type	A11

## 8.2.2 Detailed Design Procedure

### 8.2.2.1 Capacitor Selection

Capacitor selection is critical to proper system operation. The total capacitance value of  $4 \times 100$  nF is required in the resonant tank. This is the WPC system compatibility requirement, not a guideline.

#### NOTE

A total capacitance value of  $4 \times 100$  nF (C0G dielectric type, 50-V rating) is required in the resonant tank to achieve the correct resonance frequency. The capacitors chosen must be rated for at least 50 V and must be of a high-quality C0G dielectric (sometimes also called NP0). These are typically available in a 5% tolerance, which is adequate. TI does **not** recommend the use of X7R types or below if WPC compliance is required because critical WPC Certification Testing, such as the minimum modulation or guaranteed power test, might fail. The designer can combine capacitors to achieve the desired capacitance value. Various combinations can work depending on market availability. All capacitors must be of C0G types (not mixed with any other dielectric types).

### 8.2.2.2 Current Monitoring Requirements

The bq500511 is WPC v1.2 ready. To enable the FOD feature, current monitoring is provided in the bq50002 Analog Front End. For proper scaling of the current monitor signal, the current sense resistor should be 20 mΩ. For FOD accuracy, the current sense resistor must be a quality component with 0.5% tolerance, at least 1/4-W rating, and a temperature stability of  $\pm 200$  PPM.

### 8.2.2.3 Input Voltage Monitoring

The VSENSE input is used to calculate power for the FOD function, and to detect the supply drooping when the bq500511 is receiving power from an insufficient adapter (for example from a weak USB port). The VSENSE input should reflect the input source voltage and should be scaled with a resistor divider comprising a 76.8 kΩ over 10 kΩ.

**Figure 9. VSENSE Signal Conditioning**

### 8.2.2.4 Tank Voltage Monitoring

The VPEAK input is used to estimate losses in the power components for the FOD function. The VPEAK input should reflect the envelope of the tank voltage (i.e. the node directly between the resonant capacitors and the primary coil) and should be buffered with a diode (100 V, 0.2 A) and scaled with a resistor divider comprising a 113 kΩ over 7.5 kΩ, with a 2200-pF filter capacitor.

Figure 10. VPEAK Signal Conditioning

### 8.2.2.5 All Unused Pins

All unused pins can be left open unless otherwise indicated. Refer to the table in the [Pin Configuration and Functions](#) section. To improve PCB layout, ground unused pins, if it is an option.

### 8.2.2.6 Input Regulation

The bq500511 requires 3 VDC to operate. The regulator in the bq50002 provides this voltage rail eliminating the need for any external regulation.

### 8.2.2.7 System Input Power Requirements

The design works with 5-V input voltage to the bq50002. The WPC defined A11 TX type requires 5-V system voltage in order to deliver 5 W of output power from the receiver.

### 8.2.2.8 LED Modes

The bq500511 can directly drive three LED outputs (pin 11 (LED-A), pin 12 (LED-B), and pin 14 (LED-C)). Select one of the desired LED indication schemes through the voltage on LED\_MODE (pin 34) by choosing appropriate values for the resistor divider.

## 8.2.3 Application Curves

Figure 11. Typical Low-Level Output Current vs Low-Level Output Voltage

Figure 12. Typical High-Level Output Current vs High-Level Output Voltage

## 9 Power Supply Recommendations

The A11 TX type requires a 5-V system voltage.

## 10 Layout

### 10.1 Layout Guidelines

Careful PCB layout practice is critical to proper system operation. Many references are available on proper PCB layout techniques. A few good tips are as follows.

The TX layout requires a 4-layer PCB layout for best ground plane technique. A 2-layer PCB layout can be achieved though not as easily. Ideally, the approach to the layer stack-up is:

- Layer 1 component placement and as much ground plane as possible
- Layer 2 clean ground
- Layer 3 finish routing
- Layer 4 clean ground

Thus, the circuitry is virtually sandwiched between grounds. This minimizes EMI noise emissions and also provides a noise-free voltage reference plane for device operation.

Keep as much copper as possible. Make sure the bq500511 GND pins have a continuous flood connection to the ground plane. The power pad of the bq50002 should also be stitched to the ground plane, which also acts as a heat sink. A good GND reference is necessary for proper system operation, such as analog-digital conversion, clock stability, and best overall EMI performance. Separate the analog ground plane from the power ground plane and use only **one** tie point to connect grounds. Having several tie points defeats the purpose of separating the grounds. See the bq500511 EVM for an example of a good layout technique.

#### 10.1.1 Layout Notes

Make sure the bypass capacitors intended for the bq500511 3.3-V supply are actually bypassing these supply pins (pin 32, DVCC, and pin 40, AVCC) to solid ground plane (see [Figure 13](#)). This means they need to be placed as close to the device as possible and the traces must be as wide as possible.

Make sure the bq500511 has a continuous flood connection to the ground plane (see [Figure 14](#)).

The full-bridge power stage that drives the TX coil is composed of two half-bridge power stages (integrated in bq50002) and resonant capacitors. Input bypass capacitors should be placed as close as possible to the bq50002 PVIN1 pins (pin 27, 28) and PVIN2 pins (pin 14, 15). The input and ground pours and traces should be made as wide as possible for better current flow. The trace to the coil and resonant capacitors should also be made as wide as possible (see [Figure 15](#)).

To ensure proper operation, grounds conducting a large amount of current and switching noise must be isolated from low current, quiet grounds. Separate the ground pours for the power stages and the bq500511 IC. Connect all grounds to a single point at the main ground terminal (see [Figure 16](#)).

Proper current sensing layout technique is very important, as it directly affects the FOD and PMOD performance. When sampling the very-low voltages generated across a current sense resistor, be sure to use the so called 4-wire or Kelvin-connection technique. This is important to avoid introducing false voltage drops from adjacent pads and copper power routes. It is a common power-supply layout technique. Some high-accuracy sense resistors have dedicated sense pins (see [Figure 17](#)).

The trace from bq50002 CSP pin to sense resistor must be minimized to avoid unwanted offset in the application. This trace should be limited to less than 20-mΩ resistance.

<sup>(1)</sup> **Status:** For more details on status, see our [product life cycle](#).

<sup>(2)</sup> **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

<sup>(3)</sup> **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

<sup>(4)</sup> **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

<sup>(5)</sup> **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

<sup>(6)</sup> **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "-" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
