

# TPS84210 2.95V 至 6V 输入、2A 同步降压集成式电源解决方案

## 1 特性

- 完整的集成式电源解决方案可实现小尺寸和扁平设计
- 效率高达 96%
- 宽输出电压调节范围 0.8V 至 3.6V, 基准精度为  $\pm 1\%$
- 可调开关频率 (500kHz 至 2MHz)
- 与外部时钟同步
- 可调慢速启动
- 输出电压排序/跟踪
- 电源正常输出
- 可编程欠压锁定 (UVLO)
- 输出过流保护
- 过热保护
- 运行温度范围: -40°C 至 85°C
- 增强的散热性能: 12°C/W
- 符合 EN55022 B 类辐射标准

## 2 应用

- 宽带和通信基础设施
- 自动化测试和医疗设备
- 紧凑型 PCI/PCI 快速接口/PXI 快速接口
- DSP 和 FPGA 负载点应用
- 高密度分布式电源系统

### 简化应用

## 3 说明

TPS84210RKG 是一个简单易用的集成式电源解决方案, 它在一个小外形尺寸的 BQFN 封装内整合了一个带有功率 MOSFET 的 2A 直流/直流转换器、一个电感器以及无源器件。此整体电源解决方案仅需 3 个外部组件, 并省去了环路补偿和磁性元件选择过程。

BQFN 封装能轻松焊接到印制电路板上, 并且可实现效率高于 90% 的紧凑型负载点设计且结至环境的热阻抗仅为 12°C/W 的出色功率耗散。在环境温度为 85°C 且无气流的情况下, 该器件可提供 2A 的满额输出电流。

TPS84210 具有离散式负载点设计的灵活性和功能集, 是为高性能 DSP 和 FPGA 供电的理想选择。先进的封装技术可提供一个与标准 QFN 贴装和测试技术兼容的耐用且可靠的电源解决方案。

### 器件信息<sup>(1)</sup>

器件型号	封装	封装尺寸
TPS84210	QFN (39)	11.0mm × 9.0mm

(1) 要了解所有可用封装, 请参阅数据表末尾的可订购产品附录。

### 效率与输出电流间的关系

## 5 Pin Configuration and Functions

### Pin Functions

TERMINAL		DESCRIPTION
NAME	NO.	
AGND	1, 5, 29 33, 34	Zero VDC reference for the analog control circuitry. These pins should be connected directly to the PCB analog ground plane. Not all pins are connected together internally. All pins must be connected together externally with a copper plane or pour directly under the module. Connect the AGND copper area to the PGND copper area at a single point; directly at the pin 37 PowerPAD using multiple vias. See the recommended layout in <a href="#">Figure 34</a> .
PowerPAD (PGND)	37	This pad provides both an electrical and thermal connection to the PCB. This pad should be connected directly to the PCB power ground plane using multiple vias for good electrical and thermal performance. The same vias should also be used to connect to the PCB analog ground plane. See the recommended layout in <a href="#">Figure 34</a> .
DNC	2, 3, 15, 16, 26	Do Not Connect. Do not connect these pins to AGND, to another DNC pin, or to any other voltage. These pins are connected to internal circuitry. Each pin must be soldered to an isolated pad.
INH/UVLO	28	Inhibit and UVLO adjust pin. Use an open drain or open collector output logic to control the INH function. A resistor between this pin and AGND adjusts the UVLO voltage.
PH	17, 18, 19, 20, 21, 22, 23, 24, 25, 39	Phase switch node. These pins should be connected by a small copper island under the device for thermal relief. Do not connect any external component to this pin or tie it to a pin of another function.
PWRGD	27	Power good fault pin. Asserts low if the output voltage is out of tolerance. A pull-up resistor is required.
RT/CLK	4	This pin automatically selects between RT mode and CLK mode. An external timing resistor adjusts the switching frequency of the device. In CLK mode, the device synchronizes to an external clock.

**Pin Functions (continued)**

TERMINAL		DESCRIPTION
NAME	NO.	
SENSE+	36	Remote sense connection. Connect this pin to VOUT at the load for improved regulation. This pin must be connected to VOUT at the load, or at the module pins.
SS/TR	6	Slow-start and tracking pin. Connecting an external capacitor to this pin adjusts the output voltage rise time. A voltage applied to this pin allows for tracking and sequencing control.
STSEL	7	Slow-start or track feature select. Connect this pin to AGND to enable the internal SS capacitor with a SS interval of approximately 1.1 ms. Leave this pin open to enable the TR feature.
VADJ	35	Connecting a resistor between this pin and AGND sets the output voltage above the 0.8 V default voltage.
VIN	30, 31, 32	The positive input voltage power pins, which are referenced to PGND. Connect external input capacitance between these pins and the PGND plane, close to the device.
VOUT	8, 9, 10, 11, 12, 13, 14, 38	Output voltage. Connect output capacitors between these pins and the PGND plane, close to the device.

## 6 Specifications

### 6.1 Absolute Maximum Ratings<sup>(1)</sup>

over operating temperature range (unless otherwise noted)

		MIN	MAX	UNIT
Input Voltage	VIN, PWRGD	-0.3	7	V
	INH/UVLO, RT/CLK	-0.3	3.3	V
	SS/TR, STSEL, VADJ	-0.3	3	V
	SENSE+   VADJ rating must also be met	-0.3	VOUT	V
Output Voltage	PH	-0.6	7	V
	PH 10 ns Transient	-2	7	V
	VOUT	-0.6	VIN	V
V <sub>DIFF</sub> (GND to exposed thermal pad)		-0.2	0.2	V
Source Current	RT/CLK, INH/UVLO			±100
	PH	Current Limit		μA
Sink Current	PH	Current Limit		A
	SS/TR	±100		μA
	PWRGD	10		mA
Operating Junction Temperature <sup>(2)</sup>		-40	125 <sup>(2)</sup>	°C
Storage Temperature		-65	150	°C
Peak Reflow Case Temperature <sup>(3)</sup>		250 <sup>(4)</sup>		°C
Maximum Number of Reflows Allowed <sup>(3)</sup>		3 <sup>(4)</sup>		
Mechanical shock	Mil-STD-883D, Method 2002.3, 1 msec, 1/2 sine, mounted	1500		
Mechanical vibration	Mil-STD-883D, Method 2007.2, 20-2000Hz	20		G

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

(2) See the temperature derating curves in the *Typical Characteristics* section for thermal information.

(3) For soldering specifications, refer to the [Soldering Requirements for BQFN Packages](#) application note.

(4) Devices with a date code prior to week 14 2018 (1814) have a peak reflow case temperature of 240°C with a maximum of one reflow.

## 6.2 Package Specifications

TPS84210		UNIT
Weight		0.85 grams
Flammability	Meets UL 94 V-O	
MTBF Calculated reliability	Per Bellcore TR-332, 50% stress, $T_A = 40^\circ\text{C}$ , ground benign	38.5 MHrs

## 6.3 Thermal Information

THERMAL METRIC <sup>(1)</sup>	TPS84210	UNIT
	RKG (QFN)	
	39 PINS	
$\theta_{JA}$	Junction-to-ambient thermal resistance <sup>(2)</sup>	12
$\psi_{JT}$	Junction-to-top characterization parameter <sup>(3)</sup>	2.2
$\psi_{JB}$	Junction-to-board characterization parameter <sup>(4)</sup>	9.7

(1) For more information about traditional and new thermal metrics, see the IC Package Thermal Metrics application report, [SPRA953](#).

(2) The junction-to-ambient thermal resistance,  $\theta_{JA}$ , applies to devices soldered directly to a 100 mm x 100 mm double-sided PCB with 1 oz. copper and natural convection cooling. Additional airflow reduces  $\theta_{JA}$ .

(3) The junction-to-top characterization parameter,  $\psi_{JT}$ , estimates the junction temperature,  $T_J$ , of a device in a real system, using a procedure described in JESD51-2A (sections 6 and 7).  $T_J = \psi_{JT} * P_{dis} + T_T$ ; where  $P_{dis}$  is the power dissipated in the device and  $T_T$  is the temperature of the top of the device.

(4) The junction-to-board characterization parameter,  $\psi_{JB}$ , estimates the junction temperature,  $T_J$ , of a device in a real system, using a procedure described in JESD51-2A (sections 6 and 7).  $T_J = \psi_{JB} * P_{dis} + T_B$ ; where  $P_{dis}$  is the power dissipated in the device and  $T_B$  is the temperature of the board 1mm from the device.

## 6.4 Electrical Characteristics

Over -40°C to 85°C free-air temperature,  $V_{IN} = 3.3\text{ V}$ ,  $V_{OUT} = 1.8\text{ V}$ ,  $I_{OUT} = 2\text{ A}$ ,  
 $C_{IN1} = 47\text{ }\mu\text{F}$  ceramic,  $C_{IN2} = 220\text{ }\mu\text{F}$  poly-tantalum,  $C_{OUT1} = 47\text{ }\mu\text{F}$  ceramic,  $C_{OUT2} = 100\text{ }\mu\text{F}$  poly-tantalum (unless otherwise noted)

PARAMETER		TEST CONDITIONS		MIN	TYP	MAX	UNIT		
$I_{OUT}$	Output current	$T_A = 85^\circ\text{C}$ , natural convection		0		2	A		
$V_{IN}$	Input voltage range	Over $I_{OUT}$ range		2.95 <sup>(1)</sup>		6	V		
UVLO	VIN Undervoltage lockout	VIN = increasing			3.05	3.135	V		
		VIN = decreasing		2.5	2.75				
$V_{OUT(adj)}$	Output voltage adjust range	Over $I_{OUT}$ range		0.8		3.6	V		
$V_{OUT}$	Set-point voltage tolerance	$T_A = 25^\circ\text{C}$ , $I_{OUT} = 0\text{A}$			$\pm 1.0\%$ <sup>(2)</sup>				
	Temperature variation	$-40^\circ\text{C} \leq T_A \leq +85^\circ\text{C}$ , $I_{OUT} = 0\text{A}$			$\pm 0.3\%$				
	Line regulation	Over $V_{IN}$ range, $T_A = 25^\circ\text{C}$ , $I_{OUT} = 0\text{A}$			$\pm 0.1\%$				
	Load regulation	Over $I_{OUT}$ range, $T_A = 25^\circ\text{C}$			$\pm 0.1\%$				
	Total output voltage variation	Includes set-point, line, load, and temperature variation			$\pm 1.5\%$ <sup>(2)</sup>				
$\eta$	Efficiency	VIN = 5 V $I_O = 1\text{ A}$	$V_{OUT} = 3.3\text{ V}$ , $f_{SW} = 1.5\text{ MHz}$	95%					
			$V_{OUT} = 2.5\text{ V}$ , $f_{SW} = 1.5\text{ MHz}$	93%					
			$V_{OUT} = 1.8\text{ V}$ , $f_{SW} = 1\text{ MHz}$	92%					
			$V_{OUT} = 1.5\text{ V}$ , $f_{SW} = 1\text{ MHz}$	91%					
			$V_{OUT} = 1.2\text{ V}$ , $f_{SW} = 750\text{ kHz}$	90%					
			$V_{OUT} = 1.0\text{ V}$ , $f_{SW} = 650\text{ kHz}$	88%					
			$V_{OUT} = 0.8\text{ V}$ , $f_{SW} = 650\text{ kHz}$	87%					
	Efficiency	VIN = 3.3 V $I_O = 1\text{ A}$	$V_{OUT} = 1.8\text{ V}$ , $f_{SW} = 1\text{ MHz}$	93%					
			$V_{OUT} = 1.5\text{ V}$ , $f_{SW} = 1\text{ MHz}$	92%					
			$V_{OUT} = 1.2\text{ V}$ , $f_{SW} = 750\text{ kHz}$	91%					
			$V_{OUT} = 1.0\text{ V}$ , $f_{SW} = 650\text{ kHz}$	89%					
			$V_{OUT} = 0.8\text{ V}$ , $f_{SW} = 650\text{ kHz}$	87%					
$V_{OUT}$ ripple	Output voltage ripple	20-MHz bandwidth			9		$\text{mV}_{PP}$		
$I_{LIM}$	Overcurrent threshold				3.5		A		
Transient response		1.0 A/ $\mu\text{s}$ load step from 0.5A to 1.5A		Recovery time	80		$\mu\text{s}$		
				$V_{OUT}$ over/undershoot	45		$\text{mV}$		
$V_{INH-H}$	Inhibit Control	Inhibit High Voltage			1.25	Open <sup>(3)</sup>	V		
$V_{INH-L}$		Inhibit Low Voltage			-0.3	1.0			
$I_{I(stby)}$	Input standby current	INH pin to AGND			70	100	$\mu\text{A}$		
Power Good	PWRGD Thresholds	$V_{OUT}$ rising		Good	93%				
				Fault	107%				
		$V_{OUT}$ falling		Fault	91%				
				Good	105%				
PWRGD Low Voltage		$I(PWRGD) = 0.33\text{ mA}$			0.3		V		
Thermal Shutdown		Shutdown Temperature			175		$^\circ\text{C}$		
		Hysteresis			15		$^\circ\text{C}$		
$C_{IN}$	External input capacitance	Ceramic		47 <sup>(4)</sup>			$\mu\text{F}$		
		Non-ceramic		220 <sup>(4)</sup>					

- (1) The minimum  $V_{IN}$  depends on  $V_{OUT}$  and the switching frequency. Please refer to [Table 7](#) for operating limits.
- (2) The stated limit of the set-point voltage tolerance includes the tolerance of both the internal voltage reference and the internal adjustment resistor. The overall output voltage tolerance will be affected by the tolerance of the external  $R_{SET}$  resistor.
- (3) This control pin has an internal pullup. Do not place an external pull-up resistor on this pin. If this pin is left open circuit, the device operates when input power is applied. A small low-leakage MOSFET is recommended for control. See the application section for further guidance.
- (4) A minimum of 47 $\mu\text{F}$  of ceramic capacitance is required across the input for proper operation. Locate the capacitor close to the device. An additional 220 $\mu\text{F}$  of bulk capacitance is recommended. See [Table 5](#) for more details.

## Electrical Characteristics (continued)

Over  $-40^{\circ}\text{C}$  to  $85^{\circ}\text{C}$  free-air temperature,  $\text{VIN} = 3.3 \text{ V}$ ,  $\text{V}_{\text{OUT}} = 1.8 \text{ V}$ ,  $\text{I}_{\text{OUT}} = 2 \text{ A}$ ,  $\text{C}_{\text{IN1}} = 47 \mu\text{F}$  ceramic,  $\text{C}_{\text{IN2}} = 220 \mu\text{F}$  poly-tantalum,  $\text{C}_{\text{OUT1}} = 47 \mu\text{F}$  ceramic,  $\text{C}_{\text{OUT2}} = 100 \mu\text{F}$  poly-tantalum (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
$\text{C}_{\text{OUT}}$	External output capacitance	Ceramic	47 <sup>(5)</sup>	150	650 <sup>(6)</sup>	$\mu\text{F}$
		Non-ceramic		100 <sup>(5)</sup>	1000 <sup>(6)</sup>	
		Equivalent series resistance (ESR)			25	$\text{m}\Omega$

- (5) The amount of required output capacitance varies depending on the output voltage (see [Table 3](#)). The amount of required capacitance must include at least  $47\mu\text{F}$  of ceramic capacitance. Locate the capacitance close to the device. Adding additional capacitance close to the load improves the response of the regulator to load transients. See [Table 3](#) and [Table 5](#) for more details.
- (6) When using both ceramic and non-ceramic output capacitance, the combined maximum must not exceed  $1200\mu\text{F}$ .

## 6.5 Switching Characteristics

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
$f_{\text{SW}}$	Switching frequency	Over $\text{VIN}$ and $\text{I}_{\text{OUT}}$ ranges, RT/CLK pin OPEN	400	500	600	$\text{kHz}$
$f_{\text{CLK}}$	CLK Control	Synchronization frequency	500		2000	$\text{kHz}$
$V_{\text{CLK-H}}$		CLK high level	2.2		3.3	$\text{V}$
$V_{\text{CLK-L}}$		CLK low level	-0.3		0.4	$\text{V}$
$\text{CLK\_PW}$		CLK Pulse Width	75 <sup>(1)</sup>			$\text{ns}$

- (1) The maximum synchronization clock pulse width is dependant on  $\text{VIN}$ ,  $\text{V}_{\text{OUT}}$ , and the synchronization frequency. See the [Synchronization \(CLK\)](#) section for more information.

## 6.6 Typical Characteristics (VIN = 5 V)

The electrical characteristic data has been developed from actual products tested at 25°C. This data is considered typical for the converter. Applies to [Figure 1](#), [Figure 2](#), and [Figure 4](#). The temperature derating curves represent the conditions at which internal components are at or below the manufacturer's maximum operating temperatures. Derating limits apply to devices soldered directly to a 100 mm × 100 mm double-sided PCB with 1 oz. copper. Applies to [Figure 4](#).

Figure 1. Efficiency vs. Output Current

Figure 2. Output Voltage Ripple vs. Output Current

Figure 3. Power Dissipation vs. Output Current

Figure 4. Safe Operating Area

Figure 5.  $V_{OUT} = 1.8\text{ V}$ ,  $I_{OUT} = 2\text{ A}$ ,  $C_{OUT1} = 47\text{ }\mu\text{F}$  ceramic,  $C_{OUT2} = 100\text{ }\mu\text{F}$  POSCAP,  $f_{SW} = 1\text{ MHz}$

## 6.7 Typical Characteristics (VIN = 3.3 V)

The electrical characteristic data has been developed from actual products tested at 25°C. This data is considered typical for the converter. Applies to [Figure 6](#), [Figure 7](#), and [Figure 8](#). The temperature derating curves represent the conditions at which internal components are at or below the manufacturer's maximum operating temperatures. Derating limits apply to devices soldered directly to a 100 mm x 100 mm double-sided PCB with 1 oz. copper. Applies to [Figure 9](#).

**Figure 6. Efficiency vs. Output Current**

**Figure 7. Output Voltage Ripple vs. Output Current**

**Figure 8. Power Dissipation vs. Output Current**

**Figure 9. Safe Operating Area**

**Figure 10.  $V_{OUT} = 1.8 \text{ V}$ ,  $I_{OUT} = 2 \text{ A}$ ,  $C_{OUT1} = 47 \mu\text{F}$  ceramic,  $C_{OUT2} = 100 \mu\text{F}$  POSCAP,  $f_{sw} = 1 \text{ MHz}$**

## 6.8 Functional Block Diagram

## 7 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 7.1 Application Information

#### 7.1.1 Adjusting The Output Voltage

The VADJ control sets the output voltage of the TPS84210. The output voltage adjustment range is from 0.8V to 3.6V. The adjustment method requires the addition of  $R_{SET}$ , which sets the output voltage, the connection of SENSE+ to VOUT, and in some cases  $R_{RT}$  which sets the switching frequency. The  $R_{SET}$  resistor must be connected directly between the VADJ (pin 35) and AGND (pin 33 & 34). The SENSE+ pin (pin 36) must be connected to VOUT either at the load for improved regulation or at VOUT of the module. The  $R_{RT}$  resistor must be connected directly between the RT/CLK (pin 4) and AGND (pins 33 & 34).

Table 1 gives the standard external  $R_{SET}$  resistor for a number of common bus voltages, along with the recommended  $R_{RT}$  resistor for that output voltage.

**Table 1. Standard  $R_{SET}$  Resistor Values for Common Output Voltages**

RESISTORS	OUTPUT VOLTAGE $V_{OUT}$ (V)					
	0.8	1.2	1.5	1.8	2.5	3.3
$R_{SET}$ (k $\Omega$ )	open	2.87	1.65	1.15	0.673	0.459
$R_{RT}$ (k $\Omega$ )	1200	715	348	348	174	174

For other output voltages, the value of the required resistor can either be calculated using the following formula, or simply selected from the range of values given in Table 2.

$$R_{SET} = \frac{1.43}{\left( \left( \frac{V_{OUT}}{0.803} \right) - 1 \right)} \text{ (k}\Omega\text{)} \quad (1)$$

**Table 2. Standard  $R_{SET}$  Resistor Values**

$V_{OUT}$ (V)	$R_{SET}$ (k $\Omega$ )	$R_{RT}$ (k $\Omega$ )	$f_{SW}$ (kHz)	$V_{OUT}$ (V)	$R_{SET}$ (k $\Omega$ )	$R_{RT}$ (k $\Omega$ )	$f_{SW}$ (kHz)
0.8	open	1200	650	2.3	0.768	174	1500
0.9	11.8	1200	650	2.4	0.715	174	1500
1.0	5.83	1200	650	2.5	0.673	174	1500
1.1	3.83	1200	650	2.6	0.634	174	1500
1.2	2.87	715	750	2.7	0.604	174	1500
1.3	2.32	715	750	2.8	0.576	174	1500
1.4	1.91	715	750	2.9	0.549	174	1500
1.5	1.65	348	1000	3.0	0.523	174	1500
1.6	1.43	348	1000	3.1	0.499	174	1500
1.7	1.27	348	1000	3.2	0.475	174	1500
1.8	1.15	348	1000	3.3	0.459	174	1500
1.9	1.05	348	1000	3.4	0.442	174	1500
2.0	0.953	174	1500	3.5	0.422	174	1500
2.1	0.845	174	1500	3.6	0.412	174	1500
2.2	0.825	174	1500				

## 7.2 Capacitor Recommendations For The TPS84210 Power Supply

### 7.2.1 Capacitor Technologies

#### 7.2.1.1 Electrolytic, Polymer-Electrolytic Capacitors

When using electrolytic capacitors, high-quality, computer-grade electrolytic capacitors are recommended. Polymer-electrolytic type capacitors are recommended for applications where the ambient operating temperature is less than 0°C. The Sanyo OS-CON capacitor series is suggested due to the lower ESR, higher rated surge, power dissipation, ripple current capability, and small package size. Aluminum electrolytic capacitors provide adequate decoupling over the frequency range of 2 kHz to 150 kHz, and are suitable when ambient temperatures are above 0°C.

#### 7.2.1.2 Ceramic Capacitors

The performance of aluminum electrolytic capacitors is less effective than ceramic capacitors above 150 kHz. Multilayer ceramic capacitors have a low ESR and a resonant frequency higher than the bandwidth of the regulator. They can be used to reduce the reflected ripple current at the input as well as improve the transient response of the output.

#### 7.2.1.3 Tantalum, Polymer-Tantalum Capacitors

Polymer-tantalum type capacitors are recommended for applications where the ambient operating temperature is less than 0°C. The Sanyo POSCAP series and Kemet T530 capacitor series are recommended rather than many other tantalum types due to their lower ESR, higher rated surge, power dissipation, ripple current capability, and small package size. Tantalum capacitors that have no stated ESR or surge current rating are not recommended for power applications.

### 7.2.2 Input Capacitor

The TPS84210 requires a minimum input capacitance of 47  $\mu$ F of ceramic capacitance. An additional 220  $\mu$ F polymer-tantalum capacitor is recommended for applications with transient load requirements. The combined ripple current rating of the input capacitors must be at least 1000 mA rms. [Table 5](#) includes a preferred list of capacitors by vendor. For applications where the ambient operating temperature is less than 0°C, an additional 1  $\mu$ F, X5R or X7R ceramic capacitor placed between VIN and AGND is recommended.

### 7.2.3 Output Capacitor

The required output capacitance is determined by the output voltage of the TPS84210. See [Table 3](#) for the amount of required capacitance. The required output capacitance must include at least one 47  $\mu$ F ceramic capacitor. For applications where the ambient operating temperature is less than 0°C, an additional 100  $\mu$ F polymer-tantalum capacitor is recommended. When adding additional non-ceramic bulk capacitors, low-ESR devices like the ones recommended in [Table 5](#) are required. The required capacitance above the minimum is determined by actual transient deviation requirements. See [Table 4](#) for typical transient response values for several output voltage, input voltage and capacitance combinations. [Table 5](#) includes a preferred list of capacitors by vendor.

**Table 3. Required Output Capacitance**

V <sub>OUT</sub> RANGE (V)		MINIMUM REQUIRED C <sub>OUT</sub> ( $\mu$ F)
MIN	MAX	
0.8	< 1.8	147 <sup>(1)</sup>
1.8	< 3.3	100 <sup>(2)</sup>
3.3	3.6	47 <sup>(2)</sup>

(1) Minimum required must include at least 1  $\times$  47  $\mu$ F ceramic capacitor plus 1  $\times$  100  $\mu$ F polymer-tantalum capacitor.

(2) Minimum required must include at least 47  $\mu$ F of ceramic capacitance.

**Table 4. Output Voltage Transient Response**

**(1) Capacitor Supplier Verification**

Please verify availability of capacitors identified in this table.

**RoHS, Lead-free and Material Details**

Please consult capacitor suppliers regarding material composition, RoHS status, lead-free status, and manufacturing process requirements.

(2) Maximum ESR @ 100 kHz, 25°C.

### 7.3 Transient Response

## Transient Response (continued)

## 7.4 Application Schematics

**Figure 19. Typical Schematic**  
**VIN = 2.95 V to 6.0 V, VOUT = 1.2 V**

**Figure 20. Typical Schematic**  
**VIN = 4.4 V to 6.0 V, VOUT = 3.3 V**

## 7.5 Power Good (PWRGD)

The PWRGD pin is an open drain output. Once the voltage on the SENSE+ pin is between 93% and 105% of the set voltage, the PWRGD pin pull-down is released and the pin floats. The recommended pull-up resistor value is between 10 k $\Omega$  and 100 k $\Omega$  to a voltage source that is 6 V or less. The PWRGD pin is in a defined state once VIN is greater than 1.2 V, but with reduced current sinking capability. The PWRGD pin achieves full current sinking capability once the VIN pin is above 2.95V. [Figure 21](#) shows the PWRGD waveform during power-up. The PWRGD pin is pulled low when the voltage on SENSE+ is lower than 91% or greater than 107% of the nominal set voltage. Also, the PWRGD pin is pulled low if the input UVLO or thermal shutdown is asserted, or if the INH pin is pulled low.

## 7.6 Power-Up Characteristics

When configured as shown in the front page schematic, the TPS84210 produces a regulated output voltage following the application of a valid input voltage. During the power-up, internal soft-start circuitry slows the rate that the output voltage rises, thereby limiting the amount of in-rush current that can be drawn from the input source. The soft-start circuitry introduces a short time delay from the point that a valid input voltage is recognized. [Figure 21](#) shows the start-up waveforms for a TPS84210, operating from a 5-V input and with the output voltage adjusted to 1.8 V. The waveform is measured with a 2-A constant current load.

**Figure 21. Start-Up Waveforms**

## 7.7 Remote Sense

The SENSE+ pin must be connected to  $V_{OUT}$  at the load, or at the device pins.

Connecting the SENSE+ pin to  $V_{OUT}$  at the load improves the load regulation performance of the device by allowing it to compensate for any I-R voltage drop between its output pins and the load. An I-R drop is caused by the high output current flowing through the small amount of pin and trace resistance. This should be limited to a maximum of 300 mV.

### NOTE

The remote sense feature is not designed to compensate for the forward drop of nonlinear or frequency dependent components that may be placed in series with the converter output. Examples include OR-ing diodes, filter inductors, ferrite beads, and fuses. When these components are enclosed by the SENSE+ connection, they are effectively placed inside the regulation control loop, which can adversely affect the stability of the regulator.

## 7.8 Output On/Off Inhibit (INH)

The INH pin provides electrical on/off control of the device. Once the INH pin voltage exceeds the threshold voltage, the device starts operation. If the INH pin voltage is pulled below the threshold voltage, the regulator stops switching and enters low quiescent current state.

The INH pin has an internal pull-up current source, allowing the user to float the INH pin for enabling the device. If an application requires controlling the INH pin, use an open drain/collector device, or a suitable logic gate to interface with the pin. Do not place an external pull-up resistor on this pin. [Figure 22](#) shows the typical application of the inhibit function.

Turning Q1 on applies a low voltage to the inhibit control (INH) pin and disables the output of the supply, as shown in [Figure 23](#). If Q1 is turned off, the supply executes a soft-start power-up sequence, as shown in [Figure 24](#). The waveforms were measured with a 2-A constant current load.

Figure 22. Typical Inhibit Control

## 7.9 Slow Start (SS/TR)

Connecting the STSEL pin to AGND and leaving SS/TR pin open enables the internal SS capacitor with a slow start interval of approximately 1.1 ms. Adding additional capacitance between the SS pin and AGND increases the slow start time. [Table 6](#) shows an additional SS capacitor connected to the SS/TR pin and the STSEL pin connected to AGND. See [Table 6](#) below for SS capacitor values and timing interval.

UDG-11119

**Figure 25. Slow-Start Capacitor ( $C_{SS}$ ) and STSEL Connection**

**Table 6. Slow-Start Capacitor Values and Slow-Start Time**

$C_{SS}$ (pF)	open	2200	4700	10000	15000	22000	25000
SS Time (msec)	1.1	1.9	2.8	4.6	6.4	8.8	9.8

## 7.10 Overcurrent Protection

For protection against load faults, the TPS84210 uses current limiting. The device is protected from overcurrent conditions by cycle-by-cycle current limiting and frequency foldback. During an overcurrent condition the output current is limited and the output voltage is reduced, as shown in [Figure 26](#). When the overcurrent condition is removed, the output voltage returns to the established voltage, as shown in [Figure 27](#).

## 7.11 Synchronization (CLK)

An internal phase locked loop (PLL) has been implemented to allow synchronization between 500 kHz and 2 MHz, and to easily switch from RT mode to CLK mode. To implement the synchronization feature, connect a square wave clock signal to the RT/CLK pin with a minimum pulse width of 75 ns. The maximum clock pulse width must be calculated using [Equation 2](#). The clock signal amplitude must transition lower than 0.4 V and higher than 2.2 V. The start of the switching cycle is synchronized to the falling edge of RT/CLK pin. In applications where both RT mode and CLK mode are needed, the device can be configured as shown in [Figure 28](#).

Before the external clock is present, the device works in RT mode and the switching frequency is set by RT resistor ( $R_{RT}$ ). When the external clock is present, the CLK mode overrides the RT mode. The device switches from RT mode to CLK mode and the RT/CLK pin becomes high impedance as the PLL starts to lock onto the frequency of the external clock. The device will lock to the external clock frequency approximately 15  $\mu$ s after a valid clock signal is present. It is not recommended to switch from CLK mode back to RT mode because the internal switching frequency drops to a lower frequency before returning to the switching frequency set by the RT resistor.

$$CLK\_PW_{MAX} = \frac{0.75 \times \left(1 - \frac{V_{OUT}}{V_{IN(\min)}}\right)}{f_{SW}} \quad (2)$$

**Figure 28. CLK/RT Configuration**

The synchronization frequency must be selected based on the output voltages of the devices being synchronized. [Table 7](#) shows the allowable frequencies for a given range of output voltages based on a resistive load. 5-V input applications requiring 1.5 A or less can synchronize to a wider frequency range. For the most efficient solution, always synchronize to the lowest allowable frequency. For example, an application requires synchronizing three TPS84210 devices with output voltages of 1.2V@1.7A, 1.8@1.1AV and 3.3V@ 1.0A, all powered from  $V_{IN} = 5V$ . [Table 7](#) shows that all three output voltages can be synchronized to any frequency between 700 kHz to 1 MHz. For best efficiency, choose 700 kHz as the synchronization frequency.

**Table 7. Synchronization Frequency vs Output Voltage**

SYNCHRONIZATION FREQUENCY (kHz)	$R_{RT}$ (kΩ)	VIN = 5 V				VIN = 3.3 V	
		$I_{OUT} \leq 1.5$ A		$I_{OUT} > 1.5$ A		All $I_{OUT}$

1750	137	2.0	3.6	2.0	3.6	1.3	2.4

**Table 7. Synchronization Frequency vs Output Voltage (continued)**

SYNCHRONIZATION FREQUENCY (kHz)	R <sub>RT</sub> (kΩ)	VIN = 5 V				VIN = 3.3 V	
		I <sub>OUT</sub> ≤ 1.5 A		I <sub>OUT</sub> > 1.5 A		All I <sub>OUT</sub>	
		V <sub>OUT</sub> RANGE (V)		V <sub>OUT</sub> RANGE (V)		V <sub>OUT</sub> RANGE (V)	
		MIN	MAX	MIN	MAX	MIN	MAX
2000	113	2.3	3.6	2.3	3.6	1.5	2.3

## 7.12 Sequencing (SS/TR)

Many of the common power supply sequencing methods can be implemented using the SS/TR, INH and PWRGD pins. The sequential method is illustrated in Figure 29 using two TPS84210 devices. The PWRGD pin of the first device is coupled to the INH pin of the second device which enables the second power supply once the primary supply reaches regulation. Do not place a pull-up resistor on PWRGD in this configuration. Figure 30 shows sequential turn-on waveforms of two TPS84210 devices.

Simultaneous power supply sequencing can be implemented by connecting the resistor network of R1 and R2 shown in Figure 31 to the output of the power supply that needs to be tracked or to another voltage reference source. Figure 32 shows simultaneous turn-on waveforms of two TPS84210 devices. Use Equation 3 and Equation 4 to calculate the values of R1 and R2.

$$R1 = \frac{(V_{OUT2} \times 12.6)}{0.803} \text{ (k}\Omega\text{)} \quad (3)$$

$$R2 = \frac{0.803 \times R1}{(V_{OUT2} - 0.803)} \text{ (k}\Omega\text{)} \quad (4)$$

## 7.13 Programmable Undervoltage Lockout (UVLO)

The TPS84210 implements internal UVLO circuitry on the VIN pin. The device is disabled when the VIN pin voltage falls below the internal VIN UVLO threshold. The internal VIN UVLO rising threshold is 3.135 V (max) with a typical hysteresis of 300 mV.

If an application requires a higher UVLO threshold on the VIN pin, the UVLO pin can be configured as shown in Figure 33. Table 8 lists standard values for  $R_{UVLO}$  to adjust the VIN UVLO voltage up.

Figure 33. Adjustable VIN UVLO

Table 8. Standard Resistor values for Adjusting VIN UVLO

VIN UVLO (V) (typ)	3.25	3.5	3.75	4.0	4.25	4.5	4.75
$R_{UVLO}$ (kΩ)	294	133	86.6	63.4	49.9	42.2	35.7
Hysteresis (mV)	325	335	345	355	365	375	385

## 7.14 Thermal Shutdown

The internal thermal shutdown circuitry forces the device to stop switching if the junction temperature exceeds 175°C typically. The device reinitiates the power up sequence when the junction temperature drops below 160°C typically.

## 7.15 Layout Guidelines

To achieve optimal electrical and thermal performance, an optimized PCB layout is required. Figure 34, shows a typical PCB layout. Some considerations for an optimized layout are:

- Use large copper areas for power planes (VIN, VOUT, and PGND) to minimize conduction loss and thermal stress.
- Place ceramic input and output capacitors close to the module pins to minimize high frequency noise.
- Locate additional output capacitors between the ceramic capacitor and the load.
- Place a dedicated AGND copper area beneath the TPS84210.
- Connect the AGND and PGND copper area at one point; directly at the pin 37 PowerPad using multiple vias.
- Place  $R_{SET}$ ,  $R_{RT}$ , and  $C_{SS}$  as close as possible to their respective pins.
- Use multiple vias to connect the power planes to internal layers.

## 7.16 Layout Example

Figure 34. Typical Top-Layer Recommended Layout

Figure 35. Typical PGND-Layer Recommended Layout

## 7.17 EMI

The TPS84210 is compliant with EN55022 Class B radiated emissions. Figure 36 and Figure 37 show typical examples of radiated emissions plots for the TPS84210 operating from 5V and 3.3V respectively. Both graphs include the plots of the antenna in the horizontal and vertical positions.

Figure 36. Radiated Emissions 5-V Input, 1.8-V Output, 2-A Load (EN55022 Class B)

Figure 37. Radiated Emissions 3.3-V Input, 1.8-V Output, 2-A Load (EN55022 Class B)

## 8 器件和文档支持

### 8.1 接收文档更新通知

要接收文档更新通知, 请导航至 [TI.com.cn](http://TI.com.cn) 上的器件产品文件夹。单击右上角的通知我 进行注册, 即可每周接收产品信息更改摘要。有关更改的详细信息, 请查看任何已修订文档中包含的修订历史记录。

### 8.2 社区资源

下列链接提供到 TI 社区资源的连接。链接的内容由各个分销商“按照原样”提供。这些内容并不构成 TI 技术规范, 并且不一定反映 TI 的观点; 请参阅 TI 的 [《使用条款》](#)。

**TI E2E™ 在线社区** **TI 的工程师对工程师 (E2E) 社区**。此社区的创建目的在于促进工程师之间的协作。在 [e2e.ti.com](http://e2e.ti.com) 中, 您可以咨询问题、分享知识、拓展思路并与同行工程师一道帮助解决问题。

<sup>(1)</sup> **Status:** For more details on status, see our [product life cycle](#).

<sup>(2)</sup> **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

<sup>(3)</sup> **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

<sup>(4)</sup> **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

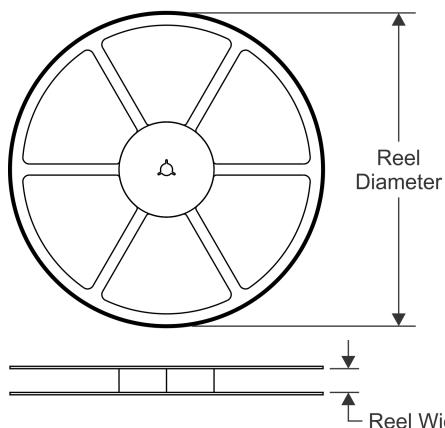

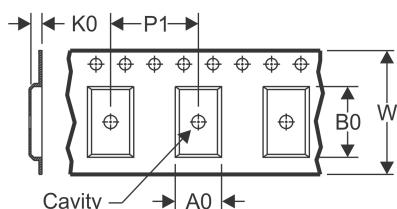

<sup>(5)</sup> **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

<sup>(6)</sup> **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

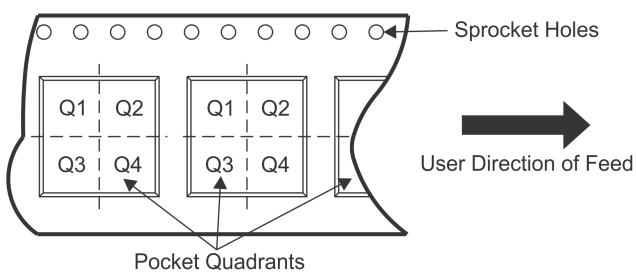

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

## THERMAL PAD MECHANICAL DATA

RKG (R-PQFN-N39)

PLASTIC QUAD FLATPACK NO-LEAD

## THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at [www.ti.com](http://www.ti.com).

The exposed thermal pad dimensions for this package are shown in the following illustration.

- E. Customers should contact their board fabrication site for minimum solder mask web tolerances between signal pads.

## 重要通知和免责声明

TI“按原样”提供技术和可靠性数据（包括数据表）、设计资源（包括参考设计）、应用或其他设计建议、网络工具、安全信息和其他资源，不保证没有瑕疵且不做出任何明示或暗示的担保，包括但不限于对适销性、与某特定用途的适用性或不侵犯任何第三方知识产权的暗示担保。

这些资源可供使用 TI 产品进行设计的熟练开发人员使用。您将自行承担以下全部责任：(1) 针对您的应用选择合适的 TI 产品，(2) 设计、验证并测试您的应用，(3) 确保您的应用满足相应标准以及任何其他安全、安保法规或其他要求。

这些资源如有变更，恕不另行通知。TI 授权您仅可将这些资源用于研发本资源所述的 TI 产品的相关应用。严禁以其他方式对这些资源进行复制或展示。您无权使用任何其他 TI 知识产权或任何第三方知识产权。对于因您对这些资源的使用而对 TI 及其代表造成的任何索赔、损害、成本、损失和债务，您将全额赔偿，TI 对此概不负责。

TI 提供的产品受 [TI 销售条款](#)、[TI 通用质量指南](#) 或 [ti.com](#) 上其他适用条款或 TI 产品随附的其他适用条款的约束。TI 提供这些资源并不会扩展或以其他方式更改 TI 针对 TI 产品发布的适用的担保或担保免责声明。除非德州仪器 (TI) 明确将某产品指定为定制产品或客户特定产品，否则其产品均为按确定价格收入目录的标准通用器件。

TI 反对并拒绝您可能提出的任何其他或不同的条款。
