# INA351 具有集成基准缓冲器、成本和尺寸经优化的低功耗 1.8V 至 5.5V 可选增益仪表放大器

1 特性

- 专为尺寸、成本和功耗敏感型应用而设计
- 具有集成基准缓冲器的可选增益选项
  - G = 10 或 G = 20 (INA351ABS)
  - G = 30 或 G = 50 (INA351CDS)
- 节省空间的超小型封装选项
  - 10 引脚 X2QFN (RUG) – 3mm^2
  - 8 引脚 WSON (DSG) – 4mm^2
  - 8 引脚 SOT23-THN (DDF) – 4.64mm^2
- 针对 10 位至 14 位系统的优化性能
  - CMRR：所有增益均为 95dB（典型值）
  - 失调电压：所有增益均为 0.2mV（典型值）
  - 增益误差（典型值）：
    - G = 10、G = 50 时为 0.015%
    - G = 20、G = 30 时为 0.020%
- 带宽：G = 10 时为 100kHz（典型值）
- 驱动 500pF，过冲小于 20%（典型值）
- 优化的静态电流：110µA（典型值）
- 适用于功耗敏感型应用的关断选项
- 电源电压范围：1.8V (±0.9V) 至 5.5V (±2.75V)
- 额定温度范围：-40°C 至 125°C

2 应用

- 桥接网络传感
- 差分至单端转换
- 称重计
- 模拟输入模块
- 流量变送器
- 可穿戴健身和活动监测仪
- 血糖监测仪
- 压力和温度传感
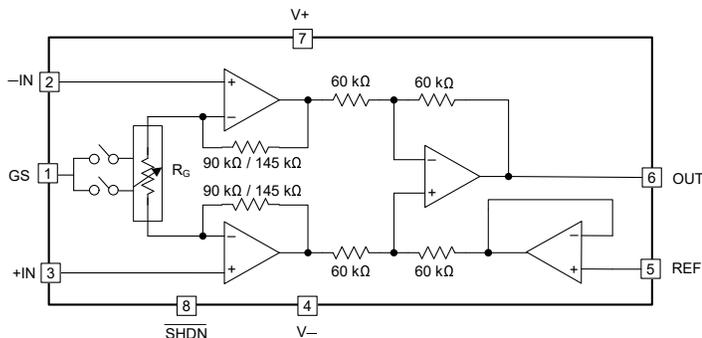

3 说明

INA351 是一款具有集成基准缓冲器的可选增益仪表放大器，可在采用小型封装的 INA351ABS 和 INA351CDS 型号中提供四种增益选项。INA351ABS 具有 10 或 20 的增益选项，INA351CDS 具有 30 或 50 的增益选项。可以通过切换增益选择 (GS) 引脚来选择这些增益选项。INA351 是桥式感应以及差分至单端转换应用的理想选择。

INA351 采用精密匹配的集成电阻器构建而成，无需使用精密或高度匹配的外部电阻器，从而节省了 BOM 成本、贴片机器处理成本和布板空间。INA351 可直接连接到低速 10 位至 14 位模数转换器 (ADC)，非常适合替换使用普通放大器和分立式电阻器构建的仪表放大器的分立式实现方案。

INA351 的设计采用三放大器架构，能够更好地提供性能。该器件在所有增益选项下可实现 86dB 的最小 CMRR 和 0.1% 精度的最大增益误差，以及 1.3mV 的最大失调电压，而仅消耗 135µA 的最大静态电流。INA351 有一个集成关断选项，可在空闲时关闭放大器，从而在电池供电应用中进一步节省电能。

封装信息

器件型号[1]	封装[2]	封装尺寸[3]
INA351ABS	DSG（WSON，8）	2mm × 2mm
	DDF（SOT-23，8）	1.6mm × 2.9mm
	RUG（X2QFN，10）	1.5mm × 2mm
INA351CDS	DSG（WSON，8）	2mm × 2mm
	DDF（SOT-23，8）	1.6mm × 2.9mm
	RUG（X2QFN，10）	1.5mm × 2mm

(1)   请参阅节 4
(2)   有关更多信息，请参阅节 11。
(3)   封装尺寸（长 × 宽）为标称值，并包括引脚（如适用）。

注意：INA351ABS 使用 90kΩ，INA351CDS 使用 145kΩ

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)[1]

		MIN	MAX	UNIT
Supply voltage, V_S = (V+) – (V–)		0	6	V
Signal input pins	Common mode voltage[2]	(V–) – 0.5	(V+) + 0.5	V
	Differential voltage[3]		V_S + 0.2	V
	Current[2]	–10	10	mA
Output short-circuit[4]		Continuous		
Operating Temperature, T_A		–55	150	
Junction Temperature, T_J			150	°C
Storage Temperature, T_{stg}		–65	150	

(1)   Operation outside the Absolute Maximum Ratings may cause permanent device damage. Absolute Maximum Ratings do not imply functional operation of the device at these or any other conditions beyond those listed under Recommended Operating Conditions. If used outside the Recommended Operating Conditions but within the Absolute Maximum Ratings, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.
(2)   Input pins are diode-clamped to the power-supply rails. Input signals that may swing more than 0.5 V beyond the supply rails must be current limited to 10 mA or less
(3)   Differential input voltages greater than 0.5 V applied continuously can result in a shift to the input offset voltage above the maximum specification of this parameter. The magnitude of this effect increases as the ambient operating temperature rises.
(4)   Short-circuit to V_S / 2.

6.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001[1]	±2000	V
		Charged-device model (CDM), per ANSI/ESDA/JEDEC JS-002[2]	±1000	

(1)   JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2)   JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	MAX	UNIT
Supply voltage V_S = (V+) – (V–)	Single-supply	1.8	5.5	V
	Dual-supply	±0.9	±2.75	
Input Voltage Range		(V–)	(V+)	V
Specified temperature	Specified temperature	–40	125	°C

6.4 Thermal Information

		INA351ABS, INA351CDS			
THERMAL METRIC[1]		DDF (SOT-23-THN)	DSG (WSON)	RUG (X2QFN)	UNIT
		8 PINS	8 PINS	10 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	172.1	80.3	174.7	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	90.1	100.4	63.2	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	88.2	46.4	99.6	°C/W
ψ_{JT}	Junction-to-top characterization parameter	7.3	5.3	1.3	°C/W
ψ_{JB}	Junction-to-board characterization parameter	88.0	46.4	99.2	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	n/a	21.9	n/a	°C/W

(1)   For more information about traditional and new thermal metrics, see the Semiconductor and IC Package Thermal Metrics application note.

6.5 Electrical Characteristics

For V_S = (V+) – (V–) = 1.8 V to 5.5 V (±0.9 V to ±2.75 V) at T_A = 25°C, V_{REF} = V_S/2, G = 10, R_L = 10 kΩ connected to V_S / 2, V_{CM} = [(V_{IN+}) + ($V_{IN–}$)] / 2 = V_S / 2, V_{IN} = (V_{IN+}) – ($V_{IN–}$) = 0 V and V_{OUT} = V_S / 2 (unless otherwise noted)

PARAMETER		TEST CONDITIONS		MIN	TYP	MAX	UNIT
INPUT							
V_{OSI}	Offset Voltage, RTI[1]	V_S = 5.5 V, G = 10, 20, 30, 50	T_A = 25°C		±0.2	±1.3	mV
	Offset Voltage over T, RTI[1]	V_S = 5.5 V, G = 10, 20, 30, 50	T_A = –40°C to 125°C			±1.4	mV
	Offset temp drift, RTI[2]	V_S = 5.5 V, G = 10, 20, 30, 50	T_A = –40°C to 125°C		±0.65		µV/°C
PSRR	Power-supply rejection ratio	G = 10, 20, 30, 50	T_A = 25°C		20	75	µV/V
Z_{IN-DM}	Differential Impedance				100 || 5		GΩ || pF
Z_{IN-CM}	Common Mode Impedance				100 || 9		GΩ || pF
V_{CM}	Input Stage Common Mode Range[3]			(V–)		(V+)	V
CMRR DC	Common-mode rejection ratio, RTI	G = 10, 20, 30, 50, V_{CM} = (V–) + 0.1 V to (V+) – 1 V, High CMRR Region	V_S = 5.5 V, V_{REF} = V_S/2	86	95		dB
		G = 10, 20, 30, 50, V_{CM} = (V–) + 0.1 V to (V+) – 1 V, High CMRR Region	V_S = 3.3 V, V_{REF} = V_S/2		94		
		G = 10, 20, 30, 50, V_{CM} = (V–) + 0.1 V to (V+) – 0.1 V	V_S = 5.5 V, V_{REF} = V_S/2	62	75		
BIAS CURRENT							
I_B	Input bias current	V_{CM} = V_S / 2			±0.65		pA
I_{OS}	Input offset current	V_{CM} = V_S / 2			±0.25		pA
NOISE VOLTAGE							
e_{NI}	Input referred voltage noise density[5]	G = 10, 20, 30, 50	f = 1 kHz		36		nV/$\sqrt{Hz}$
		G = 10, 20, 30, 50	f = 10 kHz		35		
E_{NI}	Input referred voltage noise[5]	G = 10, f_B = 0.1 Hz to 10 Hz			3.2		µV$_{PP}$
i_n	Input current noise	f = 1 kHz			22		fA/$\sqrt{Hz}$
GAIN							
GE	Gain error[4]	G = 10, V_{REF} = V_S/2	V_O = (V–) + 0.1 V to (V+) – 0.1V		±0.015	±0.10	%
		G = 20, V_{REF} = V_S/2			±0.020	±0.10	
	Gain error[4]	G = 30, V_{REF} = V_S/2			±0.020	±0.10	
		G = 50, V_{REF} = V_S/2			±0.015	±0.10	
OUTPUT							
V_{OH}	Positive rail headroom	R_L = 10 kΩ to V_S/2			15	30	mV
V_{OL}	Negative rail headroom	R_L = 10 kΩ to V_S/2			15	30	mV
C_L Drive	Load capacitance drive	V_O = 100 mV step, Overshoot < 20%			500		pF
Z_O	Closed-loop output impedance	f = 10 kHz			51		Ω
I_{SC}	Short-circuit current	V_S = 5.5 V			±20		mA
FREQUENCY RESPONSE							
BW	Bandwidth, –3 dB	G = 10	V_{IN} = 10 mV$_{pk-pk}$		100		kHz
		G = 20			50		
	Bandwidth, –3 dB	G = 30			40		
		G = 50			25		
THD + N	Total harmonic distortion + noise	V_S = 5.5 V, V_{CM} = 2.75 V, V_O = 1 V$_{RMS}$, G = 10, R_L = 100 kΩ f = 1 kHz, 80-kHz measurement BW			0.035		%
EMIRR	Electro-magnetic interference rejection ratio	f = 1 GHz, V_{IN_EMIRR} = 100 mV			96		dB

POWER SUPPLY						
V_S	Power-supply voltage	Single-supply	1.7		5.5	V
		Dual-supply	±0.85		±2.75	
I_Q	Quiescent current	V_{IN} = 0 V		110	135	µA
		T_A = – 40°C to 125°C			147	
I_{QSD}	Quiescent current per amplifier	All amplifiers disabled, $\overline{SHDN}$ = V –		0.85	1.5	µA
V_{IL}	Logic low threshold voltage (Gain Select)	G = 10 for INA351ABS, G = 30 for INA351CDS			(V –) + 0.2 V	V
V_{IH}	Logic high threshold voltage (Gain Select)	G = 20 for INA351ABS, G = 50 for INA351CDS	(V –) + 1 V			V
t_{ON}	Amplifier enable time (full shutdown) [6]	G = 10, V_{CM} = V_S / 2, V_O = 0.9 × V_S / 2, R_L connected to V –		100		µs
t_{OFF}	Amplifier disable time [6]	G = 10, V_{CM} = V_S / 2, V_O = 0.1 × V_S / 2, R_L connected to V –		5		µs
	$\overline{SHDN}$ pin input bias current (per pin)	(V+) ⩾ $\overline{SHDN}$ ⩾ (V –) + 1 V		10		nA
	$\overline{SHDN}$ pin input bias current (per pin)	(V –) ⩽ $\overline{SHDN}$ ⩽ (V –) + 0.2 V		175		nA

(1) Total offset, referred-to-input (RTI): V_{OS} = (V_{OSI}) + (V_{OSO} / G).
(2) Offset drifts are uncorrelated. Input-referred offset drift is calculated using: $\Delta V_{OS(RTI)}$ = $\sqrt{[\Delta V_{OSI}^2 + (\Delta V_{OSO} / G)^2]}$
(3) Input common-mode voltage range of the just the input stage of the instrumentation amplifier. The entire INA351 input range depends on the combination input common-mode voltage, differential voltage, gain, reference voltage and power supply voltage. *Typical Characteristic* curves will be added with more information.
(4) Minimum and Maximum values are specified by characterization.
(5) Total RTI voltage noise is equal to: $e_{N(RTI)}$ = $\sqrt{[e_{NI}^2 + (e_{NO} / G)^2]}$
(6) Disable time (t_{OFF}) and enable time (t_{ON}) are defined as the time interval between the 50% point of the signal applied to the $\overline{SHDN}$ pin and the point at which the output voltage reaches the 10% (disable) or 90% (enable) level.

7 Detailed Description

7.1 Overview

The INA351 is a selectable gain instrumentation amplifier with integrated reference buffer designed to provide an integrated, small size, cost-effective solution for applications employing general purpose INAs or discrete implementation of INAs using commodity amplifiers and resistors. The device incorporates a three op amp INA architecture integrating three operational amplifiers and seven precision matched integrated resistors. The INA351 is designed for 10-bit to 14-bit systems without any additional effort, but calibrating offset and gain error at a system level can further improve system resolution and accuracy, enabling use in precision applications.

One of the key features of the INA351 is that the device does not need any external resistors to set the gain. Often these external resistors require tighter tolerance and careful routing, which adds to system complexity and cost. The INA351 is offered in four gain options across two variants. The INA351ABS has two gain options of 10 and 20. The INA351CDS has two other gain options of 30 and 50. Gains can be selected by connecting the GS pin to logic high or logic low. Note that the GS pin can be left floating as well, as the pin is designed with an internal pull up to default to the same configuration as GS tied logic high.

The INA351 is designed for industrial applications leveraging pressure and temperature sensing via bridge-type sensor networks and load cells. The device can also be used in space-constrained applications such as patient monitoring, sleep diagnostics, electronic hospital beds, and blood glucose monitoring for voltage sensing and differential to single-ended conversion. The INA351 can enable these applications to reduce the overall size through the use of tiny packages, including a 2-mm × 1.5-mm X2QFN package and a 2-mm × 2-mm WSON package.

7.3 Feature Description

7.3.1 Gain-Setting

方程式 1 is the gain equation for INA351ABS:

$$G = 1 + \frac{180\,k\Omega}{R_G} \tag{1}$$

The value of the internal gain resistor R_G for INA351ABS can then be derived from the gain equation:

$$R_G = \frac{180\,k\Omega}{G-1} \tag{2}$$

Similarly, 方程式 3 is the gain equation for INA351CDS:

$$G = 1 + \frac{290\,k\Omega}{R_G} \tag{3}$$

The value of the internal gain resistor R_G for INA351CDS can then be derived from the gain equation:

$$R_G = \frac{290\,k\Omega}{G-1} \tag{4}$$

表 7-1 provides how to choose different gain options across the INA351ABS and INA351CDS. The 60-kΩ, 90-kΩ, and 145-kΩ resistors mentioned are all typical values of the on-chip resistors.

表 7-1. Gain Selection Table

DEVICE	GAIN SELECT (GS)	SELECTED GAIN
INA351ABS	High or No Connect	20
	Low	10
INA351CDS	High or No Connect	50
	Low	30

7.3.1.1 Gain Error and Drift

Gain error in the INA351 is limited by the mismatch of the integrated precision resistors and is specified based on characterization results. Gain error of maximum 0.1% can be expected for all gains of 10, 20, 30 and 50. Gain drift in the INA351 is limited by the slight mismatch of the temperature coefficient of the integrated resistors. Since these integrated resistors are precision matched with low temperature coefficient resistors to begin with, the overall gain drift is much better in comparison to discrete implementation of the instrumentation amplifiers built using external resistors.

7.3.2 Input Common-Mode Voltage Range

The INA351 has two gain stages, the first stage has a common-mode gain of 1 and a differential gain set by the GS pin. The second stage is configured in a difference-amplifier configuration with differential gain of 1 and ideally rejects all of the input common mode completely. The second stage also provides a gain of 1 from REF pin to set the output common-mode voltage.

The linear input voltage range of the INA351, even for a rail-to-rail first stage, is dictated by both the signal swing at output of the first stage as well as the input common-mode voltage range output swing of the second stage. To maximize performance, it is critical to keep the INA351 within the linear range for a given combination of gain, reference, and input common-mode voltage for a particular input differential. Input common-mode voltage (V_{CM}) vs output voltage graphs (V_{OUT}) in this section show a particular reference voltage and gain configuration to outline the linear performance region of the INA351. A good common-mode rejection can be expected when operating with in the limits of the V_{CM} vs V_{OUT} graph. Note that the INA351 linear input voltage cannot be close to or extend beyond the supply rails, as the output of the first stage is driven into saturation.

The common-mode range for the most common operating conditions is outlined as follows. 图 7-1 shows the region of operation where a minimum of 86 dB can be achieved. 图 7-2 has much wider region of operation with a lower minimum CMRR of 62 dB, because the input signal crosses over the transition region of the input pairs to achieve rail-to-rail operation. The common-mode range for other operating conditions is best calculated with the INA V_{CM} vs V_{OUT} tool located under the *Amplifiers and Comparators* section of the Analog Engineer's Calculator on ti.com. The INA351-HCM model can be specifically used for applications requiring high CMRR and corresponds to performance shown in 图 7-1. The INA351xxS model can be used for applications where the input common mode can be expected to vary rail-to-rail and the model corresponds to performance shown in 图 7-2 where CMRR drops to 62-dB minimum.

V_S = 5.5 V   G = 10, 20, 30, 50 V_{REF} = V_S / 2

V_S = 5.5 V   G = 10, 20, 30, 50 V_{REF} = V_S / 2

图 7-2. Input Common-Mode Voltage vs Output Voltage
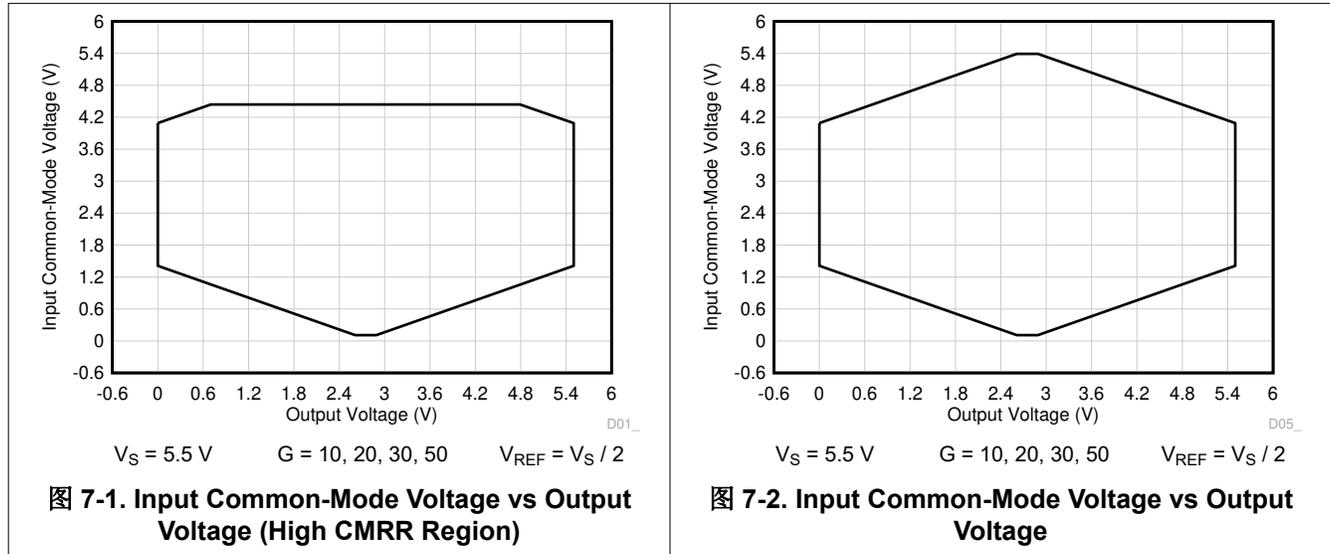

7.3.3 EMI Rejection

The INA351 uses integrated electromagnetic interference (EMI) filtering to reduce the effects of EMI from sources such as wireless communications and densely-populated boards with a mix of analog signal chain and digital components. EMI immunity can be improved with circuit design techniques; the INA351 benefits from these design improvements. Texas Instruments has developed the ability to accurately measure and quantify the immunity of an operational amplifier over a broad frequency spectrum extending from 10 MHz to 6 GHz. 图 7-3 shows the results of this testing on the INA351. 表 7-2 provides the EMIRR IN+ values for the INA351 at particular frequencies commonly encountered in real-world applications. The *EMI Rejection Ratio of Operational Amplifiers* application report contains detailed information on the topic of EMIRR performance relating to op amps and is available for download from www.ti.com.

5 GHz	802.11a, 802.11n, aero communication and navigation, mobile communication, space and satellite operation, C-band (4 GHz to 8 GHz)	105 dB

7.3.4 Typical Specifications and Distributions

Designers often have questions about a typical specification of an amplifier to design a more robust circuit. Due to natural variation in process technology and manufacturing procedures, every specification of an amplifier exhibits some amount of deviation from the ideal value, like an amplifier's input offset voltage. These deviations often follow *Gaussian* (*bell curve*), or *normal* distributions, and circuit designers can leverage this information to guard band their system, even when there is not a minimum or maximum specification in the *Electrical Characteristics* table.

| 0.00002% | 0.00312% | 0.13185% | 2.145% | 13.59% | 34.13% | 34.13% | 13.59% | 2.145% | 0.13185% | 0.00312% | 0.00002% |

σ σ σ σ σ σ σ σ σ σ σ σ

μ-6σ μ-5σ μ-4σ μ-3σ μ-2σ μ-σ μ μ+σ μ+2σ μ+3σ μ+4σ μ+5σ μ+6σ
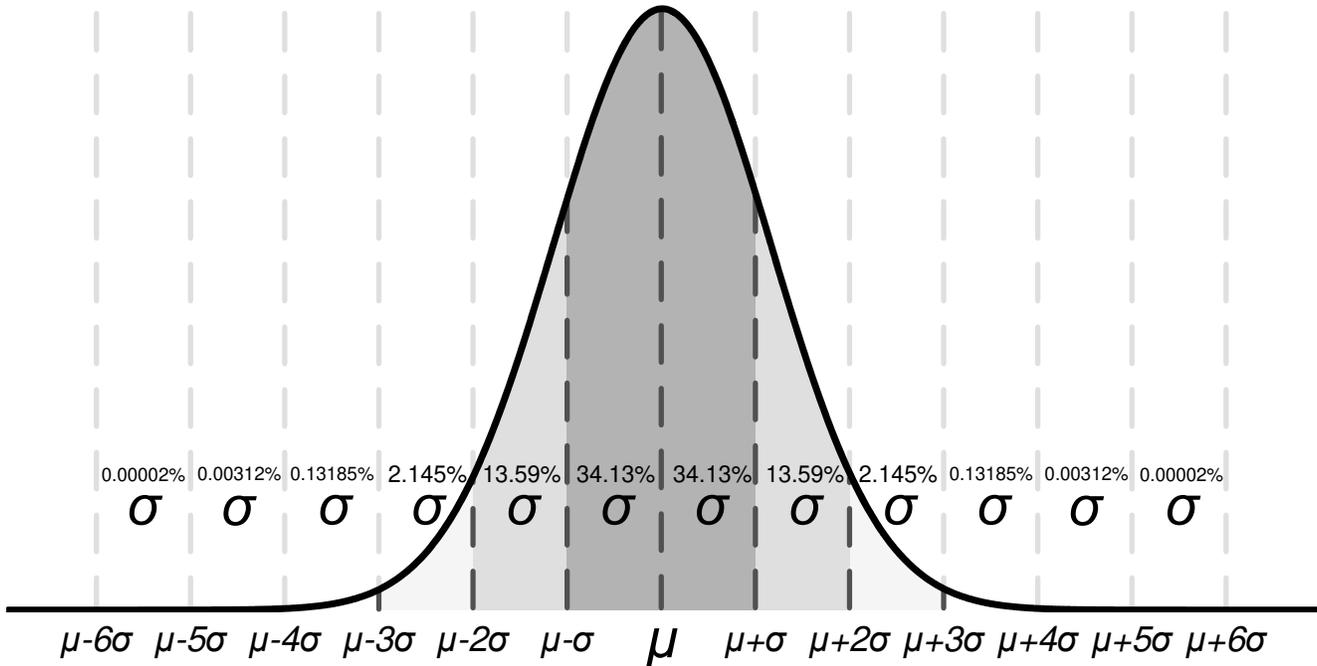

图 7-4. Ideal Gaussian Distribution

图 7-4 shows an example distribution, where *μ*, or *mu*, is the mean of the distribution, and where σ, or *sigma*, is the standard deviation of a system. For a specification that exhibits this kind of distribution, approximately two-thirds (68.26%) of all units can be expected to have a value within one standard deviation, or one sigma, of the mean (from $\mu - \sigma$ to $\mu + \sigma$).

Depending on the specification, values listed in the *typical* column of the *Electrical Characteristics* table are represented in different ways. As a general rule, if a specification naturally has a nonzero mean (for example, like gain bandwidth), then the typical value is equal to the mean (μ). However, if a specification naturally has a mean near zero (like input offset voltage), then the typical value is equal to the mean plus one standard deviation ($\mu + \sigma$) to most accurately represent the typical value.

You can use this chart to calculate approximate probability of a specification in a unit; for example, the INA351 typical input voltage offset is 200 μV, so 68.2% of all INA351 devices are expected to have an offset from –200 μV to +200 μV. At 4 σ (±800 μV), 99.9937% of the distribution has an offset voltage less than ±800 μV, which means 0.0063% of the population is outside of these limits, which corresponds to about 1 in 15,873 units.

Specifications with a value in the minimum or maximum column are verified by TI, and units outside these limits are removed from production material. For example, the INA351 family has a maximum offset voltage of 1.3 mV at 25°C, and even though this corresponds to 6 σ ($\approx$1 in 500 million units), which is extremely unlikely, TI verifies that any unit with larger offset than 1.3 mV are removed from production material.

For specifications with no value in the minimum or maximum column, consider selecting a sigma value of sufficient guard band for your application, and design worst-case conditions using this value. As stated earlier, the 6-σ value corresponds to about 1 in 500 million units, which is an extremely unlikely chance, and can be an option as a wide guard band to design a system around. In this case, the INA351 family does not have a maximum or minimum for offset voltage drift, but based on 图 6-2 and the typical value of 0.65 μV/°C in the *Electrical Characteristics* table, the 6-σ value for offset voltage drift can be calculated to 3.9 μV/°C. When designing for worst-case system conditions, this value can be used to estimate the worst possible offset drift without having an actual minimum or maximum value.

Product Folder Links: *INA351*

English Data Sheet: SBOSAD5

However, process variation and adjustments over time can shift typical means and standard deviations, and unless there is a value in the minimum or maximum specification column, TI cannot verify the performance of a device. This information must be used only to estimate the performance of a device.

7.3.5 Electrical Overstress

Designers often ask questions about the capability of an operational amplifier to withstand electrical overstress. These questions tend to focus on the device inputs, but can involve the supply voltage pins or even the output pin. Each of these different pin functions have electrical stress limits determined by the voltage breakdown characteristics of the particular semiconductor fabrication process and specific circuits connected to the pin. Additionally, internal electrostatic discharge (ESD) protection is built into these circuits to protect them from accidental ESD events both before and during product assembly.

Having a good understanding of this basic ESD circuitry and the relevance to an electrical overstress event is helpful. 图 7-5 shows the ESD circuits contained in the INA351 devices. The ESD protection circuitry involves several current-steering diodes connected from the input and output pins and routed back to the internal power supply lines, where these diodes meet at an absorption device internal to the operational amplifier. This protection circuitry is intended to remain inactive during normal circuit operation.
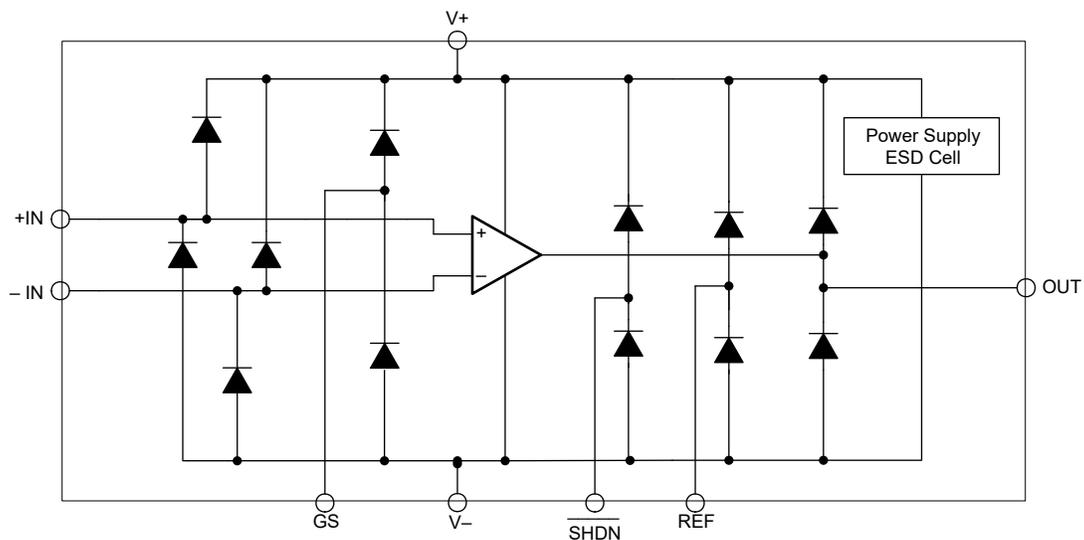

图 7-5. Equivalent Internal ESD Circuitry

7.4 Device Functional Modes

The INA351 has a shutdown or disable mode to enable power savings in battery powered applications. The shutdown mode has a maximum quiescent current of just 1.25 µA, which is 100 times lower from the quiescent current when the amplifier is powered-on or enabled.

The INA351 enters disable mode when the $\overline{\text{SHDN}}$ pin is tied low. The INA351 is enabled when the $\overline{\text{SHDN}}$ pin is tied high. A no connection or a floating $\overline{\text{SHDN}}$ pin enables or powers-on the INA as the pin has an internal pull up current to default to the same configuration as $\overline{\text{SHDN}}$ pin tied high.

English Data Sheet: SBOSAD5

8 Application and Implementation

备注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

8.1 Application Information

8.1.1 Reference Pin

The output voltage of the INA351 is developed with respect to the voltage on the reference pin (REF). Often in dual-supply operation, REF pin connects to the system ground. However, In single-supply operation, offsetting the output signal to a precise mid-supply level is useful and required (for example, 2.75-V in a 5.5-V supply environment). To accomplish this level shift, a voltage source must be connected to the REF pin to level-shift the output so that the INA can drive a single-supply ADC. Traditionally, this is accomplished using an external reference buffer as shown in 图 8-1.

The INA351 has an integrated reference buffer amplifier configured in unity gain, voltage follower configuration internal to the amplifier as shown in Simplified Internal Schematic. This allows designers to directly connect the INA351 to a resistive divider without any need for an external reference buffer amplifier as shown in 图 8-2.

English Data Sheet: SBOSAD5

8.1.2 Input Bias Current Return Path

The input impedance of the INA351 is extremely high, but a path must be provided for the input bias current of both inputs. This input bias current is typically a few pico amps but at high temperature this can be a few nano amps. High input impedance means that the input bias current changes little with varying input voltage.

For proper operation, input circuitry must provide a path for this input bias current. 图 8-3 shows various provisions for an input bias current path. Without a bias current path, the inputs float to a potential that exceeds the common-mode range of the INA351, and the input amplifiers saturate. If the differential source resistance is low, the bias current return path connects to one input (as shown in the thermocouple example in 图 8-3). With a higher source impedance, use two equal resistors to provide a balanced input, with the possible advantages of a lower input offset voltage as a result of bias current, and better high-frequency common-mode rejection.

8.2 Typical Applications

8.2.1 Resistive-Bridge Pressure Sensor

The INA351 is an integrated instrumentation amplifier that measures small differential voltages while simultaneously rejecting larger common-mode voltages. The device offers a low power consumption of 110 μA (typical) and has a smaller form factor.

The device is designed for portable applications where sensors measure physical parameters, such as changes in fluid, pressure, temperature, or humidity. An example of a pressure sensor used in the medical sector is in portable infusion pumps or dialysis machines.

The pressure sensor is made of a piezo-resistive element that can be derived as a classical 4-resistor Wheatstone bridge.

Occlusion (infusion of fluids, medication, or nutrients) happens only in one direction, and therefore can only cause the resistive element (R) to expand. This expansion causes a change in voltage on one leg of the Wheatstone bridge, which induces a differential voltage V_{DIFF}.

图 8-4 shows an example circuit for an occlusion pressure sensor application, as required in infusion pumps. When blockage (occlusion) occurs against a set-point value, the tubing depresses, thus causing the piezo-resistive element to expand (Node AD: R + $\triangle$R). The signal chain connected to the bridge downstream processes the pressure change and can trigger an alarm.

图 8-4. Resistive-Bridge Pressure Sensor
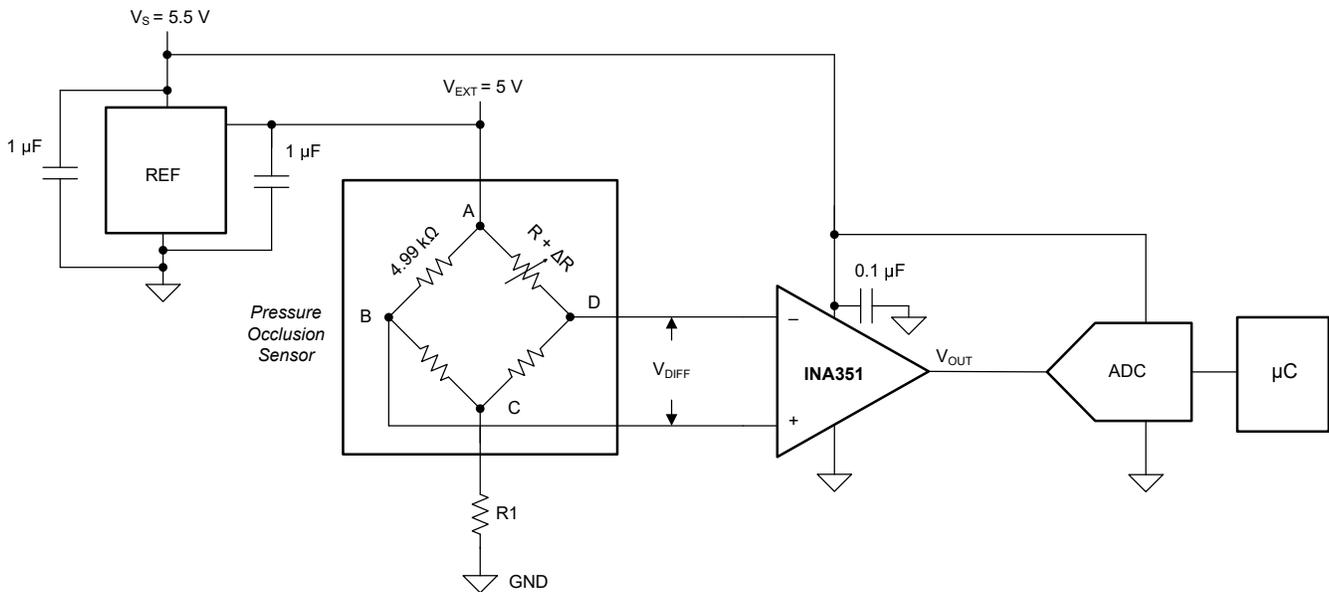

Low-tolerance bridge resistors must be used to minimize the offset and gain errors.

Given that there is only a positive differential voltage applied, this circuit is laid out in single-ended supply mode. The excitation voltage, V_{EXT}, to the bridge must be precise and stable; otherwise, measurement errors can be introduced.

English Data Sheet: SBOSAD5

8.2.1.1 Design Requirements

For this application, the design requirements are as provided in 表 8-1.

表 8-1. Design Requirements

DESCRIPTION	VALUE
Single supply voltage	V_S = 5.5 V
Excitation voltage	V_{EXT} = 5.0 V
Occlusion pressure range	P = 1 psi to 12 psi, increments of P = 0.5 psi
Occlusion pressure sensitivity	S = 2 ±0.5 (25%) mV/V/psi
Occlusion pressure impedance (R)	R = 4.99 kΩ ±50 Ω (0.1%)
Total pressure sampling rate	Sr = 20 Hz
Full-scale range of ADC	$V_{ADC(fs)}$ = V_{OUT} = 3.0 V

8.2.1.2 Detailed Design Procedure

This section provides basic calculations to lay out the instrumentation amplifier with respect to the given design requirements.

One of the key considerations in resistive-bridge sensors is the common-mode voltage, V_{CM}. If the bridge is balanced (no pressure, thus no voltage change), $V_{CM(zero)}$ is half of the bridge excitation (V_{EXT}). In this example $V_{CM \ (zero)}$ is 2.5 V. For the maximum pressure of 12 psi, the bridge common-mode voltage, $V_{CM(MAX)}$, is calculated by:

$$V_{CM(MAX)} = \frac{V_{DIFF}}{2} + V_{CM(zero)} \tag{5}$$

where

$$V_{DIFF} = S_{MAX} \times V_{EXT} \times P_{MAX} = 2.5 \frac{mV}{V \times psi} \times 5\,V \times 12\,psi = 150\,mV \tag{6}$$

Thus, the maximum common-mode voltage applied results in:

$$V_{CM(MAX)} = \frac{150\,mV}{2} + 2.5\,V = 2.575\,V \tag{7}$$

Similarly, the minimum common-mode voltage can be calculated as,

$$V_{CM(MIN)} = \frac{-150\,mV}{2} + 2.5\,V = 2.425\,V \tag{8}$$

The next step is to calculate the gain required for the given maximum sensor output voltage span, V_{DIFF}, in respect to the required V_{OUT}, which is the full-scale range of the ADC.

The following equation calculates the gain value using the maximum input voltage and the required output voltage:

$$G = \frac{V_{OUT}}{V_{DIFF(MAX)}} = \frac{3.0\,V}{150\,mV} = 20\,V/V \tag{9}$$

Considering the INA351 is a selectable gain INA with gain options of 10, 20, 30, 50, the INA351ABS with GS tied high enables G = 20 maintaining the maximum output signal swing for the ADC.

Next, let us make sure that the INA351 can operate within this range checking the *Input Common-Mode Voltage vs Output Voltage* curves in the *Typical Characteristics* section. The relevant figure is also in this section for convenience. Looking at 图 8-5, we can confirm that a output signal swing of 3 V is supported for the input signal swing between 2.425 V and 2.575 V, thus making sure of the linear operation.

Product Folder Links: *INA351*

English Data Sheet: SBOSAD5

$V_S = 5.5$ V   G = 10, 20, 30, 50 $V_{REF} = 0$ V
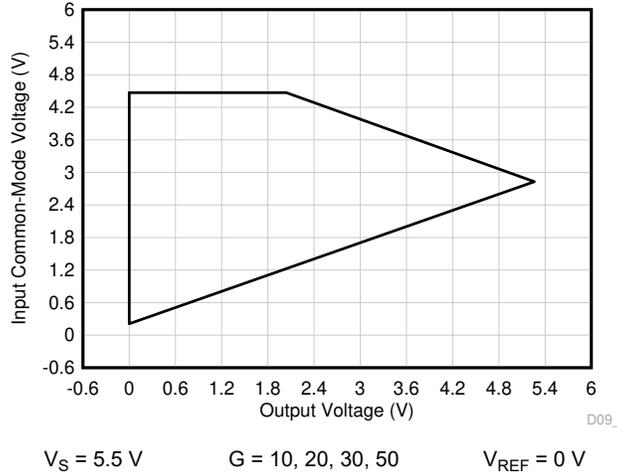

图 8-5. Input Common-Mode Voltage vs Output Voltage (High CMRR Region)

An additional series resistor in the Wheatstone bridge string (R1) may or may not be required, and can be decided based on the intended output voltage swing for a particular combination of supply voltage, reference voltage and the selected gain for an input common-mode voltage range. R1 helps adjust the input common-mode voltage range, and thus can help accommodate the intended output voltage swing. In this particular example, it is not required and can be shorted out.

8.2.1.3 Application Curves

The following typical characteristic curve is for the circuit in 图 8-4.
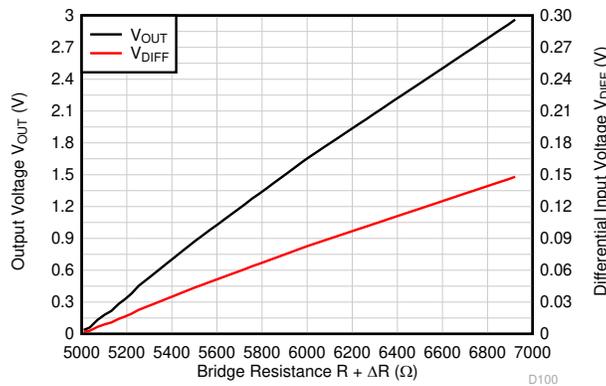

图 8-6. Input Differential Voltage, Output Voltage vs Bridge Resistance

8.3 Power Supply Recommendations

The nominal performance of the INA351 is specified with a supply voltage of ±2.75 V and midsupply reference voltage. The device also operates using power supplies from ±0.85 V (1.7 V) to ±2.75 V (5.5 V) and non-midsupply reference voltages with excellent performance. Parameters can vary significantly with operating voltage and reference voltage.

Product Folder Links: *INA351*

English Data Sheet: SBOSAD5

8.4 Layout

8.4.1 Layout Guidelines

Attention to good layout practices is always recommended. For best operational performance of the device, use the following PCB layout practices:

- Make sure that both input paths are well-matched for source impedance and capacitance to avoid converting common-mode signals into differential signals.
- Use bypass capacitors to reduce the coupled noise by providing low-impedance power sources local to the analog circuitry.
  - Connect low-ESR, 0.1-µF ceramic bypass capacitors between each supply pin and ground, placed as close to the device as possible. A single bypass capacitor from V+ to ground is applicable for single-supply applications.
- Route the input traces as far away from the supply or output traces as possible to reduce parasitic coupling. If these traces cannot be kept separate, crossing the sensitive trace perpendicular is much better than crossing in parallel with the noisy trace.
- Place the external components as close to the device as possible.
- Keep the traces as short as possible.

9.5 Trademarks

TI E2E™ is a trademark of Texas Instruments.
Bluetooth® is a registered trademark of Bluetooth SIG, Inc.
PSpice® is a registered trademark of Cadence Design Systems, Inc.
所有商标均为其各自所有者的财产。

9.6 静电放电警告

静电放电 (ESD) 会损坏这个集成电路。德州仪器 (TI) 建议通过适当的预防措施处理所有集成电路。如果不遵守正确的处理和安装程序，可能会损坏集成电路。

ESD 的损坏小至导致微小的性能降级，大至整个器件故障。精密的集成电路可能更容易受到损坏，这是因为非常细微的参数更改都可能会导致器件与其发布的规格不相符。

9.7 术语表

TI 术语表   本术语表列出并解释了术语、首字母缩略词和定义。

(1) **Status:** For more details on status, see our product life cycle.

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.
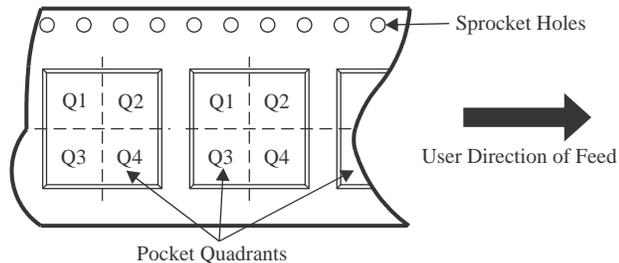

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

PACKAGE OPTION ADDENDUM

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
