

DAC5675A 14-Bit, 400-MSPS Digital-to-Analog Converter

1 Features

- 400MSPS Update Rate
- LVDS-Compatible Input Interface
- Spurious-Free Dynamic Range (SFDR) to Nyquist:
 - 69dBc at 70MHz IF, 400MSPS
- W-CDMA Adjacent Channel Power Ratio (ACPR):
 - 73dBc at 30.72MHz IF, 122.88MSPS
 - 71dBc at 61.44MHz IF, 245.76MSPS
- Differential Scalable Current Sink Outputs: 2mA to 20mA
- On-Chip 1.2V Reference
- Single 3.3V Supply Operation
- Power Dissipation: 660mW at $f_{CLK} = 400\text{MSPS}$, $f_{OUT} = 20\text{MHz}$
- Package: 48-Pin HTQFP PowerPad™, $T_{JA} = 28.8^{\circ}\text{C/W}$

2 Applications

- Cellular Base Transceiver Station Transmit Channel:
 - CDMA: WCDMA, CDMA2000, IS-95
 - TDMA: GSM, IS-136, EDGE/GPRS
 - Supports Single-Carrier and Multicarrier Applications
- Test and Measurement: Arbitrary Waveform Generation
- Direct Digital Synthesis (DDS)
- Cable Modem Headend

3 Description

The DAC5675A is a 14-bit resolution high-speed digital-to-analog converter. The DAC5675A is designed for high-speed digital data transmission in wired and wireless communication systems, high-frequency direct-digital synthesis (DDS), and waveform reconstruction in test and measurement applications. The DAC5675A has excellent spurious-free dynamic range (SFDR) at high intermediate frequencies, which makes the DAC5675A well-suited for multicarrier transmission in TDMA- and CDMA-based cellular base transceiver stations (BTSS).

The DAC5675A operates from a single-supply voltage of 3.3 V. Power dissipation is 660 mW at $f_{CLK} = 400\text{ MSPS}$, $f_{OUT} = 70\text{ MHz}$. The DAC5675A provides a nominal full-scale differential current output of 20mA, supporting both single-ended and differential applications. The output current can be directly fed to the load with no additional external output buffer required. The output is referred to the analog supply voltage AV_{DD} .

The DAC5675A comprises a low-voltage differential signaling (LVDS) interface for high-speed digital data input. LVDS features a low differential voltage swing with a low constant power consumption across frequency, allowing for high-speed data transmission with low noise levels; that is, with low electromagnetic interference (EMI). LVDS is typically implemented in low-voltage digital CMOS processes, making it the ideal technology for high-speed interfacing between the DAC5675A and high-speed low-voltage CMOS ASICs or FPGAs. The DAC5675A current-sink-array architecture supports update rates of up to 400MSPS. On-chip edge-triggered input latches provide for minimum setup and hold times, thereby relaxing interface timing.

4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision C (March 2005) to Revision D	Page
• Added ESD Ratings, Recommended Operating Conditions, Thermal Information, Detailed Description section, Application and Implementation section, Power Supply Recommendations section, Layout section, Device and Documentation Support section, Mechanical, Packaging, and Orderable Information section	1
• Changed AV _{DD} to DV _{DD} From: –3.6 to +3.6 To: –0.7 to +0.7 in the <i>Absolute Maximum Ratings</i>	4

5 Description Continued

The DAC5675A has been specifically designed for a differential transformer-coupled output with a 50 Ω doubly-terminated load. With the 20 mA full-scale output current, both a 4:1 impedance ratio (resulting in an output power of 4 dBm) and 1:1 impedance ratio transformer (–2 dBm) are supported. The last configuration is preferred for optimum performance at high output frequencies and update rates. The outputs are terminated to AV_{DD} and have voltage compliance ranges from AV_{DD} –1 to AV_{DD} + 0.3 V.

An accurate on-chip 1.2-V temperature-compensated bandgap reference and control amplifier allows the user to adjust this output current from 20 mA down to 2 mA. This provides 20-dB gain range control capabilities. Alternatively, an external reference voltage may be applied. The DAC5675A features a SLEEP mode, which reduces the standby power to approximately 18 mW.

The DAC5675A is available in a 48-pin HTQFP thermally-enhanced PowerPad package. This package increases thermal efficiency in a standard size IC package. The device is characterized for operation over the industrial temperature range of –40°C to +85°C.

6 Pin Configuration and Functions

Note: Thermal pad size: 4.5 mm x 4.5 mm (min), 5.5 mm x 5.5 mm (max)

Pin Functions

PIN		I/O	DESCRIPTION
NAME	NO.		
AGND	19, 41, 46, 47	I	Analog negative supply voltage (ground); pin 47 internally connected to PowerPAD.
AVDD	20, 42, 45, 48	I	Analog positive supply voltage.
BIASJ	39	O	Full-scale output current bias.
CLK	22	I	External clock input.
CLKC	21	I	Complementary external clock input.
D(13:0)A	1, 3, 5, 7, 9, 11, 13, 23, 25, 27, 29, 31, 33, 35	I	LVDS positive input, data bits 0 through 13. D13A is most significant data bit (MSB). D0A is least significant data bit (MSB).
D(13:0)B	2, 4, 6, 8, 10, 12, 14, 24, 26, 28, 30, 32, 34, 36	I	LVDS negative input, data bits 0 through 13. D13B is most significant data bit (MSB). D0B is least significant data bit (MSB).
DGND	16, 18	I	Digital negative supply voltage (ground).
NC	38	—	Not connected in chip. Can be high or low.
DVDD	15, 17	I	Digital positive supply voltage.
EXTIO	40	I/O	Internal reference output or external reference input. Requires a 0.1µF decoupling capacitor to AGND when used as reference output.
IOUT1	43	O	DAC current output. Full-scale when all input bits are set to '0'. Connect reference side of DAC load resistors to AV _{DD} .
IOUT2	44	O	DAC complementary current output. Full-scale when all input bits are set to '1'. Connect reference side of DAC load resistors to AV _{DD} .
SLEEP	37	I	Asynchronous hardware power down input. Active high. Internal pulldown.

7 Specifications

7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
Supply voltage range	AV_{DD} ⁽²⁾	−0.3	+3.6	V
	DV_{DD} ⁽³⁾	−0.3	+3.6	V
	AV_{DD} to DV_{DD}	−0.7	+0.7	V
Voltage between AGND and DGND		−0.3	+0.5	V
CLK, CLKC ⁽²⁾		−0.3	$AV_{DD} + 0.3$	V
Digital input D[13:0]A, D[13:0]B(3), SLEEP		−0.3	$DV_{DD} + 0.3$	V
IOUT1, IOUT2 ⁽²⁾		−1.0	$AV_{DD} + 0.3$	V
EXTIO, BIAS ⁽²⁾		−1.0	$AV_{DD} + 0.3$	V
Peak input current (any input)			20	mA
Peak total input current (all inputs)			−30	mA
Operating free-air temperature range, T_A		−40	+85	°C
Storage temperature range		−65	+150	°C

- (1) Stresses above those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. Exposure outside of absolute maximum conditions for extended periods may degrade device reliability. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under recommended operating conditions is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) Measured with respect to AGND.
- (3) Measured with respect to DGND.

7.2 ESD Ratings

		VALUE	UNIT
$V_{(ESD)}$ Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±1000	V
	Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±250	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
Supplies					
	AVDD	3.15	3.3	3.6	V
	DVDD	3.15	3.3	3.6	V
$I_{(AVDD)}$	Analog supply current		115		mA
$I_{(DVDD)}$	Digital supply current		85		mA
Analog Output					
$I_{O(FS)}$	Full-scale output current	2		20	mA
	Output compliance range	$AV_{DD} - 1$		$AV_{DD} + 0.3$	V
Clock Interface (CLK, CLKC)					
	CLKINPUT Frequency			400	MHz
	CLK – CLKC	0.4		0.8	V _{PP}
	Clock duty cycle	40%		60%	
V_{CM}	Common-mode voltage range	1.6	2	2.4	V

8 Detailed Description

8.1 Overview

The DAC5675A is a 14-bit resolution high-speed digital-to-analog converter. The DAC5675A is designed for high-speed digital data transmission in wired and wireless communication systems, high frequency direct-digital synthesis (DDS), and waveform reconstruction in test and measurement applications. The DAC5675A has excellent spurious free dynamic range (SFDR) at high intermediate frequencies, which makes the DAC5675A well-suited for multicarrier transmission in TDMA- and CDMA based cellular base transceiver stations (BTSs).

8.2 Functional Block Diagram

Copyright © 2016, Texas Instruments Incorporated

8.3 Feature Description

8.3.1 Digital Inputs

The DAC5675A uses a low voltage differential signaling (LVDS) bus input interface. The LVDS features a low differential voltage swing with low constant power consumption ($\approx 4\text{mA}$ per complementary data input) across frequency. The differential characteristic of LVDS allows for high-speed data transmission with low electromagnetic interference (EMI) levels. The LVDS input minimum and maximum input threshold table lists the LVDS input levels. [Figure 13](#) shows the equivalent complementary digital input interface for the DAC5675A, valid for pins D[13:0]A and D[13:0]B. Note that the LVDS interface features internal 110Ω resistors for proper termination. [Figure 2](#) shows the LVDS input timing measurement circuit and waveforms. A common-mode level of 1.2V and a differential input swing of 0.8V_{pp} is applied to the inputs.

[Figure 14](#) shows a schematic of the equivalent CMOS/TTL-compatible digital inputs of the DAC5675A, valid for the SLEEP pin.

Feature Description (continued)

Figure 13. LVDS Digital Equivalent Input

Figure 14. CMOS/TTL Digital Equivalent Input

Feature Description (continued)

8.3.2 Clock Input

The DAC5675A features differential, LVPECL compatible clock inputs (CLK, CLKC). Figure 15 shows the equivalent schematic of the clock input buffer. The internal biasing resistors set the input common-mode voltage to approximately 2V, while the input resistance is typically 670Ω. A variety of clock sources can be ac-coupled to the device, including a sine wave source (see Figure 16).

Figure 15. Clock Equivalent Input

Figure 16. Driving the DAC5675A with a Single-Ended Clock Source Using a Transformer

To obtain best ac performance the DAC5675A clock input should be driven with a differential LVPECL or sine wave source as shown in Figure 17 and Figure 18. Here, the potential of V_{TT} should be set to the termination voltage required by the driver along with the proper termination resistors (R_T). The DAC5675A clock input can also be driven single-ended; this is shown in Figure 19.

Figure 19. Driving the DAC5675A with a Single-Ended TTL/CMOS Clock Source

Feature Description (continued)

8.3.3 Supply Inputs

The DAC5675A comprises separate analog and digital supplies, that is, AV_{DD} and DV_{DD} , respectively. These supply inputs can be set independently from 3.6V down to 3.15V.

8.3.4 DAC Transfer Function

The DAC5675A has a current sink output. The current flow through IOUT1 and IOUT2 is controlled by D[13:0]A and D[13:0]B. For ease of use, we denote D[13:0] as the logical bit equivalent of D[13:0]A and its complement D[13:0]B. The DAC5675A supports straight binary coding with D13 being the MSB and D0 the LSB. Full-scale current flows through IOUT2 when all D[13:0] inputs are set high and through IOUT1 when all D[13:0] inputs are set low. The relationship between IOUT1 and IOUT2 can be expressed as [Equation 1](#):

$$IOUT1 = IO_{(FS)} - IOUT2 \quad (1)$$

$IO_{(FS)}$ is the full-scale output current sink (2mA to 20mA). Since the output stage is a current sink, the current can only flow from AV_{DD} through the load resistors R_L into the IOUT1 and IOUT2 pins.

The output current flow in each pin driving a resistive load can be expressed as shown in [Figure 20](#), as well as in [Equation 2](#) and [Equation 3](#).

Figure 20. Relationship Between D[13:0], IOUT1 and IOUT2

$$IOUT1 = \frac{IO_{(FS)} \times (16383 - \text{CODE})}{16384} \quad (2)$$

$$IOUT2 = \frac{IO_{(FS)} \times \text{CODE}}{16384} \quad (3)$$

where CODE is the decimal representation of the DAC input word. This would translate into single-ended voltages at IOUT1 and IOUT2, as shown in [Equation 4](#) and [Equation 5](#):

$$VOUT1 = AVDD - IOUT1 \times R_L \quad (4)$$

$$VOUT2 = AVDD - IOUT2 \times R_L \quad (5)$$

Assuming that D[13:0] = 1 and the R_L is 50Ω, the differential voltage between pins IOUT1 and IOUT2 can be expressed as shown in [Equation 6](#) through [Equation 8](#):

$$VOUT1 = 3.3 \text{ V} - 0 \text{ mA} \times 50 = 3.3 \text{ V} \quad (6)$$

$$VOUT2 = AVDD - 20 \text{ mA} \times 50 = 2.3 \text{ V} \quad (7)$$

$$V_{DIFF} = VOUT1 - VOUT2 = 1 \text{ V} \quad (8)$$

If D[13:0] = 0, then IOUT2 = 0mA and IOUT1 = 20mA and the differential voltage $V_{DIFF} = -1\text{V}$.

The output currents and voltages in IOUT1 and IOUT2 are complementary. The voltage, when measured differentially, will be doubled compared to measuring each output individually. Care must be taken not to exceed the compliance voltages at the IOUT1 and IOUT2 pins in order to keep signal distortion low.

8.3.5 Reference Operation

The DAC5675A has a bandgap reference and control amplifier for biasing the full-scale output current. The full-scale output current is set by applying an external resistor R_{BIAS} . The bias current I_{BIAS} through resistor R_{BIAS} is defined by the on-chip bandgap reference voltage and control amplifier. The full-scale output current equals 16 times this bias current. The full-scale output current $IO_{(FS)}$ is thus expressed as [Equation 9](#):

Feature Description (continued)

$$I_{O(FS)} = 16 \times I_{BIAS} = \frac{16 \times V_{EXTIO}}{R_{BIAS}} \quad (9)$$

where V_{EXTIO} is the voltage at terminal EXTIO. The bandgap reference voltage delivers a stable voltage of 1.2 V. This reference can be overridden by applying an external voltage to terminal EXTIO. The bandgap reference can additionally be used for external reference operation. In such a case, an external buffer amplifier with high impedance input should be selected in order to limit the bandgap load current to less than 100 nA. The capacitor C_{EXT} may be omitted. Terminal EXTIO serves as either an input or output node. The full-scale output current is adjustable from 20mA down to 2mA by varying resistor R_{BIAS} .

8.3.6 Analog Current Outputs

Figure 21 shows a simplified schematic of the current sink array output with corresponding switches. Differential NPN switches direct the current of each individual NPN current sink to either the positive output node IOUT1 or its complementary negative output node IOUT2. D[13:0] controls the S(N)C current switches and D[13:0] controls the S(N) current switches, as explained in the previous **DAC Transfer Function** section (see Figure 20). The output impedance is determined by the stack of the current sinks and differential switches, and is $> 300k\Omega$ in parallel with an output capacitance of 5pF.

The external output resistors are referred to the positive supply AV_{DD} .

Figure 21. Equivalent Analog Current Output

The DAC5675A can easily be configured to drive a doubly-terminated 50Ω cable using a properly selected transformer. Figure 22 and Figure 23 show the 1:1 and 4:1 impedance ratio configuration, respectively. These configurations provide maximum rejection of common-mode noise sources and even-order distortion components, thereby doubling the power of the DAC to the output. The center tap on the primary side of the transformer is terminated to AV_{DD} , enabling a dc current flow for both IOUT1 and IOUT2. Note that the ac performance of the DAC5675A is optimum and specified using a 1:1 differential transformer-coupled output.

Copyright © 2016, Texas Instruments Incorporated

Figure 23. Driving a Doubly-Terminated 50Ω Cable Using a 4:1 Impedance Ratio Transformer

Figure 24(a) shows the typical differential output configuration with two external matched resistor loads. The nominal resistor load of 25 Ω gives a differential output swing of 1V_{PP} (0.5–V_{PP} single-ended) when applying a 20 mA full-scale output current. The output impedance of the DAC5675A slightly depends on the output voltage at nodes IOUT1 and IOUT2. Consequently, for optimum dc-integral nonlinearity, the configuration of Figure 24(b) should be chosen. In this current/voltage (I-V) configuration, terminal IOUT1 is kept at AV_{DD} by the inverting operational amplifier. The complementary output should be connected to AV_{DD} to provide a dc-current path for the current sources switched to IOUT1. The amplifier maximum output swing and the full-scale output current of the DAC determine the value of the feedback resistor (R_{FB}). The capacitor (C_{FB}) filters the steep edges of the DAC5675A current output, thereby reducing the operational amplifier slew-rate requirements. In this configuration, the op amp should operate at a supply voltage higher than the resistor output reference voltage AV_{DD} as a result of its positive and negative output swing around AV_{DD}. Node IOUT1 should be selected if a single-ended unipolar output is desired.

Figure 24. Output Configurations

8.4 Device Functional Modes

8.4.1 Sleep Mode

The DAC5675A features a power-down mode that turns off the output current and reduces the supply current to approximately 6mA. The power-down mode is activated by applying a logic level 1 to the SLEEP pin pulled down internally.

Typical Application (continued)

9.2.1 Design Requirements

The requirements for this design were to generate a 2-carrier WCDMA signal at an intermediate frequency of 92.16 MHz. The ACPR needs to be better than 65 dBc. For this design example use the parameters shown in [Table 1](#).

Table 1. Design Parameters

PARAMETER	VALUE
Clock rate	368.64 MHz
Input data	2C WCDMA with IF frequency at 92.16MHz
V_{CC} / V_{AA}	3.3 V

9.2.2 Detailed Design Procedure

The 2-carrier signal with an intermediate frequency of 92.16 MHz must be created in the digital processor at a sample rate of 368.64 Msps for DAC. These 14 bit samples are placed on the 14b LVDS input port of the DAC.

A differential DAC clock must be generated from a clock source at 368.64 MHz. This must be provided to the CLKIN pins of the DAC.

The IOUOTA and IOUTB differential connections must be connected to a transformer to provide a single ended output. A typical 1:1 impedance transformer is used on the device EVM. The DAC5675AEVM ([SLAU080](#)) provides a good reference for this design example.

9.2.3 Application Curves

This spectrum analyzer plot shows the ACPR for the transformer output 2-carrier signal with intermediate frequency of 92.16 MHz. The results meet the system requirements for a minimum of 65 dBc ACPR.

Figure 26. W-CDMA TM1 Dual Carrier Power vs Frequency

10 Power Supply Recommendations

It is recommended that the device be powered with the nominal supply voltages as indicated in the [Recommended Operating Conditions](#).

In most instances the best performance is achieved with LDO supplies. However the supplies may be driven with direct outputs from a DC-DC switcher as long as the noise performance of the switcher is acceptable.

11 Layout

11.1 Layout Guidelines

The DAC5675 EVM layout should be used as a reference for the layout to obtain the best performance. A sample layout is shown in Figure 27. Some important layout recommendations are:

- Use a single ground plane. Keep the digital and analog signals on distinct separate sections of the board. This may be virtually divided down the middle of the device package when doing placement and layout.
- Keep the analog outputs as far away from the switching clocks and digital signals as possible. This will keep coupling from the digital circuits to the analog outputs to a minimum.
- Decoupling caps should be kept close to the power pins of the device.

12 Device and Documentation Support

12.1 Receiving Notification of Documentation Updates

To receive notification of documentation updates — go to the product folder for your device on ti.com. In the upper right-hand corner, click the *Alert me* button to register and receive a weekly digest of product information that has changed (if any). For change details, check the revision history of any revised document.

12.2 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

TI E2E™ Online Community *TI's Engineer-to-Engineer (E2E) Community*. Created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

Design Support *TI's Design Support* Quickly find helpful E2E forums along with design support tools and contact information for technical support.

12.3 Trademarks

PowerPad, E2E are trademarks of Texas Instruments.
All other trademarks are the property of their respective owners.

12.4 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

12.5 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

12.6 Device Nomenclature

12.6.1 Definitions of Specifications and Terminology

Gain error is defined as the percentage error in the ratio between the measured full-scale output current and the value of $16 \times V_{(EXTIO)}/R_{BIAS}$. A $V_{(EXTIO)}$ of 1.25V is used to measure the gain error with an external reference voltage applied. With an internal reference, this error includes the deviation of $V_{(EXTIO)}$ (internal bandgap reference voltage) from the typical value of 1.25V.

Offset error is defined as the percentage error in the ratio of the differential output current (IOUT1–IOUT2) and the half of the full-scale output current for input code 8192.

THD is the ratio of the rms sum of the first six harmonic components to the rms value of the fundamental output signal.

SNR is the ratio of the rms value of the fundamental output signal to the rms sum of all other spectral components below the Nyquist frequency, including noise, but excluding the first six harmonics and dc.

SINAD is the ratio of the rms value of the fundamental output signal to the rms sum of all other spectral components below the Nyquist frequency, including noise and harmonics, but excluding dc.

ACPR or adjacent channel power ratio is defined for a 3.84Mcps 3GPP W-CDMA input signal measured in a 3.84MHz bandwidth at a 5MHz offset from the carrier with a 12dB peak-to-average ratio.

APSSR or analog power supply ratio is the percentage variation of full-scale output current versus a 5% variation of the analog power supply AV_{DD} from the nominal. This is a dc measurement.

DPSSR or digital power supply ratio is the percentage variation of full-scale output current versus a 5% variation of the digital power supply DV_{DD} from the nominal. This is a dc measurement.

13 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable part number	Status (1)	Material type (2)	Package Pins	Package qty Carrier	RoHS (3)	Lead finish/ Ball material (4)	MSL rating/ Peak reflow (5)	Op temp (°C)	Part marking (6)
DAC5675AIPHP	Active	Production	HTQFP (PHP) 48	250 JEDEC TRAY (10+1)	Yes	NIPDAU	Level-3-260C-168 HR	-40 to 85	DAC5675AI

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

THERMAL PAD MECHANICAL DATA

PHP (S-PQFP-G48)

PowerPAD™ PLASTIC QUAD FLATPACK

THERMAL INFORMATION

This PowerPAD™ package incorporates an exposed thermal pad that is designed to be attached to a printed circuit board (PCB). The thermal pad must be soldered directly to the PCB. After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For additional information on the PowerPAD package and how to take advantage of its heat dissipating abilities, refer to Technical Brief, PowerPAD Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 and Application Brief, PowerPAD Made Easy, Texas Instruments Literature No. SLMA004. Both documents are available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.
