

- **Low Supply Voltage Range: 1.8 V to 3.6 V**
- **Ultralow-Power Consumption:**
  - Active Mode: 400  $\mu$ A at 1 MHz, 2.2 V
  - Standby Mode: 1.3  $\mu$ A
  - Off Mode (RAM Retention): 0.22  $\mu$ A
- **Five Power-Saving Modes**
- **Wake-Up From Standby Mode in Less Than 6  $\mu$ s**
- **16-Bit RISC Architecture, Extended Memory, 125-ns Instruction Cycle Time**
- **Three Channel Internal DMA**
- **12-Bit A/D Converter With Internal Reference, Sample-and-Hold and Autoscan Feature (MSP430x461x only)**
- **16-Bit Timer\_A With Three Capture/Compare Registers**
- **16-Bit Timer\_B With Seven Capture/Compare-With-Shadow Registers**
- **On-Chip Comparator**
- **Supply Voltage Supervisor/Monitor With Programmable Level Detection**
- **Basic Timer With Real Time Clock Feature**
- **Integrated LCD Driver up to 160 Segments With Regulated Charge Pump**
- **Serial Communication Interface (USART1), Select Asynchronous UART or Synchronous SPI by Software**
- **Universal Serial Communication Interface**
  - Enhanced UART Supporting Auto-Baudrate Detection
  - IrDA Encoder and Decoder
  - Synchronous SPI
  - I2C™
- **Serial Onboard Programming, Programmable Code Protection by Security Fuse**
- **Brownout Detector**
- **Family Members Include:**
  - MSP430x4616, MSP430x46161†: 92KB+256B Flash or ROM Memory, 4KB RAM
  - MSP430x4617, MSP430x46171†: 92KB+256B Flash or ROM Memory, 8KB RAM
  - MSP430x4618, MSP430x46181†: 116KB+256B Flash or ROM Memory, 8KB RAM
  - MSP430x4619, MSP430x46191†: 120KB+256B Flash or ROM Memory, 4KB RAM

† The MSP430F461x1 devices are identical to the MSP430F461x devices, with the exception that the ADC12 module is not implemented.

## description

The Texas Instruments MSP430 family of ultralow-power microcontrollers consists of several devices featuring different sets of peripherals targeted for various applications. The architecture, combined with five low-power modes, is optimized to achieve extended battery life in portable measurement applications. The devices feature a powerful 16-bit RISC CPU, 16-bit registers, and constant generators that contribute to maximum code efficiency. The digitally controlled oscillator (DCO) allows wake-up from low-power modes to active mode in less than 6  $\mu$ s.

The MSP430x461x(1) series are microcontroller configurations with two 16-bit timers, a high-performance 12-bit A/D converter (MSP430x461x only), one universal serial communication interface (USCI), one universal synchronous/asynchronous communication interface (USART), DMA, 80 I/O pins, and a liquid crystal display (LCD) driver with regulated charge pump.

Typical applications for this device include portable medical applications and e-meter applications.

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage. ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications. These devices have limited built-in ESD protection.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

PRODUCTION DATA information is current as of publication date. Products conform to specifications per the terms of Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

## DEVELOPMENT TOOL SUPPORT

All MSP430 microcontrollers include an Embedded Emulation Module (EEM) allowing advanced debugging and programming through easy to use development tools. Recommended hardware options include the following:

- Debugging and Programming Interface
  - MSP-FET430UIF (USB)
  - MSP-FET430PIF (Parallel Port)
- Debugging and Programming Interface with Target Board
  - MSP-FET430U100
- Stand-Alone Target Board
  - MSP-TS430PZ100
- Production Programmer
  - MSP-GANG430

## short-form description

### CPU

The MSP430 CPU has a 16-bit RISC architecture that is highly transparent to the application. All operations, other than program-flow instructions, are performed as register operations in conjunction with seven addressing modes for source operand and four addressing modes for destination operand.

The CPU is integrated with 16 registers that provide reduced instruction execution time. The register-to-register operation execution time is one cycle of the CPU clock.

Four of the registers, R0 to R3, are dedicated as program counter, stack pointer, status register, and constant generator respectively. The remaining registers are general-purpose registers.

Peripherals are connected to the CPU using data, address, and control buses, and can be handled with all instructions.

The MSP430x461x(1) device family uses the MSP430X CPU and is completely backward compatible with the MSP430 CPU. For a complete description of the MSP430X CPU, see the *MSP430x4xx Family User's Guide*.

### instruction set

The instruction set consists of the original 51 instructions with three formats and seven address modes and additional instructions for the expanded address range. Each instruction can operate on word and byte data. Table 1 shows examples of the three types of instruction formats; Table 2 shows the address modes.

## operating modes

The MSP430 has one active mode and five software-selectable low-power modes of operation. An interrupt event can wake up the device from any of the five low-power modes, service the request, and restore back to the low-power mode on return from the interrupt program.

The following six operating modes can be configured by software:

- Active mode (AM)
  - All clocks are active
- Low-power mode 0 (LPM0)
  - CPU is disabled
  - ACLK and SMCLK remain active, MCLK is disabled
  - FLL+ loop control remains active
- Low-power mode 1 (LPM1)
  - CPU is disabled
  - FLL+ loop control is disabled
  - ACLK and SMCLK remain active, MCLK is disabled
- Low-power mode 2 (LPM2)
  - CPU is disabled
  - MCLK, FLL+ loop control and DCOCLK are disabled
  - DCO's dc generator remains enabled
  - ACLK remains active
- Low-power mode 3 (LPM3)
  - CPU is disabled
  - MCLK, FLL+ loop control, and DCOCLK are disabled
  - DCO's dc generator is disabled
  - ACLK remains active
- Low-power mode 4 (LPM4)
  - CPU is disabled
  - ACLK is disabled
  - MCLK, FLL+ loop control, and DCOCLK are disabled
  - DCO's dc generator is disabled
  - Crystal oscillator is stopped

**interrupt vector addresses**

The interrupt vectors and the power-up start address are located in the address range 0FFFh to 0FFC0h. The vector contains the 16-bit address of the appropriate interrupt-handler instruction sequence.

- NOTES:
- Multiple source flags
  - Interrupt flags are located in the module.
  - A reset is generated if the CPU tries to fetch instructions from within the module register memory address range (0h to 01FFh). (Non)maskable: the individual interrupt-enable bit can disable an interrupt event, but the general-interrupt enable cannot disable it.
  - The interrupt vectors at addresses 0FFDAh to 0FFC0h are not used in this device and can be used for regular program code if necessary.
  - Access and key violations, KEYV and ACCVIFG, only applicable to F devices.
  - ADC12 is not implemented in MSP430x461x1 devices.

### bootstrap loader (BSL)

The MSP430 BSL enables users to program the flash memory or RAM using a UART serial interface. Access to the MSP430 memory via the BSL is protected by user-defined password. A bootstrap loader security key is provided at address 0FFBEh to disable the BSL completely or to disable the erasure of the flash if an invalid password is supplied. The BSL is optional for ROM-based devices. For complete description of the features of the BSL and its implementation, see the application report *Features of the MSP430 Bootstrap Loader*, literature number SLAA089.

BSLKEY	DESCRIPTION
00000h	Erasure of flash disabled if an invalid password is supplied
0AA55h	BSL disabled
any other value	BSL enabled

BSL FUNCTION	PZ PACKAGE PINS
Data Transmit	87/A7 – P1.0
Data Receive	86/E7 – P1.1

### flash memory

The flash memory can be programmed via the JTAG port, the bootstrap loader, or in system by the CPU. The CPU can perform single-byte and single-word writes to the flash memory. Features of the flash memory include:

- Flash memory has n segments of main memory and two segments of information memory (A and B) of 128 bytes each. Each segment in main memory is 512 bytes in size.
- Segments 0 to n may be erased in one step, or each segment may be individually erased.
- Segments A and B can be erased individually, or as a group with segments 0 to n. Segments A and B are also called *information memory*.
- New devices may have some bytes programmed in the information memory (needed for test during manufacturing). The user should perform an erase of the information memory prior to the first use.

## peripherals

Peripherals are connected to the CPU through data, address, and control buses and can be handled using all instructions. For complete module descriptions, see the *MSP430x4xx Family User's Guide*, literature number SLAU056.

## DMA controller

The DMA controller allows movement of data from one memory address to another without CPU intervention. For example, the DMA controller can be used to move data from the ADC12 conversion memory to RAM. Using the DMA controller can increase the throughput of peripheral modules. The DMA controller reduces system power consumption by allowing the CPU to remain in sleep mode without having to awaken to move data to or from a peripheral.

## oscillator and system clock

The clock system in the MSP430x461x(1) family of devices is supported by the FLL+ module, which includes support for a 32768-Hz watch crystal oscillator, an internal digitally controlled oscillator (DCO), and a high frequency crystal oscillator. The FLL+ clock module is designed to meet the requirements of both low system cost and low power consumption. The FLL+ features digital frequency locked loop (FLL) hardware that, in conjunction with a digital modulator, stabilizes the DCO frequency to a programmable multiple of the watch crystal frequency. The internal DCO provides a fast turn-on clock source and stabilizes in less than 6  $\mu$ s. The FLL+ module provides the following clock signals:

- Auxiliary clock (ACLK), sourced from a 32768-Hz watch crystal or a high-frequency crystal
- Main clock (MCLK), the system clock used by the CPU
- Sub-Main clock (SMCLK), the subsystem clock used by the peripheral modules
- ACLK/n, the buffered output of ACLK, ACLK/2, ACLK/4, or ACLK/8

## brownout, supply voltage supervisor

The brownout circuit is implemented to provide the proper internal reset signal to the device during power-on and power-off. The supply voltage supervisor (SVS) circuitry detects if the supply voltage drops below a user selectable level and supports both supply voltage supervision (the device is automatically reset) and supply voltage monitoring (SVM, the device is not automatically reset).

The CPU begins code execution after the brownout circuit releases the device reset. However,  $V_{CC}$  may not have ramped to  $V_{CC(min)}$  at that time. The user must insure the default FLL+ settings are not changed until  $V_{CC}$  reaches  $V_{CC(min)}$ . If desired, the SVS circuit can be used to determine when  $V_{CC}$  reaches  $V_{CC(min)}$ .

## digital I/O

There are ten 8-bit I/O ports implemented—ports P1 through P10:

- All individual I/O bits are independently programmable.
- Any combination of input, output, and interrupt conditions is possible.
- Edge-selectable interrupt input capability for all the eight bits of ports P1 and P2.
- Read/write access to port-control registers is supported by all instructions.
- Ports P7/P8 and P9/P10 can be accessed word-wise as ports PA and PB respectively.

## Basic Timer1 and Real-Time Clock (RTC)

The Basic Timer1 has two independent 8-bit timers that can be cascaded to form a 16-bit timer/counter. Both timers can be read and written by software. Basic Timer1 is extended to provide an integrated real-time clock (RTC). An internal calendar compensates for months with less than 31 days and includes leap-year correction.

### **LCD\_A drive with regulated charge pump**

The LCD\_A driver generates the segment and common signals required to drive an LCD display. The LCD\_A controller has dedicated data memory to hold segment drive information. Common and segment signals are generated as defined by the mode. Static, 2-MUX, 3-MUX, and 4-MUX LCDs are supported by this peripheral. The module can provide a LCD voltage independent of the supply voltage with its integrated charge pump. Furthermore it is possible to control the level of the LCD voltage and, thus, contrast by software.

### **watchdog timer (WDT+)**

The primary function of the WDT+ module is to perform a controlled system restart after a software problem occurs. If the selected time interval expires, a system reset is generated. If the watchdog function is not needed in an application, the module can be configured as an interval timer and can generate interrupts at selected time intervals.

### **universal serial communication interface (USCI)**

The USCI modules are used for serial data communication. The USCI module supports synchronous communication protocols like SPI (3 or 4 pin), I2C and asynchronous communication protocols like UART, enhanced UART with automatic baudrate detection, and IrDA.

The USCI\_A0 module provides support for SPI (3 or 4 pin), UART, enhanced UART and IrDA.

The USCI\_B0 module provides support for SPI (3 or 4 pin) and I2C.

### **USART1**

The hardware universal synchronous/asynchronous receive transmit (USART) peripheral module is used for serial data communication. The USART supports synchronous SPI (3 or 4 pin) and asynchronous UART communication protocols, using double-buffered transmit and receive channels.

### **hardware multiplier**

The multiplication operation is supported by a dedicated peripheral module. The module performs  $16 \times 16$ ,  $16 \times 8$ ,  $8 \times 16$ , and  $8 \times 8$  bit operations. The module is capable of supporting signed and unsigned multiplication, as well as signed and unsigned multiply and accumulate operations. The result of an operation can be accessed immediately after the operands have been loaded into the peripheral registers. No additional clock cycles are required.

### **Comparator\_A**

The primary function of the comparator\_A module is to support precision slope analog-to-digital conversions, battery-voltage supervision, and monitoring of external analog signals.

### **ADC12 (MSP430x461x Only)**

The ADC12 module supports fast, 12-bit analog-to-digital conversions. The module implements a 12-bit SAR core, sample select control, reference generator and a 16 word conversion-and-control buffer. The conversion-and-control buffer allows up to 16 independent ADC samples to be converted and stored without any CPU intervention.

## absolute maximum ratings over operating free-air temperature (unless otherwise noted)†

Voltage range applied at $V_{CC}$ to $V_{SS}$ .....	-0.3 V to 4.1 V
Voltage range applied to any pin (see Note) .....	-0.3 V to $V_{CC} + 0.3$ V
Diode current at any device terminal .....	$\pm 2$ mA
Storage temperature range, $T_{stg}$ : Unprogrammed device .....	-55°C to 150°C
Programmed device .....	-40°C to 85°C

† Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

NOTE: All voltages referenced to  $V_{SS}$ . The JTAG fuse-blow voltage,  $V_{FB}$ , is allowed to exceed the absolute maximum rating. The voltage is applied to the TDI/TCLK pin when blowing the JTAG fuse.

## recommended operating conditions

		MIN	NOM	MAX	UNITS
Supply voltage during program execution (see Note 1), $V_{CC}$ ( $AV_{CC} = DV_{CC1/2} = V_{CC}$ )	MSP430x461x(1)	1.8		3.6	V
Supply voltage during flash memory programming (see Note 1), $V_{CC}$ ( $AV_{CC} = DV_{CC1/2} = V_{CC}$ )	MSP430F461x(1)	2.7		3.6	V
Supply voltage during program execution, SVS enabled and PORON = 1 (see Note 1 and Note 2), $V_{CC}$ ( $AV_{CC} = DV_{CC1/2} = V_{CC}$ )	MSP430x461x(1)	2		3.6	V
Supply voltage (see Note 1), $V_{SS}$ ( $AV_{SS} = DV_{SS1/2} = V_{SS}$ )		0		0	V
Operating free-air temperature range, $T_A$	MSP430x461x(1)	-40		85	°C
LFXT1 crystal frequency, $f_{(LFXT1)}$ (see Note 2)	LF selected, XTS_FLL = 0	Watch crystal		32.768	kHz
	XT1 selected, XTS_FLL = 1	Ceramic resonator	450	8000	
	XT1 selected, XTS_FLL = 1	Crystal	1000	8000	
XT2 crystal frequency, $f_{(XT2)}$	Ceramic resonator	450		8000	kHz
	Crystal	1000		8000	
Processor frequency (signal MCLK), $f_{(System)}$	$V_{CC} = 1.8$ V	DC		3.0	MHz
	$V_{CC} = 2.0$ V	DC		4.6	
	$V_{CC} = 3.6$ V	DC		8.0	

- NOTES: 1. It is recommended to power  $AV_{CC}$  and  $DV_{CC}$  from the same source. A maximum difference of 0.3 V between  $AV_{CC}$  and  $DV_{CC}$  can be tolerated during power up and operation.  
 2. The minimum operating supply voltage is defined according to the trip point where POR is going active by decreasing the supply voltage. POR is going inactive when the supply voltage is raised above the minimum supply voltage plus the hysteresis of the SVS circuitry.  
 3. In LF mode, the LFXT1 oscillator requires a watch crystal. In XT1 mode, LFXT1 accepts a ceramic resonator or a crystal.

 2. Refer to the supply current specifications I<sub>(LPM3)</sub> for additional current specifications with the LCD\_A module active.  
 3. Segments S0 through S3 are disabled when the LCD charge pump feature is enabled (LCDCPEN = 1) and cannot be used together with the LCD charge pump. In addition, when using segments S0 through S3 with an external LCD voltage supply, V<sub>LCD</sub> ≤ AV<sub>CC</sub>.  
 4. Connecting an actual display will increase the current consumption depending on the size of the LCD.

V <sub>IH</sub>				0.8×V <sub>CC</sub>		V <sub>CC</sub>	

- NOTES:
- The parasitic capacitance from the package and board may be estimated to be 2 pF. The effective load capacitor for the crystal is  $(C_{XIN} \times C_{XOUT}) / (C_{XIN} + C_{XOUT})$ . This is independent of XTS\_FLL.
  - To improve EMI on the low-power LFXT1 oscillator, particularly in the LF mode (32 kHz), the following guidelines should be observed.
    - Keep the trace between the MSP430 device and the crystal as short as possible.
    - Design a good ground plane around the oscillator pins.
    - Prevent crosstalk from other clock or data lines into oscillator pins XIN and XOUT.
    - Avoid running PCB traces underneath or adjacent to the XIN and XOUT pins.
    - Use assembly materials and praxis to avoid any parasitic load on the oscillator XIN and XOUT pins.
    - If conformal coating is used, ensure that it does not induce capacitive/resistive leakage between the oscillator pins.
    - Do not route the XOUT line to the JTAG header to support the serial programming adapter as shown in other documentation. This signal is no longer required for the serial programming adapter.
  - Applies only when using an external logic-level clock source. XTS\_FLL must be set. Not applicable when using a crystal or resonator.
  - External capacitance is recommended for precision real-time clock applications; OSCCAP<sub>x</sub> = 0h.

t <sub>(τ)</sub>	USART1 deglitch time	2.2 V	200	430	800	ns
		3 V	150	280	500	

NOTE 1: The signal applied to the USART1 receive signal/terminal (URXD1) should meet the timing requirements of t<sub>(τ)</sub> to ensure that the URXS flip-flop is set. The URXS flip-flop is set with negative pulses meeting the minimum-timing condition of t<sub>(τ)</sub>. The operating conditions to set the flag must be met independently from this timing constraint. The deglitch circuitry is active only on negative transitions on the URXD1 line.

- NOTES: 1. The leakage current is defined in the leakage current table with Ax parameter.  
2. The analog input voltage range must be within the selected reference voltage range  $V_{R+}$  to  $V_{R-}$  for valid conversion results.  
3. The internal reference supply current is not included in current consumption parameter  $I_{ADC12}$ .  
4. The internal reference current is supplied via terminal  $V_{AVCC}$ . Consumption is independent of the ADC12ON control bit, unless a conversion is active. The REFON bit enables to settle the built-in reference before starting an A/D conversion.

- NOTES: 1. The external reference is used during conversion to charge and discharge the capacitance array. The input capacitance,  $C_I$ , is also the dynamic load for an external reference during conversion. The dynamic impedance of the reference supply should follow the recommendations on analog-source impedance to allow the charge to settle for 12-bit accuracy.  
2. The accuracy limits the minimum positive external reference voltage. Lower reference voltage levels may be applied with reduced accuracy requirements.  
3. The accuracy limits the maximum negative external reference voltage. Higher reference voltage levels may be applied with reduced accuracy requirements.  
4. The accuracy limits minimum external differential reference voltage. Lower differential reference voltage levels may be applied with reduced accuracy requirements.

			3 V	1220		

- NOTES: 1. The sensor current  $I_{SENSOR}$  is consumed if (ADC12ON = 1 and REFON=1), or (ADC12ON=1 AND INCH=0Ah and sample signal is high). When REFON = 1,  $I_{SENSOR}$  is already included in  $I_{REF+}$ .
2. The temperature sensor offset can be as much as  $\pm 20^\circ C$ . A single-point calibration is recommended in order to minimize the offset error of the built-in temperature sensor.
3. The typical equivalent impedance of the sensor is 51 k $\Omega$ . The sample time required includes the sensor-on time  $t_{SENSOR(on)}$ .
4. No additional current is needed. The  $V_{MID}$  is used during sampling.
5. The on-time  $t_{VMID(on)}$  is included in the sampling time  $t_{VMID(sample)}$ ; no additional on time is needed.

JTAG pins TMS, TCK, TDI/TCLK, TDO/TDI, input/output with Schmitt-trigger or output

**JTAG fuse check mode**

MSP430 devices that have the fuse on the TDI/TCLK terminal have a fuse check mode that tests the continuity of the fuse the first time the JTAG port is accessed after a power-on reset (POR). When activated, a fuse check current ( $I_{(TF)}$ ) of 1 mA at 3 V can flow from the TDI/TCLK pin to ground if the fuse is not burned. Care must be taken to avoid accidentally activating the fuse check mode and increasing overall system power consumption.

Activation of the fuse check mode occurs with the first negative edge on the TMS pin after power up or if the TMS is being held low during power up. The second positive edge on the TMS pin deactivates the fuse check mode. After deactivation, the fuse check mode remains inactive until another POR occurs. After each POR the fuse check mode has the potential to be activated.

The fuse check current only flows when the fuse check mode is active and the TMS pin is in a low state (see Figure 26). Therefore, the additional current flow can be prevented by holding the TMS pin high (default condition). The JTAG pins are terminated internally and therefore do not require external termination.

**P9.7/S10**  
The table includes *LCDS16* in the "CONTROL BITS / SIGNALS" column. This is correct for P9.0/S17 and P9.1/S16.  
For P9.2/S15, P9.3/S14, P9.4/S13, and P9.5/S12, the correct control bit is **LCDS12**.  
For P9.6/S11 and P9.7/S10, the correct control bit is **LCDS8**.
- 84 In the "PIN NAME (P10.X)" and "FUNCTION" columns, the segment signal names on P10.0 and P10.1 are incorrect—they should be changed to:  
**P10.0/S9**  
**P10.1/S8**  
The table includes *LCDS8* in the "CONTROL BITS / SIGNALS" column. This is correct for P10.0/S9 and P10.1/S8.  
For P10.2/S7, P10.3/S6, P10.4/S5, and P10.5/S4, the correct control bit is **LCDS4**.

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSELETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of  $\leq 1000$ ppm threshold. Antimony trioxide based flame retardants must also meet the  $\leq 1000$ ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

PLASTIC QUAD FLAT PACK

NOTES:

- A. All linear dimensions are in millimeters.
- B. This drawing is subject to change without notice.
- C. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Example stencil design based on a 50% volumetric metal load solder paste. Refer to IPC-7525 for other stencil recommendations.
- D. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.
