3 说明

TLC227x-Q1 为双通道和四通道 LinCMOS™ 运算放大器。两款器件均在单电源或双电源应用中表现出优异的轨到轨输出性能，能够进一步扩大动态范围。TLC227x-Q1 系列器件可为更高速率的应用提供 2MHz 的带宽和 $3\text{V}/\mu\text{s}$ 的压摆率。这些器件能够提供出色的交流性能，其噪声、输入失调电压和功耗均低于现有 CMOS 运算放大器。TLC227x-Q1 的噪声电压为 $9\text{nV}/\sqrt{\text{Hz}}$ ，是同类解决方案的二分之一。

TLC227x-Q1 具有高输入阻抗和低噪声特性，是用于高阻抗源 (如压电式传感器) 小信号调节的理想选择。此外，该系列器件的单电源或双电源具有轨到轨输出特性，是与模数转换器 (ADC) 连接的理想选择。

对于精密应用，TLC227x-A-Q1 系列器件的最大输入失调电压为 $950\mu\text{V}$ 。该器件系列的额定工作电压为 5V 或 $\pm 5\text{V}$ 。

这些器件可提供更大的输出动态范围，更低的噪声电压和输入失调电压。凭借这一系列增强特性，TLC227x-Q1 能够用于更广泛的应用。对于需要更高输出驱动和更宽输入电压范围的应用，请参阅 [TLV2432-Q1](#) 和 [TLV2442-Q1](#)。TLC227x-Q1 系列器件的所有参数使这些器件能够适用于大多数汽车应用。

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under [§ 6.3](#). Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

7 Detailed Description

7.1 Overview

The TLC227x-Q1 devices are a rail-to-rail output operational amplifiers. These devices operate from a 4.4-V to 16-V single supply and a ± 2.2 -V ± 8 -V dual supply, are unity-gain stable, and are an excellent choice for a wide range of general-purpose applications.

7.2 Functional Block Diagram

Transistors	38	76
Resistors	26	52
Diodes	9	18
Capacitors	3	6

(1) Includes both amplifiers and all ESD, bias, and trim circuitry.

7.3 Feature Description

The TLC227x-Q1 family features 2-MHz bandwidth and voltage noise of $9 \text{ nV}/\sqrt{\text{Hz}}$ with performance rated from 4.4 V to 16 V across an automotive temperature range (–40°C to +125°C). LinMOS is a great choice for a wide range of audio, automotive, industrial, and instrumentation applications.

7.4 Device Functional Modes

The TLC227x-Q1 family of devices is powered on when the supply is connected. The device can operate with single or dual supply, depending on the application. The device is in full performance after the supply is greater than the recommended value.

8.1 Application Information

8.1.1 Macromodel Information

Macromodel information provided was derived using MicroSim Parts, the model generation software used with PSpice®. The Boyle macromodel (see also [节 9.2.1](#)) and subcircuit in [图 8-1](#) were generated using the TLC227x typical electrical and operating characteristics at $T_A = 25^\circ\text{C}$. Using this information, output simulations of the following key parameters can be generated to a tolerance of 20% (in most cases):

- Maximum positive output voltage swing
- Maximum negative output voltage swing
- Slew rate
- Quiescent power dissipation
- Input bias current
- Open-loop voltage amplification
- Unity gain frequency
- Common-mode rejection ratio
- Phase margin
- DC output resistance
- AC output resistance
- Short-circuit output current limit

8.2.1 Design Requirements

For this design example, use these parameters listed in 表 8-1 as the input parameters.

表 8-1. Design Parameters

PARAMETER	VALUE
V _{BAT}	Battery voltage 12 V
R _{SENSE}	Sense resistor 0.1 Ω
I _{LOAD}	Load current 0 A to 10 A
	Operational amplifier Set in differential configuration with gain = 10

8.2.2 Detailed Design Procedure

This circuit is designed for measuring the high-side current in automotive body control modules with a 12-V battery or similar applications. The operational amplifier is set as differential with an external resistor network.

8.2.2.1 Differential Amplifier Equations

方程式 1 和 方程式 2 are used to calculate V_{OUT}.

$$V_{OUT} = \frac{R_g}{R} \left(\frac{\frac{R}{R_g} - \frac{R_1}{R_2}}{1 + \frac{R_1}{R_2}} \times \frac{V_1 + V_2}{2} + \frac{1 + \frac{1}{2} \left(\frac{R_1}{R_2} + \frac{R}{R_g} \right)}{1 + \frac{R_1}{R_2}} (V_1 - V_2) \right) \quad (1)$$

$$V_{OUT} = \frac{R_g}{R} \left(\frac{\frac{R}{R_g} - \frac{R_1}{R_2}}{1 + \frac{R_1}{R_2}} \times V_{BAT} + \frac{1 + \frac{1}{2} \left(\frac{R_1}{R_2} + \frac{R}{R_g} \right)}{1 + \frac{R_1}{R_2}} \times R_S \times I_{LOAD} \right) \quad (2)$$

In an ideal case, 方程式 3 then calculates R₁ = R and R₂ = R_g, and V_{OUT}:

$$V_{OUT} = \frac{R_g}{R} \times R_S \times I_{LOAD} \quad (3)$$

However, the resistors have tolerances; therefore, the resistors cannot be perfectly matched.

$$R_1 = R \pm \Delta R_1$$

$$R_2 = R \pm \Delta R_2$$

$$R = R \pm \Delta R$$

$$R_g = R_g \pm \Delta R_g$$

$$Tol = \frac{\Delta R}{R} \quad (4)$$

方程式 5 shows that by developing the equations and neglecting the second order, the worst case is when the tolerances add up:

$$V_{OUT} = \pm (4 Tol) \frac{R_g}{R + R_g} \times V_{BAT} + \left(1 \pm 2 Tol \left(1 + \frac{2R}{R + R_g} \right) \right) \frac{R_g}{R} \times R_S \times I_{LOAD} \quad (5)$$

where

- Tol = 0.01 for 1%
- Tol = 0.001 for 0.1%

If the resistors are perfectly matched, then Tol = 0 and 方程式 6 calculates V_{OUT} :

$$V_{OUT} = \frac{R_g}{R} \times R_S \times I_{LOAD} \quad (6)$$

The highest error is from the common mode:

$$4 (Tol) \frac{R_g}{R + R_g} \times V_{BAT} \quad (7)$$

Gain of 10, $R_g / R = 10$, and Tol = 1%:

$$\text{Common mode error} = ((4 \times 0.01) / 1.1) \times 12 \text{ V} = 0.436 \text{ V}$$

Gain of 10 and Tol = 0.1%:

$$\text{Common mode error} = 43.6 \text{ mV}$$

The resistors were chosen from 2% batches.

R_1 and R 12 k Ω

R_2 and R_g 120 k Ω

$$\text{Ideal Gain} = 120 / 12 = 10$$

The measured value of the resistors:

$$R_1 = 11.835 \text{ k}\Omega$$

$$R = 11.85 \text{ k}\Omega$$

$$R_2 = 117.92 \text{ k}\Omega$$

$$R_g = 118.07 \text{ k}\Omega$$

8.3 Power Supply Recommendations

Supply voltage is 4.4 V to 16 V for single supply and ± 2.2 V to ± 8 V for dual. In the high-side sensing application, the supply is connected to a 12-V battery.

8.4 Layout

8.4.1 Layout Guidelines

The TLC227x-Q1 is a wideband amplifier. To realize the full operational performance of the device, good high frequency printed-circuit-board (PCB) layout practices are required. Low-loss 0.1- μ F bypass capacitors must be connected between each supply pin and ground as close to the device as possible. The bypass capacitor traces must be designed for minimum inductance.

9.6 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

- ⁽³⁾ MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.
- ⁽⁴⁾ There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.
- ⁽⁵⁾ Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.
- ⁽⁶⁾ Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
