OPA561 高电流、高速运算放大器

1 特性

- 1.2A 输出电流
- $12V_{PP}$ 输出电压
- 宽电源范围
  - 单电源：7 V 至 15 V
  - 双电源：±3.5V 至 ±7.5V
- 全面保护
  - 热关断保护
  - 可调电流限制
- 输出禁用控制
- 17MHz 增益带宽积
- 50V/μs 压摆率
- 1MHz 全功率带宽
- 热增强型 HTSSOP-20 PowerPAD™ 集成电路封装
- 温度范围：0°C 至 125°C

2 应用

- 电力线通信
- 阀门执行器驱动器
- 电源
- 测试设备
- TEC 驱动器
- 激光二极管驱动器

3 说明

OPA561 是一款低成本、高电流运算放大器，能够将高达 1.2A 的脉冲驱动至无功负载。该单片集成电路可以在要求严格的线路载波通信、激光二极管驱动器和电机控制应用中提供高可靠性。高压摆率可提供 1MHz 的全功率带宽和出色的线性度。

为了实现设计灵活性，OPA561 通过 7V 至 15V 范围内的单电源或 ±3.5V 至 ±7.5V 范围的双电源供电。采用单电源供电时，输入共模范围可扩展至接地电平以下。在最大输出电流下，宽输出摆幅能够以标称 15V 的电源电压提供 $12V_{PP}$ 性能。

OPA561 在过热条件下以及电流过载时会受到内部保护。此外，OPA561 可提供准确的用户自选的电流限制。可以使用低功耗电阻器或电位器或 DAC（数模转换器）在 0.2A 至 1.2A 的范围内调节电流限制。即使在脉冲负载条件下，电流控制环路的高速特性也能提供高精度。

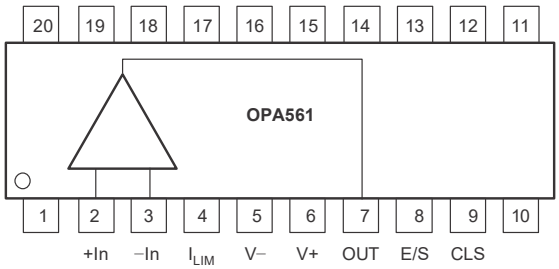
使能和状态 (E/S) 引脚执行两项功能：可以对该引脚进行监测以确定器件是否处于热关断状态（低电平有效），还可以强制该引脚为低电平以禁用输出，从而断开负载。

OPA561 采用微型 HTSSOP-20 PowerPAD 集成电路封装。该表面贴装封装在热性能方面得到增强，具有非常低的热阻。额定工作工业温度范围为 0°C 至 125°C。

封装信息

器件型号	封装(1)	封装尺寸(2)
OPA561	PWP（HTSSOP，20）	6.5mm x 6.4mm

(1) 有关详细信息，请参阅 节 10。
(2) 封装尺寸（长 x 宽）为标称值，并包括引脚（如适用）。



HTSSOP−20

NOTE: Pins 1, 10, and 11−20 are not connected.
Flag must be connected to V−.

4 Pin Configuration and Functions

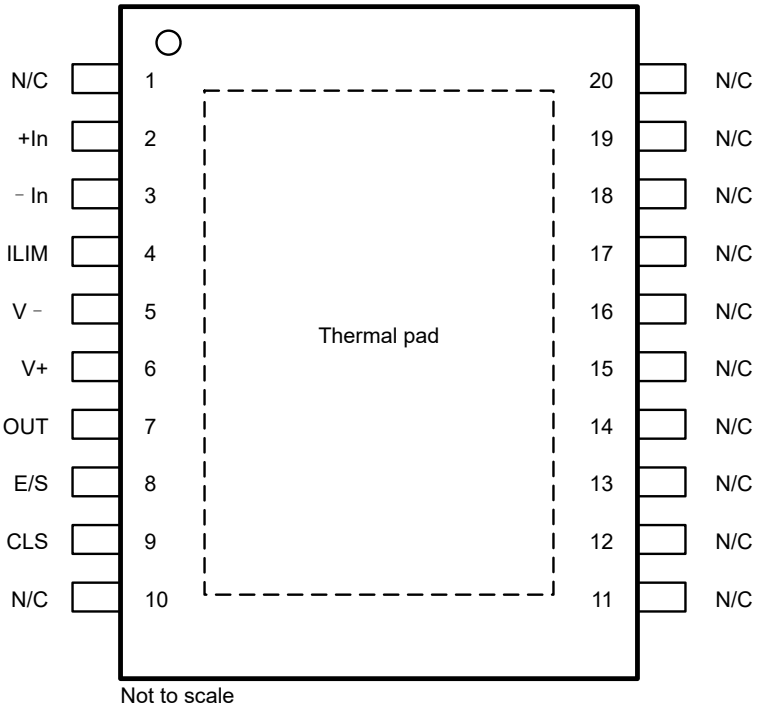

图 4-1. PWP Package, 20-Pin HTSSOP (Top View)

表 4-1. Pin Functions

PIN		TYPE(1)	DESCRIPTION
NAME	NO.		
1	N/C	—	No electrical connection. Solder this pin to the printed circuit board (PCB).
2	+In	I	Noninverting input
3	– In	I	Inverting input
4	I_{LIM}	I	Adjustable current limit pin
5	V –	G	Negative supply
6	V+	P	Positive supply
7	OUT	O	Output
8	E/S	I/O	Enable and status pin
9	CLS	O	Overcurrent status flag
10-20	N/C	—	No electrical connection. Solder this pin to the printed circuit board (PCB).
Pad	Thermal pad	—	Connect the thermal pad to the most negative supply of the device, V – .

(1) I = input, O = output, G = ground, P = power.

5 Specifications

5.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)(1)

		MIN	MAX	UNIT
	Supply voltage, V− to V+		16	V
	Input voltage	(V –) − 0.4	(V+) + 0.5	V
	Input shutdown voltage	(V –) − 0.4	(V –) + 0.5	V
	Junction temperature		150	°C
T_{stg}	Storage temperature	– 65	150	°C

(1) Operation outside the *Absolute Maximum Ratings* may cause permanent device damage. *Absolute Maximum Ratings* do not imply functional operation of the device at these or any other conditions beyond those listed under *Recommended Operating Conditions*. If used outside the *Recommended Operating Conditions* but within the *Absolute Maximum Ratings*, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.

5.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001(1)	±2000	V
		Charged device model (CDM), per ANSI/ESDA/JEDEC JS-002(2)	±1000	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

5.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V_S	Specified voltage	7	15	16	V
T_J	Specified junction temperature	0		125	°C

5.4 Thermal Information

THERMAL METRIC(1)			OPA561 PWP (HTSSOP) 20 PINS	UNIT
$R_{\theta JA}$	Junction-to-ambient thermal resistance	2-oz trace and 9-in^2 copper pad with solder	32	°C/W
		Without heat sink	100	
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance		1.4	°C/W

(1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC package thermal metrics* application report.

5.5 Electrical Characteristics

at T_{CASE} = 25°C, V_S = 15 V, load connected to V/2, and E/S enabled (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
OFFSET VOLTAGE, V_S = 12 V						
V_{OS}	Input offset voltage	V_{CM} = 0 V		–3	±20	mV
dV_{OS}/dT	Input offset voltage vs temperature	T_A = 0°C to 125°C		±50		µV/°C
PSRR	Input Offset Voltage vs Power Supply	V_{CM} = 0 V, V_S = 7 V to 16 V		25	150	µV/V
INPUT BIAS CURRENT(1)						
I_B	Input bias current	V_{CM} = 0 V		10	100	pA
I_{OS}	Input offset current	V_{CM} = 0 V		10	100	pA
NOISE						
e_n	Input voltage noise density	f = 1 kHz		83		nV/ √Hz
		f = 10 kHz		32		
		f = 100 kHz		14		
i_n	Current noise	f = 1 kHz		4		fA/ √Hz
INPUT VOLTAGE RANGE						
V_{CM}	Common-mode voltage	Linear operation	(V–) – 0.1		(V+) – 3	V
CMRR	Common-mode rejection ratio	V_S = 15 V, V_{CM} = (V–) – 0.1 V to (V+) – 3 V	70	80		dB
INPUT IMPEDANCE						
	Differential			1.8×10^{11} || 10		Ω || pF
	Common-mode			1.8×10^{11} || 18.5		Ω || pF

6 Detailed Description

6.1 Overview

The OPA561 is a monolithic low-cost, high-current operational amplifier capable of driving up to 1.2 A pulses into reactive loads. The amplifier is designed to provide high slew rate, which results in 1-MHz full-power bandwidth and excellent linearity. The OPA561 operates from either a single supply in the range of 7 V to 15 V or dual power supplies of ±3.5 V to ±7.5 V for design flexibility.

6.2 Feature Description

6.2.1 Adjustable Current Limit

The OPA561 has an accurate, user-defined, current limit which can be set from 0.2 A to 1.2 A by controlling the input to the I_{LIM} pin. Unlike other designs that use a power resistor in series with the output current path, the OPA561 senses the load internally. This allows the current limit to be set with low-power components. In contrast, other designs require one or two expensive power resistors that can handle the full output current (1.2 A in this case).

6.2.1.1 Current Limit Accuracy

The OPA561 has separate circuits to monitor the positive and negative currents. Each output is compared to a single internal reference that is set by the external current limit resistor (or voltage). The OPA561 employs a patented circuit technique to achieve an accurate and stable current limit. The output current limit has an accuracy of up to 5% on the 1-A current limit. Due to internal matching limitations, the positive and negative current limits can be slightly different. However, the values are typically within 10% of each other.

6.2.1.2 Setting the Current Limit

Do not float the I_{LIM} pin or damage to the device is possible. Connect I_{LIM} directly to V− to program the maximum output current limit, typically 1.2 A. The simplest method for adjusting the current limit (I_{LIM}) uses a resistor or potentiometer connected between the ILIM pin and V− according to the following equation:

$$I_{LIM} = \left(\frac{1.2V}{R_{CL} + 10k\Omega}\right) \times 10{,}000 \quad (1)$$

This external resistor determines a small internal current which sets the desired output current limit. Alternatively, the output current limit can be set by applying a voltage to the I_{LIM} pin. 图 6-1 shows a simplified schematic of the OPA561 current limit.

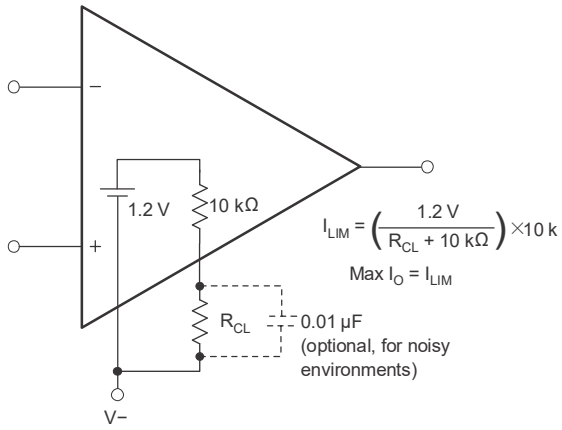

图 6-1. Adjustable Current Limit — Resistor Method

6.2.2 Enable-Status (E/S) Pin

The enable-status (E/S) pin provides two unique functions:

1. Output disable by forcing the pin LOW
2. Thermal shutdown indication by monitoring the voltage level at the pin

One or both of these functions can be used on the same device. For normal operation (output enabled), pull the E/S pin high (at least 2 V greater than V−). A small-value capacitor can be connected between the E/S pin and V− for noisy applications. To enable the OPA561 permanently, tie the E/S pin to V+ through a 402-kΩ pullup resistor.

6.2.2.1 Output Disable

The shutdown pin is referenced to the negative supply (V−). Therefore, shutdown operation is slightly different in single-supply and dual-supply applications. In single-supply operation, V− typically equals common ground. Therefore, the shutdown logic signal and the OPA561's shutdown pin are referenced to the same potential. In this configuration, the logic pin and the OPA561 enable can simply be tied together. Shutdown occurs for voltage levels of < 0.8 V. The OPA561 is enabled at logic levels > 2 V. In dual-supply operation, the logic pin is still referenced to a logic ground. However, the shutdown pin of the OPA561 is still referenced to V−. To shutdown the OPA561, the voltage level of the logic signal needs to be level shifted using an optocoupler, as shown in 图 6-2.

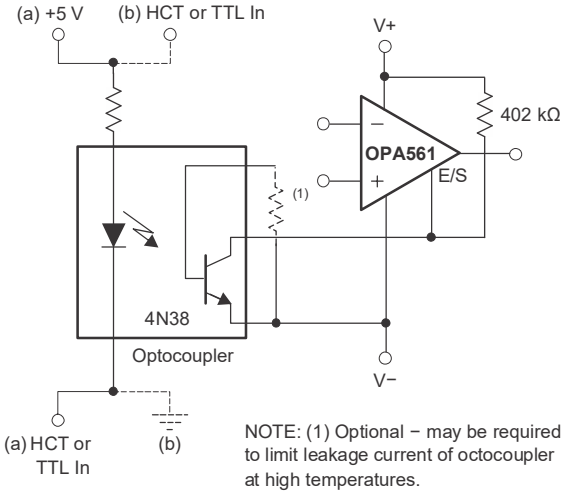

图 6-2. Shutdown Configuration for Dual Supplies

To disable the output, the E/S pin is pulled LOW, to no greater than 0.8 V above V−. This function can be used to conserve power during idle periods. The typical time required to shut down the output is 50 ns. To return the output to an enabled state, the E/S pin can be pulled to at least 2.0 V above V−. Typically, the output is enabled within 3 μs. Note that pulling the E/S pin HIGH (output enabled) does not disable the internal thermal shutdown.

6.2.2.2 Maintaining Microcontroller Compatibility

Not all microcontrollers output the same logic state after power-up or reset. 8051-type microcontrollers, for example, output logic-high levels on the ports, whereas other models power up with logic low levels after reset. In 图 6-2, configuration (a) the shutdown signal is applied on the cathode side of the photodiode within the optocoupler. A high logic level causes the OPA561 to be enabled, and a low logic level shuts down the OPA561. In 图 6-2, configuration (b), with the logic signal applied on the anode side, a high level causes the OPA561 to shut down, and a low level enables the op amp.

6.2.3 Overcurrent Flag

The OPA561 features an overcurrent status flag (CLS, pin 9) that can be monitored to see if the load exceeds the current limit. The output signal of the overcurrent limit flag is compatible to standard logic. The CLS signal is referenced to V−. A voltage level less than (V−) + 0.8 V indicates normal operation, and a level greater than (V−) + 2 V indicates that the OPA561 is current limited. The flag remains high as long as the output of the OPA561 current limited. At very low signal frequencies (typically < 1 kHz), both the upper (sourcing current) and lower (sinking current) current limits are monitored. At frequencies > 1 kHz, as a result of internal circuit limitations, the flag output signal for the upper current limit becomes delayed and shortened. The flag signal for the lower current limit is unaffected by this behavior. As the signal frequency increases further, only the lower current limit (sinking current) is output on pin 9.

7 Application and Implementation

备注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI’s customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

7.1 Application Information

图 7-1 shows the OPA561 connected as a basic noninverting amplifier. However, the OPA561 can be used in virtually any op amp configuration. Reinforce power supply terminals with low series impedance capacitors. The technique of using a ceramic and tantalum type in parallel is recommended. Low series impedance power supply wiring is recommended.

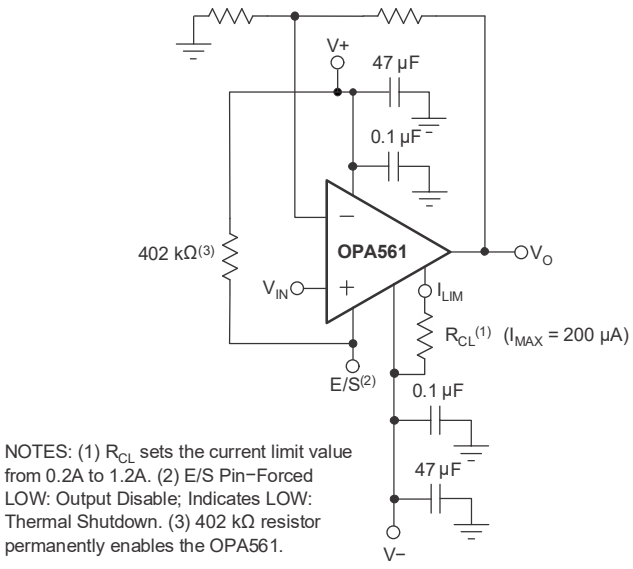

图 7-1. Basic Circuit Connections

7.1.1 Output Stage Compensation

The complex load impedances common in power op amp applications can cause output stage instability. For normal operation, output compensation circuitry is typically not required. However, if the OPA561 is intended to be driven into current limit, implementing an R/C network (snubber) is recommended. A snubber circuit also helps to enhance stability when driving large capacitive loads (> 1000 pF) or inductive loads (motors, loads separated from the amplifier by long cables). Typically, 3 Ω to 10 Ω in series with 0.01 µF to 0.1 µF is adequate. Varying the component values can help with challenging load conditions.

7.1.2 Output Protection

Reactive and EMF-generation loads can return load current to the amplifier, causing the output voltage to exceed the power-supply voltage. This damaging condition can be avoided with clamp diodes from the output terminal to the power supplies, as shown in 图 7-2. Schottky rectifier diodes with a 3 A or greater continuous rating are recommended.

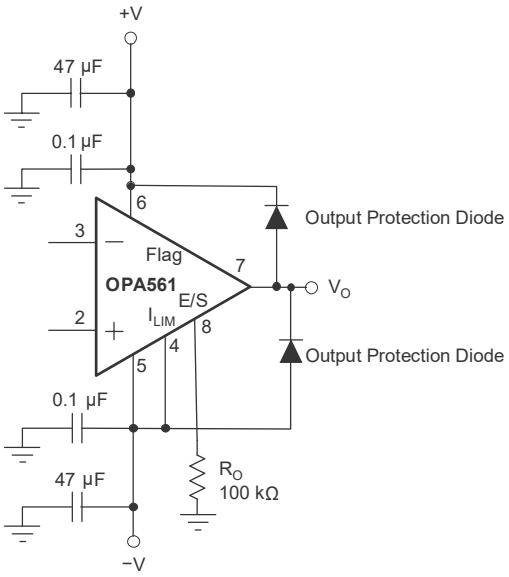

图 7-2. Output Protection Diode

7.1.3 Thermal Protection

The OPA561 has thermal sensing circuitry that helps protect the amplifier from exceeding temperature limits. Power dissipated in the OPA561 causes the junction temperature to rise. Internal thermal shutdown circuitry shuts down the output when the die temperature reaches approximately 160°C, resetting when the die has cooled to approximately 140°C. Depending on load and signal conditions, the thermal protection circuit can cycle on and off. This cycling limits the dissipation of the amplifier, but can have an undesirable effect on the load. Any tendency to activate the thermal protection circuit indicates excessive power dissipation or an inadequate heat sink. For reliable, long-term, continuous operation, limit the junction temperature to 125°C, maximum. To estimate the margin of safety in a complete design (including heat sink), increase the ambient temperature until the thermal protection is triggered. Use worst-case loading and signal conditions. For good, long-term reliability, set the thermal protection to trigger at more than 35°C greater than the maximum expected ambient condition of your application. This configuration produces a junction temperature of 125°C at the maximum expected ambient condition. The internal protection circuitry of the OPA561 is designed to protect against overload conditions, and is not intended to replace a proper heat sink. Continuously running the OPA561 into thermal shutdown can degrade reliability. The E/S pin can be monitored to determine if shutdown has occurred. During normal operation the voltage on the E/S pin is typically greater than (V−) + 2 V. During shutdown, the voltage drops to less than (V−) + 0.8 V.

7.1.4 Power Dissipation

Power dissipation depends on power supply, signal, and load conditions. For DC signals, power dissipation is equal to the product of output current times the voltage across the conducting output transistor. Dissipation with ac signals is lower. The *Power Amplifier Stress and Power Handling Limitations* application bulletin explains how to calculate or measure power dissipation with unusual signals and loads, and can be downloaded from www.ti.com.

7.1.5 Heat-Sink Area

The relationship between thermal resistance and power dissipation can be expressed as:

$$\theta_{JA} = \frac{T_J - T_A}{P_D} \quad (2)$$

Where:

- T_J = Junction temperature (°C)
- T_A = Ambient temperature (°C)
- θ_{JA} = Junction-to-ambient thermal resistance (°C/W)
- P_D = Power dissipation (W)

Calculate the appropriate power dissipation to determine required heat-sink area. At the same time, consider the relationship between power dissipation and thermal resistance to minimize shutdown conditions and allow for proper long-term operation (junction temperature of 125 °C). After the heat-sink area has been selected, verify proper thermal protection by testing worst-case load conditions. For applications with limited board size, refer to 图 7-3 for the approximate thermal resistance relative to heat-sink area. Increasing heat-sink area beyond 2 in^2 provides little improvement in thermal resistance. To achieve the 32 °C/W stated in the *Electrical Characteristics*, a copper plane size of 9 in^2 was used. The HTSSOP-20 PowerPAD integrated circuit package is a good choice for continuous power levels from 2 W to 4 W, depending on ambient temperature and heat-sink area. Higher power levels can be achieved in applications with a low on-off duty cycle, such as remote meter reading.

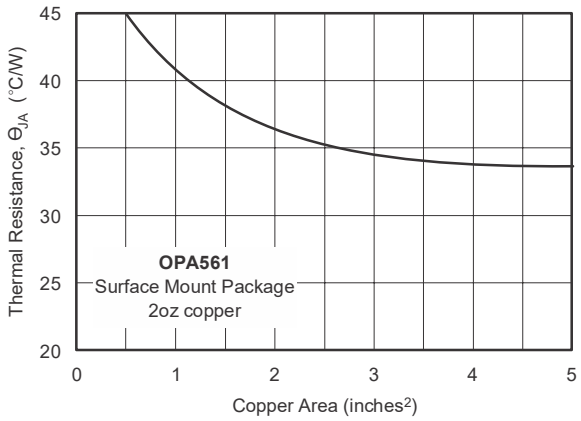

图 7-3. Thermal Resistance vs Circuit Board Copper Area

7.1.6 Amplifier Mounting

7.1.6.1 What is the PowerPAD™ Integrated Circuit Package?

The OPA561 uses the HTSSOP-20 PowerPAD integrated circuit package, a thermally enhanced, standard-size IC package designed to eliminate the use of bulky heat sinks and slugs traditionally used in thermal packages. This package can be easily mounted using standard PCB assembly techniques, and can be removed and replaced using standard repair procedures.

The PowerPAD package is designed so that the leadframe die pad (or thermal pad) is exposed on the bottom of the IC, as shown in 图 7-4. This provides an extremely low thermal resistance (θ_{JC}) path between the die and the exterior of the package. The thermal pad on the bottom of the IC must be soldered directly to the PCB, using the PCB as a heat sink. In addition, through the use of thermal vias, the thermal pad can be directly connected to a ground plane or special heat sink structure designed into the PCB.

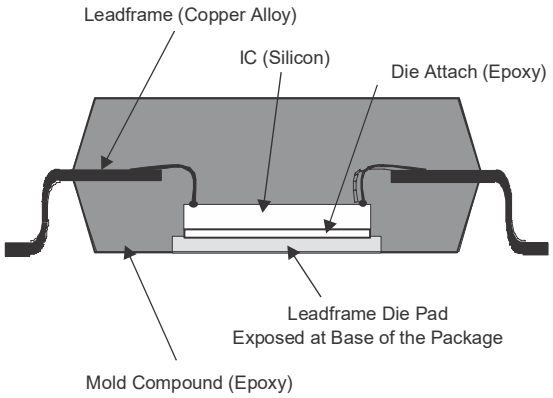

图 7-4. Section View of a PowerPAD Package

Soldering the thermal pad to the PCB is always recommended, even with applications that have low power dissipation. Soldering provides the necessary connection between the leadframe die and the PCB. Connect the thermal pad to the most negative supply of the device.

7.1.6.2 PowerPAD™ Integrated Circuit Package Assembly Process

1. Prepare the PCB with a top-side etch pattern, as shown in the attached *Thermal Land Pattern* mechanical drawing. Use etch for the leads as well as etch for the thermal land.
2. Place the recommended number of holes (or thermal vias) in the area of the thermal pad as shown on the attached *Land Pattern* mechanical. Use holes that are 13 mils in diameter. Keep the holes small so that solder wicking through the holes is not a problem during reflow.
3. Best practice is to place a small number of the holes under the package and outside the thermal pad area. These holes provide additional heat path between the copper land and ground plane and are 25 mils in diameter. The holes can be larger because the holes are not in the area to be soldered, so wicking is not a problem.
4. Connect all holes, including those within the thermal pad area and outside the pad area, to the internal ground plane or other internal copper plane.
5. When connecting these holes to the ground plane, do not use the typical web or spoke via connection methodology; see 图 7-5. Web connections have a high thermal resistance that is useful for slowing the heat transfer during soldering operations. This heat-transfer slowing makes the soldering of vias that have plane connections easier. However, in this application, low thermal resistance is desired for the most efficient heat transfer. Therefore, connect the holes under the PowerPAD package to the internal ground plane with a complete connection around the entire circumference of the plated through hole.
6. On the top-side solder mask, leave exposed the terminals of the package and the thermal pad area. On the thermal pad area, leave the 13 mil holes exposed. Cover the larger 25 mil holes outside the thermal pad area with solder mask.
7. Apply solder paste to the exposed thermal pad area and all of the package pins.
8. With these preparatory steps in place, the PowerPAD IC package is simply placed in position and run through the solder reflow operation, as with any standard surface-mount component. This procedure results in a part that is properly installed.

For detailed information on the PowerPAD IC package, including thermal modeling considerations and repair procedures, see the *PowerPAD Thermally Enhanced Package* technical brief, available at www.ti.com.

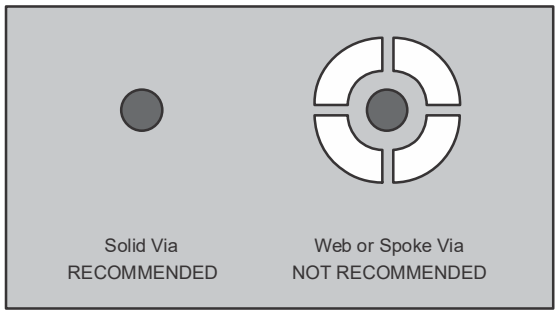

图 7-5. Via Connection

7.2 Typical Application

7.2.1 Laser Diode Driver

The high output current and low supply of the OPA561 makes this device a good candidate for driving laser diodes and thermoelectric coolers. 图 7-6 shows the OPA561 configured as a laser diode driver.

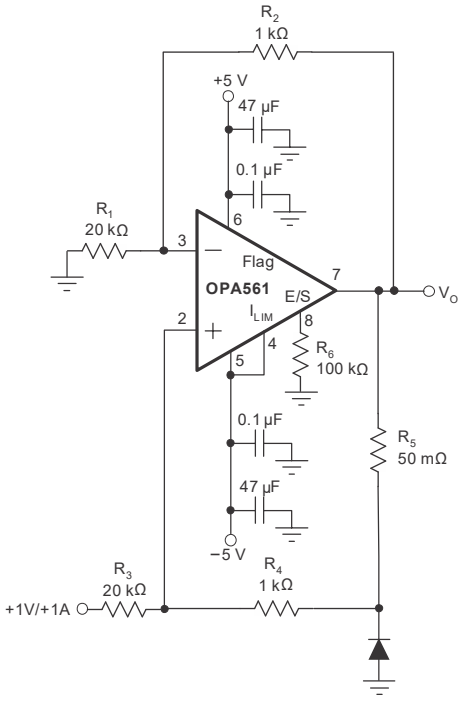

图 7-6. Laser Diode Driver

7.2.2 Programmable Power Supply

图 7-7 shows the OPA561 configured with the MSP430™ MCU, REF3030, and DAC7513 as a space-saving, low-cost, programmable power-supply design. This design features low-voltage operation, small-size packages, (DAC7513 in SOT23-8, REF3030 in SOT23-3) and low cost.

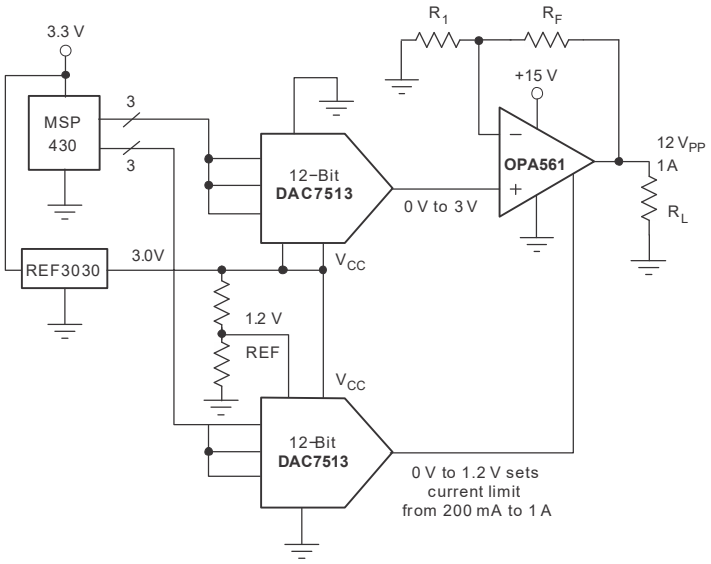

图 7-7. Programmable Power Supply

7.2.3 Power-Line Communication Modem

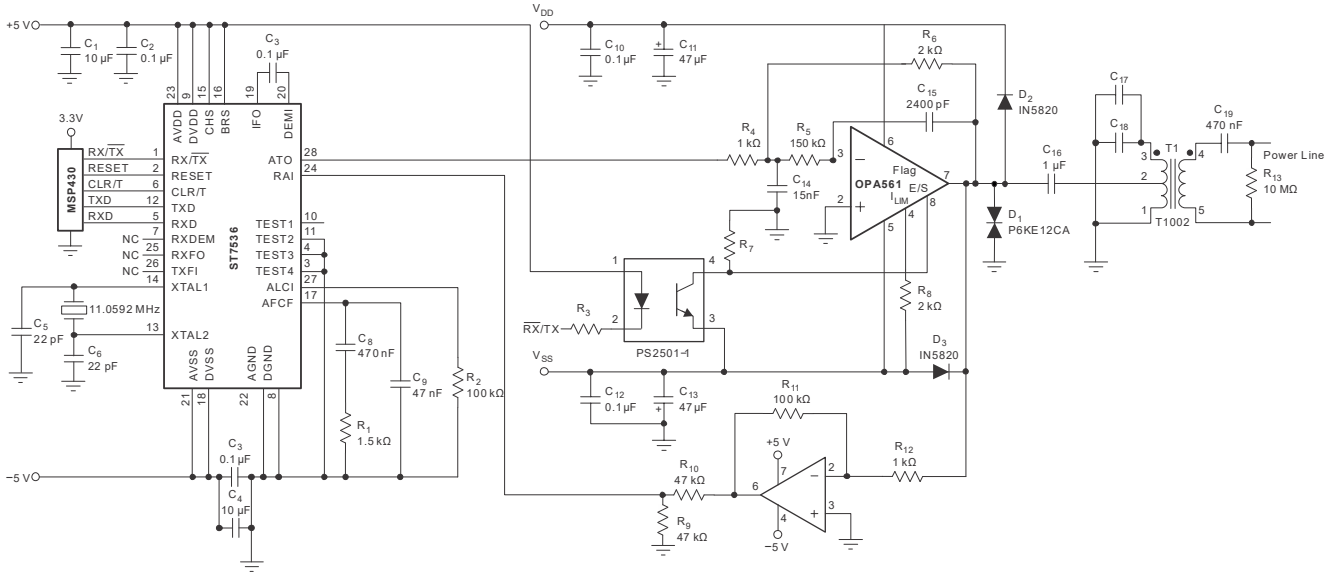

图 7-8. Power-Line Communication Driver

The OPA561 is an excellent choice to drive ac power lines for low-speed communication applications. The device provides an easily implemented, reliable option that is superior to discrete power transistor circuits. Advantages include:

1. Fully integrated device
2. Integrated shutdown circuitry for send-and-receive switching
3. Thermal shutdown
4. Adjustable current limit
5. Shutdown flag
6. Power savings
7. Small PowerPAD integrated circuit package

Typically such a system consists of a microcontroller, a modem IC and the power-line interface circuitry. See 图 7-8 for the half-duplex power line communication system.

The system uses a synchronous FSK-modem, capable of 600-baud and 1200-baud data rates, and supports two different FSK channels in the 60-kHz to 80-kHz range. A microcontroller such as the MSP430™ MCU is used to control the modem IC.

The OPA561 analog interface circuitry drives the FSK modem signals on the ac power line. The circuitry filters the transmit signal (ATO) from the ST7536 to suppress the 2nd-harmonic distortion of the transmit signal. The circuitry also amplifies the ATO signal and provides the very low output impedance necessary to properly drive the line. The impedance of a typical power line at 70-kHz ranges from 1 Ω to 100 Ω. The OPA561 is an excellent choice for this type of load. The transformer provides isolation and additional filtering. C9 prevents 50-Hz to 60-Hz current from flowing in the transformer. Choose this capacitor carefully for proper voltage rating and safety characteristics.

The receive input signal is amplified (G = 100) and applied to the modem IC. The OPA561 is disabled in receive mode to avoid loading the line.

7.3 Power Supply Recommendations

The OPA561 operates from single (7 V to 15 V) or dual (±3.5 V to ±7.5 V) supplies with excellent performance. Power-supply voltages do not need to be equal. For example, the positive supply can be set to 10 V with the negative supply at –5 V, or vice-versa. Most behaviors remain unchanged throughout the operating voltage range. Parameters that vary significantly with operating voltage are shown in the *Typical Characteristics*.

7.4 Layout

7.4.1 Layout Guidelines

The OPA561 is a high-speed power amplifier that requires proper layout for best performance. 图 7-9 shows an example of proper layout.

Keep power-supply leads as short as possible, which keeps inductance low and resistive losses at a minimum. A minimum 18-gauge wire thickness is recommended for power-supply leads. Use a wire length < 8 inches.

Proper power-supply bypassing with low-ESR capacitors is essential to achieve good performance. A parallel combination of small ceramic (around 100 nF) and larger (47 µF) nonceramic bypass capacitors provide low impedance over a wide frequency range. Place bypass capacitors as close as practical to the power-supply pins of the OPA561.

Keep PCB traces conducting high currents, such as from output to load or from the power-supply connector to the power-supply pins of the OPA561, as wide and as short as possible. This guideline helps keep inductance low and resistive losses to a minimum.

The holes in the landing pattern for the OPA561 are for the thermal vias that connect the thermal pad of the OPA561 to the heat sink area on the printed circuit board (see attached *Land Pattern* mechanical drawing). The additional larger vias further enhance the heat conduction into the heat-sink area. All traces conducting high currents are very wide for lowest inductance and minimal resistive losses. The negative supply (V−) pin on the OPA561 is connected through the thermal pad. This connection allows for maximum trace width for VOUT and the positive power supply (V+).

8 Device and Documentation Support

TI offers an extensive line of development tools. Tools and software to evaluate the performance of the device, generate code, and develop solutions are listed below.

8.1 Device Support

8.1.1 第三方产品免责声明

TI 发布的与第三方产品或服务有关的信息，不能构成与此类产品或服务或保修的适用性有关的认可，不能构成此类产品或服务单独或与任何 TI 产品或服务一起的表示或认可。

8.2 接收文档更新通知

要接收文档更新通知，请导航至 ti.com 上的器件产品文件夹。点击*通知* 进行注册，即可每周接收产品信息更改摘要。有关更改的详细信息，请查看任何已修订文档中包含的修订历史记录。

8.3 支持资源

TI E2E™ 中文支持论坛是工程师的重要参考资料，可直接从专家处获得快速、经过验证的解答和设计帮助。搜索现有解答或提出自己的问题，获得所需的快速设计帮助。

链接的内容由各个贡献者“按原样”提供。这些内容并不构成 TI 技术规范，并且不一定反映 TI 的观点；请参阅 TI 的使用条款。

8.4 Trademarks

PowerPAD™, MSP430™, and TI E2E™ are trademarks of Texas Instruments.
所有商标均为其各自所有者的财产。

8.5 静电放电警告

静电放电 (ESD) 会损坏这个集成电路。德州仪器 (TI) 建议通过适当的预防措施处理所有集成电路。如果不遵守正确的处理和安装程序，可能会损坏集成电路。

ESD 的损坏小至导致微小的性能降级，大至整个器件故障。精密的集成电路可能更容易受到损坏，这是因为非常细微的参数更改都可能会导致器件与其发布的规格不相符。

8.6 术语表

TI 术语表　　本术语表列出并解释了术语、首字母缩略词和定义。

9 Revision History

Changes from Revision E (February 2007) to Revision F (October 2023)	Page
• 更新了整个文档的表、图和交叉参考的编号格式	1
• 添加了*封装信息*表以及*引脚配置和功能*、*规格*、*ESD 等级*、*建议运行条件*、*热性能信息*、*详细说明*、*概述*、*特性说明*、*应用和实现*、*典型应用*、*电源相关建议*、*布局*、*器件和文档支持*和*机械、封装和可订购信息*部分	1
• 将整个数据表中的最低工作温度从 –40ºC 更改为 0°C	1
• Updated input offset voltage typical value in *Electrical Characteristics*	5
• Updated to correct unit in Figure 6-11, *Output Voltage Swing vs Output Current*	7
• Updated to correct unit in Figure 6-17, *Offset Voltage Production Distribution*	7
• Added "approximately" to text referring to thermal protection behavior	14
• Added missing Equation 2	15

10 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable part number	Status (1)	Material type (2)	Package | Pins	Package qty | Carrier	RoHS (3)	Lead finish/ Ball material (4)	MSL rating/ Peak reflow (5)	Op temp (°C)	Part marking (6)
OPA561PWP	Last Time Buy	Production	HTSSOP (PWP) | 20	70 | TUBE	Yes	NIPDAU	Level-2-260C-1 YEAR	0 to 125	OPA561

OPA561PWP/2K.B	Last Time Buy	Production	HTSSOP (PWP) | 20	2000 | LARGE T&R	Yes	NIPDAU	Level-2-260C-1 YEAR	0 to 125	OPA561

(1) **Status:** For more details on status, see our product life cycle.

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

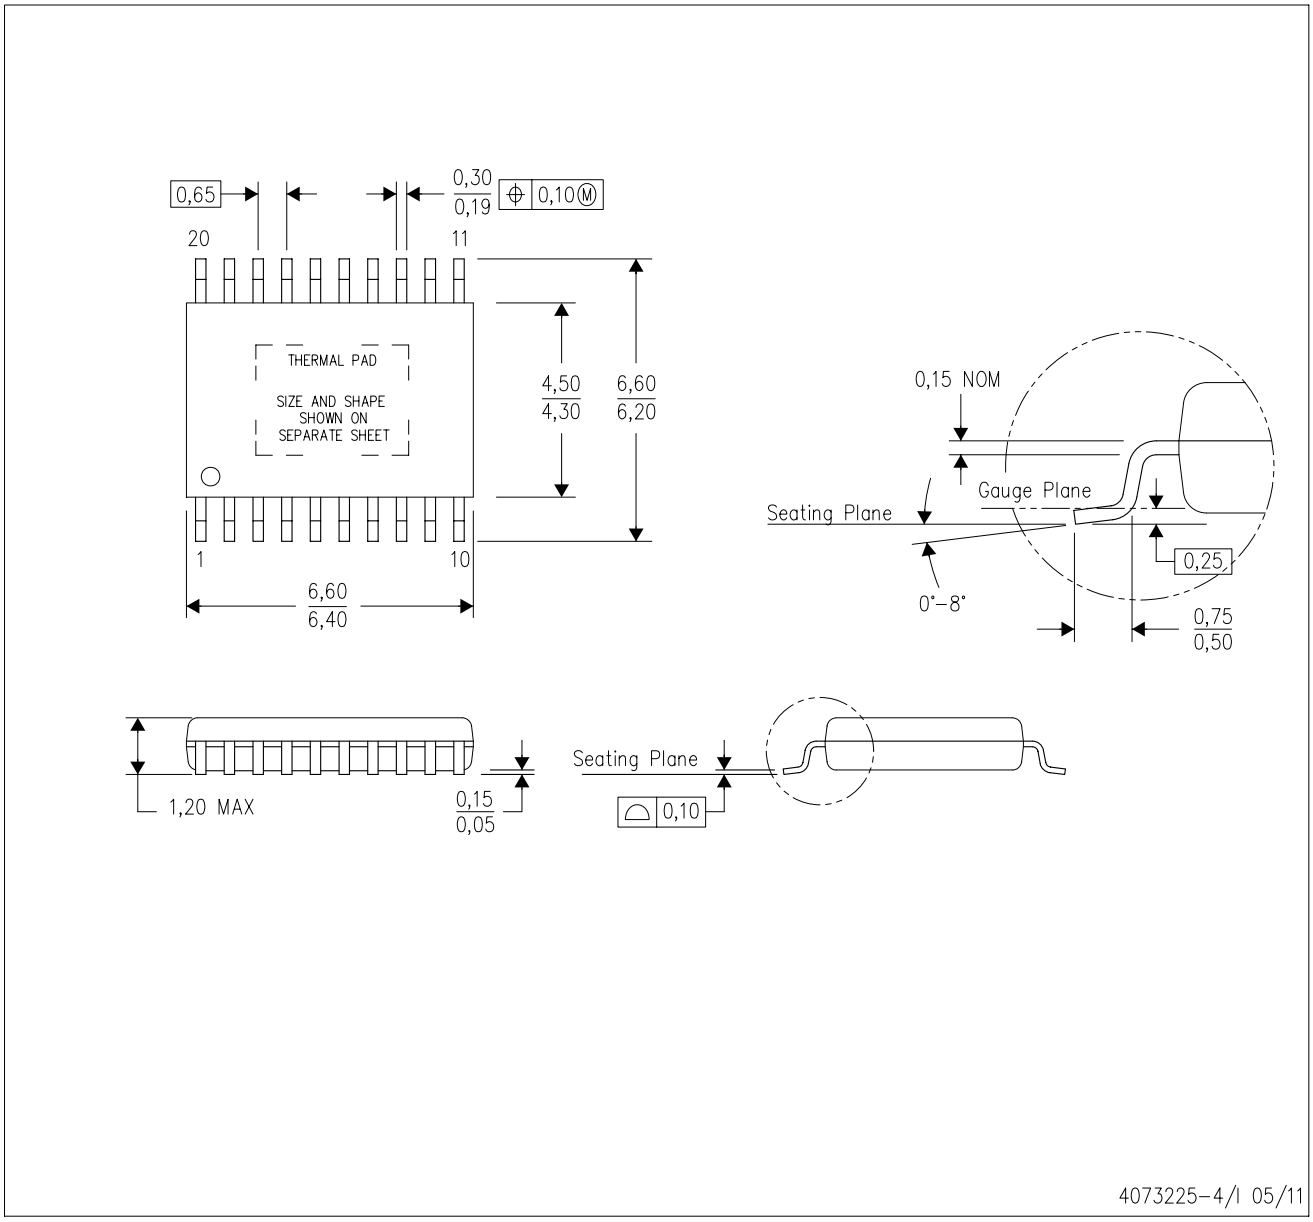
PWP (R–PDSO–G20) PowerPAD™ PLASTIC SMALL OUTLINE



NOTES:
A. All linear dimensions are in millimeters.
B. This drawing is subject to change without notice.
C. Body dimensions do not include mold flash or protrusions. Mold flash and protrusion shall not exceed 0.15 per side.
D. This package is designed to be soldered to a thermal pad on the board. Refer to Technical Brief, PowerPad Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 for information regarding recommended board layout. This document is available at www.ti.com <http://www.ti.com>.
E. See the additional figure in the Product Data Sheet for details regarding the exposed thermal pad features and dimensions.
E. Falls within JEDEC MO–153

PWP (R–PDSO–G20) PowerPAD™ SMALL PLASTIC OUTLINE

THERMAL INFORMATION

This PowerPAD™ package incorporates an exposed thermal pad that is designed to be attached to a printed circuit board (PCB). The thermal pad must be soldered directly to the PCB. After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For additional information on the PowerPAD package and how to take advantage of its heat dissipating abilities, refer to Technical Brief, PowerPAD Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 and Application Brief, PowerPAD Made Easy, Texas Instruments Literature No. SLMA004. Both documents are available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

NOTES:
A. All linear dimensions are in millimeters.
B. This drawing is subject to change without notice.
C. Customers should place a note on the circuit board fabrication drawing not to alter the center solder mask defined pad.
D. This package is designed to be soldered to a thermal pad on the board. Refer to Technical Brief, PowerPad Thermally Enhanced Package, Texas Instruments Literature No. SLMA002, SLMA004, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at www.ti.com <http://www.ti.com>. Publication IPC–7351 is recommended for alternate designs.
E. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Example stencil design based on a 50% volumetric metal load solder paste. Refer to IPC–7525 for other stencil recommendations.
F. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.
