Texas

## 1 特性

－具有光兼容输入的 $3.75 \mathrm{kV} \mathrm{RMS}_{\mathrm{RM}}$ 单通道隔离式栅极驱动器
－适用于光隔离式栅极驱动器的引脚对引脚普适版升级

- 可输出 4.5 A 峰值拉电流，5．3A 峰值灌电流
- 最高 $33 V$ 输出驱动器电源电压
- $8 \mathrm{~V}(\mathrm{~B})$ 和 12 V VCC UVLO 选项
- 轨到轨输出
- 105ns（最大值）传播延迟
- $25 n s$（最大值）器件间延迟匹配
- 35ns（最大值）脉宽失真度
- $150 \mathrm{kV} / \mu \mathrm{s}$（最小值）共模瞬态抗扰度（CMTI）
- 隔离栅寿命大于 50 年
- 输入级具有 13 V 反极性电压处理能力，支持互锁
- 扩展型 SO－6 封装，爬电距离和间隙大于 8.5 mm
- 运行结温 $\mathrm{T}_{\mathrm{J}}:-40^{\circ} \mathrm{C}$ 至 $+150^{\circ} \mathrm{C}$
- 安全相关认证（计划）：
- 符合 DIN V VDE V0884－11：2017－01 标准的 $6000 V_{\text {PK }}$ 基础型隔离
－符合 UL 1577 标准且长达 1 分钟的 $3.75 \mathrm{kV} \mathrm{VMS}_{\mathrm{RMS}}$隔离
－获得 CQC 认证，符合 GB4943．1－2011 标准

## 2 应用

- 工业电机控制驱动
- 工业用电源，UPS
- 光伏逆变器
- 感应加热

功能方框图

## 3 说明

UCC23313 是一款适用于 IGBT，MOSFET 和 SiC MOSFET 的光兼容单通道隔离式栅极驱动器，具有 4．5A 峰值拉电流和 5.3 A 峰值灌电流以及 $3.75 \mathrm{kV}_{\mathrm{RMS}}$基本隔离额定值。由于具有 33 V 的高电源电压范围，因此允许使用双极电源来有效驱动 IGBT 和 SiC 功率 FET。UCC23313 可以驱动低侧和高侧功率 FET。与基于光耦合器的标准栅极驱动器相比，此器件的主要特性可显著提高性能和可靠性，同时在原理图和布局设计中保持引脚对引脚兼容性。性能亮点包括高共模瞬态抗扰度（CMTI），低传播延迟和小脉宽失真。严格的过程控制可实现较小的器件间偏移。输入级是仿真二极管 （e－diode），这意味着与光耦合器栅极驱动器中传统的 LED 相比，可靠性和老化特性更为出色。该器件采用扩展型 SO6 封装，爬电距离和间隙大于 8.5 mm ，塑封材料（材料组 I ）的相对漏电起痕指数（CTI）大于 600V。UCC23313具有高性能和高可靠性，因此非常适合用于所有类型的电机驱动器，光伏逆变器，工业电源和电器。更高的工作温度为传统光耦合器以前无法支持的应用开辟了机会。

## 器件信息 ${ }^{(1)}$

| 器件型号 | 封装 | 封装尺寸（ 标称值 ） |
| :--- | :--- | :--- |
| UCC23313 | 扩展型 SO－6 | $7.5 \mathrm{~mm} \times 4.68 \mathrm{~mm}$ |

## Pin Functions

| PIN |  | TYPE ${ }^{(1)}$ | DESCRIPTION |
| :---: | :---: | :---: | :---: |
| NAME | NO. |  |  |
|  | UCC23313 |  |  |
| ANODE | 1 | 1 | Anode |
| CATHODE | 3 | 1 | Cathode |
| NC | 2 | - | No Connection |
| $\mathrm{V}_{\mathrm{Cc}}$ | 6 | P | Positive output supply rail |
| $\mathrm{V}_{\text {EE }}$ | 4 | P | Negative output supply rail |
| $\mathrm{V}_{\text {OUT }}$ | 5 | 0 | Gate-drive output |

(1) $P=$ Power, $G=$ Ground, $I=$ Input, $O=$ Output

## 6 Specifications

### 6.1 Absolute Maximum Ratings

Over operating free air temperature range (unless otherwise noted) ${ }^{(1)}$

|  |  | MIN | MAX |
| :--- | :--- | ---: | :---: |
| Average Input Current | $\mathrm{I}_{\mathrm{F}(\mathrm{AVG})}$ | - | 25 |
| Peak Transient Input Current | $\mathrm{I}_{\mathrm{F}(\text { TRAN })}<1$ us pulse, 300pps | mA |  |
| Reverse Input Voltage | $\mathrm{V}_{\mathrm{R}(\mathrm{MAX})}$ |  | 1 |
| Output supply voltage | $\mathrm{V}_{\mathrm{CC}}-\mathrm{V}_{\mathrm{EE}}$ | A |  |
| Output signal voltage | $\mathrm{V}_{\mathrm{OUT}}-\mathrm{V}_{\mathrm{CC}}$ | -0.3 | 14 |
| Output signal voltage | $\mathrm{V}_{\mathrm{OUT}}-\mathrm{V}_{\mathrm{EE}}$ | V |  |
| Junction temperature | $\mathrm{T}_{\mathrm{J}}{ }^{(2)}$ | -0.3 | V |
| Storage temperature | $\mathrm{T}_{\text {stg }}$ | -40 | 0.3 |

(1) Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under Recommended Operating Conditions. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) To maintain the recommended operating conditions for $\mathrm{T}_{\mathrm{J}}$, see the Thermal Information Section.

### 6.2 ESD Ratings

| $* \mid$ VALUE |  | UNIT |  |  |
| :--- | :--- | :--- | :---: | :---: |
| $\mathrm{V}_{(\text {ESD })}$ | Electrostatic <br> discharge | Human-body model (HBM), per AEC Q100-002 ${ }^{(1)}$ | $\pm 4000$ | V |
|  | Charged-device model (CDM), per AEC Q100-011 | $\pm 1500$ |  |  |

(1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

### 6.3 Recommended Operating Conditions

Over operating free-air temperature range (unless otherwise noted)

|  |  | MIN | NOM | MAX |
| :--- | :--- | ---: | :---: | :---: |
| $V_{C C}$ | Output Supply Voltage $\left(\mathrm{V}_{\mathrm{CC}}-\mathrm{V}_{\mathrm{EE}}\right)$ | 14 | 33 | V |
| $\mathrm{~V}_{\mathrm{CC}}$ | Output Supply Voltage( $\left.\mathrm{V}_{\mathrm{CC}}-\mathrm{V}_{\mathrm{EE}}\right)$ | 10 | 33 | V |
| $\mathrm{I}_{\mathrm{F}}(\mathrm{ON})$ | Input Diode Forward Current (Diode "ON") | 7 | 16 | mA |
| $\mathrm{~V}_{\mathrm{F}}(\mathrm{OFF})$ | Anode voltage - Cathode voltage (Diode "OFF") | -13 | 0.9 | V |
| $\mathrm{~T}_{\mathrm{J}}$ | Junction temperature | -40 | 150 | ${ }^{\circ} \mathrm{C}$ |
| $\mathrm{T}_{\mathrm{A}}$ | Ambient temperature | -40 | 125 | ${ }^{\circ} \mathrm{C}$ |

### 6.4 Thermal Information

| THERMAL METRIC ${ }^{(1)}$ |  | UCC23313 | UNIT |
| :---: | :---: | :---: | :---: |
|  |  | SO6 |  |
|  |  | 6 Pins |  |
| $\mathrm{R}_{\theta \text { JA }}$ | Junction-to-ambient thermal resistance | 126 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| $\mathrm{R}_{\theta \mathrm{JC} \text { (top) }}$ | Junction-to-case (top) thermal resistance | 66.1 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| $\mathrm{R}_{\theta \text { JB }}$ | Junction-to-board thermal resistance | 62.8 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| $\Psi_{\text {JT }}$ | Junction-to-top characterization parameter | 29.6 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| $\Psi_{\text {JB }}$ | Junction-to-board characterization parameter | 60.8 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |

[^1]
## 6.5 额定功率

| 参数 |  | 测试条件 | 最小值 | 典型值 最大值 | 单位 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{P}_{\mathrm{D}}$ | 输入端和输出端的最大功率耗散 ${ }^{(1)}$ | $\mathrm{V}_{\mathrm{CC}}=20 \mathrm{~V}, \mathrm{I}_{\mathrm{F}}=10 \mathrm{~mA}, 10 \mathrm{kHz}, 50 \%$ 占空比，方波， 180 nF 负载， $\mathrm{T}_{\mathrm{A}}=25^{\circ} \mathrm{C}$ |  | 750 | mW |
| $\mathrm{P}_{\mathrm{D} 1}$ | 最大输入功率耗散 ${ }^{(2)}$ |  |  | 10 | mW |
| $\mathrm{P}_{\mathrm{D} 2}$ | 最大输出功率耗散 |  |  | 740 | mW |

（1）超过 $25^{\circ} \mathrm{C}$ 环境温度时会降低 $6 \mathrm{~mW} /{ }^{\circ} \mathrm{C}$
（2）建议最大值 $P_{D 1}=40 \mathrm{~mW}$ 。绝对最大值 $P_{D 1}=55 \mathrm{~mW}$

### 6.6 Insulation Specifications

| PARAMETER |  | TEST CONDITIONS | SPECIFIC ATION | UNIT <br> mm |
| :---: | :---: | :---: | :---: | :---: |
| CLR | External clearance ${ }^{(1)}$ | Shortest terminal-to-terminal distance through air | >8.5 |  |
| CPG | External Creepage ${ }^{(1)}$ | Shortest terminal-to-terminal distance across the package surface | >8.5 | mm |
| DTI | Distance through the insulation | Minimum internal gap (internal clearance) | >17 | $\mu \mathrm{m}$ |
| CTI | Comparative tracking index | DIN EN 60112 (VDE 0303-11); IEC 60112 | >600 | V |
|  | Material Group | According to IEC 60664-1 | 1 |  |
|  | Overvoltage category per IEC 60664-1 | Rated mains voltage $\leqslant 600 \mathrm{~V}_{\mathrm{RMS}}$ | I-IV |  |
|  |  | Rated mains voltage $\leqslant 1000 \mathrm{~V}_{\mathrm{RMS}}$ | I-III |  |
| DIN V VDE 0884-11 (VDE V 0884-11) ${ }^{(2)}$ |  |  |  |  |
| $\mathrm{V}_{\text {IORM }}$ | Maximum repetitive peak isolation voltage | AC voltage (bipolar) | 990 | $\mathrm{V}_{\mathrm{PK}}$ |

|  |  | $\mathrm{V}_{10}=500 \mathrm{~V}$ at $\mathrm{T}_{\mathrm{S}}=150^{\circ} \mathrm{C}$ | $>10^{9}$ |  |
|  | Pollution degree |  | 2 |  |
|  | Climatic category |  | 40/125/21 |  |
| UL 1577 |  |  |  |  |
| VISO | Withstand isolation voltage | $\begin{aligned} & \mathrm{V}_{\text {TEST }}=\mathrm{V}_{\text {ISO }}=3750 \mathrm{~V}_{\text {RMS }}, \mathrm{t}=60 \mathrm{~s} \text { (qualification) } \\ & \mathrm{V}_{\text {TEST }}=1.2 \times \mathrm{V}_{\text {ISO }}=4500 \mathrm{~V}_{\text {RMS }}, \mathrm{t}=1 \mathrm{~s}(100 \% \\ & \text { production) } \end{aligned}$ | 3750 | $\mathrm{V}_{\text {RMS }}$ |

(1) Creepage and clearance requirements should be applied according to the specific equipment isolation standards of an application. Care should be taken to maintain the creepage and clearance distance of a board design to ensure that the mounting pads of the isolator on the printed-circuit board do not reduce this distance. Creepage and clearance on a printed-circuit board become equal in certain cases. Techniques such as inserting grooves, ribs, or both on a printed-circuit board are used to help increase these specifications.
(2) This coupler is suitable for safe electrical insulation only within the safety ratings. Compliance with the safety ratings shall be ensured by means of suitable protective circuits.
(3) Testing is carried out in air or oil to determine the intrinsic surge immunity of the isolation barrier.
(4) Apparent charge is electrical discharge caused by a partial discharge (pd).
(5) All pins on each side of the barrier tied together creating a two-pin device.

## 6．7 Safety－Related Certifications

## 6.8 安全限值

| 参数 |  | 测试条件 | 最小值 | 典型值 最大值 | 单位 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Is | 安全输入，输出或电源电流 | $\begin{aligned} & \mathrm{R}_{\mathrm{qJA}}=126^{\circ} \mathrm{C} / \mathrm{W}, \mathrm{~V}_{\mathrm{I}}=15 \mathrm{~V}, \mathrm{~T}_{\mathrm{J}}= \\ & 150^{\circ} \mathrm{C}, \mathrm{~T}_{\mathrm{A}}=25^{\circ} \mathrm{C} \end{aligned}$ |  | 50 | mA |
|  |  | $\begin{aligned} & \mathrm{R}_{\mathrm{qJA}}=126^{\circ} \mathrm{C} / \mathrm{W}, \mathrm{~V}_{1}=30 \mathrm{~V}, \mathrm{~T}_{\mathrm{J}}= \\ & 150^{\circ} \mathrm{C}, \mathrm{~T}_{\mathrm{A}}=25^{\circ} \mathrm{C} \end{aligned}$ |  | 25 |  |
| $\mathrm{P}_{\mathrm{S}}$ | 安全输入，输出或总电源 | $\mathrm{R}_{\text {qJA }}=126^{\circ} \mathrm{C} / \mathrm{W}, \mathrm{T}_{J}=150^{\circ} \mathrm{C}, \mathrm{T}_{\mathrm{A}}=25^{\circ} \mathrm{C}$ |  | 750 | mW |
| $\mathrm{T}_{\text {S }}$ | 最高安全温度 ${ }^{(1)}$ |  |  | 150 | ${ }^{\circ} \mathrm{C}$ |

（1）最高安全温度 $T_{S}$ 与器件指定的最大结温 $T_{J}$ 的值相同。 $I_{S}$ 和 $P_{S}$ 参数分别表示安全电流和安全功率。请勿超出 $I_{S}$ 和 $P_{S}$ 的最大限值。这些限值随环境温度 $T_{A}$ 的变化而变化。＂热性能信息＂表中的结至空气热阻 $R_{q J A}$ 所属器件安装在引线式表面贴装封装对应的高 $K$ 测试板上。可以使用这些公式计算每个参数的值：$T_{J}=T_{A}+R_{q J A} \times P$ ，其中 $P$ 为器件中耗散的功率。 $T_{J(m a x)}=T_{S}=T_{A}+R_{q J A} \times P_{S}$ ，其中 $T_{J(\max )}$ 为允许的最大结温。 $P_{S}=I_{S} \times V_{I}$ ，其中 $V I$ 为最大输入电源电压。

## 6．9 Electrical Characteristics

Unless otherwise noted，all typical values are at $T_{A}=25^{\circ} \mathrm{C}, \mathrm{V}_{\mathrm{CC}}-\mathrm{V}_{\mathrm{EE}}=15 \mathrm{~V}, \mathrm{~V}_{\mathrm{EE}}=\mathrm{GND}$ ．All min and max specifications are at recommended operating conditions（ $T_{J}=-40 \mathrm{C}$ to $150^{\circ} \mathrm{C}, \mathrm{I}_{\mathrm{F}(\mathrm{on})}=7 \mathrm{~mA}$ to $16 \mathrm{~mA}, \mathrm{~V}_{\mathrm{EE}}=\mathrm{GND}, \mathrm{V}_{\mathrm{CC}}=15 \mathrm{~V}$ to $30 \mathrm{~V}, \mathrm{~V}_{\mathrm{F} \text {（off）}}=-$ 5 V to 0.8 V ）

## 7．3 CMTI Testing

图 7－3 is the simplified diagram of the CMTI testing．Common mode voltage is set to 1500 V ．The test is performed with $\mathrm{I}_{\mathrm{F}}=6 \mathrm{~mA}(\mathrm{VOUT}=\mathrm{High})$ and $\mathrm{I}_{\mathrm{F}}=0 \mathrm{~mA}\left(\mathrm{~V}_{\text {OUT }}=\mathrm{LOW}\right)$ ．The diagram also shows the fail criteria for both cases．During the application on the CMTI pulse with $I_{F}=6 \mathrm{~mA}$ ，if $\mathrm{V}_{\text {OUT }}$ drops from VCC to $1 / 2 \mathrm{VCC}$ it is considered as a failure．With $\mathrm{I}_{\mathrm{F}}=0 \mathrm{~mA}$ ，if $\mathrm{V}_{\text {OUT }}$ rises above 1 V ，it is considered as a failure．

图 7－3．CMTI Test Circuit for UCC23313

## 8 Detailed Description

## 8．1 Overview

UCC23313 is a single channel isolated gate driver，with an opto－compatible input stage，that can drive IGBTs， MOSFETs and SiC FETs．It has 4A peak output current capability with max output driver supply voltage of 33V． The inputs and the outputs are galvanically isolated．UCC23313 is offered in an industry standard 6 pin（SO6） package with $>8.5 \mathrm{~mm}$ creepage and clearance．It has a working voltage of $700-\mathrm{V}_{\mathrm{RMS}}$ ，isolation rating of 3.75 $\mathrm{kV}_{\mathrm{RMS}}$ for 60 s and a surge rating of $6 \mathrm{kV} \mathrm{VK}_{\mathrm{PK}}$ ．It is pin－to－pin compatible with standard opto isolated gate drivers． While standard opto isolated gate drivers use an LED as the input stage，UCC23313 uses an emulated diode（or ＂e－diode＂）as the input stage which does not use light emission to transmit signals across the isolation barrier． The input stage is isolated from the driver stage by dual，series $\mathrm{HV} \mathrm{SiO}_{2}$ capacitors in full differential configuration that not only provides isolation but also offers best－in－class common mode transient immunity of $>150 \mathrm{kV} /$ us．The e－diode input stage along with capacitive isolation technology gives UCC23313 several performance advantages over standard opto isolated gate drivers．They are as follows：
1.

1．Since the e－diode does not use light emission for its operation，the reliability and aging characteristics of UCC23313 are naturally superior to those of standard opto isolated gate drivers．
2．Higher ambient operating temperature range of $125^{\circ} \mathrm{C}$ ，compared to only $105^{\circ} \mathrm{C}$ for most opto isolated gate drivers
3．The e－diode forward voltage drop has less part－to－part variation and smaller variation across temperature． Hence，the operating point of the input stage is more stable and predictable across different parts and operating temperature．
4．Higher common mode transient immunity than opto isolated gate drivers
5．Smaller propagation delay than opto isolated gate drivers
6．Due to superior process controls achievable in capacitive isolation compared to opto isolation，there is less part－to－part skew in the prop delay，making the system design simpler and more robust
7．Smaller pulse width distortion than opto isolated gate drivers
The signal across the isolation has an on－off keying（OOK）modulation scheme to transmit the digital data across a silicon dioxide based isolation barrier（see 图 8－1）．The transmitter sends a high－frequency carrier across the barrier to represent one digital state and sends no signal to represent the other digital state．The receiver demodulates the signal after advanced signal conditioning and produces the output through a buffer stage．The UCC23313 also incorporates advanced circuit techniques to maximize the CMTI performance and minimize the radiated emissions from the high frequency carrier and IO buffer switching．图 8－2 shows conceptual detail of how the OOK scheme works．

## 8．2 Functional Block Diagram

图 8－1．Conceptual Block Diagram of a Isolated Gate Driver with an Opto Emulated Input Stage（SO6 pkg）

图 8－2．On－Off Keying（OOK）Based Modulation Scheme

## 8．3 Feature Description

## 8．3．1 Power Supply

Since the input stage is an emulated diode，no power supply is needed at the input．
The output supply， $\mathrm{V}_{\mathrm{CC}}$ ，supports a voltage range from 10 V to 33 V ．For operation with bipolar supplies，the power device is turned off with a negative voltage on the gate with respect to the emitter or source．This configuration prevents the power device from unintentionally turning on because of current induced from the Miller effect．The typical values of the $\mathrm{V}_{\mathrm{CC}}$ and $\mathrm{V}_{\mathrm{EE}}$ output supplies for bipolar operation are 15 V and -8 V with respect to GND for IGBTs，and 20 V and -5 V for SiC MOSFETs．

For operation with unipolar supply，the $\mathrm{V}_{\mathrm{CC}}$ supply is connected to 15 V with respect to GND for IGBTs，and 20V for SiC MOSFETs．The $\mathrm{V}_{\mathrm{EE}}$ supply is connected to OV ．

## 8．3．2 Input Stage

The input stage of UCC23313 is simply the e－diode and therefore has an Anode（Pin 1）and a Cathode（Pin 3）． Pin 2 has no internal connection and can be left open or connected to ground．The input stage does not have a power and ground pin．When the e－diode is forward biased by applying a positive voltage to the Anode with respect to the Cathode，a forward current $I_{F}$ flows into the e－diode．The forward voltage drop across the e－diode is 2.1 V （typ）．An external resistor should be used to limit the forward current．The recommended range for the forward current is 7 mA to 16 mA ．When $\mathrm{I}_{\mathrm{F}}$ exceeds the threshold current $\mathrm{I}_{\mathrm{FLH}}(2.8 \mathrm{~mA}$ typ．）a high frequency signal is transmitted across the isolation barrier through the high voltage $\mathrm{SiO}_{2}$ capacitors．The HF signal is detected by the receiver and $\mathrm{V}_{\text {OUT }}$ is driven high．See 节 9．2．2．1 for information on selecting the input resistor．The dynamic impedance of the e－diode is very small（ $<1.0 \Omega$ ）and the temperature coefficient of the e－diode forward voltage drop is $<1.35 \mathrm{mV} /{ }^{\circ} \mathrm{C}$ ．This leads to excellent stability of the forward current $\mathrm{I}_{\mathrm{F}}$ across all operating conditions．If the Anode voltage drops below $\mathrm{V}_{\mathrm{F}_{-} \mathrm{HL}}(0.9 \mathrm{~V})$ ，or reverse biased，the gate driver output is driven low．The reverse breakdown voltage of the e－diode is $>15 \mathrm{~V}$ ．So for normal operation，a reverse bias of up to 13 V is allowed．The large reverse breakdown voltage of the e－diode enables UCC23313 to be operated in interlock architecture（see example in 图 8－3）where $\mathrm{V}_{\text {SUP }}$ can be as high as 12 V ．The system designer has the flexibility to choose a 3.3 V ， 5.0 V or up to 12 V PWM signal source to drive the input stage of UCC23313 using an appropriate input resistor． The example shows two gate drivers driving a set of IGBTs．The inputs of the gate drivers are connected as shown and driven by two buffers that are controlled by the MCU．Interlock architecture prevents both the e－ diodes from being＂ON＂at the same time，preventing shoot through in the IGBTs．It also ensures that if both PWM signals are erroneously stuck high（or low）simultaneously，both gate driver outputs will be driven low．

图 8-3. Interlock

### 8.3.3 Output Stage

The output stages of the UCC23313 family feature a pullup structure that delivers the highest peak-source current when it is most needed which is during the Miller plateau region of the power-switch turnon transition (when the power-switch drain or collector voltage experiences $\mathrm{dV} / \mathrm{dt}$ ). The output stage pullup structure features a P-channel MOSFET and an additional pull-up N-channel MOSFET in parallel. The function of the N-channel MOSFET is to provide a brief boost in the peak-sourcing current, enabling fast turnon. Fast turnon is accomplished by briefly turning on the N-channel MOSFET during a narrow instant when the output is changing states from low to high. The on-resistance of this N-channel MOSFET ( $\mathrm{R}_{\mathrm{NMOS}}$ ) is approximately $5.1 \Omega$ when activated.

表 8-1. UCC23313 On-Resistance

| $\mathbf{R}_{\text {NMOS }}$ | $\mathbf{R}_{\text {OH }}$ | $\mathbf{R}_{\mathbf{O L}}$ | UNIT |
| :---: | :---: | :---: | :---: |
| 5.1 | 9.5 | 0.40 | $\Omega$ |

The $\mathrm{R}_{\mathrm{OH}}$ parameter is a DC measurement and is representative of the on-resistance of the P-channel device only. This parameter is only for the P-channel device because the pullup N-channel device is held in the OFF state in DC condition and is turned on only for a brief instant when the output is changing states from low to high. Therefore, the effective resistance of the UCC23313 pullup stage during this brief turnon phase is much lower than what is represented by the $\mathrm{R}_{\mathrm{OH}}$ parameter, yielding a faster turn on. The turnon-phase output resistance is the parallel combination $\mathrm{R}_{\mathrm{OH}} \| \mathrm{R}_{\mathrm{NMOS}}$.

The pulldown structure in the UCC23313 is simply composed of an N-channel MOSFET. The output voltage swing between $\mathrm{V}_{\mathrm{CC}}$ and $\mathrm{V}_{\text {EE }}$ provides rail-to-rail operation because of the MOS-out stage which delivers very low dropout.

图8-4. Output Stage

### 8.3.4 Protection Features

### 8.3.4.1 UndervoItage Lockout (UVLO)

UVLO function is implemented for $\mathrm{V}_{\mathrm{CC}}$ and $\mathrm{V}_{\mathrm{EE}}$ pins to prevent an under-driven condition on IGBTs and MOSFETs. When $\mathrm{V}_{\mathrm{CC}}$ is lower than $\mathrm{UVLO}_{\mathrm{R}}$ at device start-up or lower than $\mathrm{UVLO}_{\mathrm{F}}$ after start-up, the voltagesupply UVLO feature holds the effected output low, regardless of the input forward current as shown in 表 8-2. The $\mathrm{V}_{\mathrm{cc}}$ UVLO protection has a hysteresis feature ( $\mathrm{UVLO}_{\text {hys }}$ ). This hysteresis prevents chatter when the power supply produces ground noise which allows the device to permit small drops in bias voltage, which occurs when the device starts switching and operating current consumption increases suddenly.
When $\mathrm{V}_{\mathrm{CC}}$ drops below $\mathrm{UVLO}_{\mathrm{F}}$, a delay, tuvLo_rec occurs on the output when the supply voltage rises above $\mathrm{UVLO}_{\mathrm{R}}$ again.

图 8-5. UVLO functionality

### 8.3.4.2 Active Pulldown

The active pull-down function is used to pull the IGBT or MOSFET gate to the low state when no power is connected to the $\mathrm{V}_{\mathrm{CC}}$ supply. This feature prevents false IGBT and MOSFET turn-on by clamping $\mathrm{V}_{\text {OUT }}$ pin to approximately 2 V .

When the output stage of the driver is in an unbiased condition ( $\mathrm{V}_{\mathrm{CC}}$ floating), the driver outputs (see 图8-4) are held low by an active clamp circuit that limits the voltage rise on the driver outputs. In this condition, the upper PMOS \& NMOS are held off while the lower NMOS gate is tied to the driver output through an internal $500-\mathrm{k} \Omega$ resistor. In this configuration, the lower NMOS device effectively clamps the output ( $\mathrm{V}_{\text {OUT }}$ ) to less than 2 V .

### 8.3.4.3 Short-Circuit Clamping

The short-circuit clamping function is used to clamp voltages at the driver output and pull the output pin $\mathrm{V}_{\text {OUT }}$ slightly higher than the $\mathrm{V}_{\mathrm{Cc}}$ voltage during short-circuit conditions. The short-circuit clamping function helps protect the IGBT or MOSFET gate from overvoltage breakdown or degradation. The short-circuit clamping function is implemented by adding a diode connection between the dedicated pins and the $\mathrm{V}_{\mathrm{cc}}$ pin inside the driver. The internal diodes can conduct up to $500-\mathrm{mA}$ current for a duration of $10 \mu \mathrm{~s}$ and a continuous current of 20 mA . Use external Schottky diodes to improve current conduction capability as needed.

## 8．4 Device Functional Modes

表 8－2 lists the functional modes for UCC23313
表 8－2．Function Table for UCC23313 with VCC Rising

| e－diode | VCC | Vout |
| :---: | :---: | :---: |
| OFF $\left(I_{\mathrm{F}}<\mathrm{I}_{\mathrm{FLH}}\right)$ | $0 \mathrm{~V}-33 \mathrm{~V}$ | Low |
| $\mathrm{ON}\left(\mathrm{I}_{\mathrm{F}}>\mathrm{I}_{\mathrm{FLH}}\right)$ | $0 \mathrm{~V}-\mathrm{UVLO}_{R}$ | Low |
| $\mathrm{ON}\left(\left(\mathrm{I}_{\mathrm{F}}>\mathrm{I}_{\mathrm{FLH}}\right)\right.$ | UVLO $_{R}-33 \mathrm{~V}$ | High |

表 8－3．Function Table for UCC23313 with VCC Falling

| e－diode | VCC | Vout |
| :---: | :---: | :---: |
| OFF $\left(I_{F}<I_{\text {FLH }}\right)$ | $0 V-33 V$ | Low |
| ON $\left(I_{F}>I_{\text {FLH }}\right)$ | UVLO $_{F}-0 V$ | Low |
| ON $\left(I_{F}>I_{\text {FLH }}\right)$ | $33 V-$ UVLO | High |

## 9 Application and Implementation

备注
以下应用部分的信息不属于 TI 组件规范，TI 不担保其准确性和完整性。客户应负责确定 TI 组件是否适
用于其应用。客户应验证并测试其设计，以确保系统功能。

## 9．1 Application Information

UCC23313 is a single channel，isolated gate driver with opto－compatible input for power semiconductor devices， such as MOSFETs，IGBTs，or SiC MOSFETs．It is intended for use in applications such as motor control， industrial inverters，and switched－mode power supplies．It differs from standard opto isolated gate drivers as it does not have an LED input stage．Instead of an LED，it has an emulated diode（e－diode）．To turn the e－diode ＂ON＂，a forward current in the range of 7 mA to 16 mA should be driven into the Anode．This will drive the gate driver output High and turn on the power FET．Typically，MCU＇s are not capable of providing the required forward current．Hence a buffer has to be used between the MCU and the input stage of UCC23313．Typical buffer power supplies are either 5 V or 3.3 V ．A resistor is needed between the buffer and the input stage of UCC23313 to limit the current．It is simple，but important to choose the right value of resistance．The resistor tolerance， buffer supply voltage tolerance and output impedance of the buffer，have to be considered in the resistor selection．This will ensure that the e－diode forward current stays within the recommended range of 7 mA to 16mA．Detailed design recommendations are given in the 节 9．1．The current driven input stage offers excellent noise immunity that is need in high power motor drive systems，especially in cases where the MCU cannot be located close to the isolated gate driver．UCC23313 offers best in class CMTI performance of $>150 \mathrm{kV} / \mathrm{us}$ at 1500 V common mode voltages．

The e－diode is capable of 25 mA continuous in the forward direction．The forward voltage drop of the e－diode has a very tight part to part variation（ 1.8 V min to 2.4 V max）．The temperature coefficient of the forward drop is $<1.35 \mathrm{mV} /{ }^{\circ} \mathrm{C}$ ．The dynamic impedance of the e－diode in the forward biased region is $\sim 1 \Omega$ ．All of these factors contribute in excellent stability of the e－diode forward current．To turn the e－diode＂OFF＂，the Anode－Cathode voltage should be $<0.8 \mathrm{~V}$ ，or $\mathrm{I}_{\mathrm{F}}$ should be $<l_{\text {FLH }}$ ．The e－diode can also be reverse biased up to $5 \mathrm{~V}(7 \mathrm{~V}$ abs max）in order to turn it off and bring the gate driver output low．

The output power supply for UCC23313 can be as high as 33 V （ 35 V abs max）．The output power supply can be configured externally as a single isolated supply up to 33 V or isolated bipolar supply such that $\mathrm{V}_{\mathrm{CC}}-\mathrm{V}_{\mathrm{EE}}$ does not exceed 33 V ，or it can be bootstrapped（with external diode \＆capacitor）if the system uses a single power supply with respect to the power ground．Typical quiescent power supply current from $\mathrm{V}_{\mathrm{cc}}$ is 1.2 mA （max 2.2 mA ）．

## 9．2 Typical Application

The circuit in 图 9－1，shows a typical application for driving IGBTs．

图 9－1．Typical Application Circuit for UCC23313 to Drive IGBT

## 9．2．1 Design Requirements

表 9－1 lists the recommended conditions to observe the input and output of the UCC23313 gate driver．
表 9－1．UCC23313 Design Requirements

| PARAMETER | VALUE | UNIT |
| :--- | :---: | :---: |
| $\mathrm{V}_{\mathrm{CC}}$ | 15 | V |
| $\mathrm{I}_{\mathrm{F}}$ | 10 | mA |
| Switching frequency | 8 | kHz |

## 9．2．2 Detailed Design Procedure

## 9．2．2．1 Selecting the Input Resistor

The input resistor limits the current that flows into the e－diode when it is forward biased．The threshold current $\mathrm{I}_{\mathrm{FLH}}$ is 2.8 mA typ．The recommended operating range for the forward current is 7 mA to 16 mA （e－diode ON）．All the electrical specifications are guaranteed in this range．The resistor should be selected such that for typical operating conditions， $\mathrm{I}_{\mathrm{F}}$ is 10 mA ．Following are the list of factors that will affect the exact value of this current：
1．Supply Voltage $V_{\text {SUP }}$ variation
2．Manufacturer＇s tolerance for the resistor and variation due to temperature
3．e－diode forward voltage drop variation（at $\mathrm{I}_{\mathrm{F}}=10 \mathrm{~mA}, \mathrm{~V}_{\mathrm{F}}=$ typ 2.1 V ，min 1.8 V ，max 2.4 V ，with a temperature coefficient $<1.35 \mathrm{mV} /{ }^{\circ} \mathrm{C}$ and dynamic impedance $<1 \Omega$ ）

See 图 9－2 for the schematic using a single NMOS and split resistor combination to drive the input stage of UCC23313．The input resistor can be selected using the equation shown．

图 9－2．Configuration 1：Driving the input stage of UCC23313 with a single NMOS and split resistors
Driving the input stage of UCC23313 using a single buffer is shown in 图 9－3 and using 2 buffers is shown in 图 9－4

图 9－3．Configuration 2：Driving the input stage of UCC23313 with one Buffer and split resistors

图 9－4．Configuration 3：Driving the input stage of UCC23313 with 2 buffers and split resistors
表 9－2 shows the range of values for $R_{\text {EXT }}$ for the 3 different configurations shown in 图 9－2，图 9－3 and 图 $9-4$ ．The assumptions used in deriving the range for $\mathrm{R}_{\mathrm{EXT}}$ are as follows：
1．Target forward current $\mathrm{I}_{\mathrm{F}}$ is $7 \mathrm{~mA} \mathrm{~min}, 10 \mathrm{~mA}$ typ and 16 mA max
2．e－diode forward voltage drop is 1.8 V to 2.4 V
3．$V_{\text {SUP }}$（Buffer supply voltage）is 5 V with $\pm 5 \%$ tolerance
4．Manufacturer＇s tolerance for $R_{E X T}$ is $1 \%$
5．NMOS resistance is $0.25 \Omega$ to $1.0 \Omega$（for configuration 1）
6． $\mathrm{R}_{\mathrm{OH}}$（buffer output impedance in output＂High＂state）is $13 \Omega \min , 18 \Omega$ typ and $22 \Omega$ max
7．RoL（buffer output impedance in＂Low＂state）is $10 \Omega \mathrm{~min}, 14 \Omega$ typ and $17 \Omega$ max
表 9－2． $\mathbf{R}_{\mathrm{EXT}}$ Values to Drive The Input Stage

|  | $\mathbf{R}_{\mathrm{EXT}} \Omega$ |  |  |
| :---: | :---: | :---: | :---: |
| Configuration | Min | Typ | Max |
| Single NMOS and <br> $R_{\text {EXT }}$ | 218 | 290 | 331 |
| Single Buffer and <br> $R_{\text {EXT }}$ | 204 | 272 | 311 |
| Two Buffers and $\mathrm{R}_{\mathrm{EXT}}$ | 194 | 259 | 294 |

## 9．2．2．2 Gate Driver Output Resistor

The external gate－driver resistors， $\mathrm{R}_{\mathrm{G}(\mathrm{ON})}$ and $\mathrm{R}_{\mathrm{G}(\mathrm{OFF})}$ are used to：
1．Limit ringing caused by parasitic inductances and capacitances
2．Limit ringing caused by high voltage or high current switching dv／dt，di／dt，and body－diode reverse recovery
3．Fine－tune gate drive strength，specifically peak sink and source current to optimize the switching loss
4．Reduce electromagnetic interference（EMI）
The output stage has a pull up structure consisting of a P－channel MOSFET and an N－channel MOSFET in parallel．The combined peak source current is 4.5 A Use 方程式 1 to estimate the peak source current as an example．

$$
\begin{equation*}
\mathrm{I}_{\mathrm{OH}}=\min \left[4.5 \mathrm{~A}, \frac{\mathrm{~V}_{\mathrm{CC}}-\mathrm{V}_{\mathrm{GDF}}}{\left(\mathrm{R}_{\mathrm{NMOS}} \| \mathrm{R}_{\mathrm{OH}}+\mathrm{R}_{\mathrm{GON}}+\mathrm{R}_{\mathrm{GFET}_{\mathrm{INT}}}\right)}\right] \tag{1}
\end{equation*}
$$

where
－$R_{G O N}$ is the external turnon resistance．
－ $\mathrm{R}_{\text {GFET＿Int }}$ is the power transistor internal gate resistance，found in the power transistor data sheet．We will assume $0 \Omega$ for our example
－ $\mathrm{I}_{\mathrm{OH}}$ is the peak source current which is the minimum value between 4.5 A ，the gate－driver peak source current，and the calculated value based on the gate－drive loop resistance．
－$V_{G D F}$ is the forward voltage drop for each of the diodes in series with $R_{G O N}$ and $R_{G O F F}$ ．The diode drop for this example is 0.7 V ．

In this example，the peak source current is approximately 1.7 A as calculated in 方程式 2.

$$
\begin{equation*}
\mathrm{I}_{\mathrm{OH}}=\min \left[4.5 \mathrm{~A}, \frac{15-0.7}{(5.1 \Omega| | 9.5 \Omega+5 \Omega+0 \Omega)}\right]=1.72 \mathrm{~A} \tag{2}
\end{equation*}
$$

Similarly，use 方程式 3 to calculate the peak sink current．

$$
\begin{equation*}
\mathrm{I}_{\mathrm{OL}}=\min \left[5.3 \mathrm{~A}, \frac{\mathrm{~V}_{\mathrm{CC}}-\mathrm{V}_{\mathrm{GDF}}}{\left(\mathrm{R}_{\mathrm{OL}}+\mathrm{R}_{\mathrm{GOFF}}+\mathrm{R}_{\mathrm{GFET}_{\mathrm{INT}}}\right)}\right] \tag{3}
\end{equation*}
$$

where
－$R_{\text {GOFF }}$ is the external turnoff resistance．
－ $\mathrm{I}_{\mathrm{OL}}$ is the peak sink current which is the minimum value between 5.3 A ，the gate－driver peak sink current，and the calculated value based on the gate－drive loop resistance．
In this example，the peak sink current is the minimum of 方程式 4 and 1.38 A ．

$$
\begin{equation*}
\mathrm{I}_{\mathrm{OL}}=\min \left[5.3 \mathrm{~A}, \frac{15-0.7}{(0.4 \Omega+10 \Omega+0 \Omega)}\right]=1.38 \mathrm{~A} \tag{4}
\end{equation*}
$$

The diodes shown in series with each，$R_{G O N}$ and $R_{G O F F}$ ，in 图 9－1 ensure the gate drive current flows through the intended path，respectively，during turn－on and turn－off．Note that the diode forward drop will reduce the voltage level at the gate of the power switch．To achieve rail－to－rail gate voltage levels，add a resistor from the $\mathrm{V}_{\text {OUT }}$ pin to the power switch gate，with a resistance value approximately 20 times higher than $\mathrm{R}_{\mathrm{GON}}$ and $\mathrm{R}_{\mathrm{GOFF}}$ ． For the examples described in this section，a good choice is $100 \Omega$ to $200 \Omega$ ．

## 备注

The estimated peak current is also influenced by PCB layout and load capacitance．Parasitic inductance in the gate－driver loop can slow down the peak gate－drive current and introduce overshoot and undershoot．Therefore， TI strongly recommends that the gate－driver loop should be minimized． Conversely，the peak source and sink current is dominated by loop parasitics when the load capacitance（ $\mathrm{C}_{I S S}$ ）of the power transistor is very small（typically less than 1 nF ）because the rising and falling time is too small and close to the parasitic ringing period．

## 9．2．2．3 Estimate Gate－Driver Power Loss

The total loss，$P_{G}$ ，in the gate－driver subsystem includes the power losses（ $P_{G D}$ ）of the UCC23313 device and the power losses in the peripheral circuitry，such as the external gate－drive resistor．

The $P_{G D}$ value is the key power loss which determines the thermal safety－related limits of the UCC23313 device， and it can be estimated by calculating losses from several components．
The first component is the static power loss， $\mathrm{P}_{\mathrm{GDQ}}$ ，which includes power dissipated in the input stage（ $\mathrm{P}_{\mathrm{GDQ}} \mathrm{IN}^{\mathrm{N}}$ ） as well as the quiescent power dissipated in the output stage（ $\mathrm{P}_{\text {GDQ＿OUT }}$ ）when operating with a certain switching frequency under no load．$P_{G D Q} I N$ is determined by $I_{F}$ and $V_{F}$ and is given by 方程式 5．The $P_{G D Q}$ out
parameter is measured on the bench with no load connected to $V_{\text {OUT }}$ pin at a given $V_{C C}$ ，switching frequency， and ambient temperature．In this example， $\mathrm{V}_{\mathrm{CC}}$ is 15 V ．The current on the power supply，with PWM switching at 10 kHz ，is measured to be $\mathrm{I}_{\mathrm{CC}}=1.33 \mathrm{~mA}$ ．Therefore，use 方程式 6 to calculate $\mathrm{P}_{\mathrm{GDQ}}$＿OUT．

$$
\begin{gather*}
\mathrm{P}_{\mathrm{GDQ} \_\mathrm{IN}}=\frac{1}{2} * \mathrm{~V}_{\mathrm{F}} * \mathrm{I}_{\mathrm{F}}  \tag{5}\\
\mathrm{P}_{\mathrm{GDQ} \text { _OUT }}=\mathrm{V}_{\mathrm{CC}} * \mathrm{I}_{\mathrm{CC}}
\end{gather*}
$$

（6）
The total quiescent power（without any load capacitance）dissipated in the gate driver is given by the sum of 方程式 5 and 方程式 6 as shown in 方程式 7

$$
\begin{equation*}
\mathrm{P}_{\mathrm{GDQ}}=\mathrm{P}_{\mathrm{GDQ} \text { _IN }}+\mathrm{P}_{\mathrm{GDQ} \text { _OUT }}=10 \mathrm{~mW}+20 \mathrm{~mW}=30 \mathrm{~mW} \tag{7}
\end{equation*}
$$

The second component is the switching operation loss， $\mathrm{P}_{\text {GDSW }}$ ，with a given load capacitance which the driver charges and discharges the load during each switching cycle．Use 方程式 8 to calculate the total dynamic loss from load switching，$P_{G s w}$ ．

$$
\begin{equation*}
P_{G S W}=V_{C C 2} \times Q_{G} \times f_{S W} \tag{8}
\end{equation*}
$$

where
－$Q_{G}$ is the gate charge of the power transistor at $V_{C C}$ ．
So，for this example application the total dynamic loss from load switching is approximately 18 mW as calculated in 方程式 9 。

$$
\begin{equation*}
\mathrm{P}_{\mathrm{GSW}}=15 \mathrm{~V} \times 120 \mathrm{nC} \times 10 \mathrm{kHz}=18 \mathrm{~mW} \tag{9}
\end{equation*}
$$

$Q_{G}$ represents the total gate charge of the power transistor switching 520 V at 50 A ，and is subject to change with different testing conditions．The UCC23313 gate－driver loss on the output stage， $\mathrm{P}_{\mathrm{GDO}}$ ，is part of $\mathrm{P}_{\mathrm{GSW}}$ ． $P_{G D O}$ is equal to $P_{G S W}$ if the external gate－driver resistance and power－transistor internal resistance are $0 \Omega$ ， and all the gate driver－loss will be dissipated inside the UCC23313．If an external turn－on and turn－off resistance exists，the total loss is distributed between the gate driver pull－up／down resistance，external gate resistance，and power－transistor internal resistance．Importantly，the pull－up／down resistance is a linear and fixed resistance if the source／sink current is not saturated to $4.5 \mathrm{~A} / 5.3 \mathrm{~A}$ ，however，it will be non－linear if the source／sink current is saturated．Therefore， $\mathrm{P}_{\mathrm{GDO}}$ is different in these two scenarios．

## Case 1 －Linear Pull－Up／Down Resistor：

In this design example，all the predicted source and sink currents are less than 4．5 A and 5．3 A，therefore，use方程式 10 to estimate the UCC23313 gate－driver loss．

$$
\begin{equation*}
\mathrm{P}_{\mathrm{GDO}}=\frac{18 \mathrm{~mW}}{2}\left[\frac{9.5 \Omega \| 5.1 \Omega}{9.5 \Omega| | 5.1 \Omega+5.1 \Omega+0 \Omega}+\frac{0.4 \Omega}{0.4 \Omega+10 \Omega+0 \Omega}\right]=3.9 \mathrm{~mW} \tag{11}
\end{equation*}
$$

## Case 2 －Nonlinear Pull－Up／Down Resistor：

$$
\begin{equation*}
\mathrm{P}_{\mathrm{GDO}}=\mathrm{f}_{\mathrm{sw}} \mathrm{x}\left[4.5 \mathrm{Ax} \int_{0}^{\mathrm{T}_{\mathrm{R} \text { Sys }}}\left(\mathrm{V}_{\mathrm{CC}}-\mathrm{V}_{\text {OUT }}(\mathrm{t})\right) \mathrm{dt}+5.3 \mathrm{Ax} \int_{0}^{\mathrm{T}_{\mathrm{F} .5 \mathrm{ss}}} \mathrm{~V}_{\text {OUT }}(\mathrm{t}) \mathrm{dt}\right] \tag{12}
\end{equation*}
$$

where
－ $\mathrm{V}_{\text {OUT（t）}}$ is the gate－driver OUT pin voltage during the turnon and turnoff period．In cases where the output is saturated for some time，this value can be simplified as a constant－current source（ 4.5 A at turnon and 5.3 A at turnoff）charging or discharging a load capacitor．Then，the $\mathrm{V}_{\text {OUT（t）}}$ waveform will be linear and the $\mathrm{T}_{\text {R＿Sys }}$ and $\mathrm{T}_{\mathrm{F}_{-} \text {Sys }}$ can be easily predicted．

For some scenarios，if only one of the pullup or pulldown circuits is saturated and another one is not，the $\mathrm{P}_{\mathrm{GDO}}$ is a combination of case 1 and case 2 ，and the equations can be easily identified for the pullup and pulldown based on this discussion．

Use 方程式 13 to calculate the total gate－driver loss dissipated in the UCC23313 gate driver， $\mathrm{P}_{\mathrm{GD}}$ ．

$$
\begin{equation*}
\mathrm{P}_{\mathrm{GD}}=\mathrm{P}_{\mathrm{GDQ}}+\mathrm{P}_{\mathrm{GDO}}=30 \mathrm{~mW}+3.9 \mathrm{~mW}=33.9 \mathrm{~mW} \tag{13}
\end{equation*}
$$

## 9．2．2．4 Estimating Junction Temperature

Use 方程式 14 to estimate the junction temperature（ $\mathrm{T}_{\mathrm{J}}$ ）of UCC23313．

$$
\begin{equation*}
T_{J}=T_{C}+\Psi_{J T} \times P_{G D} \tag{14}
\end{equation*}
$$

where
－ $\mathrm{T}_{\mathrm{C}}$ is the UCC23313 case－top temperature measured with a thermocouple or some other instrument．
－$\Psi_{J T}$ is the junction－to－top characterization parameter from the table．
Using the junction－to－top characterization parameter（ $\Psi_{J T}$ ）instead of the junction－to－case thermal resistance （ $\mathrm{R}_{\theta \mathrm{Jc}}$ ）can greatly improve the accuracy of the junction temperature estimation．The majority of the thermal energy of most ICs is released into the PCB through the package leads，whereas only a small percentage of the total energy is released through the top of the case（where thermocouple measurements are usually conducted）． The $\mathrm{R}_{{ }_{\theta \mathrm{JC}}}$ resistance can only be used effectively when most of the thermal energy is released through the case， such as with metal packages or when a heat sink is applied to an IC package．In all other cases，use of $R_{\theta \mathrm{Jc}}$ will inaccurately estimate the true junction temperature．The $\Psi_{Ј \top}$ parameter is experimentally derived by assuming that the dominant energy leaving through the top of the IC will be similar in both the testing environment and the application environment．As long as the recommended layout guidelines are observed，junction temperature estimations can be made accurately to within a few degrees Celsius．

## 9．2．2．5 Selecting $V_{c c}$ Capacitor

Bypass capacitors for $\mathrm{V}_{\mathrm{CC}}$ is essential for achieving reliable performance．TI recommends choosing low－ESR and low－ESL，surface－mount，multi－layer ceramic capacitors（MLCC）with sufficient voltage ratings，temperature coefficients，and capacitance tolerances．A 50－V，10－$\mu \mathrm{F}$ MLCC and a $50-\mathrm{V}, 0.22-\mu \mathrm{F}$ MLCC are selected for the $\mathrm{C}_{\mathrm{VCC}}$ capacitor．If the bias power supply output is located a relatively long distance from the $\mathrm{V}_{\mathrm{CC}}$ pin，a tantalum or electrolytic capacitor with a value greater than $10 \mu \mathrm{~F}$ should be used in parallel with $\mathrm{C}_{\mathrm{Vcc}}$ ．

## 备注

DC bias on some MLCCs will impact the actual capacitance value．For example，a $25-\mathrm{V}, 1-\mu \mathrm{F} \times 7 \mathrm{R}$ capacitor is measured to be only 500 nF when a DC bias of $15-\mathrm{V}_{\mathrm{DC}}$ is applied．

## 10 Power Supply Recommendations

The recommended input supply voltage ( $\mathrm{V}_{\mathrm{CC}}$ ) for the UCC23313 device is from 10 V or 14 V to 33 V . The lower limit of the range of output bias-supply voltage $\left(\mathrm{V}_{\mathrm{CC}}\right)$ is determined by the internal UVLO protection feature of the device. $\mathrm{V}_{\mathrm{CC}}$ voltage should not fall below the UVLO threshold for normal operation, or else the gate-driver outputs can become clamped low for more than $20 \mu \mathrm{~s}$ by the UVLO protection feature. The higher limit of the $\mathrm{V}_{\mathrm{CC}}$ range depends on the maximum gate voltage of the power device that is driven by the UCC23313 device, and should not exceed the recommended maximum $\mathrm{V}_{\mathrm{CC}}$ of 33 V . A local bypass capacitor should be placed between the $\mathrm{V}_{\mathrm{CC}}$ and $\mathrm{V}_{\text {EE }}$ pins, with a value of $220-\mathrm{nF}$ to $10-\mu \mathrm{F}$ for device biasing. TI recommends placing an additional $100-\mathrm{nF}$ capacitor in parallel with the device biasing capacitor for high frequency filtering. Both capacitors should be positioned as close to the device as possible. Low-ESR, ceramic surface-mount capacitors are recommended.
If only a single, primary-side power supply is available in an application, isolated power can be generated for the secondary side with the help of a transformer driver such as Texas Instruments' SN6501 or SN6505A. For such applications, detailed power supply design and transformer selection recommendations are available in SN6501 Transformer Driver for Isolated Power Supplies data sheet and SN6505A Low-Noise 1-A Transformer Drivers for Isolated Power Supplies data sheet.

## 11 Layout

### 11.1 Layout Guidelines

Designers must pay close attention to PCB layout to achieve optimum performance for the UCC23313. Some key guidelines are:

- Component placement:
- Low-ESR and low-ESL capacitors must be connected close to the device between the $\mathrm{V}_{\mathrm{CC}}$ and $\mathrm{V}_{\text {EE }}$ pins to bypass noise and to support high peak currents when turning on the external power transistor.
- To avoid large negative transients on the $\mathrm{V}_{\mathrm{EE}}$ pins connected to the switch node, the parasitic inductances between the source of the top transistor and the source of the bottom transistor must be minimized.
- Grounding considerations:
- Limiting the high peak currents that charge and discharge the transistor gates to a minimal physical area is essential. This limitation decreases the loop inductance and minimizes noise on the gate terminals of the transistors. The gate driver must be placed as close as possible to the transistors.
- High-voltage considerations:
- To ensure isolation performance between the primary and secondary side, avoid placing any PCB traces or copper below the driver device. A PCB cutout or groove is recommended in order to prevent contamination that may compromise the isolation performance.
- Thermal considerations:
- A large amount of power may be dissipated by the UCC23313 if the driving voltage is high, the load is heavy, or the switching frequency is high. Proper PCB layout can help dissipate heat from the device to the PCB and minimize junction-to-board thermal impedance ( $\theta_{\mathrm{JB}}$ ).
- Increasing the PCB copper connecting to the $\mathrm{V}_{C C}$ and $\mathrm{V}_{\mathrm{EE}}$ pins is recommended, with priority on maximizing the connection to $\mathrm{V}_{\mathrm{EE}}$. However, the previously mentioned high-voltage PCB considerations must be maintained.
- If the system has multiple layers, TI also recommends connecting the $\mathrm{V}_{\mathrm{CC}}$ and $\mathrm{V}_{\mathrm{EE}}$ pins to internal ground or power planes through multiple vias of adequate size. These vias should be located close to the IC pins to maximize thermal conductivity. However, keep in mind that no traces or coppers from different high voltage planes are overlapping.

## 11．2 Layout Example

图 11－1 shows a PCB layout example with the signals and key components labeled．

A．No PCB traces or copper are located between the primary and secondary side，which ensures isolation performance．
图 11－1．Layout Example
图 11－2 and 图 11－3 show the top and bottom layer traces and copper．

图 11-2. Top-Layer Traces and Copper

图 11-3. Bottom-Layer Traces and Copper (Flipped)
图 11-4 shows the 3D layout of the top view of the PCB.

A. The location of the PCB cutout between primary side and secondary sides ensures isolation performance.

图 11-4. 3-D PCB View

### 11.3 PCB Material

Use standard FR-4 UL94V-0 printed circuit board. This PCB is preferred over cheaper alternatives because of lower dielectric losses at high frequencies, less moisture absorption, greater strength and stiffness, and the selfextinguishing flammability-characteristics.

## 12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

INSTRUMENTS

## PACKAGING INFORMATION

${ }^{(1)}$ The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.
${ }^{(2)}$ RoHS: TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed $0.1 \%$ by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the $<=1000$ ppm threshold requirement.
${ }^{(3)}$ MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.
${ }^{(4)}$ There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.
${ }^{(5)}$ Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a " $\sim$ " will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.
${ }^{(6)}$ Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
