

TLC59581 具有预充电 FET、LOD Caterpillar 消除功能和显示数据存储且支持 32 路多路复用的 48 通道 16 位 ES-PWM LED 驱动器

1 特性

- 48 个恒定灌电流输出通道
- 具有最大亮度控制 (BC)/最大颜色亮度控制 (CC) 数据的灌电流：
 - 5 VCC 时为 25mA
 - 3.3 VCC 时为 20mA
- 全局亮度控制 (BC)：3 位 (8 步长)
- 每个颜色组的颜色亮度控制 (CC)：9 位 (512 步长)，分为三组
- 发光二极管 (LED) 电源电压高达 10V
- $V_{CC} = 3.0V$ 至 $5.5V$
- 恒流精度
 - 通道到通道 = $\pm 1\%$ (典型值)， $\pm 3\%$ (最大值)
 - 器件到器件 = $\pm 1\%$ (典型值)， $\pm 2\%$ (最大值)
- 数据传输速率：25MHz
- 灰度时钟频率：33MHz
- 预充电场效应晶体管 (FET) 可避免重影现象
- 增强电路可消除 Caterpillar 效应
- 低灰度增强
- LED 开路检测 (LOD)
- 热关断 (TSD)
- 运行温度：-40°C 至 85°C

2 应用范围

- 采用多路复用系统的 LED 视频显示屏
- 采用多路复用系统的 LED 信号板
- 高刷新率、高密度的 LED 面板

3 说明

TLC59581 是一款 48 通道恒定灌电流驱动器。每个通道都具有单独可调的 65536 步长脉宽调制 (PWM) 灰度 (GS) 亮度控制。

输出通道分为三组。各组都具有 512 步长颜色亮度控制 (CC) 功能。CC 可调节颜色之间的亮度。全部 48 通道的最大电流值可通过 8 步长全局亮度控制 (BC) 功能设置。BC 调节 LED 驱动器之间的亮度偏差。可通过一个串行接口端口访问 GS、CC 和 BC 数据。

TLC59581 具有一个错误标志：LED 开路检测 (LOD)。该标志可通过串行接口端口读取。为解决开路 LED 引发的此类 caterpillar 问题，TLC59581 器件具有一个增强型电路。该电路可提供 caterpillar 效应消除、热关断 (TSD) 和 I_{REF} 电阻短路保护 (ISP) 功能，以确保较高的系统稳定性。TLC59581 器件还具有节电模式，可在输出全部关闭后将总流耗降为 0.8mA (典型值)。TLC59581 器件是一款提升多路复用面板低灰度显示模式性能的良好解决方案。

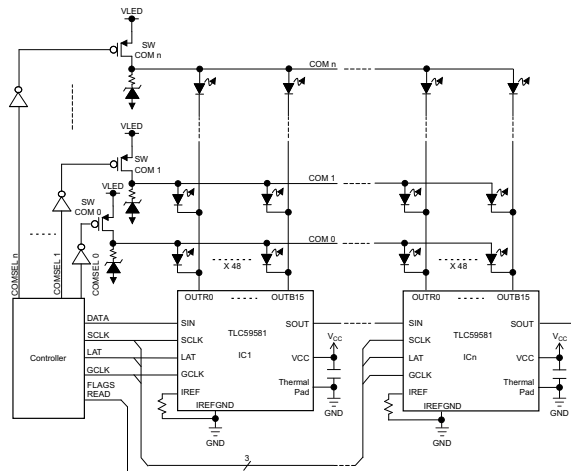

请参见应用笔记《使用 TLC59581 构建高密度、高刷新率多路复用 LED 面板》，SLVA744。

5 Pin Configuration and Functions

Pin Functions

PIN		I/O	DESCRIPTION
NAME	NO.		
GCLK	29	I	Grayscale(GS) pulse width modulation (PWM) reference clock control for OUTXn. Each GCLK rising edge increase the GS counter by 1 for PWM control.
GND	ThermalPad	–	Power ground. The thermal pad must be soldered to GND on PCB.
IREF	1	–	Maximum constant-current value setting. The OUTR0 to OUTB15 maximum constant output current are set to the desired values by connecting an external resistor between IREF and IREFGND. See ⁽¹⁾ for more detail. The external resistor should be placed close to the device.
IREFGND	56	–	Analog ground. Dedicated ground pin for the external IREF resistor. This pin should be connected to analog ground trace which is connected to power ground near the common GND point of board.
LAT	27	I	The LAT falling edge latches the data from the common shift register into the GS data memory or function control (FC) register FC1 or FC2.

- (1) The deviation of each output in same color group (OUTR0~15 or OUTG0~15 or OUTB0~15) from the average of same color group constant current. The deviation is calculated by the formula. (X = R or G or B, n = 0~15)

$$\Delta(\%) = \left[\frac{IOUTXn}{(IOUTX0 + IOUTX1 + \dots + IOUTX14 + IOUTX15)} - 1 \right] \times 100$$

Pin Functions (continued)

PIN		I/O	DESCRIPTION
NAME	NO.		
OUTR0	8	O	Constant current output for RED LED. Multiple outputs can be tied together to increase the constant current capability. Different voltages can be applied to each output. These outputs are turned on-off by GCLK signal and the data in GS data memory.
OUTR1	11		
OUTR2	14		
OUTR3	17		
OUTR4	20		
OUTR5	23		
OUTR6	30		
OUTR7	33		
OUTR8	36		
OUTR9	39		
OUTR10	44		
OUTR11	47		
OUTR12	50		
OUTR13	53		
OUTR14	2		
OUTR15	5		
OUTG0	9	O	Constant current output for GREEN LED. Multiple outputs can be tied together to increase the constant current capability. Different voltages can be applied to each output. These outputs are turned on-off by GCLK signal and the data in GS data memory.
OUTG1	12		
OUTG2	15		
OUTG3	18

OUTB10	46		
OUTB11	49		
OUTB12	52		
OUTB13	55		
OUTB14	4		
OUTB15	7		
SCLK	28	I	Serial data shift clock. Data present on SIN are shifted to the 48-bit common shift register LSB with the SCLK rising edge. Data in the shift register are shifted towards the MSB at each SCLK rising edge. The common shift register MSB appears on SOUT.
SIN	26	I	Serial data input of the 48-bit common shift register. When SIN is high level, the LSB is set to '1' for only one SCLK input rising edge. If two SCLK rising edges are input while SIN is high, then the 48-bit shift register LSB and LSB+1 are set to '1'. When SIN is low, the LSB is set to '0' at the SCLK input rising edge.
SOUT	42	O	Serial data output of the 48-bit common shift register. SOUT is connected to the MSB of the register.
VCC	43	–	Power-supply voltage.

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

PARAMETER			MIN	MAX	UNIT
V _{CC} ⁽²⁾	Supply voltage	VCC	0.3	6.0	V
I _{OUT}	Output current (dc)	OUTx0 to OUTx15, x = R, G, B		30	mA
V _{IN} ⁽²⁾	Input voltage	SIN, SCLK, LAT, GCLK, IREF	−0.3	V _{CC} +0.3	V
V _{OUT} ⁽²⁾	Output voltage	SOUT	−0.3	V _{CC} +0.3	V
		OUTx0 to OUTx15, x = R, G, B	−0.3	11	
T _{J(MAX)}	Operating junction temperature			150	°C
T _{STG}	Storage temperature range		−55	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltage values are with respect to device ground terminal.

6.2 ESD Ratings

			MIN	MAX	UNIT
V _(ESD) ⁽¹⁾	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins ⁽²⁾	0	4000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins ⁽³⁾	0	1000	

- (1) Electrostatic discharge (ESD) measures device sensitivity and immunity to damage caused by assembly line electrostatic discharges into the device.
- (2) Level listed above is the passing level per ANSI, ESDA, and JEDEC JS-001. JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (3) Level listed above is the passing level per EIA-JEDEC JESD22-C101. JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

At T_A = −40°C to 85°C, unless otherwise noted

			MIN	NOM	MAX	UNIT
DC CHARACTERISTICS, VCC = 3 V to 5.5 V						
V _{CC}	Supply voltage		3		5.5	V
V _O	Voltage applied to output	OUTx0 to OUTx15, x = R, G, B			10	V
V _{IH}	High level input voltage	SIN, SCLK, LAT, GCLK	0.7 × VCC		VCC	V
V _{IL}	Low level input voltage	SIN, SCLK, LAT, GCLK	GND		0.3 × VCC	V
I _{OH}	High level output current	SOUT			−2	mA
I _{OL}	Low level output current	SOUT			2	mA
I _{OLC}	Constant output sink current	OUTx0 to OUTx15, x = R, G, B, 3 V ≤ VCC ≤ 3.6 V			20	mA
		OUTx0 to OUTx15, x = R, G, B, 4 V < VCC ≤ 5.5 V			25	
T _A	Operating free air temperature		−40		85	°C
T _J	Operation junction temperature		−40		125	°C

Recommended Operating Conditions (continued)

At $T_A = -40^{\circ}\text{C}$ to 85°C , unless otherwise noted

I_{IN}	Input current (SIN, SCLK)		$V_{IN} = V_{CC}$ or GND	-1		1	μA
I_{CC0}	Supply current (V_{CC})		SIN/SCLK/LAT/GSCLK = GND, GS _n = 0000h, BC = 0h, CCR/G/B = 100h, PCHG_EN = 0, VOUT _n = V_{CC} , R _{REF} = OPEN		9	11	mA
I_{CC1}			SIN/SCLK/LAT/GSCLK = GND, GS _n = 0000h, BC = 4h, CCR/G/B = 140h, VOUT _n Floating, PCHG_EN = 0, R _{REF} = 7.5 k Ω ($I_O = 10\text{ mA}$ target)		11	13	
I_{CC2}			SIN/SCLK/LAT = GND, GCLK = 33 MHz, TSU5 = 200 nS, 8+8 mode, GS _n = FFFFh, BC = 4h, CCR/G/B = 140h, VOUT _n = 1 V when channel on, VOUT _n = V_{CC} when channel off. PCHG_EN = 0		25	31	
I_{CC3}			SIN/SCLK/LAT = GND, GCLK = 33 MHz, TSU5 = 200 nS, 8+8 mode, GS _n = FFFFh, BC = 7h, CCR/G/B = 1FFh, VOUT _n = 1 V when channel on, VOUT _n = V_{CC} when channel off. PCHG_EN = 0		28	33	
I_{CC4}			In power save mode and PCHG_EN = 1		1	1.4	
ΔI_{OLC0}	Constant current error (OUTx0-15, x = R/G/B)	Channel-to-channel ⁽¹⁾	All OUT _n = on, BC = 0h, CCR/G/B = 81h, VOUT _n = VOUT _{fix} = 1 V, R _{REF} = 6.2 k Ω (1 mA target), $T_A = 25^\circ\text{C}$, at same color grouped output of OUTR0-15, OUTG0-15 and OUTB0-15		$\pm 1\%$	$\pm 3\%$	
ΔI_{OLC1}	Constant current error (OUTx0-15, x = R/G/B)	Device-to-device ⁽²⁾	All OUT _n = on, BC = 0h, CCR/G/B = 81h, VOUT _n = VOUT _{fix} = 1 V, R _{REF} = 6.2 k Ω (1 mA target), $T_A = 25^\circ\text{C}$, at same color grouped output of OUTR0-15, OUTG0-15 and OUTB0-15		$\pm 1\%$	$\pm 2\%$	
ΔI_{OLC2}	Line regulation ⁽³⁾		$V_{CC} = 3.0$ to 5.5 V , All OUT _n = on, BC = 0h, CCR/G/B = 81h, VOUT _n = VOUT _{fix} = 1 V, R _{REF} = 6.2 k Ω (1 mA target)		± 1	± 1.5	%/V

- (1) The deviation of each output in same color group (OUTR0~15 or OUTG0~15 or OUTB0~15) from the average of same color group constant current. The deviation is calculated by the formula. (X = R or G or B, n = 0~15)

$$\Delta(\%) = \left[\frac{I_{OUTXn}}{\frac{(I_{OUTX0} + I_{OUTX1} + \dots + I_{OUTX14} + I_{OUTX15})}{16}} - 1 \right] \times 100$$

- (2) The deviation of the average of constant-current in each color group from the ideal constant-current value. (X = R or G or B) :

$$\Delta(\%) = \left[\frac{\frac{(I_{OUTX0} + I_{OUTX1} + \dots + I_{OUTX15})}{16} - (\text{Ideal Output Current})}{\text{Ideal Output Current}} \right] \times 100$$

Ideal current is calculated by the following equation:

$$\text{Ideal Output (mA)} = \text{Gain} \times \left[\frac{V_{REF}}{R_{REF}(\Omega)} \right] \times \text{CCR (or CCG, CCB)}/511d, V_{REF} = 1.209\text{V (Typ)}.$$

Refer to Table 1 for the Gain at chosen BC.

- (3) Line regulation is calculated by the following equation. (X = R or G or B, n = 0~15):

$$\Delta(\%V) = \left[\frac{(I_{OUTXn} \text{ at } V_{CC} = 5.5\text{V}) - (I_{OUTXn} \text{ at } V_{CC} = 3.0\text{V})}{(I_{OUTXn} \text{ at } V_{CC} = 3.0\text{V})} \right] \times \frac{100}{5.5\text{V} - 3\text{V}}$$

Electrical Characteristics (continued)

At $V_{CC} = 3.0\text{ V}$ to 5.5 V and $T_A = -40^\circ\text{C}$ to 85°C , $V_{LED} = 5.0\text{ V}$; Typical values are at $V_{CC} = 3.3\text{ V}$, $T_A = 25^\circ\text{C}$ (unless otherwise noted).

8 Detailed Description

8.1 Overview

The TLC59581 device is a 48-channel constant-current sink driver for multiplexing system with 1 to 32 duty ratio. Each channel has an individually-adjustable, 65536-step, pulse width modulation (PWM) grayscale (GS).

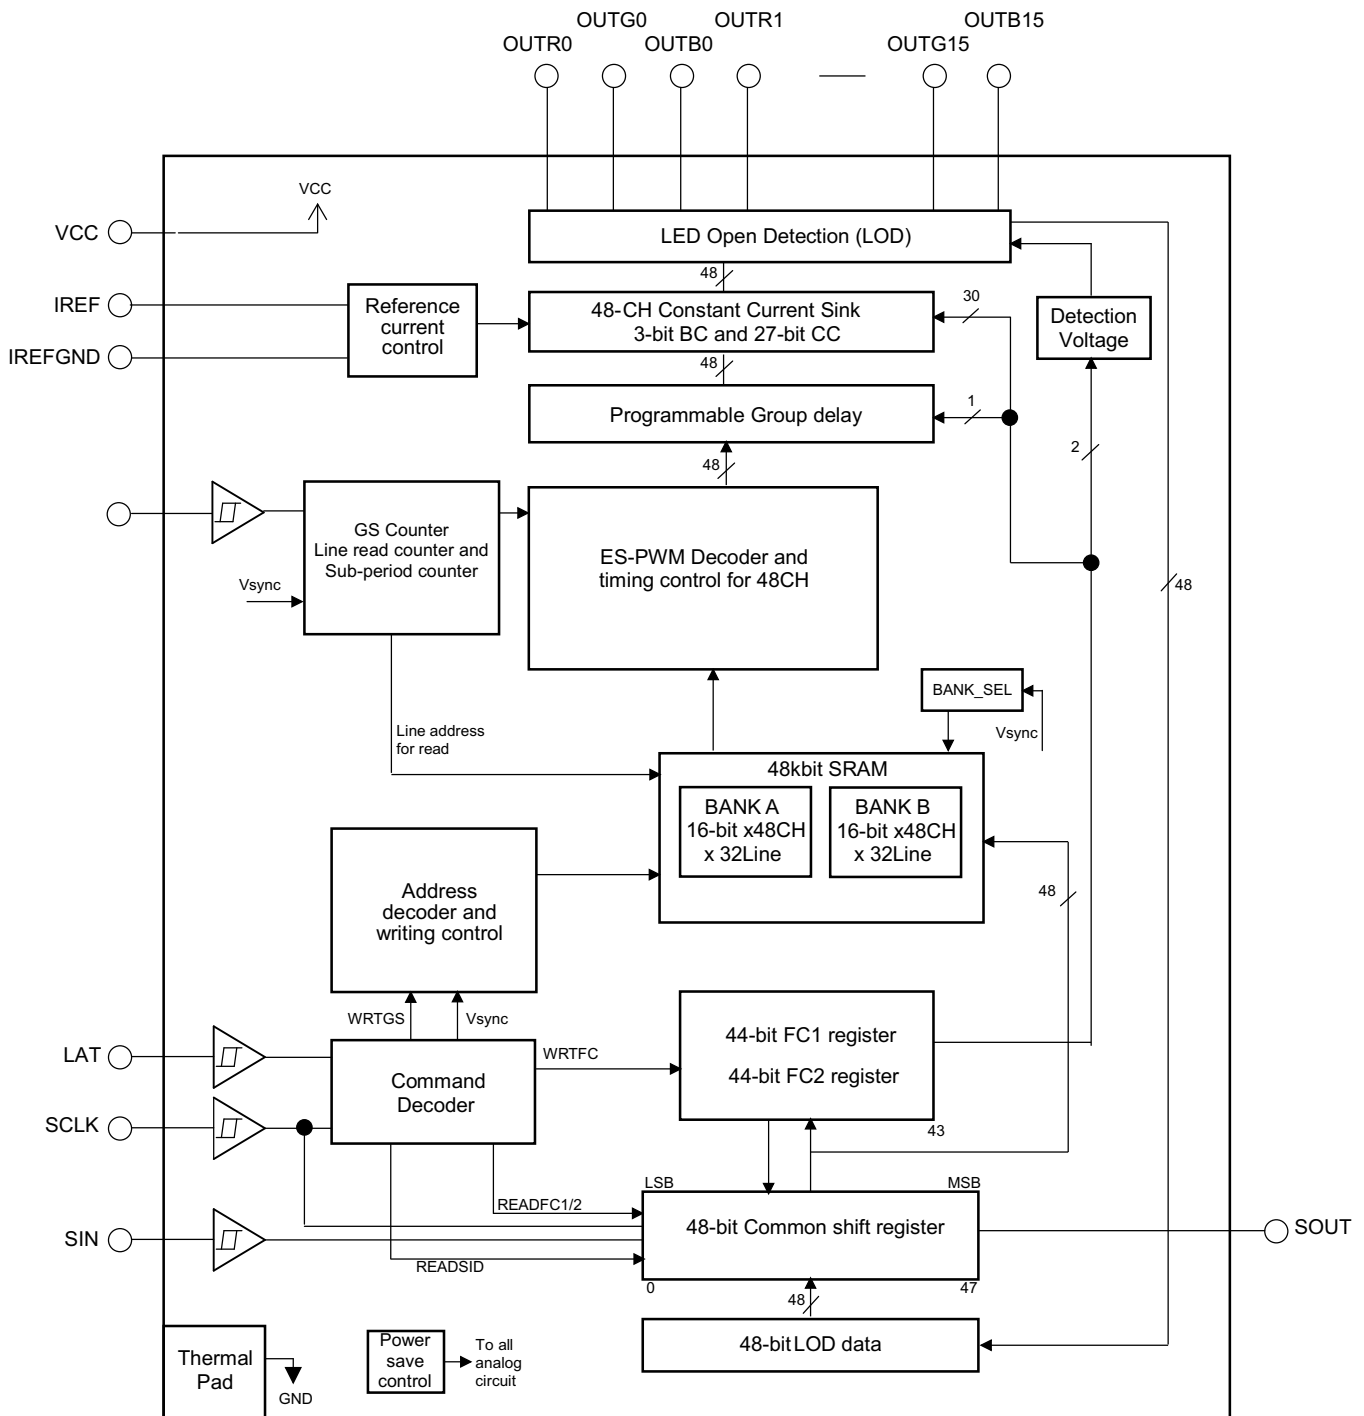

48-kbit display memory is implemented to increase the visual refresh rate and to decrease the GS data writing frequency.

The TLC59581 device's support output current ranges from 1 mA to 25 mA; channel-to-channel accuracy is 3% max, and device-to-device accuracy is 2% max in all current range. The device also implements Low Gray Scale Enhancement (LGSE) technology to improve the display quality at low grayscale condition. These features make the TLC59581 device more suitable for high-density multiplexing application.

The output channels are divided into three groups. Each group has a 512-step color brightness control (CC). CC adjusts brightness control between colors. The maximum current value of all 48 channels can be set by 8-step global brightness control (BC). BC adjusts brightness deviation between LED drivers. GS, CC and BC data are accessible through a serial interface port.

The TLC59581 device has one error flag: the LED open detection (LOD), which can be read through a serial interface port. The TLC59581 device has an enhanced circuit to resolve this caterpillar issue caused by an open LED. Thermal shut down (TSD) and I_{REF} resistor short protection (ISP) ensure a higher system reliability. The TLC59581 device also has a power-save mode that sets the total current consumption to 0.8 mA (typical) when all outputs are off.

8.2 Functional Block Diagram

8.3 Device Functional Modes

After power on, all OUTXn of the TLC59581 device are turned off. All the internal counters and function control registers (FC1/FC2) are initialized. The following list is a brief summary of the sequence to operate the TLC59581 driver that gives users a general idea of how the device works. The function block related to each step is detailed in subsequent sections.

1. According to required LED current, choose BC & CC code, select the current-programming resistor R_{REF} .
2. Send WRTFC command to set FC1/2 register value if the default value need be changed.
3. Write GS data of all lines (max 32 lines) into one of the two memory BANKs.
4. Send Vsync command, the BANK with the GS data written just now will be displayed.
5. Input GCLK continuously, 257GCLK (or 129GCLK) as a segment. Between the interval of two segments, supply voltage should be switched from one line to next line accordingly.
6. During the same period of step 5, GS data for next frame should be written into another BANK.
7. When the time of one frame ends, Vsync command should be input to swap the purpose of the two BANKs.

Repeat step 5 through 7.

8.3.1 Brightness Control (BC) Function

The TLC59581 device is able to adjust the output current of all constant-current outputs simultaneously. This function is called global brightness control (BC). The global BC for all outputs is programmed with a 3-bit word, thus all output currents can be adjusted in 8 steps from 12.9% to 100% for a given current-programming resistor, R_{REF} (See [Table 2](#)).

BC data can be set through the serial interface. When the BC data changes, the output current also changes immediately. When the device is powered on, the BC data in the function control (FC) register FC1 is set to 4h as the initial value.

8.3.2 Color Brightness Control (CC) Function

The TLC59581 device is able to adjust the output current of each of the three color groups OUTR0-OUTR15, OUTG0-OUTG15, and OUTB0-OUTB15 separately. This function is called color brightness control (CC). For each color, it has 9-bit data latch CCR, CCG, or CCB in FC1 register. Thus, all color group output currents can be adjusted in 512 steps from 0% to 100% of the maximum output current, I_{OLCMax} . (See the next section for more detail about I_{OLCMax}). The CC data are entered through the serial interface. When the CC data change, the output current also changes immediately.

When the IC is powered on, the CC data are set to '100h'. [Equation 1](#) calculates the actual output current.

$$I_{out}(mA) = I_{OLCMax}(mA) \times (CCR/511d \text{ or } CCG/511d \text{ or } CCB/511d)$$

where

- I_{OLCMax} = the maximum channel current for each channel, determined by BC data and R_{REF} (see [Equation 2](#))
- CCR/G/B = the color brightness control value for each color group in the FC1 register (000h to 1FFh) (1)

[Table 1](#) shows the CC data versus the constant-current against I_{OLCMax} :

Device Functional Modes (continued)

Table 1. CC Data vs Current Ratio and Set Current Value

CC DATA (CCR or CCG or CCB)			RATIO OF OUTPUT CURRENT TO I_{OLCMax} (%, typical)	OUTPUT CURRENT (mA, $R_{IREF} = 7.41\text{ k}\Omega$)	
BINARY	DECIMAL	HEX		BC = 7 h ($I_{OLCMax} = 25\text{ mA}$)	BC = 0 h ($I_{OLCMax} = 3.2\text{ mA}$)
0 0000 0000	0	00	0	0	0
0 0000 0001	1	01	0.2	0.05	0.006
0 0000 0010	2	02	0.4	0.10	0.013
---	---	---	---	---	---
1 0000 0000 (Default)	256 (Default)	100 (Default)	50.1	12.52	1.621
---	---	---	---	---	---
1 1111 1101	509	1FD	99.6	24.90	3.222
1 1111 1110	510	1FE	99.8	24.95	3.229
1 1111 1111	511	1FF	100.0	25	3.235

8.3.3 Select R_{IREF} For a Given BC

The maximum output current per channel, I_{OLCMax} , is determined by resistor R_{IREF} , placed between the IREF and IREFGND pins, and the BC code in FC1 register. The voltage on IREF is typically 1.209 V. R_{IREF} can be calculated by [Equation 2](#).

$$R_{IREF}(\text{k}\Omega) = V_{IREF}(\text{V}) / I_{OLCMax}(\text{mA}) \times \text{Gain}$$

where

- V_{IREF} = the internal reference voltage on IREF (1.209 V, typical)
- I_{OLCMax} = the largest current for each output at CCR/G/B = 1FFh.
- Gain = the current gain at a selected BC code (See [Table 2](#))

(2)

Table 2. Current Gain Versus BC Code

BC DATA		GAIN	RATIO OF GAIN / GAIN_MAX (AT MAX BC)
BINARY	HEX		
000 (recommend)	0 (recommend)	20.4	12.9%
001	1	40.3	25.6%
010	2	59.7	52.4%
011	3	82.4	12.9%
100 (default)	4 (default)	101.8	64.7%
101	5	115.4	73.3%
110	6	144.3	91.7%
111	7	157.4	100%

NOTE: Recommend using a smaller BC code for better performance. For noise immunity purposes, suggest $R_{IREF} < 60\text{ k}\Omega$

8.3.4 Choosing BC/CC For a Different Application

BC is mainly used for global brightness adjustment between day and night. Suggested BC is 4h, which is in the middle of the range, allowing flexible changes in brightness up and down.

CC can be used to fine tune the brightness in 512 steps, this is suitable for white balance adjustment between RGB color group. To get a pure white color, the general requirement for the luminous intensity ratio of R, G, B LED is 3:6:1. Depending on the characteristics of the LED (Electro-Optical conversion efficiency), the current ratio of R, G, B LED will be much different from this ratio. Usually, the Red LED needs the largest current. Choose 511d (the max value) CC code for the color group that needs the largest initial current, then choose proper CC code for the other two color groups according to the current ratio requirement of the LED used.

8.3.4.1 Example 1: Red LED Current is 20 mA, Green LED Needs 12 mA, Blue LED needs 8 mA

1. Red LED needs the largest current; choose 511d for CCR
2. $511 \times 12 \text{ mA} / 20 \text{ mA} = 306.6$; choose 307d for CCG. With same method, choose 204d for CCB.
3. According to the required red LED current, choose 7h for BC.
4. According to Equation 2, $R_{\text{REF}} = 1.209 \text{ V} / 20 \text{ mA} \times 157.4 = 9.5 \text{ k}\Omega$

In this example, choose 7h for BC instead of using the default 4h. This is because the Red LED current is 20 mA, approaching the upper limit of current range. To prevent the constant output current from exceeding the upper limit in case a larger BC code is input accidentally, choose the maximum BC code here.

8.3.4.2 Example 2: Red LED Current is 5 mA, Green LED Needs 2 mA, Blue LED Needs 1 mA.

1. Red LED needs the largest current; choose 511d for CCR.
2. $511 \times 2 \text{ mA} / 5 \text{ mA} = 204.4$; choose 204d for CCG. With same method, choose 102d for CCB.
3. According to the required blue LED current, choose 0h for BC.
4. According to Equation 2, $R_{\text{REF}} = 1.209 \text{ V} / 5 \text{ mA} \times 20.4 = 4.93 \text{ k}\Omega$

In this example, choose 0h for BC, instead of using the default 4h. This is because the Blue LED current is 1 mA, is approaching the lower limit of current range. To prevent the constant output current from exceeding the lower limit in case a lower BC code is input accidentally, choose the minimum BC code here. In general, if LED current is in the middle of the range (i.e., 10 mA), use the default 4h as BC code.

8.3.5 LED Open Detection (LOD)

The LOD function detects faults caused by an open circuit in any LED string; or, a short from OUTXn to ground with low impedance. It does this by comparing the OUTXn voltage to the LOD detection threshold voltage level set by LODVLT in the FC1 register. If the OUTXn voltage is lower than the programmed voltage, the corresponding output LOD bit is set to '1' to indicate an open LED. Otherwise, the output of that LOD bit is '0'. LOD data output by the detection circuit are valid only during the 'on' period of that OUTXn output channel. The LOD data are always '0' for outputs that are turned off.

8.3.6 Internal Circuit for Caterpillar Removal

Caterpillar effect is a common issue for the LED panel. It is usually caused by LED lamp open, LED lamp leakage or LED lamp short. The TLC59581 device implements an internal circuit that can eliminate the caterpillar issue caused by LED open. The caterpillar removal function is enabled by setting LOD_MMC_EN (bit4 of FC1 register) to '1'. When powered on, the default value of this bit is '0'. When this function is enabled, the IC automatically detects the open LED lamp, and the lamp does not turn on until IC reset.

8.3.7 Power Save Mode (PSM)

The power-save mode (PSM) is enabled by setting PSAVE_ENA (bit5 of FC2 register) to '1'. At power on, this bit default is '0'.

When this function is enabled, if the GS data received for the next frame is all '0', the IC enters power-save mode immediately.

When the IC is in power-save mode, it resumes normal mode when it detects non-zero GS data input. In power-save mode all analog circuits such as constant current output and the LOD circuit are not operational; the device total current consumption, I_{CC} , is below 1 mA.

8.3.8 Internal Pre-Charge FET

The internal pre-charge FET can prevent ghosting of multiplexed LED modules. One cause of this phenomenon is the charging current for parasitic capacitance of the OUTXn through the LED when the supply voltage switches from one common line to the next common line.

To prevent this unwanted charging current, the TLC59581 device uses an internal FET to pull OUTXn up to VCC –1.4 V during the common line switching period. As a result, no charging current flows through LED and ghosting is eliminated.

8.3.9 Thermal Shutdown (TSD)

The thermal shutdown (TSD) function turns off all IC constant-current outputs when the junction temperature (T_J) exceeds 170°C (typical). It resumes normal operation when T_J falls below 160°C (typical).

8.3.10 IREF Resistor Short Protection (ISP)

The IREF resistor short protection (ISP) function prevents unwanted large currents from flowing through the constant-current output when the IREF resistor is shorted accidentally. The TLC59581 device turns off all output channels when the IREF pin voltage is lower than 0.19 V (typical). When the IREF pin voltage goes higher than 0.325 V (typical), the TLC59581 device resumes normal operation.

9 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

See application note: *Build High Density, High Refresh Rate, Multiplexing LED Panel with TLC59581*, [SLVA744](#) available on ti.com

10 Power Supply Recommendations

Decouple the V_{CC} power supply voltage by placing a 0.1- μ F ceramic capacitor close to VCC pin and GND plane. Depending on panel size, several electrolytic capacitors must be placed on the board equally distributed to get a well regulated LED supply voltage (VLED). VLED voltage ripple must be less than 5% of its nominal value. Furthermore, set the VLED voltage as calculated by equation:

$$V_{LED} > V_f + 0.4 \text{ V (10 mA constant current example)}$$

where

- V_f = maximum forward voltage of LED (3)

11 Layout

11.1 Layout Guidelines

1. Place the decoupling capacitor near the VCC pin and GND plane.
2. Place the current programming resistor R_{IREF} close to IREF pin and IREFGND pin.
3. Route the GND pattern as widely as possible for large GND currents. Maximum GND current is approximately 1.2 A.
4. Routing between the LED cathode side and the device OUTXn pin should be as short and straight as possible to reduce wire inductance.
5. The PowerPAD™ must be connected to GND plane because the pad is used as power ground pin internally, there will be large current flow through this pad when all channels turn on. Furthermore, this pad should be connected to a heat sink layer by thermal via to reduce device temperature. One suggested thermal via pattern is shown as below. For more information about suggested thermal via pattern and via size, see *PowerPAD Thermally Enhanced Package*, [SLMA002G](#).
6. MOSFETS must be placed in the in the middle of the board, which should be laid out as symmetrically as possible.

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
