

## TMUX6219 具有 1.8V 逻辑电平的 36V、低 Ron、2:1 (SPDT) 开关

## 1 特性

- 双电源电压范围：±4.5V 至 ±18V
- 单电源电压范围：4.5V 至 36V
- 低导通电阻：2.1  $\Omega$
- 低电荷注入：-10pC
- 大电流支持：330mA (最大值) (VSSOP)
- 大电流支持：440mA (最大值) (WSON)
- -40°C 至 +125°C 工作温度
- 兼容 1.8V 逻辑电平
- 失效防护逻辑
- 轨到轨运行
- 双向信号路径
- 先断后合开关

## 2 应用

- 工厂自动化和工业控制
- 可编程逻辑控制器 (PLC)
- 模拟输入模块
- 半导体测试
- 交流充电 (桩) 站
- 超声波扫描仪
- 患者监护和诊断
- 光纤网络
- 光学测试设备
- 远程无线电单元
- 有线网络
- 数据采集系统
- 燃气表
- 流量变送器

## 3 说明

TMUX6219 是一款的互补金属氧化物半导体 (CMOS) 开关，采用单通道 2:1 (SPDT) 配置。此器件在单电源 (4.5V 至 36V)、双电源 (±4.5V 至 ±18V) 或非对称电源 (例如  $V_{DD} = 5V$ ,  $V_{SS} = -8V$ ) 供电时均能正常运行。TMUX6219 可在源极 (Sx) 和漏极 (D) 引脚上支持  $V_{SS}$  到  $V_{DD}$  范围的双向模拟和数字信号。

可以通过控制 EN 引脚来启用或禁用 TMUX6219。当禁用时，两个信号路径开关都被关闭。当启用时，SEL 引脚可用于打开信号路径 1 (S1 至 D) 或信号路径 2 (S2 至 D)。所有逻辑控制输入均支持 1.8V 到  $V_{DD}$  的逻辑电平，因此，当器件在有效电源电压范围内运行时，可确保 TTL 和 CMOS 逻辑兼容性。失效防护逻辑电路允许先在控制引脚上施加电压，然后在电源引脚上施加电压，从而保护器件免受潜在的损害。

TMUX6219 属于精密开关和多路复用器器件系列。这些器件具有非常低的导通和关断漏电流以及低电荷注入，因此可用于高精度测量应用。

## 封装信息

器件型号	封装 <sup>(1)</sup>	封装尺寸 <sup>(2)</sup>
TMUX6219	DGK (VSSOP, 8)	3mm × 4.9mm
	RQX (WSON, 8)	2mm × 3mm

(1) 有关更多信息，请参阅节 13

(2) 封装尺寸 (长 × 宽) 为标称值，并包括引脚 (如适用)。

## 4 Pin Configuration and Functions

图 4-1. DGK Package,  
8-Pin VSSOP  
(Top View)

图 4-2. RQX Package,  
8-Pin WSON  
(Top View)

表 4-1. Pin Functions

PIN			TYPE <sup>(1)</sup>	DESCRIPTION <sup>(2)</sup>
NAME	DGK	RQX		
D	1	1	I/O	Drain pin. Can be an input or output.
S1	2	2	I/O	Source pin 1. Can be an input or output.
GND	3	3	P	Ground (0V) reference
V <sub>DD</sub>	4	4	P	Positive power supply. This pin is the most positive power-supply potential. For reliable operation, connect a decoupling capacitor ranging from 0.1μF to 10μF between V <sub>DD</sub> and GND.
EN	5	5	I	Active high logic enable, has internal pull-up resistor. When this pin is low, all switches are turned off. When this pin is high, the SEL logic input determine which switch is turned on.
SEL	6	6	I	Logic control input, has internal pull-down resistor. Controls the switch connection as shown in 节 7.5.
V <sub>SS</sub>	7	7	P	Negative power supply. This pin is the most negative power-supply potential. In single-supply applications, this pin can be connected to ground. For reliable operation, connect a decoupling capacitor ranging from 0.1μF to 10μF between V <sub>SS</sub> and GND.
S2	8	8	I/O	Source pin 2. Can be an input or output.
Thermal Pad			—	The thermal pad is not connected internally. It is recommended that the pad be tied to GND or VSS for best performance.

(1) I = input, O = output, I/O = input and output, P = power.

(2) Refer to 节 7.4 for what to do with unused pins.

## 5 Specifications

### 5.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1) (2)</sup>

		MIN	MAX	UNIT
$V_{DD} - V_{SS}$	Supply voltage		38	V
$V_{DD}$		- 0.5	38	V
$V_{SS}$		- 38	0.5	V
$V_{SEL}$ or $V_{EN}$	Logic control input pin voltage (SEL, EN) <sup>(3)</sup>	- 0.5	38	V
$I_{SEL}$ or $I_{EN}$	Logic control input pin current (SEL, EN) <sup>(3)</sup>	- 30	30	mA
$V_S$ or $V_D$	Source or drain voltage (Sx, D) <sup>(3)</sup>	$V_{SS} - 0.5$	$V_{DD} + 0.5$	V
$I_{IK}$	Diode clamp current <sup>(3)</sup>	- 30	30	mA
$I_S$ or $I_D$ (CONT)	Source or drain continuous current (Sx, D)		$I_{DC} + 10\%$ <sup>(4)</sup>	mA
$T_A$	Ambient temperature	- 55	150	°C
$T_{stg}$	Storage temperature	- 65	150	°C
$T_J$	Junction temperature		150	°C
$P_{tot}$	Total power dissipation (DGK Package) <sup>(5)</sup>		460	mW
	Total power dissipation (RQX Package) <sup>(6)</sup>		1110	mW

(1) Stresses beyond those listed under *Absolute Maximum Rating* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Condition*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

(2) All voltages are with respect to ground, unless otherwise specified.

(3) Pins are diode-clamped to the power-supply rails. Over voltage signals must be voltage and current limited to maximum ratings.

(4) Refer to *Source or Drain Continuous Current* table for  $I_{DC}$  specifications.

(5) For DGK package:  $P_{tot}$  derates linearly above  $T_A = 70^\circ\text{C}$  by  $6.7\text{mW}/^\circ\text{C}$ .

(6) For RQX package:  $P_{tot}$  derates linearly above  $T_A = 70^\circ\text{C}$  by  $16\text{mW}/^\circ\text{C}$ .

### 5.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/ JEDEC JS-001, all pins <sup>(1)</sup>	±2000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins <sup>(2)</sup>	±500	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 5.3 Thermal Information

THERMAL METRIC <sup>(1)</sup>		TMUX6219	TMUX6219	UNIT
		DGK (VSSOP)	RQX (WSO)	
		8 PINS	8 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	152.1	62.9	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	48.4	54.0	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	73.2	31.0	°C/W
$\Psi_{JT}$	Junction-to-top characterization parameter	4.1	0.8	°C/W
$\Psi_{JB}$	Junction-to-board characterization parameter	71.8	30.9	°C/W

THERMAL METRIC <sup>(1)</sup>		TMUX6219	TMUX6219	UNIT
		DGK (VSSOP)	RQX (WSON)	
		8 PINS	8 PINS	
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	N/A	23.4	°C/W

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

## 5.4 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
$V_{DD} - V_{SS}$ <sup>(1)</sup>	Power supply voltage differential	4.5		36	V
$V_{DD}$	Positive power supply voltage	4.5		36	V
$V_S$ or $V_D$	Signal path input/output voltage (source or drain pin) (Sx, D)	$V_{SS}$		$V_{DD}$	V
$V_{SEL}$ or $V_{EN}$	Address or enable pin voltage	0		36	V
$I_S$ or $I_D (CONT)$	Source or drain continuous current (Sx, D)			$I_{DC}$ <sup>(2)</sup>	mA
$T_A$	Ambient temperature	- 40		125	°C

- (1)  $V_{DD}$  and  $V_{SS}$  can be any value as long as  $4.5\text{ V} \leq (V_{DD} - V_{SS}) \leq 36\text{ V}$ , and the minimum  $V_{DD}$  is met.  
(2) Refer to *Source or Drain Continuous Current* table for  $I_{DC}$  specifications.

## 5.5 Source or Drain Continuous Current

at supply voltage of  $V_{DD} \pm 10\%$ ,  $V_{SS} \pm 10\%$  (unless otherwise noted)

CONTINUOUS CURRENT PER CHANNEL ( $I_{DC}$ )		$T_A = 25^\circ\text{C}$	$T_A = 85^\circ\text{C}$	$T_A = 125^\circ\text{C}$	UNIT
PACKAGE	TEST CONDITIONS				
RQX (WSON)	±15 V Dual Supply	440	270	130	mA
	+36 V Single Supply <sup>(1)</sup>	440	270	130	mA
	+12 V Single Supply	330	200	105	mA
	±5 V Dual Supply	330	200	105	mA
	+5 V Single Supply	230	140	90	mA
DGK (VSSOP)	±15 V Dual Supply	330	210	120	mA
	+36 V Single Supply <sup>(1)</sup>	300	190	110	mA
	+12 V Single Supply	240	160	100	mA
	±5 V Dual Supply	240	160	100	mA
	+5 V Single Supply	180	120	80	mA

- (1) Specified for nominal supply voltage only.

## 5.6 ±15 V Dual Supply: Electrical Characteristics

$V_{DD} = +15\text{ V} \pm 10\%$ ,  $V_{SS} = -15\text{ V} \pm 10\%$ ,  $GND = 0\text{ V}$  (unless otherwise noted)

Typical at  $V_{DD} = +15\text{ V}$ ,  $V_{SS} = -15\text{ V}$ ,  $T_A = 25^\circ\text{C}$  (unless otherwise noted)

PARAMETER		TEST CONDITIONS	T <sub>A</sub>	MIN	TYP	MAX	UNIT
ANALOG SWITCH

## 6 Parameter Measurement Information

### 6.1 On-Resistance

The on-resistance of a device is the ohmic resistance between the source (Sx) and drain (D) pins of the device. The on-resistance varies with input voltage and supply voltage. The symbol  $R_{ON}$  is used to denote on-resistance. 图 6-1 shows the measurement setup used to measure  $R_{ON}$ . Voltage (V) and current ( $I_{SD}$ ) are measured using the following setup, where  $R_{ON}$  is computed as  $R_{ON} = V / I_{SD}$ :

图 6-1. On-Resistance

### 6.2 Off-Leakage Current

There are two types of leakage currents associated with a switch during the off state:

1. Source off-leakage current.
2. Drain off-leakage current.

Source leakage current is defined as the leakage current flowing into or out of the source pin when the switch is off. This current is denoted by the symbol  $I_{S(OFF)}$ .

Drain leakage current is defined as the leakage current flowing into or out of the drain pin when the switch is off. This current is denoted by the symbol  $I_{D(OFF)}$ .

图 6-2 shows the setup used to measure both off-leakage currents.

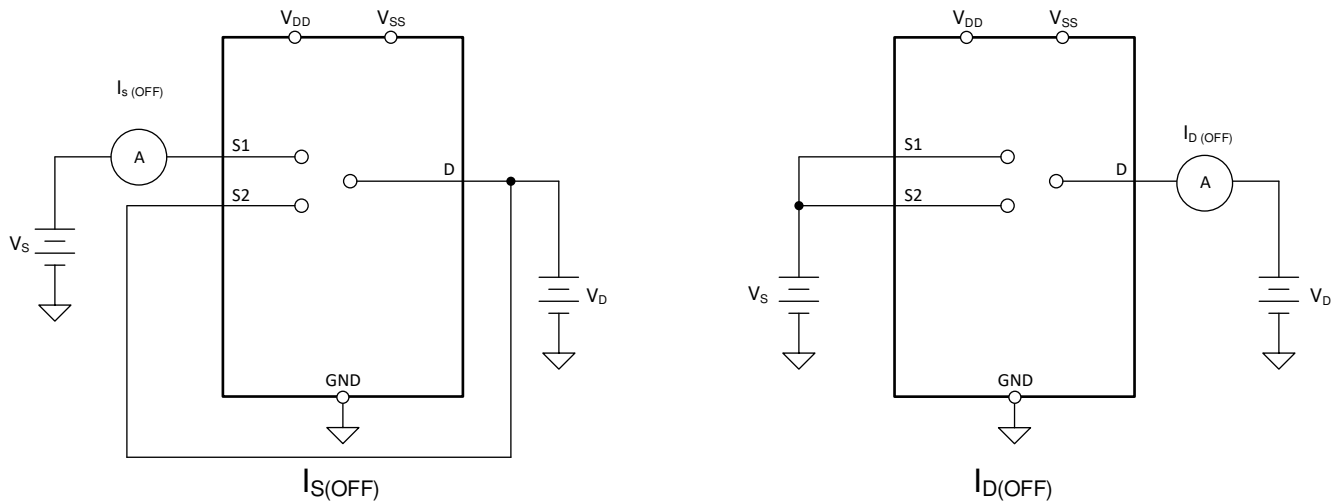

图 6-2. Off-Leakage Measurement Setup

### 6.3 On-Leakage Current

Source on-leakage current is defined as the leakage current flowing into or out of the source pin when the switch is on. This current is denoted by the symbol  $I_{S(ON)}$ .

Drain on-leakage current is defined as the leakage current flowing into or out of the drain pin when the switch is on. This current is denoted by the symbol  $I_{D(ON)}$ .

Either the source pin or drain pin is left floating during the measurement. 图 6-3 shows the circuit used for measuring the on-leakage current, denoted by  $I_{S(ON)}$  or  $I_{D(ON)}$ .

图 6-3. On-Leakage Measurement Setup

### 6.4 Transition Time

Transition time is defined as the time taken by the output of the device to rise or fall 90% after the address signal has risen or fallen past the logic threshold. The 90% transition measurement is utilized to provide the timing of the device. System level timing can then account for the time constant added from the load resistance and load capacitance. 图 6-4 shows the setup used to measure transition time, denoted by the symbol  $t_{\text{TRANSITION}}$ .

图 6-4. Transition-Time Measurement Setup

## 6.5 $t_{ON(EN)}$ and $t_{OFF(EN)}$

Turn-on time is defined as the time taken by the output of the device to rise to 90% after the enable has risen past the logic threshold. The 90% measurement is utilized to provide the timing of the device. System level timing can then account for the time constant added from the load resistance and load capacitance. 图 6-5 shows the setup used to measure turn-on time, denoted by the symbol  $t_{ON(EN)}$ .

Turn-off time is defined as the time taken by the output of the device to fall to 10% after the enable has fallen past the logic threshold. The 10% measurement is utilized to provide the timing of the device. System level timing can then account for the time constant added from the load resistance and load capacitance. 图 6-5 shows the setup used to measure turn-off time, denoted by the symbol  $t_{OFF(EN)}$ .

图 6-5. Turn-On and Turn-Off Time Measurement Setup

## 6.6 Break-Before-Make

Break-before-make delay is a safety feature that prevents two inputs from connecting when the device is switching. The output first breaks from the on-state switch before making the connection with the next on-state switch. The time delay between the *break* and the *make* is known as break-before-make delay. 图 6-6 shows the setup used to measure break-before-make delay, denoted by the symbol  $t_{OPEN(BBM)}$ .

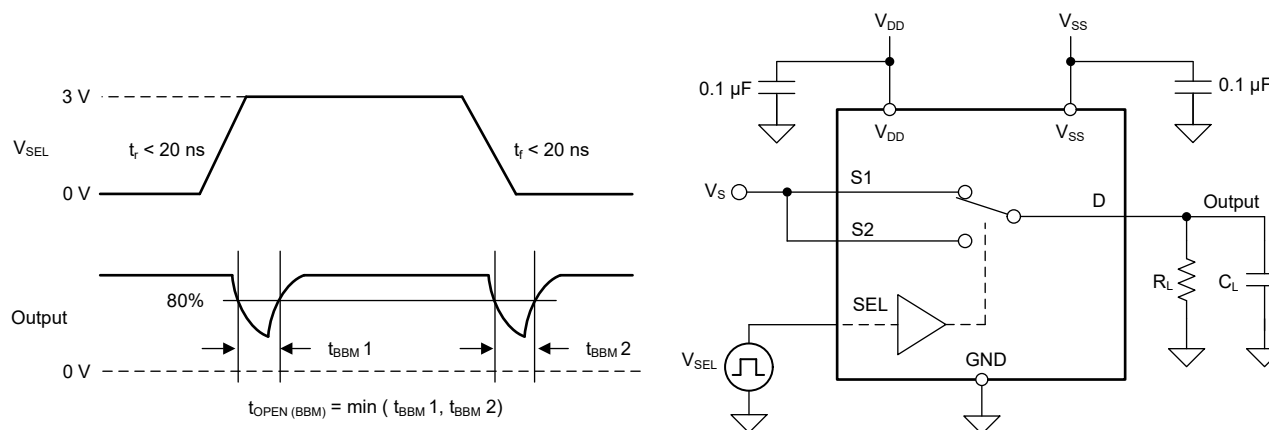

图 6-6. Break-Before-Make Delay Measurement Setup

## 6.7 $t_{ON}(V_{DD})$ Time

The  $t_{ON}(V_{DD})$  time is defined as the time taken by the output of the device to rise to 90% after the supply has risen past the supply threshold. The 90% measurement is used to provide the timing of the device turning on in the system. 图 6-7 shows the setup used to measure turn on time, denoted by the symbol  $t_{ON}(V_{DD})$ .

图 6-7.  $t_{ON}(V_{DD})$  Time Measurement Setup

## 6.8 Propagation Delay

Propagation delay is defined as the time taken by the output of the device to rise or fall 50% after the input signal has risen or fallen past the 50% threshold. 图 6-8 shows the setup used to measure propagation delay, denoted by the symbol  $t_{PD}$ .

图 6-8. Propagation Delay Measurement Setup

## 6.9 Charge Injection

The TMUX6219 has a transmission-gate topology. Any mismatch in capacitance between the NMOS and PMOS transistors results in a charge injected into the drain or source during the falling or rising edge of the gate signal. The amount of charge injected into the source or drain of the device is known as charge injection, and is denoted by the symbol  $Q_C$ . 图 6-9 shows the setup used to measure charge injection from source (Sx) to drain (D).

图 6-9. Charge-Injection Measurement Setup

## 6.10 Off Isolation

Off isolation is defined as the ratio of the signal at the drain pin (D) of the device when a signal is applied to the source pin (Sx) of an off-channel. 图 6-10 shows the setup used to measure, and the equation used to calculate off isolation.

图 6-10. Off Isolation Measurement Setup

## 6.11 Crosstalk

Crosstalk is defined as the ratio of the signal at the drain pin (D) of a different channel, when a signal is applied at the source pin (Sx) of an on-channel. 图 6-11 shows the setup used to measure, and the equation used to calculate crosstalk.

图 6-11. Crosstalk Measurement Setup

## 6.12 Bandwidth

Bandwidth is defined as the range of frequencies that are attenuated by less than 3 dB when the input is applied to the source pin (Sx) of an on-channel, and the output is measured at the drain pin (D) of the device. 图 6-12 shows the setup used to measure bandwidth.

图 6-12. Bandwidth Measurement Setup

## 6.13 THD + Noise

The total harmonic distortion (THD) of a signal is a measurement of the harmonic distortion, and is defined as the ratio of the sum of the powers of all harmonic components to the power of the fundamental frequency at the mux output.

The on-resistance of the device varies with the amplitude of the input signal and results in distortion when the drain pin is connected to a low-impedance load. Total harmonic distortion plus noise is denoted as THD + N.

图 6-13. THD + N Measurement Setup

## 6.14 Power Supply Rejection Ratio (PSRR)

PSRR measures the ability of a device to prevent noise and spurious signals that appear on the supply voltage pin from coupling to the output of the switch. The DC voltage on the device supply is modulated by a sine wave of 620 mV<sub>PP</sub>. The ratio of the amplitude of signal on the output to the amplitude of the modulated signal is the ACPSRR. A high ratio represents a high degree of tolerance to supply rail variation.

This helps stabilize the supply and immediately filter as much of the supply noise as possible.

$$\text{PSRR} = 20 \times \text{Log} \frac{V_{\text{OUT}}}{V_{\text{IN}}}$$

图 6-14. ACPSRR Measurement Setup

## 7 Detailed Description

### 7.1 Overview

The TMUX6219 is a 2:1, 1-channel switch. Each input is turned on or turned off based on the state of the select line and enable pin.

### 7.2 Functional Block Diagram

图 7-1. TMUX6219 Functional Block Diagram

### 7.3 Feature Description

#### 7.3.1 Bidirectional Operation

The TMUX6219 conducts equally well from source (Sx) to drain (D) or from drain (D) to source (Sx). Each channel has very similar characteristics in both directions and supports both analog and digital signals.

#### 7.3.2 Rail to Rail Operation

The valid signal path input or output voltage for TMUX6219 ranges from  $V_{SS}$  to  $V_{DD}$ .

#### 7.3.3 1.8V Logic Compatible Inputs

The TMUX6219 has 1.8-V logic compatible control for all logic control inputs. 1.8-V logic level inputs allows the TMUX6219 to interface with processors that have lower logic I/O rails and eliminates the need for an external translator, which saves both space and BOM cost. For more information on 1.8V logic implementations refer to [Simplifying Design with 1.8V logic Muxes and Switches](#).

#### 7.3.4 Fail-Safe Logic

The TMUX6219 supports Fail-Safe Logic on the control input pins (EN and SEL) allowing for operation up to 36V above ground, regardless of the state of the supply pins. This feature allows voltages on the control pins to be applied before the supply pin, protecting the device from potential damage. Fail-Safe Logic minimizes system complexity by removing the need for power supply sequencing on the logic control pins. For example, the Fail-Safe Logic feature allows the logic input pins of the TMUX6219 to be ramped to +36V while  $V_{DD}$  and  $V_{SS}$  = 0V. The logic control inputs are protected against positive faults of up to +36V in powered-off condition, but do not offer protection against negative overvoltage conditions.

### 7.3.5 Latch-Up Immune

Latch-up is a condition where a low impedance path is created between a supply pin and ground. This condition is caused by a trigger (current injection or overvoltage), but once activated, the low impedance path remains even after the trigger is no longer present. This low impedance path may cause system upset or catastrophic damage due to excessive current levels. The latch-up condition typically requires a power cycle to eliminate the low impedance path.

The TMUX62xx family of devices are constructed on Silicon on Insulator (SOI) based process where an oxide layer is added between the PMOS and NMOS transistor of each CMOS switch to prevent parasitic structures from forming. The oxide layer is also known as an insulating trench and prevents triggering of latch up events due to overvoltage or current injections. The latch-up immunity feature allows the TMUX62xx family of switches and multiplexers to be used in harsh environments.

### 7.3.6 Ultra-Low Charge Injection

The TMUX6219 has a transmission gate topology, as shown in 图 7-2. Any mismatch in the stray capacitance associated with the NMOS and PMOS causes an output level change whenever the switch is opened or closed.

图 7-2. Transmission Gate Topology

The TMUX6219 contains specialized architecture to reduce charge injection on the source (Sx). To further reduce charge injection in a sensitive application, a compensation capacitor (Cp) can be added on the drain (D). This will ensure that excess charge from the switch transition will be pushed into the compensation capacitor on the drain (D) instead of the source (Sx). As a general rule, Cp should be 20× larger than the equivalent load capacitance on the source (Sx). 图 7-3 shows charge injection variation with source voltage with different compensation capacitors on the Drain side.

图 7-3. Charge Injection Compensation

## 7.4 Device Functional Modes

When the EN pin of the TMUX6219 is pulled high, one of the switches is closed based on the state of the SEL pin. When the EN pin is pulled low, both of the switches are in an open state regardless of the state of the SEL pin. The control pins can be as high as 36V.

The TMUX6219 can be operated without any external components except for the supply decoupling capacitors. The EN pin has an internal pull-up resistor of 4 M $\Omega$  and SEL pin has internal pull-down resistor of 4 M $\Omega$ . If unused, the EN pin must be tied to V<sub>DD</sub> and SEL pin must be tied to GND to ensure the device does not consume additional current as highlighted in [Implications of Slow or Floating CMOS Inputs](#). Unused signal path inputs (S1, S2, or D) should be connected to GND.

## 7.5 Truth Tables

表 7-1 provides the truth tables for the TMUX6219.

表 7-1. TMUX6219 Truth Table

EN	SEL	Selected Source Connected To Drain (D) Pin
0	X <sup>(1)</sup>	All sources are off (HI-Z)
1	0	S1
1	1	S2

(1) X denotes *do not care*.

## 8 Application and Implementation

### 备注

以下应用部分中的信息不属于 TI 器件规格的范围，TI 不担保其准确性和完整性。TI 的客户应负责确定器件是否适用于其应用。客户应验证并测试其设计，以确保系统功能。

### 8.1 Application Information

TMUX6219 is part of the precision switches and multiplexers family of devices. TMUX6219 offers low  $R_{ON}$ , low on and off leakage currents and ultra-low charge injection performance. These properties make TMUX6219 ideal for implementing high precision industrial systems requiring selection of one of two inputs or outputs.

### 8.2 Typical Application

#### 8.2.1 Power Amplifier Gate Driver

One application of the TMUX6219 is for input control of a power amplifier gate driver. Utilizing a switch allows a system to control when the DAC is connected to the power amplifier and can stop biasing the power amplifier by switching the gate to  $V_{SS}$ . The wide dual supply range of  $\pm 4.5V$  to  $\pm 18V$  allows the switch to work with GaN power amplifiers, and the wide single supply range 4.5V to 36V works well with LDMOS power amplifiers.

图 8-1 shows the TMUX6219 configured for control of the power amplifier gate driver in GaN application.

图 8-1. Power Amplifier Gate Driver

#### 8.2.2 Design Requirements

For the design example, use the parameters listed in 表 8-1.

表 8-1. Design Parameters

PARAMETERS	VALUES	
	GAN application	LDMOS application
Supply ( $V_{DD}$ )	8V	5V
Supply ( $V_{SS}$ )	-12V	0V
MUX I/O signal range	-12V to 8V (Rail-to-Rail)	0V to 5V (Rail-to-Rail)
Control logic thresholds	1.8V compatible (up to $V_{DD}$ )	1.8V compatible (up to $V_{DD}$ )
EN	EN pulled high to enable the switch	EN pulled high to enable the switch

### 8.2.3 Detailed Design Procedure

The application shown in 图 8-1 demonstrates how to toggle between the DAC output and low signal voltage for control of a GaN power amplifier using a single control input. The DAC output is utilized to bias the gate of the power amplifier and can be disconnected from the circuit using the select pin of the switch. The TMUX6219 can support 1.8V logic signals on the control input, allowing the device to interface with low logic controls of an FPGA or MCU. The TMUX6219 can operate without any external components except for the supply decoupling capacitors. The select pin has an internal pull-down resistor to prevent floating input logic. All inputs to the switch must fall within the recommended operating conditions of the TMUX6219 including signal range and continuous current. For this design with a positive supply of 8V on  $V_{DD}$  and negative supply of -12V on  $V_{SS}$ , the signal range can be 8V to -12V. The maximum continuous current ( $I_{DC}$ ) can be up to 330mA as shown in the *Recommended Operating Conditions* table for wide-range current measurement.

### 8.2.4 Application Curve

The low on and off leakage currents of TMUX6219 and ultra-low charge injection performance make this device ideal for implementing high precision industrial systems. 图 8-2 shows the plot for the charge injection versus source voltage for the TMUX6219.

图 8-2. Charge Injection vs Drain Voltage

## 9 Power Supply Recommendations

The TMUX6219 operates across a wide supply range of  $\pm 4.5V$  to  $\pm 18V$  (4.5V to 36V in single-supply mode). As shown in 图 8-1, the device also performs well with asymmetrical supplies such as  $V_{DD} = 5V$  and  $V_{SS} = -8V$ .

Power-supply bypassing improves noise margin and prevents switching noise propagation from the supply rails to other components. Good power-supply decoupling is important to achieve optimum performance. For improved supply noise immunity, use a supply decoupling capacitor ranging from 0.1  $\mu F$  to 10  $\mu F$  at both the  $V_{DD}$  and  $V_{SS}$  pins to ground. Place the bypass capacitors as close to the power supply pins of the device as possible using low-impedance connections. TI recommends using multi-layer ceramic chip capacitors (MLCCs) that offer low equivalent series resistance (ESR) and inductance (ESL) characteristics for power-supply decoupling purposes. For very sensitive systems, or for systems in harsh noise environments, avoiding the use of vias for connecting the capacitors to the device pins may offer superior noise immunity. The use of multiple vias in parallel lowers the overall inductance and is beneficial for connections to power and ground planes. Always ensure the ground (GND) connection is established before supplies are ramped.

## 10 Layout

### 10.1 Layout Guidelines

When a PCB trace turns a corner at a 90° angle, a reflection can occur. A reflection occurs primarily because of the change of width of the trace. At the apex of the turn, the trace width increases to 1.414 times the width. This increase upsets the transmission-line characteristics, especially the distributed capacitance and self-inductance of the trace which results in the reflection. Not all PCB traces can be straight and therefore some traces must turn corners. 图 10-1 shows progressively better techniques of rounding corners. Only the last example (BEST) maintains constant trace width and minimizes reflections.

图 10-1. Trace Example

Route high-speed signals using a minimum of vias and corners which reduces signal reflections and impedance changes. When a via must be used, increase the clearance size around it to minimize its capacitance. Each via introduces discontinuities in the signal's transmission line and increases the chance of picking up interference from the other layers of the board. Be careful when designing test points, through-hole pins are not recommended at high frequencies.

图 10-2 shows an example of a PCB layout with the TMUX6219. Some key considerations are as follows:

- Decouple the supply pins with a 0.1 $\mu$ F and 1 $\mu$ F capacitor, and place the lowest value capacitor as close to the pin as possible. Make sure that the capacitor voltage rating is sufficient for the supply voltage.
- Keep the input lines as short as possible.
- Use a solid ground plane to help reduce electromagnetic interference (EMI) noise pickup.
- Do not run sensitive analog traces in parallel with digital traces. Avoid crossing digital and analog traces if possible, and only make perpendicular crossings when necessary.
- Using multiple vias in parallel will lower the overall inductance and is beneficial for connection to ground planes.

(1) **Status:** For more details on status, see our [product life cycle](#).

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

SOLDER PASTE EXAMPLE  
SCALE: 15X

4214862/A 04/2023

NOTES: (continued)

11. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
12. Board assembly site may have different recommendations for stencil design.

## 重要通知和免责声明

TI“按原样”提供技术和可靠性数据（包括数据表）、设计资源（包括参考设计）、应用或其他设计建议、网络工具、安全信息和其他资源，不保证没有瑕疵且不做任何明示或暗示的担保，包括但不限于对适销性、与某特定用途的适用性或不侵犯任何第三方知识产权的暗示担保。

这些资源可供使用 TI 产品进行设计的熟练开发人员使用。您将自行承担以下全部责任：(1) 针对您的应用选择合适的 TI 产品，(2) 设计、验证并测试您的应用，(3) 确保您的应用满足相应标准以及任何其他安全、安保法规或其他要求。

这些资源如有变更，恕不另行通知。TI 授权您仅可将这些资源用于研发本资源所述的 TI 产品的相关应用。严禁以其他方式对这些资源进行复制或展示。您无权使用任何其他 TI 知识产权或任何第三方知识产权。对于因您对这些资源的使用而对 TI 及其代表造成的任何索赔、损害、成本、损失和债务，您将全额赔偿，TI 对此概不负责。

TI 提供的产品受 [TI 销售条款](#)、[TI 通用质量指南](#) 或 [ti.com](#) 上其他适用条款或 TI 产品随附的其他适用条款的约束。TI 提供这些资源并不会扩展或以其他方式更改 TI 针对 TI 产品发布的适用的担保或担保免责声明。除非德州仪器 (TI) 明确将某产品指定为定制产品或客户特定产品，否则其产品均为按确定价格收入目录的标准通用器件。

TI 反对并拒绝您可能提出的任何其他或不同的条款。
