

STEREO DIGITAL AUDIO LIP-SYNC DELAY

FEATURES

- Digital Audio Format: 16-24-bit I²S
- Single Serial Input Port
- Delay Time: 170 ms/ch at fs = 48 kHz
- Delay Resolution: 256 samples
- Delay Memory Cleared on Power-Up or After Delay Changes
 - Eliminates Erroneous Data From Being Output
- 3.3 V Operation With 5 V Tolerant I/O
- Supports Audio Bit Clock Rates of 32 to 64 fs with fs = 32 kHz-192 kHz
- No External Crystal or Oscillator Required
 - All Internal Clocks Generated From the Audio Clock
- Surface Mount 4mm × 4mm, 16-pin QFN Package

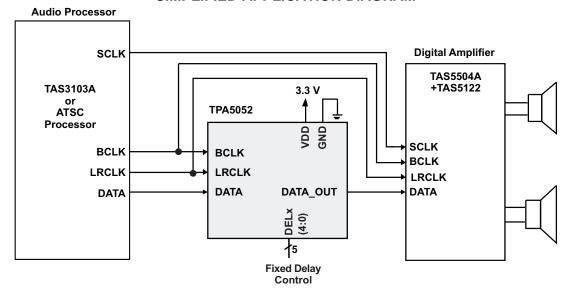

APPLICATIONS

- High Definition TV Lip-Sync Delay
- Flat Panel TV Lip-Sync Delay
- Home Theater Rear-Channel Effects
- Wireless Speaker Front-Channel Synchronization
- Camcorders

DESCRIPTION

The TPA5052 accepts a single serial audio input, buffers the data for a selectable period of time, and outputs the delayed audio data on a single serial output. In systems with complex video processing algorithms, one device allows delay of up to 170 ms/ch (fs = 48 kHz) to synchronize the audio stream to the video stream. If more delay is needed, the devices can be connected in series.

SIMPLIFIED APPLICATION DIAGRAM

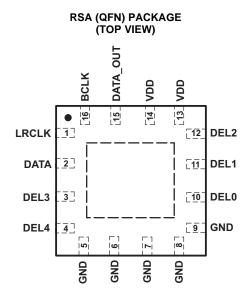

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

PIN DESCRIPTIONS

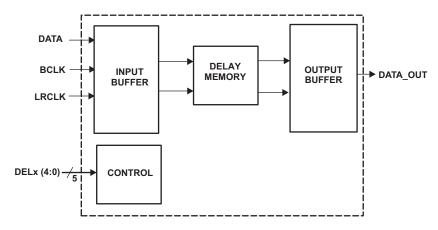

TERMINAL FUNCTIONS

TERM	INAL	1/0	DESCRIPTION					
NAME	NO.	1/0	DESCRIPTION					
DEL0	10	I	Delay select pin – LSB. 5V tolerant input.					
DEL1	11	I	Delay select pin. 5V tolerant input.					
DEL2	12	1	Delay select pin. 5V tolerant input.					
DEL3	3	1	Delay select pin. 5V tolerant input.					
DEL4	4	1	Delay select pin - MSB. 5V tolerant input.					
BCLK	16	I	Audio data bit clock input for serial input. 5V tolerant input.					
DATA	2	1	Audio serial data input for serial input. 5V tolerant input.					
DATA_OUT	15	0	Delayed audio serial data output.					
GND	5–9	Р	Ground – All ground terminals must be tied to GND for proper operation					
LRCLK	1	1	Left and Right serial audio sampling rate clock (fs). 5V tolerant input.					
VDD	13, 14	Р	Power supply interface. Both pins must be tied to power supply.					
Thermal Pad		-	Connect to ground. Must be soldered down in all applications to properly secure device on the PCB.

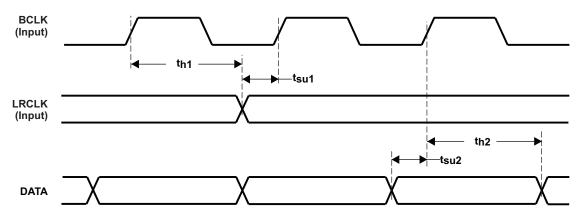

Figure 1. Serial Data Interface Timing

APPLICATION INFORMATION

AUDIO SERIAL INTERFACE

The audio serial interface for the TPA5052 consists of a 3-wire synchronous serial port. It includes LRCLK, BCLK, and DATA. BCLK is the serial audio bit clock, and it is used to clock the serial data present on DATA into the serial shift register of the audio interface. Serial data is clocked into the TPA5052 on the rising edge of BCLK. LRCLK is the serial audio left/right word clock. It is used to latch serial data into the internal registers of the serial audio interface. LRCLK is operated at the sampling frequency, fs. BCLK can be operated at 32 to 64 times the sampling frequency for I²S formats. A system clock is not necessary for the operation of the TPA5052.

I2S TIMING

The I²S data format diagram is shown in Figure 2.

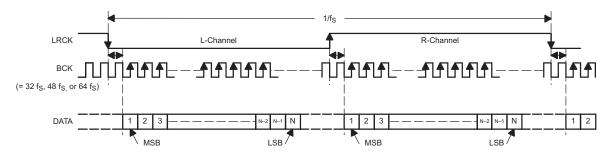

Figure 2. I²S Data Format; L-Channel = LOW, R-Channel = HIGH

GENERAL DELAY OPERATION

The delay of the TPA5052 is set using the 5 delay pins (DEL4, DEL3, DEL2, DEL1, DEL0). The minimum delay is 255 samples, and occurs when all five pins are at logic 0. The maximum delay is 8191 samples, and occurs when all five pins are at logic 1. The delay can be increased by changing the values on each pin from a 0 to a 1. See Table 1. Delay pin DEL4 is the MSB, and DEL0 is the LSB.

The delay is calculated with the following forumula:

Audio Delay (in samples) = $4096 \times (DEL4) + 2048 \times (DEL3) + 1024 \times (DEL2) + 512 \times (DEL1) + 256 \times (DEL0) + 255$

Audio Delay (ms) = Audio Delay (in samples) x (1/fs)

Both channels have the same amount of delay. They cannot be controlled individually.

DEL4	DEL3	DEL2	DEL1	DEL0	Delay in Samples
0	0	0	0	0	255
0	0	0	0	1	511
0	0	0	1	0	767
0	0	0	1	1	1023
\	\	\	\	\	\
1	1	1	1	1	8191

Table 1. Delay Settings

TPA5052 Operation

Only a single decoupling capacitor (0.1 μ F–1 μ F) is required across VDD and GND. The DELx terminals can be directly connected to VDD or GND. Table 1 describes the delay settings selectable via the DELx terminals. A schematic implementation of the TPA5052 is shown in Figure 3.

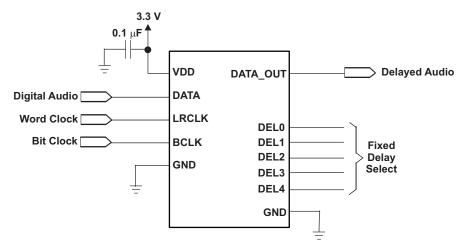

Figure 3. TPA5052 Schematic

COMPLETE UPDATE

To avoid pops and clicks in the audio stream when the delay is changed, the TPA5052 holds each channel in an internal mute mode until all the set number of samples have passed. For example, if the delay is set to 511 samples, the TPA5052 holds each channel in mute until all 511 samples of audio data have passed.

APPLICATION EXAMPLES

Connecting Two Devices in Series to Increase the Delay

It is sometimes desirable to increase the delay time beyond the limit which one device provides. In such cases, the TPA5052 device can be placed in a series to increase the delay. See Figure 4 for an example.

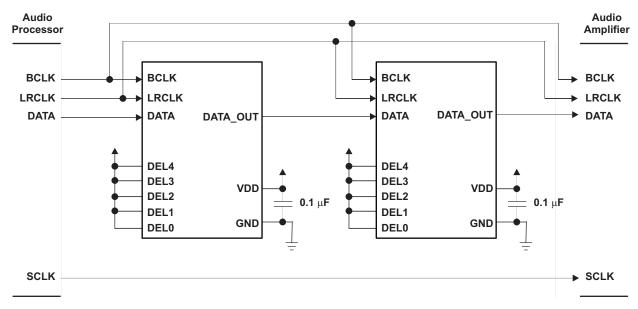

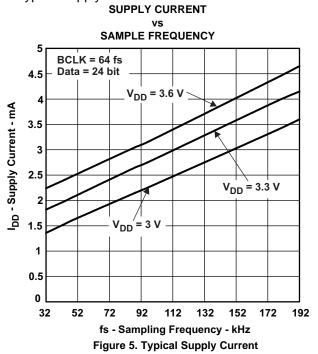

Figure 4. Two Devices in Series

DEVICE CURRENT CONSUMPTION

The TPA5052 draws different amounts of supply current depending upon the conditions under which it is operated. As V_{DD} increases, so too does I_{DD} . Likewise, as V_{DD} decreases, I_{DD} decreases. The same is true of the sampling frequency, fs. An increase in fs causes an increase in I_{DD} . Figure 5 illustrates the relationship between operating condition and typical supply current.

⁽¹⁾ Status: For more details on status, see our product life cycle.

- (3) RoHS values: Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.
- (4) Lead finish/Ball material: Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
- (5) MSL rating/Peak reflow: The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.
- (6) Part marking: There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

⁽²⁾ Material type: When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

PLASTIC QUAD FLATPACK - NO LEAD

NOTES:

- 1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
 2. This drawing is subject to change without notice.
- 3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.

 4. Reference JEDEC registration MO-220.

PLASTIC QUAD FLATPACK - NO LEAD

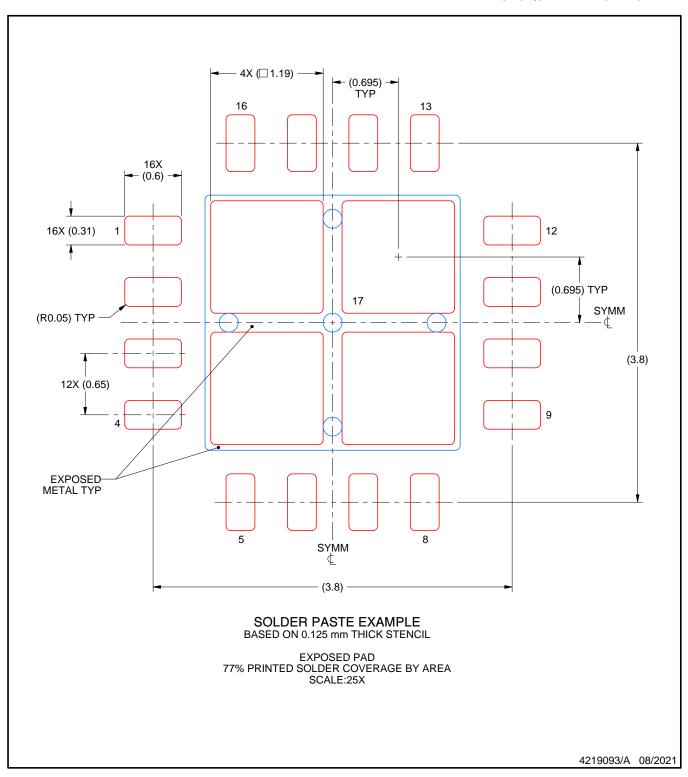

NOTES: (continued)

- 5. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/slua271).
- 6. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.

PLASTIC QUAD FLATPACK - NO LEAD

NOTES: (continued)

7. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
