

TPS40197 4.5V 至 14V 输入、6A 降压控制器 具有 4 位 VID 接口

1 特性

- 输入电压范围：4.5V 至 14V
- 4 位动态 VID 即时转换支持
- 具有可编程转换率的 VID 可编程输出电压
- 520kHz 固定开关频率
- 可选的低侧（三个设置）和固定高侧热补偿过流保护
- 电源正常指示器
- 内部 5V 稳压器
- 电压模式控制
- 内部固定 5.5ms 软启动时间
- 预偏置输出安全保护
- 140°C 时进行热关断
- 16 引脚 QFN 封装

2 应用

- Smart-Reflex™ DSP
- POL 模块
- 电信

3 说明

TPS40197 是一款同步降压控制器，可在 4.5V 至 14V 的标称输入电源电压下工作。该控制器采用电压模式控制架构，具有 520kHz 的固定开关频率。由于更高的开关频率有利于使用较小的电感器和输出电容器，因此可实现紧凑型电源解决方案。自适应反交叉传导方案可用于避免功率 FET 出现直通电流。

TPS40197 在单芯片中集成了 PWM 控制和 4 位 VID 接口，可使用可编程的转换率实现无缝即时 VID 切换。它为 Smart-Reflex™ DSP 内核提供了一个简单的电源解决方案。

器件信息⁽¹⁾

| 器件型号 | 封装 | 封装尺寸（标称值） |
|----------|-----------|-----------------|
| TPS40197 | VQFN (16) | 4.50mm x 3.50mm |

5 说明（续）

短路检测是通过检测低侧 FET（通电时）上的压降并将其与用户选择的 100mV、200mV 或 280mV 阈值进行比较而实现的。此阈值可通过从 COMP 连接到 GND 的单个外部电阻器进行设置。在启动时即对该电阻器进行检测并锁存所选阈值。通过检测高侧 FET（通电时）上的电压并在压降上升超过 550mV 固定阈值时终止周期来提供逐脉冲限流功能（以防止电流失控）。如果控制器检测到输出短路，则会关闭两个 FET，并在达到超时时间后尝试重启。这能在持续故障情况下实现有限的功率耗散。

6 Pin Configuration and Functions

Pin Functions

| PIN | | I/O | DESCRIPTION |
|-------|-----|-----|---|
| NAME | NO. | | |
| BOOT | 12 | I | Gate drive voltage for the high-side N-channel MOSFET. A 100-nF capacitor (typical) must be connected between this pin and SW. |
| BP | 10 | O | Output bypass for the internal regulator. Connect a low ESR bypass ceramic capacitor of 1 μ F or greater from this pin to GND. |
| COMP | 6 | O | Output of the error amplifier and connection node for loop feedback components. |
| EN | 4 | I | Logic level input which starts or stops the controller from an external user command. A high level turns the controller on. A weak internal pullup holds this pin high so that the pin may be left floating if this function is not used. Pulling this pin low disables the controller. |
| FB | 5 | I | Inverting input to the error amplifier. |
| HDRV | 14 | O | Bootstrapped gate drive output for the high-side N-channel MOSFET. |
| LDRV | 11 | O | Gate drive output for the low-side synchronous rectifier N-channel MOSFET. |
| PGOOD | 8 | O | Open drain power good output. |
| REF | 3 | I | Non-Inverting input to the error amplifier. Its voltage range is from 0.9 V to 1.2 V in 20-mV steps. It is also internally connected to the DAC output through a unit gain buffer with 650- μ A source/sink current capability. An external capacitor connected from this pin to GND programs the output voltage transition rate when VID code changes. |
| VDD | 7 | I | Power input to the controller. Connect a 1- μ F bypass capacitor closely from this pin to GND. |
| VID0 | 2 | I | Logic level inputs to the internal DAC that provides the reference voltage for output regulation. These pins are internally pulled up to a 1.68-V source with 80- μ A pullup current. |
| VID1 | 1 | I | |
| VID2 | 16 | I | |
| VID3 | 15 | I | |
| GND | 9 | | Ground connection to the controller |

7 Specifications

7.1 Absolute Maximum Ratings⁽¹⁾

over operating free-air temperature range (unless otherwise noted)

| | | VALUE | UNIT |
|--|--------------------------|-------------|------|
| Input voltage | VDD, EN | –0.3 to 20 | V |
| | SW | –5 to 25 | |
| | BOOT, HDRV | –0.3 to 30 | |
| | BOOT–SW, HDRV–SW | –0.3 to 6 | |
| | FB, BP, LDRV, PGOOD, REF | –0.3 to 6 | |
| Output voltage | COMP | –0.3 to 3.5 | V |
| | VID0, VID1, VID2, VID3 | –0.3 to 2 | |
| Operating junction temperature range, T _J | | –40 to 150 | °C |
| Storage temperature, T _{stg} | | –55 to 150 | °C |

- (1) Stresses beyond those listed under *absolute maximum ratings* may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under *recommended operating conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

7.2 ESD Ratings

| | | | VALUE | UNIT |
|--------------------|-------------------------|--|-------|------|
| V _(ESD) | Electrostatic discharge | Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾ | 2500 | V |
| | | Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾ | 1500 | |

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

| | | MIN | MAX | UNIT |
|--|-----|-----|-----|------|
| Supply voltage | VDD | 4.5 | 14 | V |
| Operating junction temperature, T _J | | –40 | 125 | °C |

7.4 Package Dissipation Ratings

| PACKAGE | AIRFLOW (LFM) | R _{θJA} HIGH-K Board ⁽¹⁾ (°C/W) | POWER RATING (W) T _A = 25°C | POWER RATING (W) T _A = 85°C |
|------------------------------------|------------------------|--|---|---|
| 16-Pin Plastic Quad Flatpack (RGY) | 0 (Natural Convection) | 49.2 | 2.0 | 0.81 |
| | 200 | 41.2 | 2.4 | 0.97 |
| | 400 | 37.7 | 2.6 | 1.00 |

- (1) Ratings based on JEDEC High Thermal Conductivity (High K) Board. For more information on the test method, see TI Technical Brief SZZA017.

7.5 Electrical Characteristics

8 Detailed Description

8.1 Overview

The TPS40197 is a synchronous buck controller which provides all the necessary features to construct a high-performance DC/DC converter. Support for pre-biased outputs eliminates concerns about damaging sensitive loads during startup. Strong gate drivers for the high-side and rectifier MOSFETs decrease switching losses for increased efficiency. Adaptive gate drive timing prevents shoot through and minimizes body diode conduction in the rectifier MOSFET, also increasing efficiency. Selectable short-circuit protection thresholds and hiccup recovery from a short-circuit increase design flexibility and minimize power dissipation in the event of a prolonged output fault. A dedicated enable pin allows the converter to be placed in a very low quiescent current shutdown mode. Internally fixed switching frequency and soft-start time reduce external component count, simplifying design and layout, as well as reducing footprint and cost. The dynamic voltage identification (VID) circuitry is designed to provide Smart-Reflex™ power supply solution to DSPs with core voltage optimization.

8.2 Functional Block Diagram

8.3 Feature Description

8.3.1 Enable

The TPS40197 includes a dedicated EN pin. This simplifies user level interface design since no multiplexed functions exist. Another benefit is a true low-power shutdown mode of operation. When the EN pin is pulled to GND, all unnecessary functions, including the BP regulator, are turned off, reducing the I_{VDD} current to 45 μ A. A functionally equivalent circuit of the enable circuitry is shown in Figure 14.

Figure 14. Tps40197 En Pin Internal Circuitry

If the EN pin is left floating, the device starts automatically. The pin must be pulled to less than 600 mV to specify that the TPS40197 is in shutdown mode. Note that the EN pin is relatively high impedance. In some situations, there could be enough noise nearby to cause the EN pin to swing below the 600-mV threshold and give erroneous shutdown commands to other components of the device. There are two solutions to this potential problem.

- Place a capacitor from EN to GND. A side-effect of this is to delay the start of the converter while the capacitor charges past the enable threshold.
- Place a resistor from VDD to EN. This causes more current to flow in the shutdown mode, but does not delay converter start-up. If a resistor is used, the total current into the EN pin must be limited to no more than 500 μ A.

The ENABLE pin is self clamping. The clamp voltage can be as low as 1 V with a 1-k Ω ground impedance. Due to this self-clamping feature, the pull-up impedance on the ENABLE pin should be selected to limit the sink current to less than 500 μ A. Driving the ENABLE pin with a low-impedance source voltage can result in damage to the device. Because of the self-clamping feature, it requires care when connecting multiple ENABLE pins together. For enabling multiple TPS4019x devices (TPS40190, TPS40192, TPS40193, TPS40195, TPS40197), see application report [SLVA509](#).

8.3.2 Oscillator

The fixed internal switching frequency of the TPS40197 is 520 kHz.

8.3.3 UVLO

When the input voltage is below the UVLO threshold, the device holds all gate drive outputs in the low (OFF) state. When the input rises above the UVLO threshold, and the EN pin is above the turn ON threshold, the oscillator begins to operate and the start-up sequence is allowed to begin. The UVLO level is internally fixed at 4.2 V.

Feature Description (continued)

8.3.4 Start-up Sequence and Timing

The TPS40197 startup sequence is as follows. After input power is applied, the 5-V onboard regulator initiates. Once this regulator comes up, the device goes through a period where it samples the impedance at the COMP pin and determines the short-circuit protection threshold voltage, by placing 400 mV on the COMP pin for approximately 1.15 ms. During this time, the current is measured and compared against internal thresholds to select the short circuit protection threshold. After this, the COMP pin is brought low for 1.15 ms. This ensures that the feedback loop is preconditioned at startup and no sudden output rise occurs at the output of the converter when the converter is allowed to start switching. After these initial 2.3 ms, the internal soft-start circuitry is engaged and the converter is allowed to start as shown in [Figure 15](#).

Figure 15. Start-up Sequence

8.3.5 Selecting the Short Circuit Current

A short circuit in the TPS40197 is detected by sensing the voltage drop across the low-side FET when it is on, and across the high-side FET when it is on. If the voltage drop across either FET exceeds the short-circuit threshold in any given switching cycle, a counter increments one count. If the voltage across the high-side FET was higher than the short circuit threshold, that FET is turned off early. If the voltage drop across either FET does not exceed the short circuit threshold during a cycle, the counter is decremented for that cycle. If the counter fills up (a count of 7) a fault condition is declared and the drivers turn off both MOSFETs. After a timeout of approximately 50 ms, the controller attempts to restart. If a short circuit continues at the output, the current quickly ramps up to the short-circuit threshold and another fault condition is declared and the process of waiting for the 50 ms and attempting to restart repeats. The low-side threshold increases as the low-side on time decreases due to blanking time and comparator response time. See [Figure 9](#) for changes in the threshold as the low-side FET conduction time decreases.

The TPS40197 provides three selectable short-circuit protection thresholds for the low-side FET: 100 mV, 200 mV, and 280 mV. The particular threshold is selected by connecting a resistor from COMP to GND. [Table 1](#) shows the short-circuit thresholds for corresponding resistors from COMP to GND. When designing the compensation for the feedback loop, remember that a low impedance compensation network combined with a long network time constant can cause the short-circuit threshold setting to not be as expected. The time constant and impedance of the network connected from COMP to FB must be as in [Equation 1](#) to ensure no interaction with the short-circuit threshold setting.

Feature Description (continued)

$$\left(\frac{0.4 \text{ V}}{R1} \right) \times e^{\left(\frac{-t}{R1 \times C1} \right)} \leq 10 \mu\text{A}$$

where

- t is 1.15 ms, the sampling time of the short circuit threshold setting circuit
- $R1$ and $C1$ are the values of the components in [Figure 16](#)

(1)

Figure 16. Short Circuit Threshold Feedback Network

Table 1. Circuit Threshold Voltage Selection

| COMPARATOR RESISTANCE R_{COMP} (k Ω) | CURRENT LIMIT THRESHOLD VOLTAGE V_{ILIM} (mV) |
|---|--|
| 12 \pm 10% | 280 |
| OPEN | 200 |
| 4 \pm 10% | 100 |

The range of expected short-circuit current thresholds is shown in [Equation 2](#) and [Equation 3](#).

$$I_{SCP(max)} = \frac{V_{ILIM(max)}}{R_{DS(on)min}}$$

(2)

$$I_{SCP(min)} = \frac{V_{ILIM(min)}}{R_{DS(on)max}}$$

where

- I_{SCP} is the short circuit current
- V_{ILIM} is the short-circuit threshold for the low-side MOSFET
- $R_{DS(on)}$ is the channel resistance of the low-side MOSFET

(3)

Note that due to blanking time considerations, overcurrent threshold accuracy may fall off for duty cycle greater than 75% because the overcurrent comparator has only a very short time to sample the SW pin voltage under these conditions and may not have time to respond to voltages very near the threshold.

The short-circuit protection threshold for the high-side MOSFET is fixed at 550 mV typical, 400 mV minimum. This threshold is in place to provide a maximum current output using pulse-by-pulse current limit in the case of a fault. The pulse terminates when the voltage drop across the high-side FET exceeds the short-circuit threshold. The maximum amount of current that can be specified to be sourced from a converter can be found by [Equation 4](#).

$$I_{OUT(max)} = \frac{V_{ILIMH(min)}}{R_{DS(on)max}}$$

where

- $I_{OUT(max)}$ is the maximum current that the converter is specified to source
 - $V_{ILIMH(min)}$ is the short-circuit threshold for the high-side MOSFET (400 mV)
 - $R_{DS(on)max}$ is the maximum resistance of the high-side MOSFET
- (4)

If the required current from the converter is greater than the calculated $I_{OUT(max)}$, a lower resistance high-side MOSFET must be chosen. Both the high-side and low-side thresholds use temperature compensation to approximate the change in resistance for a typical power MOSFET. This helps counteract shifts in overcurrent thresholds as temperature increases. For this to be effective, the MOSFETs and the device must be well coupled thermally.

8.3.6 Voltage Reference and Dynamic VID

To provide optimized voltage for Smart-Reflex™ DSP cores, the TPS40197 is designed to monitor the VID code at all times once soft-start is complete, and actively adjusts its output voltage if the VID code should change during normal operation. A digital-to-analog converter (DAC) generates a reference voltage based on the state of logical signals at pins VID0 through VID3. The DAC decodes the 4-bit logic signal into one of the discrete voltages shown in [Table 2](#). The default setting for the output is 1.2 V (VID code 1111). The output voltage is 1.2 V during initial start or restart after cycling the input, toggling EN pin or recovering from a short circuit at the output.

To ensure that no erroneous output voltage is produced, the TPS40197 VID inputs have internal anti-skew circuit with approximately 550 ns of filtering time. Each VID input is pulled up to an internal 1.68-V source with 80-μA pullup current for use with open-drain outputs.

The output voltage can be programmed from 0.9 V to 1.2 V in 20 mV steps. Smooth upward and downward core voltage transition can be achieved by programming the transition rate with an external capacitor connected from REF pin to GND. The required capacitance can be calculated using [Equation 5](#).

$$C_{REF} = \frac{(I_{REF} \times T_{TR})}{V_{VID-TR}}$$

where

- V_{VID-TR} is the total voltage transition through VID
 - I_{REF} is the internal reference source/sink current
 - T_{TR} is the intended total VID voltage transition time
- (5)

C_{REF} must be limited to a maximum of 1.5 μF to avoid interfering with the soft start. A capacitor (C_{REF}) with a minimum capacitance of 100-nF is also recommended.

Table 2. Voltage Identification Codes

| VID TERMINALS (0 = LOW, 1 = HIGH) | | | | V _{REF} |
|-----------------------------------|------|------|------|--------------------|
| VID3 | VID2 | VID1 | VID0 | (V _{dc}) |
| 0 | 0 | 0 | 0 | 0.90 |
| 0 | 0 | 0 | 1 | 0.92 |

8.3.7 Minimum On-Time Consideration

The TPS40197 has a minimum on-time of 110 ns (maximum). With the restriction of this minimum on-time, the device may begin to skip pulses to effectively lower the overall on-time to keep the output in regulation when operating at high input-to-output conversion ratio. If pulse skipping is undesirable for some reason, it is recommended that the maximum input voltage be limited to 13.5 V.

8.3.8 BP Regulator

The TPS40197 has an on board 5-V BP regulator that allows the parts to operate from a single voltage feed. No separate 5-V feed to the part is required. This regulator needs to have a minimum of 1-μF of capacitance on the BP pin for stability. A ceramic capacitor is suggested for this purpose.

This regulator can also be used to supply power to nearby circuitry, eliminating the need for a separate LDO in some cases. If this pin is used for external loads, be aware that this is the power supply for the internals of the TPS40197. While efforts have been made to reduce sensitivity, any noise induced on this line has an adverse effect on the overall performance of the internal circuitry and shows up as increased pulse jitter, or skewed reference voltage. Also, when the device is disabled by pulling the EN pin low, this regulator is turned off and will not be available to supply power.

The amount of power available from this pin varies with the size of the power MOSFETs that the drivers must operate. Larger MOSFETs require more gate drive current and reduce the amount of power available on this pin for other tasks. The total current that can be drawn from this pin by both the gate drive and external loads cannot exceed 50 mA. The device itself consumes up to 4 mA from the regulator and the total gate drive current can be found from [Equation 6](#).

8.3.9 Prebias Start-up

The TPS40197 contains a unique circuit to prevent current from being pulled from the output during startup in the condition the output is prebiased. When the soft start commands a voltage higher than the pre-bias level (internal soft-start becomes greater than feedback voltage [V_{FB}]), the controller slowly activates synchronous rectification by starting the first LDRV pulse with a narrow on-time. It then increments that on-time on a cycle-by-cycle basis until it coincides with the time dictated by (1-D), where D is the duty cycle of the converter. This scheme prevents the initial sinking of the pre-bias output, and ensures that the output voltage (V_{OUT}) starts and ramps up smoothly into regulation and the control loop is given time to transition from pre-biased start-up to normal mode operation with minimal disturbance to the output voltage. The amount of time from the start of switching until the low-side MOSFET is turned on for the full (1-D) interval is defined by 32 clock cycles.

8.3.10 Drivers

The drivers for the external HDRV and LDRV MOSFETs are capable of driving a gate-to-source voltage of 5 V. The LDRV driver switches between BP and GND, while HDRV driver is referenced to SW and switches between BOOT and SW. The drivers have non-overlapping timing that is governed by an adaptive delay circuit to minimize body diode conduction in the synchronous rectifier. The drivers are capable of driving MOSFETS that are appropriate for a 15-A converter.

8.3.11 Power Good

The TPS40197 provides an indication that output power is good for the converter. This is an open drain signal and pulls low when any condition exists that would indicate that the output of the supply might be out of regulation. These conditions include:

- V_{FB} is more than 10% from the reference voltage based on VID codes
- soft-start is active
- an undervoltage condition exists for the device
- a short-circuit condition has been detected
- die temperature is over (140°C)

NOTE

When there is no power to the device, PGOOD is not able to pull close to GND if an auxiliary supply is used for the power good indication. In this case, a built in resistor connected from drain to gate on the PGOOD pull down device makes the PGOOD pin look approximately like a diode to GND.

8.3.12 Thermal Shutdown

If the junction temperature of the device reaches the thermal shutdown limit of 140°C, the PWM and the oscillator are turned off and HDRV and LDRV are driven low, turning off both FETs. When the junction cools to the required level (120°C nominal), the PWM initiates soft-start as during a normal power-up cycle.

9 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

The TPS40197 is a synchronous buck controller that operates from 4.5-V to 14-V input supply nominally. The controller implements voltage-mode control architecture with the switching frequency fixed at 520 kHz. The higher switching frequency facilitates the use of smaller inductor and output capacitors, thereby providing a compact power-supply solution.

9.2 Typical Application

The schematic for the design is shown in [Figure 17](#) and the list of materials is shown in [Table 3](#).

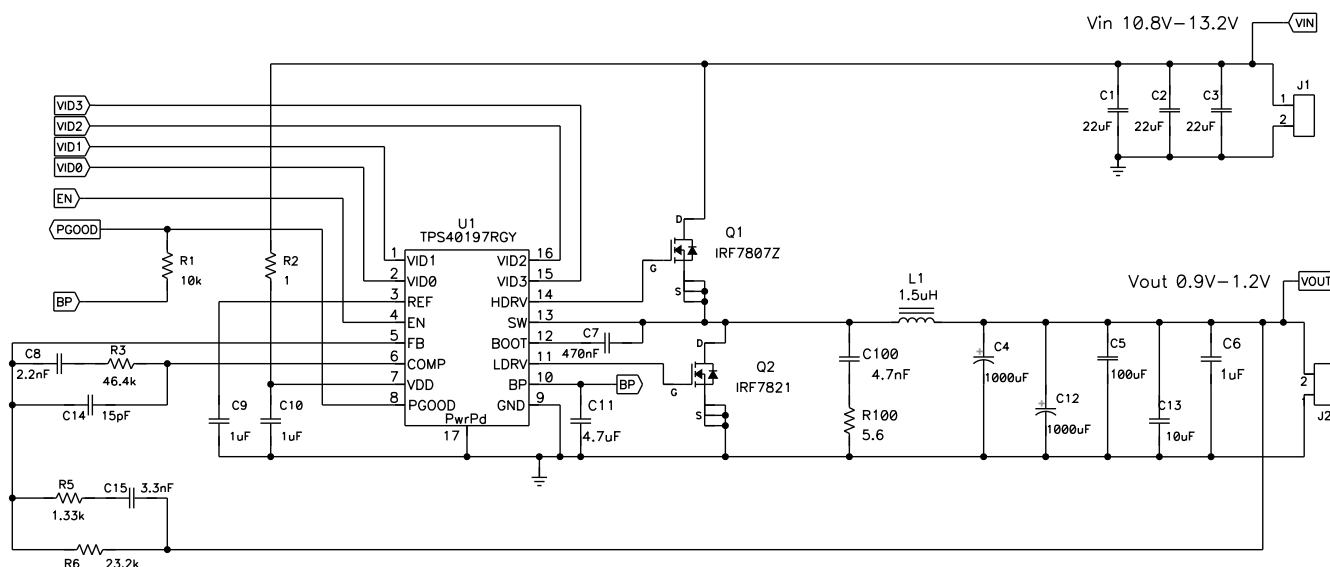

Figure 17. TPS40197 Sample Schematic

Typical Application (continued)

9.2.2 Detailed Design Procedure

For regulator stability, a 1- μ F capacitor is required to be connected from BP to GND. In some applications using higher gate charge MOSFETs, a larger capacitor is required for noise suppression. For a total gate charge of both the high-side and low-side MOSFETs greater than 20 nC, a 2.2- μ F or larger capacitor is recommended.

$$I_G = f_{SW} \times (Q_{G(\text{high})} + Q_{G(\text{low})})$$

where

- I_G is the required gate drive current
- f_{SW} is the switching frequency
- $Q_{G(\text{high})}$ is the gate charge requirement for the high-side FET when $V_{GS} = 5$ V
- $Q_{G(\text{low})}$ is the gate charge requirement for the low-side FET when $V_{GS} = 5$ V

10.6 静电放电警告

ESD 可能会损坏该集成电路。德州仪器 (TI) 建议通过适当的预防措施处理所有集成电路。如果不遵守正确的处理措施和安装程序，可能会损坏集成电路。

ESD 的损坏小至导致微小的性能降级，大至整个器件故障。精密的集成电路可能更容易受到损坏，这是因为非常细微的参数更改都可能会导致器件与其发布的规格不相符。

11 机械、封装和可订购信息

以下页面包含机械、封装和可订购信息。这些信息是指定器件的最新可用数据。数据如有变更，恕不另行通知，且不会对此文档进行修订。如需获取此数据表的浏览器版本，请查阅左侧的导航栏。

PACKAGING INFORMATION

| Orderable Device | Status (1) | Package Type | Package Drawing | Pins | Package Qty | Eco Plan (2) | Lead finish/ Ball material (6) | MSL Peak Temp (3) | Op Temp (°C) | Device Marking (4/5) | Samples |
|------------------|---------------|--------------|--------------------|------|----------------|-----------------|--------------------------------------|----------------------|--------------|-------------------------|-------------------------|
| TPS40197RGYR | ACTIVE | VQFN | RGY | 16 | 3000 | RoHS & Green | NIPDAU | Level-2-260C-1 YEAR | -40 to 85 | 40197 | Samples |
| TPS40197RGYT | ACTIVE | VQFN | RGY | 16 | 250 | RoHS & Green | NIPDAU | Level-2-260C-1 YEAR | -40 to 85 | 40197 | Samples |

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBsolete: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

RGY (R-PVQFN-N16)

PLASTIC QUAD FLATPACK NO-LEAD

- NOTES:
- All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
 - This drawing is subject to change without notice.
 - QFN (Quad Flatpack No-Lead) package configuration.
 - The package thermal pad must be soldered to the board for thermal and mechanical performance.
 - See the additional figure in the Product Data Sheet for details regarding the exposed thermal pad features and dimensions.
- F** Pin 1 identifiers are located on both top and bottom of the package and within the zone indicated. The Pin 1 identifiers are either a molded, marked, or metal feature.
- Package complies to JEDEC MO-241 variation BA.

RGY (R-PVQFN-N16)

PLASTIC QUAD FLATPACK NO-LEAD

THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

Bottom View

Exposed Thermal Pad Dimensions
