8 通道，高带宽，模拟前端

查询样片: **PGA5807A**

特性

- **8 通道完整模拟前端 (AFE)**：
  - 低噪声放大器 **(LNA)**，可编程增益放大器 **(PGA)** 和可编程低通滤波器 **(LPF)**
  - 满通道增益：**12dB 至 30dB**
  - 与输入相关的噪声：**2.1nV/√Hz**
- **LNA**：
  - 增益：**12dB**
  - 全差分
  - 宽输入共模支持：**2.1 ± 200mV**
  - 最大线性输入范围：**500mV$_{PP}$**
- **PGA 增益：0dB 至 18dB**
  - 具有 **3dB** 增益步长
  - 可通过串口或外部引脚设定
- 最大总通道增益：**30dB**
- 可编程 **LPF**：
  - 转角频率：**75MHz，60MHz**
- 功率（全链式）：
  - 每通道 **60mW**
- 快速且持续的过载恢复
- 小尺寸封装：**9mm x 9mm** 四方扁平无引线封装

(QFN)-64

应用范围

- 数据采集 前端
- 超声波成像

说明

PGA5807A 是一款 8 通道、高带宽、模拟前端 (AFE)。 此器件由一个 3.3V 模拟单电源供电运行。 此器件支持高带宽输入频率，每通道的总功率 60mW。 PGA5807A 包含一个低噪声放大器 (LNA)，一个可编程增益放大器 (PGA) 和一个可编程低通滤波器 (LPF)。 此 LNA 有一个固定的 12dB 增益（差分放大器支持直接和电容输入耦合）并且支持 500mV$_{PP}$的最大线性输入范围。

此器件提供增益步长为 3dB 的 0dB 至 18dB 的增益选项。 这个 18dB PGA 增益可使用串口或外部引脚设定。 PGA5807A 集成了一个形式为 LPF 的抗混叠滤波器以减少噪声。 此器件采用极小型，9mm x 9mm 四方扁平无引线 (QFN)-64 封装，并且额定运行温度范围为 -40°C 至 +85°C。

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

ORDERING INFORMATION[1]

PRODUCT	PACKAGE-LEAD	PACKAGE DESIGNATOR

ABSOLUTE MAXIMUM RATINGS

Over operating free-air temperature range, unless otherwise noted. [1]

		VALUE	UNIT
Supply voltage range	AVDD	−0.3 to 3.9	V
Voltage at analog input and digital input		−0.3 to minimum (3.6, AVDD + 0.3)	V
Temperature range	Operating, T_A	−40 to +85	°C
	Storage, T_{stg}	−55 to +150	°C
Electrostatic discharge (ESD) ratings	Human body model (HBM)	1	kV

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

RECOMMENDED OPERATING CONDITIONS

		MIN	NOM	MAX	UNIT
AVDD	Analog voltage supply	3.15		3.6	V
T_A	Operating temperature	−40		+85	°C
	Input common-mode voltage range	1.9		2.3	V

THERMAL INFORMATION

THERMAL METRIC[1]		PGA5807 RGC (QFN) 64 PINS	UNITS

SERIAL REGISTER TIMING

SERIAL REGISTER WRITE DESCRIPTION

Programming different modes can be accomplished through the serial interface formed by the SEN (serial interface enable), SCLK (serial interface clock), SDATA (serial interface data), and RESET pins. Each of these pins has a 20-kΩ pull-down resistor to GND. Serially shifting bits into the device is enabled when SEN is low. SDATA serial data are latched at every SCLK rising edge when SEN is active (low). Serial data are loaded into the register at every 24th SCLK rising edge when SEN is low. If the word length exceeds a multiple of 24 bits, the excess bits are ignored. Data can be loaded in multiples of 24-bit words within a single active SEN pulse (an internal counter counts groups of 24 clocks after the SEN falling edge). The interface can function with SCLK frequencies from 20 MHz down to low speeds (of a few Hertz) and even with a non-50% duty cycle SCLK. Data are divided into two main portions to load on the addressed register: a register address (eight bits) and the actual data (16 bits). When writing to a register with unused bits, these bits should be set to '0'. Figure 18 shows a timing diagram of the write operation. Table 3 lists the serial interface timing characteristics.

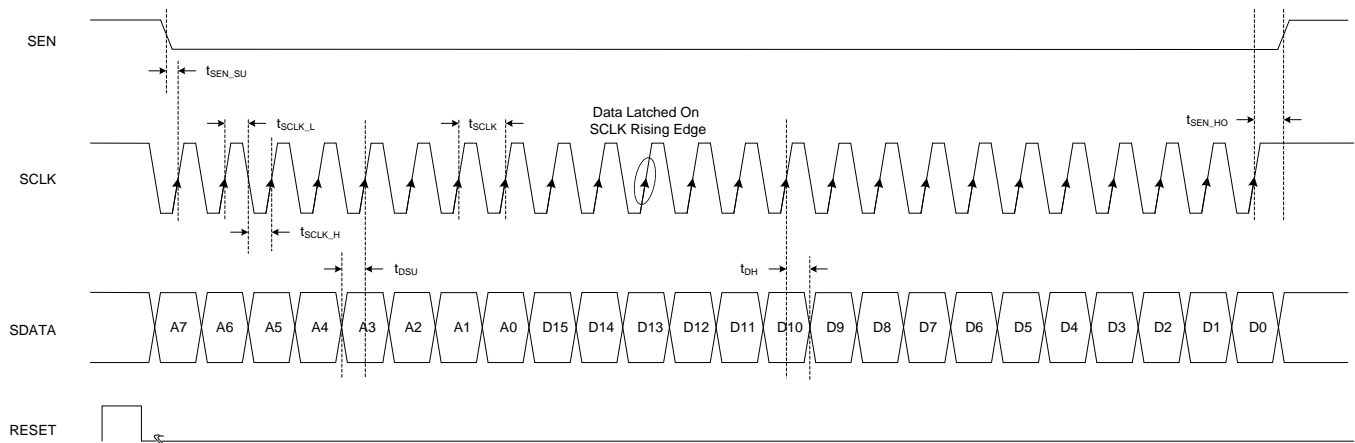

Figure 18. Serial Interface Timing Diagram

Table 3. Serial Interface Timing Characteristics[1]

	PARAMETER	MIN	TYP	MAX	UNIT
t_{SCLK}	SCLK period	50			ns
t_{SCLK_H}	SCLK high time	20			ns
t_{SCLK_L}	SCLK low time	20			ns
t_{DSU}	Data setup time	5			ns
t_{DHO}	Data hold time	5			ns
t_{SEN_SU}	SEN falling edge to SCLK rising edge	8			ns
t_{SEN_HO}	Time between last SCLK rising edge to SEN rising edge	8			ns
t_{OUT_DV}[2]	Delay from SCLK falling edge to SDOUT valid	12	20	28	ns

(1)   Minimum values are across the full temperature range of T_{MIN} = −40°C to T_{MAX} = +85°C and AVDD = 3.3 V.
(2)   See Figure 19.

REGISTER READOUT

The device includes an option where the contents of the internal registers can be read back. This readout may be useful as a diagnostic test to verify the serial interface communication between the external controller and the AFE. First, the REGISTER READOUT ENABLE bit (bit 1, register 00h) must be set to '1'. Then, initiate a serial interface cycle specifying the register address (A[7:0]) to be read. The data bits are *don't care*. The device outputs the contents (D[15:0]) of the selected register on the SDOUT pin. SDOUT has a typical 20-ns delay (t_{OUT_DV}) from the SCLK falling edge. For a lower speed SCLK, SDOUT can be latched on the SCLK rising edge. For a higher speed SCLK (for example, with an SCLK period less than 60 ns), latching SDOUT at the next SCLK falling edge is preferable. Figure 19 shows the read operation timing diagram (timing specifications follow the same information provided in Table 3). In readout mode, REGISTER READOUT ENABLE can still be accessed through SDATA, SCLK, and SEN. To enable serial register writes, set the REGISTER READOUT ENABLE bit back to '0'.

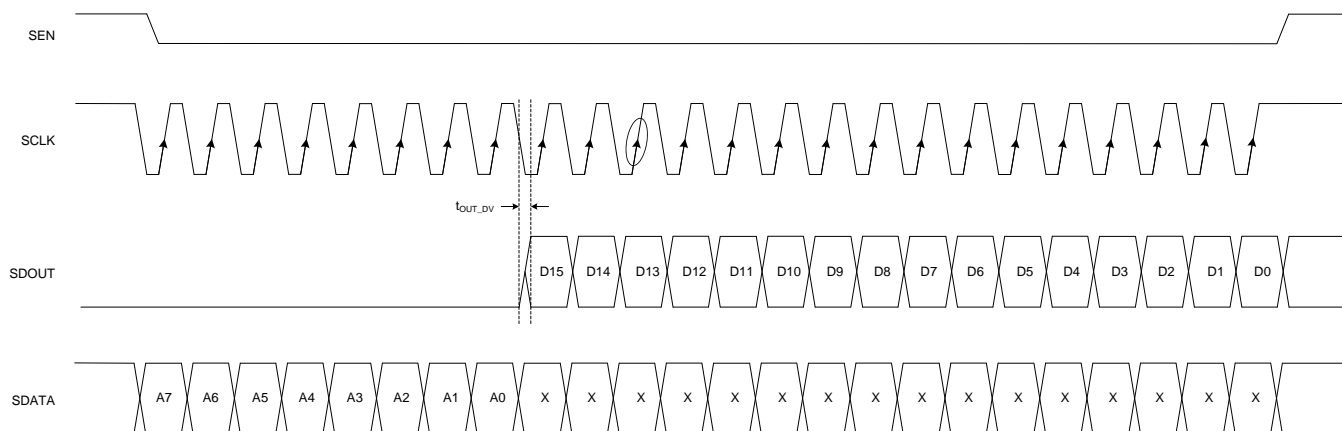

Figure 19. Serial Interface Register Read Timing Diagram

REGISTER MAP

A reset process is required at the device initialization stage. Initialization can be accomplished in one of two ways:

1. Through a hardware reset, by applying a positive pulse on the RESET pin, or

2. Through a software reset (using the serial interface), by setting the SW_RESET bit high. Setting this bit initializes the internal registers to the respective default values (all '0's) and then self-resets the SW_RESET bit low. In this case, the RESET pin can remain low (inactive).

After reset, all PGA registers are set to '0' (default). During register programming, all reserved or unlisted register bits must be set to '0'. Register settings are maintained when the device is in either partial or complete power-down mode. Table 4 lists the PGA register map.

Table 4. PGA Register Map

APPLICATION INFORMATION

THEORY OF OPERATION

The PGA5807A is a programmable gain amplifier (PGA) for applications with input frequencies up to 25 MHz. The device includes a low-noise amplifier (LNA) with a fixed gain, followed by a PGA and an antialiasing filter to reduce noise. The LNA is a fully-differential amplifier with a 12-dB fixed gain and can support a 500-mV$_{PP}$ maximum linear differential input swing. The PGA is implemented as an attenuator followed by a fixed-gain amplifier with 18-dB gain. The attenuator can provide attenuation from 0 dB to –18 dB in 3-dB steps. The attenuator can be controlled by the GAIN[2:0] pins or by using register 3Bh (bits 6 to 4). The antialiasing filter is combined with the fixed-gain amplifier. The filter has one active pole and a passive pole for a combined bandwidth of 75 MHz. For low-frequency applications, bandwidth can be reduced to 60 MHz where better noise can be achieved. The device can be programmed in this mode either by using the SDATA pin while RESET is high or by using bit 7 of register 3Bh. This device can directly drive ADCs such as the ADS5296.

Low-Noise Amplifier (LNA)

In most data-acquisition systems, an LNA is required at the front-end to obtain good noise performance. The PGA5807A has a fully-differential LNA with a 12-dB fixed gain. The LNA input-referred noise is 1.9 nV/√Hz, and supports a differential 500-mV$_{PP}$ input swing. The LNA input can be applied either directly or through an ac-coupling capacitor. Internally, the LNA input is connected to a 2.1-V common-mode voltage via a large resistor (8 kΩ). For direct input coupling, the LNA supports an input common-mode range from 1.9 V to 2.3 V. The LNA input circuits are shown in Figure 20.

**Figure 20. INP and INM Equivalent Circuits of LNA Inputs**

Programmable Gain Amplifier (PGA) and Filter

The LNA output is transmitted to a PGA with a programmable gain from 0 dB to 18 dB in 3-dB steps. This gain can either be controlled through a serial interface or through pins, as explained in the *Serial Register Write Description* section. The PGA is implemented as a programmable attenuator and as a fixed-gain amplifier with an 18-dB gain. This architecture helps achieve the same bandwidth across different gain settings. The attenuator provides programmable attenuation from 0 dB to 18 dB.

The attenuator architecture is shown in Figure 21. There are six shunt resistors that can be connected or disconnected to achieve programmable attenuation. The network provides 0-dB attenuation when no shunt resistors are connected. When the first shunt resistor (RS_1) is turned on, an attenuation of 3 dB is obtained. For achieving 6-dB attenuation, both RS_1 and RS_2 are turned on. Similarly, by turning on additional resistors, greater attenuation can be achieved; by turning on all resistors, an effective 18-dB attenuation is achieved.

Figure 21. Programmable Attenuator

The attenuator is followed by a 18-dB fixed-gain amplifier. The amplifier is implemented as a voltage-to-current (V-to-I) converter followed by a current-to-voltage (I-to-V) converter. The I-to-V bandwidth is limited so that it functions as an LPF and is followed by a passive filter, as shown in Figure 22. Both the active and passive filters provide an antialiasing filter action, which helps reduce noise when the PGA output is sampled by an ADC. The architecture of the passive filter is selected to reduce the glitches that can occur when the PGA5807A output is sampled by an ADC. For example, the PGA5807A can be directly connected to ADC devices (such as the ADS5295 or ADS5296) without any external components between the ADC and PGA5807A. Figure 23 shows an example of the PGA5807A connected directly to the ADS5296.

Figure 22. Antialias Filter

Figure 23. PGA Connected to an ADC

DEVICE CONFIGURATION USING SERIAL INTERFACE OR PARALLEL PINS

Different device modes (such as channel gain and bandwidth) can be programmed by either using the serial interface or external pins. The device can be configured via the serial interface only when the device RESET pin is pulsed and remains low. In this configuration, device gain can be programmed through register 3Bh (bits 6 to 4) and bandwidth can be programmed by register 3Bh (bit 7). When the RESET pin is connected to 3.3 V or is pulled high, the serial interface is unable to control the device. In this configuration, the GAIN[2:0] pins can be used to control gain and the SDATA pin can be used to control bandwidth.

PGA5807ARGCT.B	Active	Production	VQFN (RGC) | 64	250 | SMALL T&R	Yes	NIPDAU	Level-3-260C-168 HR	-40 to 85	PGA5807

(1) Status: For more details on status, see our product life cycle.

(2) Material type: When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) RoHS values: Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

(4) Lead finish/Ball material: Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) MSL rating/Peak reflow: The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) Part marking: There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

Images above are just a representation of the package family, actual package may vary.
Refer to the product data sheet for package details.

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for optimal thermal and mechanical performance.

NOTES: (continued)

4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/slua271).
5. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.
