ZHCSG81 - APRIL 2017

DCPA1 系列 1W、隔离式非稳压直流/直流转换器模块

1 特性

- 2.0kV 直流隔离(运行)
- 具有软启动,可减小浪涌电流
- 频率同步
- EN55022 B 类 EMC 性能
- UL1950 认证组件
- 7 引脚 PDIP 和 7 引脚 SOP 封装

2 应用

- 信号路径隔离
- 消除接地环路
- 数据采集
- 工业控制和仪器
- 测试设备

3 说明

DCPA1 系列是一系列 1W、隔离式非稳压直流/直流转换器模块。DCPA1 系列器件需要至少两个外部组件,其包含片上器件保护装置,且能够同步至外部时钟。

DCPA1 系列器件集 这些特性 和小型尺寸于一体,适合各种 应用且在需要信号路径隔离的 应用中 是一种易于使用的解决方案。

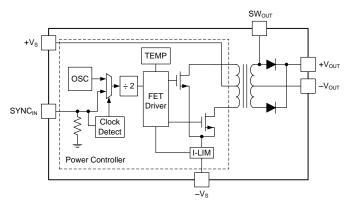

警告:此产品具有运行隔离功能,仅可用于信号隔离。 不可作为需要增强型隔离的安全隔离电路的一部分使 用。请参见*功能 描述*部分中的定义。

7 Detailed Description

INSTRUMENTS

7.1 Overview

The DCPA1 offers up to 1 W of isolated, unregulated output power from a 5-V input source with a typical efficiency of up to 87%. This efficiency is achieved through highly integrated packaging technology and the implementation of a custom power stage and control device. The DCPA1 devices are specified for operational isolation only. The circuit design uses an advanced BiCMOS and DMOS process.

7.2 Functional Block Diagrams

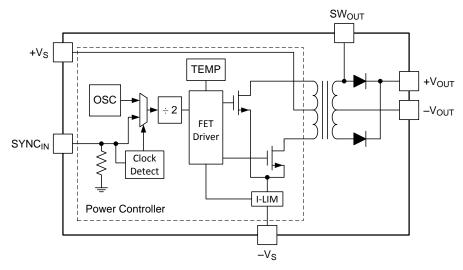

图 31. Single Output Device

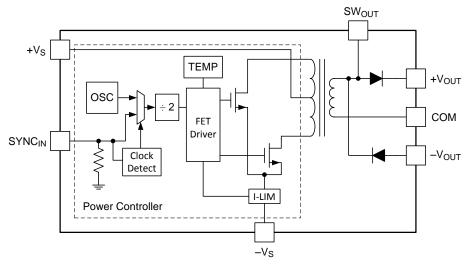

图 32. Dual Output Device

7.3 Feature Description

7.3.1 Isolation

Underwriters Laboratories, UL™ defines several classes of isolation that are used in modern power supplies.

Safety extra low voltage (SELV) is defined by UL (UL1950 E199929) as a secondary circuit which is so designated and protected that under normal and single fault conditions the voltage between any two accessible parts, or between an accessible part and the equipment earthing terminal for operational isolation does not exceed steady state 42 V peak or 60 V_{DC} for more than 1 second.

7.3.1.1 Operation or Functional Isolation

Operational or functional isolation is defined by the use of a high-potential (hipot) test only. Typically, this isolation is defined as the use of insulated wire in the construction of the transformer as the primary isolation barrier. The hipot one-second duration test (dielectric voltage, withstand test) is a production test used to verify that the isolation barrier is functioning. Products with operational isolation should never be used as an element in a safety-isolation system.

7.3.1.2 Basic or Enhanced Isolation

Basic or enhanced isolation is defined by specified creepage and clearance limits between the primary and secondary circuits of the power supply. Basic isolation is the use of an isolation barrier in addition to the insulated wire in the construction of the transformer. Input and output circuits must also be physically separated by specified distances.

7.3.1.3 Continuous Voltage

For a device that has no specific safety agency approvals (operational isolation), the continuous voltage that can be applied across the part in normal operation is less than 42.4 V_{RMS} , or 60 V_{DC} . Ensure that both input and output voltages maintain normal SELV limits. The isolation test voltage represents a measure of immunity to transient voltages.

WARNING

Do not use the device as an element of a safety isolation system that exceeds the SELV limit.

If the device is expected to function correctly with more than $42.4~V_{RMS}$ or $60~V_{DC}$ applied continuously across the isolation barrier, then the circuitry on both sides of the barrier must be regarded as operating at an unsafe voltage, and further isolation or insulation systems must form a barrier between these circuits and any user-accessible circuitry according to safety standard requirements.

7.3.1.4 Isolation Voltage

The terms *Hipot test, flash-tested, withstand voltage, proof voltage, dielectric withstand voltage,* and *isolation test voltage* all describe the same spec. The terms describe a test voltage applied for a specified time across a component designed to provide electrical isolation to verify the integrity of that isolation. TI's DCPA1 series of dc-dc converters are all 100% production tested at 1.5 kV_{AC} for one second.

7.3.1.5 Repeated High-Voltage Isolation Testing

Repeated high-voltage isolation testing of a barrier component can degrade the isolation capability, depending on materials, construction, and environment. The DCPA1 series of dc-dc converters have toroidal, enameled, wire isolation transformers with no additional insulation between the primary and secondary windings. While a device can be expected to withstand several times the stated test voltage, the isolation capability depends on the wire insulation. Any material, including this enamel (typically polyurethane), is susceptible to eventual chemical degradation when subject to very-high applied voltages. Therefore, strictly limit the number of high-voltage tests and repeated high-voltage isolation testing. However, if it is absolutely required, reduce the voltage by 20% from specified test voltage with a duration limit of one second per test.

Feature Description (接下页)

7.3.2 Power Stage

The DCPA1 series of devices uses a push-pull, center-tapped topology. The DCPA1 devices switch at 425 kHz (divide-by-2 from an 850-kHz oscillator).

7.3.3 Input and Output Capacitors

For all DCPA1 designs, a minimum 2.2-μF, low-ESR, ceramic input capacitor is required. Place the input capacitor as close as possible to the device input pins, +V_S and -V_S, to ensure good startup performance.

The recommended typical output capacitance for each output of any DCPA1 device is 1.0-μF of low-ESR, ceramic capacitance. Adding additional output capacitance will aid in ripple reduction, however, any additional capacitance will also require additional input current at start-up.

7.3.4 Oscillator And Watchdog Circuit

The onboard, 850-kHz oscillator generates the switching frequency via a divide-by-2 circuit. The oscillator can be synchronized to an external source, and is used to minimize system noise. A watchdog circuit checks the operation of the oscillator circuit.

7.3.5 Synchronization

When more than one DC/DC converter is needed onboard, beat frequencies and other electrical interference can be generated. This interference occurs because of the small variations in switching frequencies between the DC/DC converters.

The DCPA1 series of devices overcomes this interference by allowing devices to synchronize to an external clock. The SYNC_{IN} pin responds to the rising edge of the external clock. If the external clock is removed, the DCPA1 will return to the frequency of the internal oscillator. If unused, it is recommended to connect this pin to the input side common, -V_S.

7.3.6 SW_{OUT}

The SW_{OLIT} pin is directly connected to one winding of the transformer secondary prior to the output rectifier. It is not recommended to pull current from this pin. Do not connect capacitance directly to this pin as it will degrade performance. The SW_{OUT} pin is not compatible with the SYNC_{IN} pin, therefore these two pins should not be connected together.

7.3.7 Soft Start

The DCPA1 series of devices includes a soft-start feature that prevents high in-rush current during power up. Once input power is applied, there is a delay of typically 10 ms before the output voltage begins to rise. Once the output voltage begins to rise, the soft start time is typically 5 ms.

7.3.8 Load Regulation

The load regulation of the DCPA1 series of devices is specified at 10% to 100% load. Operation below 10% load may cause the output voltage to increase up to 40% higher than the typical output voltage. Placing a minimum 10% load will ensure the output voltage is within the range specified in the *Electrical Characteristics* table.

TEXAS INSTRUMENTS

Feature Description (接下页)

7.3.9 Thermal Performance

The DCPA1 family of devices have been characterized to operate over an ambient temperature range of −40°C to +100°C. The Safe Operating Area curve shown below in 33, represents the operating conditions of the DCPA1 devices where the maximum thermal ratings will not be exceeded. 33 shows that all DCPA1 devices can safely operate over the full ambient temperature range, without airflow, to the full current rating of the device.

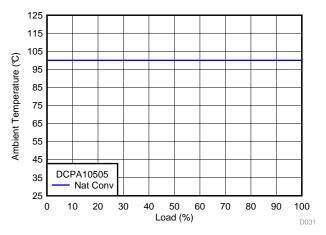

图 33. Thermal Safe Operating Area

7.3.9.1 Thermal Protection

The DCPA1 series of devices are protected by a thermal-shutdown circuit.

If the on-chip temperature rises above 150°C, the device shuts down. Normal operation resumes as soon as the temperature falls below 150°C. While the overtemperature condition continues, operation randomly cycles on and off. This cycling continues until the temperature is reduced.

7.3.10 Current Limit

For protection against a short circuit on the output, the DCPA1 series of devices have a built in current limit protection threshold of 1.75A (typical). These devices are not intended to be used at output currents greater than the device's output current rating as shown in the *Electrical Characteristics* table. Operating at currents greater than the device's current rating, but less than current limit threshold will cause excessive stress to the internal components. For protection against a partial short circuit condition, an input fuse or output fuse is recommended.

7.3.11 Construction

The basic construction of the DCPA1 series of devices is the same as standard integrated circuits. The molded package contains no substrate. The DCPA1 series of devices are constructed using an IC, rectifier diodes, and a wound magnetic toroid on a leadframe. Because the package contains no solder, the devices do not require any special printed circuit board (PCB) assembly processing. This architecture results in an isolated DC/DC converter with inherently high reliability.

8 Application and Implementation

注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

8.1.1 Ripple Reduction

INSTRUMENTS

The high switching frequency of 425 kHz allows simple filtering. To reduce output voltage ripple, it is recommended that a minimum of 1- μ F capacitor be used on the +V_{OUT} pin. For dual output devices, decouple both of the outputs to the COM pin. The required 2.2- μ F, low ESR ceramic input capacitor also helps to reduce ripple and noise. See *DC-to-DC Converter Noise Reduction* (SBVA012).

8.1.2 Connecting the DCPA1 in Series

Multiple DCPA1 isolated 1-W DC/DC converters can be connected in series to provide non-standard voltage rails. This configuration is possible by using the floating outputs provided by the galvanic isolation of the DCPA1 devices by connecting the $+V_{OUT}$ from one DCPA1 to the $-V_{OUT}$ of another as shown in 34. The synchronization feature allows easy synchronization to prevent power-rail beat frequencies at no additional filtering cost.

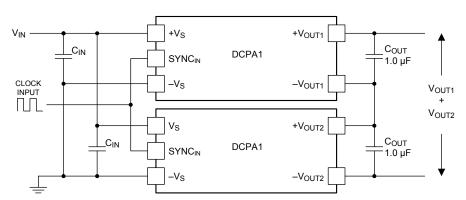

图 34. Multiple DCPA1 Devices Connected in Series

The outputs of a dual-output DCPA1 device can also be connected in series to provide two times the magnitude of +V_{OUT}, as shown in ₹ 35. For example, connect a dual-output, ±15-V, DCPA10515D device to provide a 30-V rail.

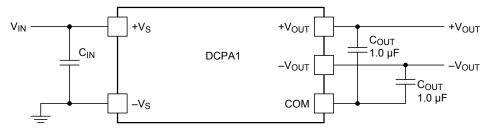

图 35. Dual Output Devices Connected in Series

TEXAS INSTRUMENTS

8.1.3 Connecting the DCPA1 in Parallel

If the output power from one DCPA1 is not sufficient, it is possible to parallel the outputs of multiple DCPA1s, as shown in 🛭 36, (applies to single output devices only). The synchronization feature allows easy synchronization to prevent power-rail beat frequencies at no additional filtering cost.

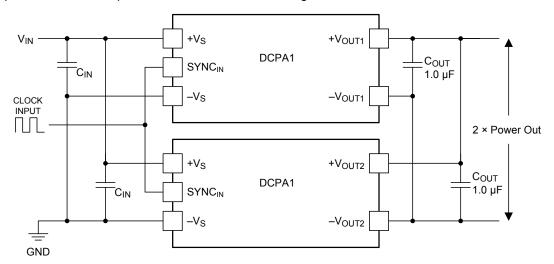

图 36. Multiple DCPA1 Devices Connected in Parallel

8.2 Typical Application

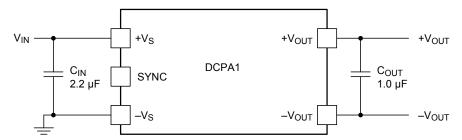

图 37. Typical DCPA10505 Application

8.2.1 Design Requirements

For this design example, use the parameters listed in 表 1 and follow the design procedures shown in *Detailed Design Procedure* section.

表 1.	Design	Example	Paran	neters
		_		

	PARAMETER	VALUE	UNIT
V _(+VS)	Input voltage	5	V
V _(+VOUT)	Output voltage	5	V
I _{OUT}	Output current rating	200	mA
f _{SW}	Operating frequency	425	kHz

www.ti.com.cn

8.2.2 DCPA10505 Application Curves

8.2.3 Detailed Design Procedure

8.2.3.1 Input Capacitor

For all DCPA1, 5-V input voltage designs, select a 2.2-µF low-ESR ceramic input capacitor to ensure a good startup performance.

8.2.3.2 Output Capacitor

For any DCPA1 design, select a 1.0-μF low-ESR ceramic output capacitor to reduce output ripple.

8.2.3.3 SYNC_{IN} Pin

In a stand-alone application, it is recommended to connect this pin to the input side common, -V_S.

8.2.4 PCB Design

The copper losses (resistance and inductance) can be minimized by the use of mutual ground and power planes where possible. If that is not possible, use wide traces to reduce the losses. If several devices are being powered from a common power source, a star-connected system for the traces must be deployed. Do not connect the devices in series, because that type of connection cascades the resistive losses. The position of the decoupling capacitors is important. They must be as close to the devices as possible in order to reduce losses. See the *PCB Layout* section for more details.

9 Power Supply Recommendations

The DCPA1 is a switching power supply, and as such can place high peak current demands on the input supply. In order to avoid the supply falling momentarily during the fast switching pulses, ground and power planes should be used to connect the power to the input of DCPA1 device. If this connection is not possible, then the supplies must be connected in a star formation with the traces made as wide as possible.

10 Layout

10.1 Layout Guidelines

Due to the high power density of these devices, provide ground planes on the input and output rails.

Including input power and ground planes provides a low-impedance path for the input power. For the output, the COM signal connects via a ground plane, while the connections for the positive and negative voltage outputs conduct via wide traces in order to minimize losses.

The output should be taken from the device using ground and power planes, thereby ensuring minimum losses.

The location of the decoupling capacitors in close proximity to their respective pins ensures low losses due to the effects of stray inductance, thus improving the ripple performance. This location is of particular importance to the input decoupling capacitor, because this capacitor supplies the transient current associated with the fast switching waveforms of the power drive circuits.

If the $SYNC_{IN}$ pin is unused, it is recommended to connect this pin to the input side common, $-V_S$. Allow the SW_{OUT} pin, to remain configured as a floating pad.

⁽¹⁾ Status: For more details on status, see our product life cycle.

⁽²⁾ Material type: When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

PACKAGE OPTION ADDENDUM

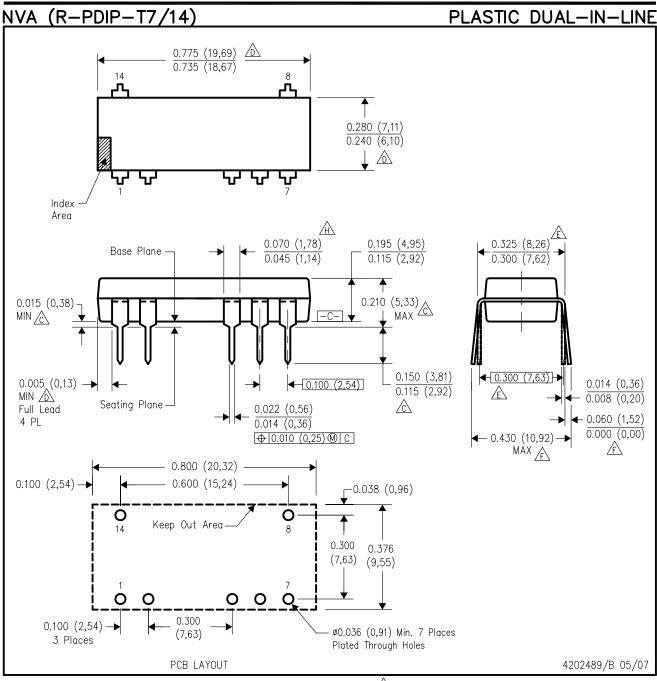

www.ti.com 10-Nov-2025

- (3) RoHS values: Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.
- (4) Lead finish/Ball material: Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
- (5) MSL rating/Peak reflow: The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.
- (6) Part marking: There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

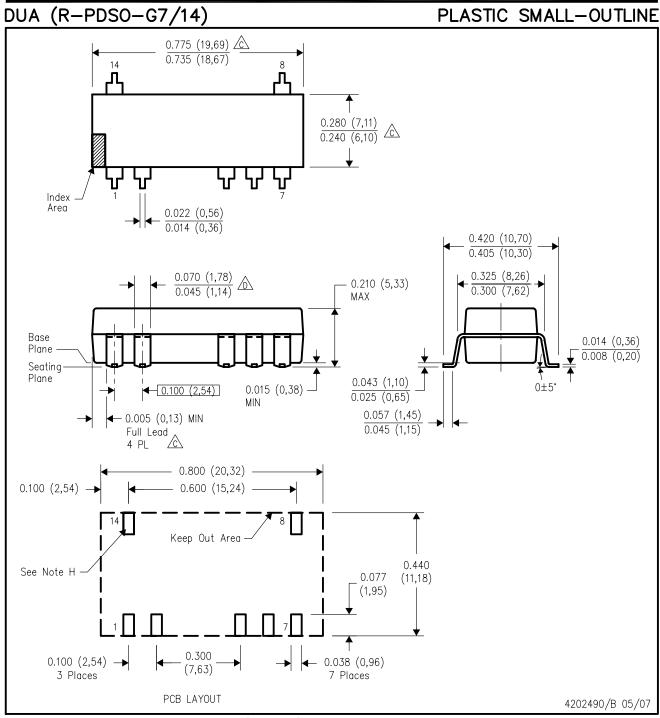

NOTES:

- A. All linear dimensions are in inches (millimeters).
- B. This drawing is subject to change without notice.
- Dimensions are measured with the package seated in JEDEC seating plane gauge GS-3.
- Dimensions do not include mold flash or protrusions.

 Mold flash or protrusions shall not exceed 0.010 (0,25).
- Dimensions measured with the leads constrained to be perpendicular to Datum C.
- Dimensions are measured at the lead tips with the leads unconstrained.
- G. Pointed or rounded lead tips are preferred to ease insertion.
- Lead shoulder maximum dimension does not include dambar protrusions. Dambar protrusions shall not exceed 0.010 (0,25).
- I. Distance between leads including dambar protrusions to be 0.005 (0,13) minimum.
- J. A visual index feature must be located within the cross—hatched area.
- K. For automatic insertion, any raised irregularity on the top surface (step, mesa, etc.) shall be symmetrical about the lateral and longitudinal package centerlines.
- L. Falls within JEDEC MS-001-AA.

- NOTES:
- A. All linear dimensions are in inches (millimeters).
- B. This drawing is subject to change without notice.
- Dimensions do not include mold flash or protrusions.

 Mold flash or protrusions shall not exceed 0.010 (0,25).
- Lead shoulder maximum dimension does not include dambar protrusions. Dambar protrusions shall not exceed exceed 0.010 (0,25).
- E. Distance between leads including dambar protrusions to be 0.005 (0,13) minimum.
- F. A visual index feature must be located within the cross—hatched area.
- G. For automatic insertion, any raised irregularity on the top surface (step, mesa, etc.) shall be symmetrical about the lateral and longitudinal package centerlines.
- H. Power pin connections should be two or more vias per input, ground and output pin.
