

LM5105 100-V Half-Bridge Gate Driver With Programmable Dead Time

1 Features

- Drives Both a High-Side and Low-Side N-Channel MOSFET
- 1.8-A Peak Gate Drive Current
- Bootstrap Supply Voltage Range up to 118-V DC
- Integrated Bootstrap Diode
- Single TTL Compatible Input
- Programmable Turnon Delays (Dead Time)
- Enable Input Pin
- Fast Turnoff Propagation Delays (26 ns Typical)
- Drives 1000 pF With 15-ns Rise and Fall Time
- Supply Rail Undervoltage Lockout
- Low Power Consumption
- Package: Thermally Enhanced 10-Pin WSON (4 mm × 4 mm)

2 Applications

- Solid-State Motor Drives
- Half- and Full-Bridge Power Converters

3 Description

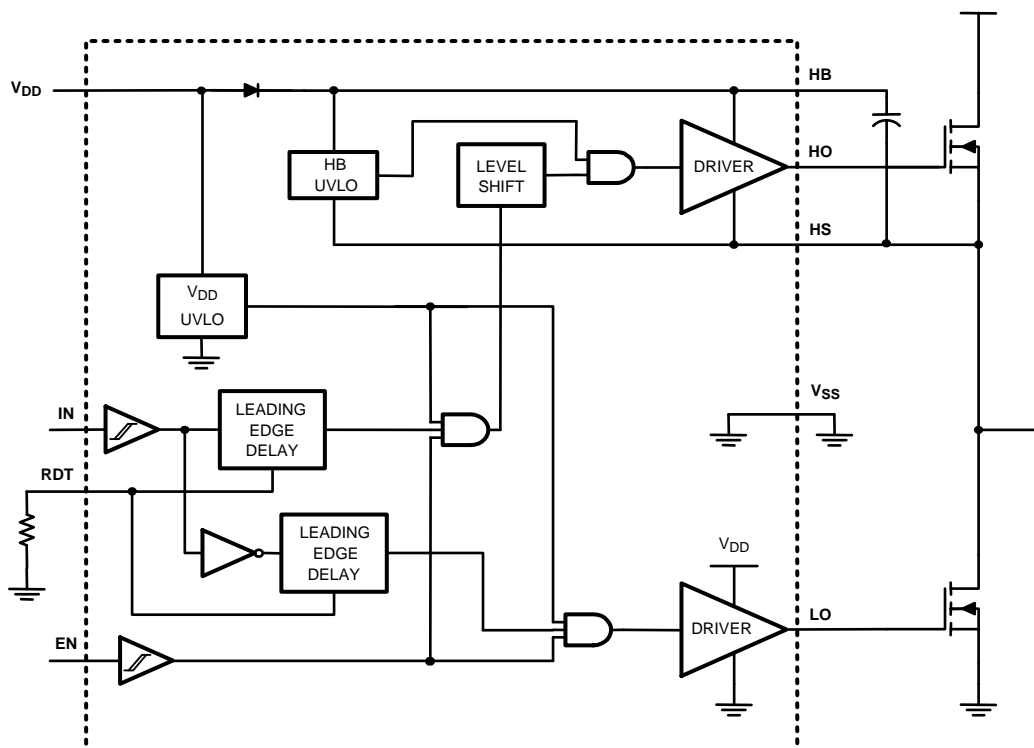

The LM5105 is a high-voltage gate driver designed to drive both the high-side and low-side N-Channel MOSFETs in a synchronous buck or half-bridge configuration. The floating high-side driver is capable of working with rail voltages up to 100 V. The single control input is compatible with TTL signal levels and a single external resistor programs the switching transition dead time through tightly matched turnon delay circuits. A high-voltage diode is provided to charge the high-side gate-drive bootstrap capacitor. The robust level shift technology operates at high speed while consuming low power and provides clean output transitions. Undervoltage lockout disables the gate driver when either the low-side or the bootstrapped high-side supply voltage is below the operating threshold. The LM5105 is offered in the thermally enhanced WSON plastic package.

5 Pin Configuration and Functions

Pin Functions

PIN		TYPE ⁽¹⁾	DESCRIPTION
NO.	NAME		
1	V _{DD}	P	Positive gate drive supply. Decouple VDD to VSS using a low ESR/ESL capacitor, placed as close to the IC as possible.
2	HB	P	High-side gate driver bootstrap rail. Connect the positive terminal of bootstrap capacitor to the HB pin and connect negative terminal to HS. The Bootstrap capacitor must be placed as close to IC as possible.
3	HO	O	High-side gate driver output. Connect to the gate of high side N-MOS device through a short, low inductance path.
4	HS	P	High-side MOSFET source connection. Connect to the negative terminal of the bootstrap capacitor and to the source of the high side N-MOS device.
5	NC	—	Not connected.
6	RDT	I	Dead-time programming pin. A resistor from RDT to VSS programs the turnon delay of both the high and low side MOSFETs. The resistor must be placed close to the IC to minimize noise coupling from adjacent PCB traces.
7	EN	I	Logic input for driver disable or enable. TTL compatible threshold with hysteresis. LO and HO are held in the low state when EN is low.
8	IN	I	Logic input for gate driver. TTL compatible threshold with hysteresis. The high side MOSFET is turned on and the low side MOSFET turned off when IN is high.
9	V _{SS}	G	Ground return. All signals are referenced to this ground.
10	LO	O	Low-side gate driver output. Connect to the gate of the low side N-MOS device with a short, low inductance path.
—	Exposed Pad	—	It is recommended that the exposed pad on the bottom of the package be soldered to ground plane on the PCB to aid thermal dissipation.

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾⁽²⁾

	MIN	MAX	UNIT
V_{DD} to V_{SS}	−0.3	18	V
HB to HS	−0.3	18	V
IN and EN to V_{SS}	−0.3	$V_{DD} + 0.3$	V
LO to V_{SS}	−0.3	$V_{DD} + 0.3$	V
HO to V_{SS}	HS − 0.3	HB + 0.3	V
HS to V_{SS} ⁽³⁾	−5	100	V
HB to V_{SS}		118	V
RDT to V_{SS}	−0.3	5	V
Junction temperature, T_J		150	°C
Storage temperature, T_{stg}	−55	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) If Military/Aerospace specified devices are required, please contact the Texas Instruments Sales Office/Distributors for availability and specifications.
- (3) In the application the HS node is clamped by the body diode of the external lower N-MOSFET, therefore the HS voltage generally does not exceed −1 V. However, in some applications, board resistance and inductance may result in the HS node exceeding this stated voltage transiently. If negative transients occur on HS, the HS voltage must never be more negative than $V_{DD} - 15$ V. For example, if $V_{DD} = 10$ V, the negative transients at HS must not exceed −5 V.

6.2 ESD Ratings

	VALUE	UNIT
$V_{(ESD)}$ Electrostatic discharge Human-body model (HBM) ⁽¹⁾⁽²⁾	±2000	V

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) The human-body model is a 100-pF capacitor discharged through a 1.5-k Ω resistor into each pin. Pin 2, Pin 3 and Pin 4 are rated at 500 V.

6.3 Recommended Operating Conditions

	MIN	NOM	MAX	UNIT
V_{DD}	8		14	V
HS ⁽¹⁾	−1		100	V
HB	HS + 8		HS + 14	V
HS Slew rate			<50	V/ns
T_J Junction temperature	−40		125	°C

- (1) In the application the HS node is clamped by the body diode of the external lower N-MOSFET; therefore, the HS voltage generally does not exceed −1 V. However in some applications, board resistance and inductance may result in the HS node exceeding this stated voltage transiently. If negative transients occur on HS, the HS voltage must never be more negative than $V_{DD} - 15$ V. For example, if $V_{DD} = 10$ V, the negative transients at HS must not exceed −5 V.

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾		LM5105	UNIT
		DPR (WSON)	
		10 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	37.8	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	36.2	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	14.9	°C/W
ψ_{JT}	Junction-to-top characterization parameter	0.3	°C/W
ψ_{JB}	Junction-to-board characterization parameter	15.2	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	4.4	°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

6.5 Electrical Characteristics

Unless otherwise noted, $V_{DD} = HB = 12\text{ V}$, $V_{SS} = HS = 0\text{ V}$, $EN = 5\text{ V}$, no load on LO or HO, $R_{DT} = 100\text{ k}\Omega$ ⁽¹⁾. Typical limits are for $T_J = 25^\circ\text{C}$, and minimum and maximum limits apply over the operating junction temperature range (-40°C to 125°C).

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT

7 Detailed Description

7.1 Overview

The LM5105 is a single PWM input Gate Driver with Enable that offers a programmable dead time. The dead time is set with a resistor at the RDT pin and can be adjusted from 100 ns to 600 ns. The wide dead-time programming range provides the flexibility to optimize drive signal timing for a wide range of MOSFETs and applications.

The RDT pin is biased at 3 V and current-limited to 1-mA maximum programming current. The time delay generator accommodates resistor values from 5 k to 100 k with a dead time that is proportional to the RDT resistance. Grounding the RDT pin programs the LM5105 to drive both outputs with minimum dead time.

7.3 Feature Description

7.3.1 Start-Up and UVLO

Both top and bottom drivers include undervoltage lockout (UVLO) protection circuitry, which monitors the supply voltage (V_{DD}) and bootstrap capacitor voltage ($HB - HS$) independently. The UVLO circuit inhibits each driver until sufficient supply voltage is available to turn on the external MOSFETs, and the UVLO hysteresis prevents chattering during supply voltage transitions. When the supply voltage is applied to the V_{DD} pin of LM5105, the top and bottom gates are held low until V_{DD} exceeds the UVLO threshold, typically about 6.9 V. Any UVLO condition on the bootstrap capacitor disables only the high-side output (HO).

8 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

The LM5105 is one of the latest generation of high-voltage gate drivers which are designed to drive both the high-side and low-side N-channel MOSFETs in a half-bridge or full-bridge configuration or in a synchronous buck circuit. The floating high-side driver can operate with supply voltages up to 110 V. This allows for N-channel MOSFET control in half-bridge, full-bridge, push-pull, two-switch forward, and active clamp topologies.

The outputs of the LM5105 are controlled from a single input. The rising edge of each output can be delayed with a programming resistor.

8.2 Typical Application

Figure 20. LM5105 Driving MOSFETS Connected in Half-Bridge Configuration

8.2.1 Design Requirements

Table 2 lists the design parameters for this application example.

Table 2. Design Parameters

PARAMETER	VALUE
Gate Drive IC	LM5105
Mosfet	CSD18531Q5A
V_{DD}	10 V
Q_{gmax}	43 nC
F_{sw}	100 kHz
D_{Max}	95%
I_{HBS}	10 μ A
V_{DH}	1.1 V

Table 2. Design Parameters (continued)

PARAMETER	VALUE
V_{HBR}	7.1 V
V_{HBH}	0.4 V

8.2.2 Detailed Design Procedure

$$\Delta V_{HB} = V_{DD} - V_{DH} - V_{HBL}$$

where

- V_{DD} = Supply voltage of the gate drive IC
- V_{DH} = Bootstrap diode forward voltage drop
- V_{gsmin} = Minimum gate source threshold voltage

$$C_{BOOT} = \frac{Q_{TOTAL}}{\Delta V_{HB}} \quad (1)$$

$$Q_{TOTAL} = Q_{gmax} + I_{HBS} \times \frac{D_{Max}}{F_{SW}} \quad (2)$$

The quiescent current of the bootstrap circuit is 10 μ A, which is negligible compared to the Q_{gs} of the MOSFET.

$$Q_{TOTAL} = 43nC + 10\mu A \times \frac{0.95}{100kHz} \quad (3)$$

$$Q_{TOTAL} = 43.01 \text{ nC} \quad (4)$$

In practice the value for the C_{BOOT} capacitor should be greater than that calculated to allow for situations where the power stage may skip pulse due to load transients. In this circumstance the boot capacitor must maintain the HB pin voltage above the UVLO voltage for the HB circuit.

As a general rule the local V_{DD} bypass capacitor should be 10 times greater than the calculated value of C_{BOOT} .

$$V_{HBL} = V_{HBR} - V_{HBH} \quad (5)$$

$$V_{HBL} = 6.7 \text{ V} \quad (6)$$

$$\Delta V_{HB} = 10 \text{ V} - 1.1 \text{ V} - 6.7 \text{ V} \quad (7)$$

$$\Delta V_{HB} = 2.2 \text{ V} \quad (8)$$

$$C_{BOOT} = 43.01nC / 2.2 \text{ V} \quad (9)$$

$$C_{BOOT} = 19.6 \text{ nF} \quad (10)$$

In practice, the value of C_{BOOT} is greater than the calculated value. This allows for the capacitance shift caused by the DC bias voltage and for situations where the power stage would otherwise skip pulses due to load transients. Therefore, it is recommended to include a safety-related margin in the C_{BOOT} value and place it as close to the VDD and VSS pins as possible. A 50-V, 0.1- μ F capacitor is chosen in this example.

The bootstrap and bias capacitors should be ceramic types with X7R dielectric. The voltage rating should be twice that of the maximum VDD to allow for loss of capacitance once the devices have a DC bias voltage across them and to ensure long-term reliability of the devices.

The resistor values, R_T , for setting turnon delay can be found in [Figure 17](#).

8.2.3 Application Curves

Figure 21. Diode Power Dissipation, $V_{IN} = 80 \text{ V}$

Figure 22. Diode Power Dissipation, $V_{IN} = 40 \text{ V}$

**Figure 23. Gate Driver Power Dissipation (LO + HO)
 $V_{CC} = 12 \text{ V}$, Neglecting Diode Losses**

9 Power Supply Recommendations

9.1 Power Dissipation Considerations

The total IC power dissipation is the sum of the gate driver losses and the bootstrap diode losses. The gate driver losses are related to the switching frequency (f), output load capacitance on LO and HO (C_L), and supply voltage (V_{DD}) and can be roughly calculated with [Equation 12](#).

$$P_{DGATES} = 2 \times f \times C_L \times V_{DD}^2 \quad (12)$$

There are some additional losses in the gate drivers due to the internal CMOS stages used to buffer the LO and HO outputs. [Figure 23](#) shows the measured gate driver power dissipation versus frequency and load capacitance. At higher frequencies and load capacitance values, the power dissipation is dominated by the power losses driving the output loads and agrees well with the previous equation. [Figure 23](#) can be used to approximate the power losses due to the gate drivers.

9.2 HS Transient Voltages Below Ground

The HS node is always clamped by the body diode of the lower external FET. In some situations, board resistances and inductances can cause the HS node to transiently swing several volts below ground. The HS node can swing below ground provided:

1. HS must always be at a lower potential than HO. Pulling HO more than -0.3 V below HS can activate parasitic transistors resulting in excessive current flow from the HB supply, possibly resulting in damage to the IC. The same relationship is true with LO and VSS. If necessary, a Schottky diode can be placed externally between HO and HS or LO and GND to protect the IC from this type of transient. The diode must be placed as close to the IC pins as possible in order to be effective.
2. HB to HS operating voltage should be 14 V or less. Hence, if the HS pin transient voltage is -5 V, VDD should be ideally limited to 9 V to keep HB to HS below 14 V.
3. Low ESR bypass capacitors from HB to HS and from VCC to VSS are essential for proper operation. The capacitor should be located at the leads of the IC to minimize series inductance. The peak currents from LO and HO can be quite large. Any inductances in series with the bypass capacitor will cause voltage ringing at the leads of the IC which must be avoided for reliable operation.

10 Layout

10.1 Layout Guidelines

The optimum performance of high- and low-side gate drivers cannot be achieved without taking due considerations during circuit board layout. Following points are emphasized.

1. A low ESR or ESL capacitor must be connected close to the IC, and between V_{DD} and V_{SS} pins and between HB and HS pins to support high peak currents being drawn from V_{DD} during turnon of the external MOSFET.
2. To prevent large voltage transients at the drain of the top MOSFET, a low ESR electrolytic capacitor must be connected between MOSFET drain and ground (V_{SS}).
3. To avoid large negative transients on the switch node (HS) pin, the parasitic inductances in the source of top MOSFET and in the drain of the bottom MOSFET (synchronous rectifier) must be minimized.
4. Grounding considerations:
 - The first priority in designing grounding connections is to confine the high peak currents from charging and discharging the MOSFET gate in a minimal physical area. This decreases the loop inductance and minimize noise issues on the gate terminal of the MOSFET. The MOSFETs must be placed as close as possible to the gate driver.
 - The second high current path includes the bootstrap capacitor, the bootstrap diode, the local ground referenced bypass capacitor and low side MOSFET body diode. The bootstrap capacitor is recharged on the cycle-by-cycle basis through the bootstrap diode from the ground referenced V_{DD} bypass capacitor. The recharging occurs in a short time interval and involves high peak current. Minimizing this loop length and area on the circuit board is important to ensure reliable operation.
5. The resistor on the RDT pin must be placed very close to the IC and separated from high current paths to avoid noise coupling to the time delay generator which could disrupt timer operation.

(1) **Status:** For more details on status, see our [product life cycle](#).

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
