

## 具有可编程延迟和 1% 复位阈值的 LP3470A 超低功耗电压监控器

### 1 特性

- 与 LP3470 引脚对引脚兼容
- 5 引脚 SOT-23 封装
- 漏极开路复位输出
- 使用外部电容器的可编程复位超时周期
- 不受 VCC 短时瞬变干扰
- $\pm 1\%$  复位阈值精度（典型值）
- 超低静态电流（ $0.3\mu\text{A}$  典型值）
- 复位有效低至  $V_{CC} = 0.95\text{V}$

### 2 应用

- 关键  $\mu\text{P}$  和  $\mu\text{C}$  电源监视
- 智能仪表
- 计算机
- 便携式和电池供电类设备
- 楼宇自动化：楼宇安全系统、视频监控
- 工厂自动化：现场发送器、位置和接近传感器
- 电机驱动器

### 3 说明

低功耗电压监控电路 LP3470A 器件设计用于在 1% 的过热复位阈值内监测电压，与 TI 现有的 LP3470 器件引脚对引脚兼容。LP3470A 器件提供精确的毫微功耗电压监控，具有可编程延迟功能。

当 VCC 电源电压低于复位阈值时，LP3470A 将发出复位信号。使用外部电容器可调节复位超时周期。VCC 升至阈值电压以上且加一定迟滞后，在某一间隔（可通过外部电容器编程）复位保持有效。

有关可用复位阈值电压选项的信息，请参阅 [机械、封装和可订购信息](#)。

## 6 Pin Configuration and Functions

### Pin Functions

PIN		I/O	DESCRIPTION
NO.	NAME		
1	SRT	I	Set reset time-out. Connect a capacitor between this pin and ground to select the reset time-out period ( $t_D$ ). $t_D = 619 \times C_1$ ( $C_{SRT}$ in $\mu\text{F}$ and $t_D$ in ms). If no capacitor is connected, leave this pin floating.
2	GND	—	Ground pin.
3	VCC1	I	Can be connected to VCC or left floating. DO NOT CONNECT TO GND.
4	VCC	I	Supply voltage, and reset threshold monitor input.
5	$\overline{\text{RESET}}$	O	Open-drain, active-low reset output. Connect to an external pullup resistor. $\overline{\text{RESET}}$ changes from high to low whenever the monitored voltage (VCC) drops below the reset threshold voltage ( $V_{IT-}$ ). Once VCC exceeds the reset threshold ( $V_{IT-}$ ) + hysteresis ( $V_{HYS}$ ), $\overline{\text{RESET}}$ remains low for the reset time-out period ( $t_D$ ) and then deasserts to logic high.

## 7 Specifications

### 7.1 Absolute Maximum Ratings

over operating free-air temperature range, unless otherwise noted<sup>(1)</sup>

		MIN	MAX	UNIT
Voltage	VCC	-0.3	12	V
	$\overline{\text{RESET}}$	-0.3	12	
	SRT	-0.3	5.5	
Current	$\overline{\text{RESET}}$		±70	mA
Temperature <sup>(2)</sup>	Operating junction temperature, T <sub>J</sub>	-40	150	°C
	Storage, T <sub>stg</sub>	-65	150	

- (1) Stresses beyond those listed under *Absolute Maximum Rating* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Condition*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) As a result of the low dissipated power in this device, it is assumed that T<sub>J</sub> = T<sub>A</sub>.

### 7.2 ESD Ratings

			VALUE	UNIT
V <sub>(ESD)</sub>	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	± 2000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup>	± 750	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V <sub>CC</sub>	Input supply voltage	0.95		10	V
$\overline{V_{\text{RESET}}}$ , V <sub>RESET</sub>	$\overline{\text{RESET}}$ pin voltage	0		10	V
$\overline{I_{\text{RESET}}}$ , I <sub>RESET</sub>	$\overline{\text{RESET}}$ pin current	0		±5	mA
T <sub>J</sub>	Junction temperature (free air temperature)	-40		125	°C

### 7.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		LP3470A	UNIT
		DBV (SOT23-5)	
		5 PINS	
R <sub>θJA</sub>	Junction-to-ambient thermal resistance	187.5	°C/W
R <sub>θJC(top)</sub>	Junction-to-case (top) thermal resistance	109.2	°C/W
R <sub>θJB</sub>	Junction-to-board thermal resistance	92.8	°C/W
ψ <sub>JT</sub>	Junction-to-top characterization parameter	35.4	°C/W
ψ <sub>JB</sub>	Junction-to-board characterization parameter	92.5	°C/W
R <sub>θJC(bot)</sub>	Junction-to-case (bottom) thermal resistance	N/A	°C/W

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

## 7.5 Electrical Characteristics

At  $0.95\text{ V} \leq V_{CC} \leq 10\text{ V}$ , SRT = Open,  $\overline{\text{RESET}}$  pull-up resistor ( $R_{\text{pull-up}}$ ) = 100 k $\Omega$  to VCC, output reset load ( $C_{\text{LOAD}}$ ) = 10 pF and over the operating free-air temperature range – 40°C to 125°C, unless otherwise noted. Typical values are at  $T_J = 25^\circ\text{C}$ .

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
$V_{CC}$	Input supply voltage		0.95		10	V
$V_{IT-}$	Negative-going input threshold accuracy	-40°C to 125°C	-1.5	1	1.5	%
$V_{HYS}$	Hysteresis on $V_{IT-}$ pin	$V_{IT-} = 3.08\text{ V}$ to $4.63\text{ V}$	175	200	225	mV
$V_{HYS}$	Hysteresis on $V_{IT-}$ pin	$V_{IT-} = 2.64\text{ V}$ to $2.93\text{ V}$	75	100	125	mV
$I_{CC}$	Supply current into VCC pin	$V_{CC} = 0.95\text{ V} < V_{CC} < 10\text{ V}$ $V_{CC} > V_{IT+}^{(1)}$ $T_A = -40^\circ\text{C}$ to $125^\circ\text{C}$		0.3	1	$\mu\text{A}$
$R_{SRT}$	SRT pin internal resistance <sup>(2)</sup>		350	500	650	k $\Omega$
$V_{POR}$	Power on Reset Voltage <sup>(3)</sup>	$V_{OL(max)} = 0.2\text{ V}$ $I_{OUT(Sink)} = 5.6\text{ uA}$			950	mV
$V_{OL}$	Low level output voltage	$1.5\text{ V} < V_{CC} < 5\text{ V}$ $V_{CC} < V_{IT-}$ $I_{OUT(Sink)} = 2\text{ mA}$			200	mV
$I_{lkg(OD)}$	Open-Drain output leakage current	$\overline{\text{RESET}}$ pin in High Impedance, $V_{CC} = V_{\text{RESET}} = 5.5\text{ V}$ $V_{IT+} < V_{CC}$			90	nA

(1)  $V_{IT+} = V_{HYS} + V_{IT-}$

(2) This parameter is guaranteed by design and characterization

(3)  $V_{POR}$  is the minimum  $V_{DD}$  voltage level for a controlled output state.  $V_{DD}$  slew rate  $\leq 100\text{mV}/\mu\text{s}$

## 7.6 Timing Requirements

At  $0.95\text{ V} \leq V_{CC} \leq 10\text{ V}$ , SRT = Open,  $\overline{\text{RESET}}$  pull-up resistor ( $R_{\text{pull-up}}$ ) = 100 k $\Omega$  to VCC, output reset load ( $C_{\text{LOAD}}$ ) = 10 pF and over the operating free-air temperature range – 40°C to 125°C,  $V_{CC}$  slew rate  $< 100\text{mV} / \mu\text{s}$ , unless otherwise noted. Typical values are at  $T_J = 25^\circ\text{C}$ .

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
$t_{P\_HL}$	Propagation detect delay for VCC falling below $V_{IT-}$	$V_{CC} = V_{IT+}$ to $(V_{IT-}) - 10\%$ <sup>(1)</sup>		15	30	$\mu\text{s}$
$t_D$	Reset time delay	SRT pin = open $V_{CC} = (V_{IT-} - 1\text{V})$ to $(V_{IT+} + 1\text{V})$			50	$\mu\text{s}$
		SRT pin = 10 nF <sup>(2)(3)</sup>		6.2		ms
		SRT pin = 1 $\mu\text{F}$ <sup>(2)(3)</sup>		619		ms
$t_{GL\_VIT-}$	Glitch immunity $V_{IT-}$	5% $V_{IT-}$ overdrive <sup>(3)(4)</sup>		10		$\mu\text{s}$

(1)  $t_{P\_HL}$  measured from threshold trip point ( $V_{IT-}$ ) to  $V_{OL}$

(2) Ideal capacitor

(3) Parameter is guaranteed by design.

(4) Overdrive % =  $[(V_{CC} / V_{IT-}) - 1] \times 100\%$

## 7.7 Typical Characteristics

Typical characteristics show the typical performance of the LP3470A device. Test conditions are at  $T_A = T_J = 25^\circ\text{C}$  (unless otherwise noted).

Typical Characteristics (接下页)

Typical characteristics show the typical performance of the LP3470A device. Test conditions are at  $T_A = T_J = 25^\circ\text{C}$  (unless otherwise noted).

## 8 Detailed Description

### 8.1 Overview

The LP3470A micropower voltage supervisory circuit provides a simple solution to monitor the power supplies in microprocessor and digital systems and provides a reset controlled by the factory-programmed reset threshold on the VCC supply voltage pin. When the voltage declines below the reset threshold, the reset signal is asserted and remains asserted for an interval programmed by an external capacitor after VCC has risen above the threshold voltage. The reset threshold options are 2.63 V, 2.75 V, 2.93 V, 3.08 V, 3.65 V, 4 V, 4.38 V, 4.63 V.

### 8.2 Functional Block Diagram

### 8.3 Feature Description

#### 8.3.1 $\overline{\text{RESET}}$ Time-Out Period

The reset time delay can be set to a minimum value of 50  $\mu\text{s}$  by leaving the SRT pin floating, or a maximum value of approximately 6.2 seconds by connecting 10  $\mu\text{F}$  delay capacitor. The reset time delay ( $t_D$ ) can be programmed by connecting a capacitor no larger than 10  $\mu\text{F}$  between SRT pin and GND.

The relationship between external capacitor ( $C_{\text{SRT}}$ ) in Farads at SRT pin and the time delay ( $t_D$ ) in seconds is given by [公式 1](#).

$$t_D = -\ln(0.29) \times R_{\text{SRT}} \times C_{\text{SRT}} + t_D(\text{no cap}) \quad (1)$$

[公式 1](#) is simplified to [公式 2](#) by plugging  $R_{\text{SRT}}$  and  $t_{D(\text{no cap})}$  given in [Electrical Characteristics](#) section:

$$t_D = 618937 \times C_{\text{SRT}} + 50 \mu\text{s} \quad (2)$$

[公式 3](#) solves for external capacitor value ( $C_{\text{SRT}}$ ) in units of Farads where  $t_D$  is in units of seconds

$$C_{\text{SRT}} = (t_D - 50 \mu\text{s}) \div 618937 \quad (3)$$

The reset delay varies according to three variables: the external capacitor variance ( $C_{\text{SRT}}$ ), SRT pin internal resistance ( $R_{\text{SRT}}$ ) provided in the [Electrical Characteristics](#) table, and a constant. The minimum and maximum variance due to the constant is shown in [Equation 5](#) and [Equation 6](#).

$$t_{D(\text{minimum})} = -\ln(0.36) \times R_{\text{SRT}(\text{min})} \times C_{\text{SRT}(\text{min})} + t_{D(\text{no cap, min})} \quad (4)$$

$$t_{D(\text{maximum})} = -\ln(0.26) \times R_{\text{SRT}(\text{max})} \times C_{\text{SRT}(\text{max})} + t_{D(\text{no cap, max})} \quad (5)$$

## Feature Description (接下页)

The recommended maximum delay capacitor for the LP3470A is limited to 10  $\mu\text{F}$  as this ensures there is enough time for the capacitor to fully discharge when the reset condition occurs. When a voltage fault occurs, the previously charged up capacitor discharges, and if the monitored voltage returns from the fault condition before the delay capacitor discharges completely, the delay capacitor will begin charging from a voltage above zero and the reset delay will be shorter than expected. Larger delay capacitors can be used so long as the capacitor has enough time to fully discharge during the duration of the voltage fault.

### 8.3.2 $\overline{\text{RESET}}$ Output

In applications like microprocessor ( $\mu\text{P}$ ) systems, errors might occur in system operation during power up, power down, or brownout conditions. It is imperative to monitor the power supply voltage to prevent these errors from occurring.

The LP3470A asserts a reset signal whenever the VCC supply voltage is below a threshold ( $V_{\text{IT-}}$ ) voltage.  $\overline{\text{RESET}}$  is ensured to be a logic low for  $V_{\text{CC}} > 0.95\text{ V}$ . Once VCC exceeds the reset threshold plus a hysteresis voltage, the reset is kept asserted for a time period ( $t_{\text{D}}$ ) programmed by an external capacitor ( $C_{\text{SRT}}$ ); after this interval  $\overline{\text{RESET}}$  goes to logic high. If a brownout condition occurs (monitored voltage falls below the reset threshold),  $\overline{\text{RESET}}$  goes low. When VCC returns above the reset threshold plus a hysteresis voltage,  $\overline{\text{RESET}}$  remains low for a time period  $t_{\text{D}}$  before going to logic high. 图 9 shows this behavior.

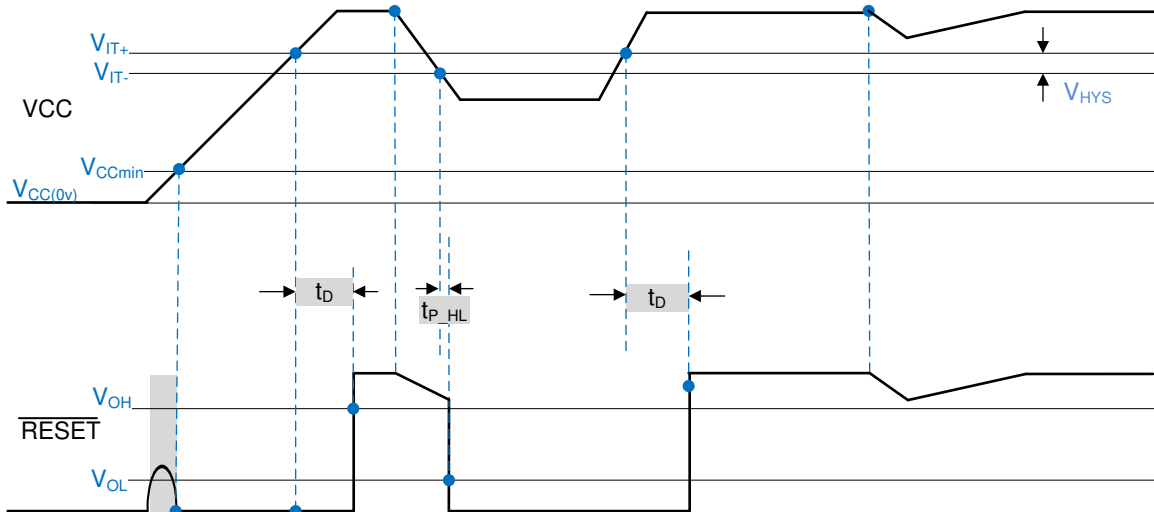

图 9.  $\overline{\text{RESET}}$  Output Timing Diagram

### 8.3.3 Pull-up Resistor Selection

The  $\overline{\text{RESET}}$  output structure of the LP3470A is an open-drain N-channel MOSFET switch. A pull-up resistor ( $R_{\text{pull-up}}$ ) must be connected to VCC to keep the output logic high when  $\overline{\text{RESET}}$  is not asserted.

Connect the pull-up resistor to the desired pull-up voltage source and  $\overline{\text{RESET}}$  can be pulled up to any voltage up to 10 V independent of the VCC voltage. To ensure proper voltage levels, give some consideration when choosing the pull-up resistor values.  $R_{\text{pull-up}}$  must be large enough to limit the current through the output within the recommended operating conditions. The pull-up resistor value determines the actual  $V_{\text{OL}}$ , the output capacitive loading, and the output leakage current ( $I_{\text{LKG(OD)}}$ ). A typical pull-up resistor value of 20 k $\Omega$  is sufficient in most applications.

### 8.3.4 VCC Transient Immunity

The LP3470A is immune to quick voltage transients or excursions on VCC. Sensitivity to transients depends on both pulse duration and overdrive. Overdrive is defined by how much VCC deviates from the specified threshold. Threshold overdrive is calculated as a percent of the threshold in question, as shown in 公式 6. A 0.1- $\mu\text{F}$  bypass capacitor mounted close to VCC provides additional transient immunity.

$$\text{Overdrive} = | (V_{\text{CC}} / V_{\text{IT-}} - 1) \times 100\% | \tag{6}$$

Feature Description (接下页)

图 10. Overdrive vs Pulse Duration

8.4 Device Functional Modes

8.4.1  $\overline{\text{RESET}}$  Output Low

When the VCC supply voltage is below the reset threshold ( $V_{IT-}$ ), the  $\overline{\text{RESET}}$  pin will output logic low.  $\overline{\text{RESET}}$  is ensured to be a logic low for  $V_{CC} > 0.95 \text{ V}$ .

8.4.2  $\overline{\text{RESET}}$  Output High

When the VCC supply voltage exceeds the reset threshold ( $V_{IT-}$ ) plus the hysteresis voltage ( $V_{HYS}$ ), the  $\overline{\text{RESET}}$  remains asserted for a time period ( $t_D$ ) programmed by an external capacitor ( $C_{SRT}$ ); after this interval  $\overline{\text{RESET}}$  goes to logic high.

## 9 Application and Implementation

### 注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 9.1 Application Information

The LP3470A is a micropower CMOS voltage supervisor that is ideal for use in battery-powered microprocessor and other digital systems. It is small in size and provides voltage monitoring and supervisory functions with nano-Iq and programmable delay, making it a good solution in a variety of applications. The LP3470A is available in six standard reset threshold voltage options, and the reset time-out period is adjustable using an external capacitor providing maximum flexibility in any application. This device can ensure system reliability and ensures that a connected microprocessor will operate only when a minimum voltage supply is satisfied.

### 9.2 Typical Application

The LP3470A can be used as a simple supervisor circuit to monitor the input supply to a microprocessor as shown in [图 11](#).

图 11. Power-On Reset Circuit

#### 9.2.1 Design Requirements

For this design example, use the parameters listed in [表 1](#) as the input parameters.

表 1. Design Parameters

DESIGN PARAMETER	EXAMPLE VALUE
Input supply voltage	0.95 to 10 V
Reset threshold voltage	2.63 V, 2.75 V, 2.93 V, 3.08 V, 3.65 V, 4 V, 4.38 V, 4.63 V
External pullup resistor	0.68 to 68 kΩ
External reset time-out period capacitor	$C_{SRT} = 1 \text{ nF}$
Reset time-out period	619 μs

#### 9.2.2 Detailed Design Procedure

The minimum application circuit requires the LP3470A Power-On Reset Circuit IC and a pullup resistor connecting the reset pin to VCC. The reset delay can be programmed with an additional capacitor connected from the SRT pin to GND. See [RESET Time-Out Period](#) and [Pull-up Resistor Selection](#) for information on choosing specific values for components.

### 9.2.3 Application Curves

Two capacitor values for  $C_{SRT}$  ( $0.1\ \mu\text{F}$  and  $1\ \mu\text{F}$ ) are used as examples to show the programmability of the output time delay as shown in 图 12 and 图 13.

## 10 Power Supply Recommendations

The input of the LP3470A is designed to handle up to the supply voltage absolute maximum rating of 12 V. If the input supply is susceptible to any large transients above the maximum rating, then take extra precautions. An input capacitor is optional but not required to help avoid false reset output triggers due to noise.

## 11 Layout

### 11.1 Layout Guidelines

- Good analog design practice recommends placing a minimum of 0.1- $\mu$ F ceramic capacitor as near as possible to the VCC pin.
- Place components as close as possible to the IC
- Keep traces short between the IC and the C<sub>SRT</sub> capacitor to ensure the timing delay is as accurate as possible.
- For VCC slew rate > 100 mV/ $\mu$ s, increase input capacitance and pull-up resistor value

### 11.2 Layout Example

图 14 shows a layout example.

图 14. LP3470A Layout Example

(1) **Status:** For more details on status, see our [product life cycle](#).

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "-" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

# EXAMPLE BOARD LAYOUT

DBV0005A

SOT-23 - 1.45 mm max height

SMALL OUTLINE TRANSISTOR

LAND PATTERN EXAMPLE  
EXPOSED METAL SHOWN  
SCALE:15X

SOLDER MASK DETAILS

4214839/K 08/2024

NOTES: (continued)

- 6. Publication IPC-7351 may have alternate designs.
- 7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

# EXAMPLE STENCIL DESIGN

DBV0005A

SOT-23 - 1.45 mm max height

SMALL OUTLINE TRANSISTOR

SOLDER PASTE EXAMPLE  
BASED ON 0.125 mm THICK STENCIL  
SCALE:15X

4214839/K 08/2024

NOTES: (continued)

8. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
9. Board assembly site may have different recommendations for stencil design.

## 重要通知和免责声明

TI“按原样”提供技术和可靠性数据（包括数据表）、设计资源（包括参考设计）、应用或其他设计建议、网络工具、安全信息和其他资源，不保证没有瑕疵且不做任何明示或暗示的担保，包括但不限于对适销性、与某特定用途的适用性或不侵犯任何第三方知识产权的暗示担保。

这些资源可供使用 TI 产品进行设计的熟练开发人员使用。您将自行承担以下全部责任：(1) 针对您的应用选择合适的 TI 产品，(2) 设计、验证并测试您的应用，(3) 确保您的应用满足相应标准以及任何其他安全、安保法规或其他要求。

这些资源如有变更，恕不另行通知。TI 授权您仅可将这些资源用于研发本资源所述的 TI 产品的相关应用。严禁以其他方式对这些资源进行复制或展示。您无权使用任何其他 TI 知识产权或任何第三方知识产权。对于因您对这些资源的使用而对 TI 及其代表造成的任何索赔、损害、成本、损失和债务，您将全额赔偿，TI 对此概不负责。
