

New Product Update

Lowering the barrier to
Edge AI

Reese Grimsley

TI Business Manager

Gavin Minnis

Brand Manager, Processing
Technology

What is AI and deep learning?

- Artificial intelligence (AI) – Using human-like intelligence to solve tasks
- Machine learning (ML) – Algorithm uses data to find patterns
- Deep learning (DL) – very large algorithm using raw data input
 - Usually needs lots of data!

- Machine learning provides significant advantages over classical computing
 - Scalability
 - Less R&D effort
 - More accurate.

Where do we use AI?

Driver Assistance / ADAS

Machine Vision & Defect Detection

Security and Home
Automation Cameras

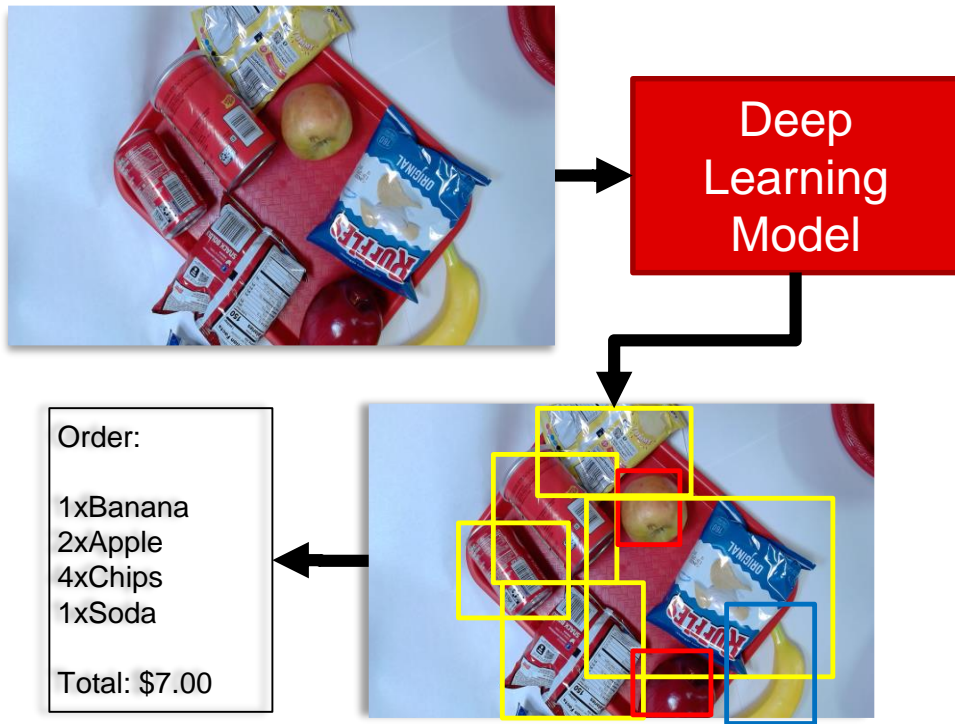

Speech recognition, text
analysis, translation

**And
Many
More!**

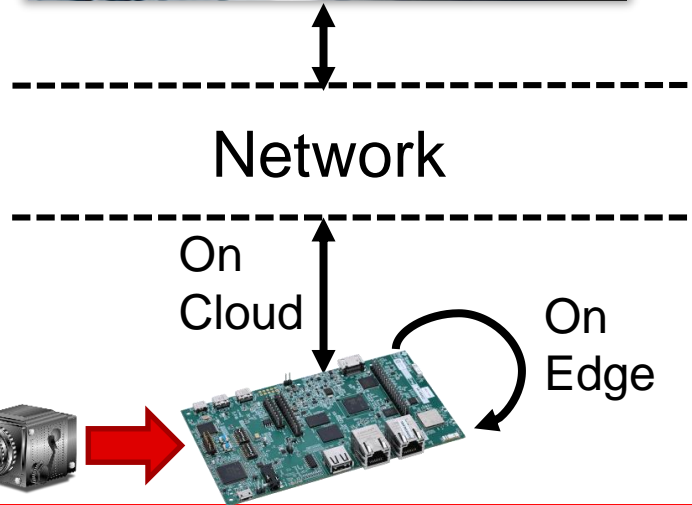

Example problem | Automating checkout scanner

- Task: recognize purchasable items
 - Fill in receipt
- Why use deep learning here?
 - Easier to implement
 - More accurate/robust
- Approach:
 - Collect data
 - Train a model offline
 - Move trained model to embedded platform for inference

Why AI at the Edge?

- Edge AI – running AI where data is generated
 - Algorithms run on embedded processors or microcontrollers
- Benefits
 - Reduced latency
 - Privacy
 - No Cloud compute or network costs
 - Increasing support & performance from embedded vendors

Barrier | Edge AI is new and intimidating

Seasoned Embedded Engineers:

- Divergence from traditional signal processing
- Topics/tools to learn are rapidly changing
- Errors in deep learning accuracy are difficult to diagnose

Data scientists and AI experts:

- Embedded is highly resource constrained and requires tradeoffs
- New tools for achieving optimal performance

Hobbyists and weekend warriors

- Need straightforward path to getting started (hardware & software)
- Rely on examples, familiar tools w/ community support

Introducing Edge AI Studio – AI Tool Hub

Edge AI Studio

Free online tools for AI model development, testing and deployment.

Model Analyzer

Remotely connect to real evaluation hardware to deploy and test AI model performance on a TI embedded processor.

Evaluate AI model performance:

- Select from hundreds of optimized, pretrained models or use a custom model (BYOM).
- Deploy models easily using industry standard APIs.
- Get benchmarks for latency, frames-per-second processing, DDR bandwidth, and accuracy.

Launch

Available platforms:

- SK-TDA4VM, SK-AM62A-LP*, SK-AM68*, and SK-AM69*

* New platforms launching 2Q 2023

Model Composer

Train, optimize and compile AI models for TI embedded processors.

Bring your own data (BYOD):

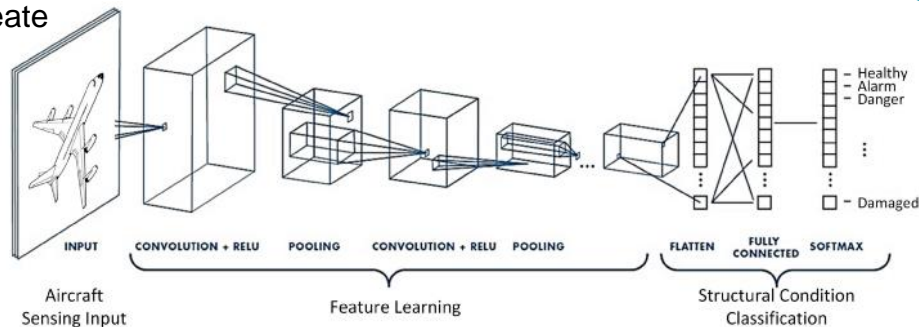

- Retrain TI models from TI Model Zoo to fine-tune performance for your unique application requirements.

Launch

To evaluate model performance, use Model Analyzer or your own hardware.

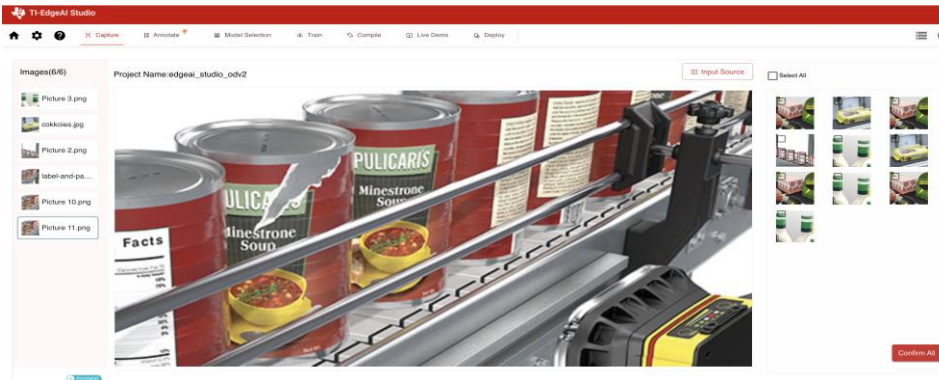

Deep learning and transfer learning

- Deep learning model
 - 10s/100s of layers, millions/billions of parameters
 - >>10k data samples to train from scratch
- Transfer Learning
 - Full model trained on large (1M+) data set
 - Retrain with a smaller dataset for a specific task
 - 50-100 samples for proof of concept
 - These can be synthetic!
 - Photo-editing to create training samples

<https://medium.com/analytics-vidhya/introduction-to-convolutional-neural-network-6942c189a723>

Model Composer | No Code AI Development

- Quick, Easy, End-to-End AI development environment in the cloud
- Transfer learning on state-of-the-art deep learning models like YOLO-X
- Targeted for Industrial applications: Machine vision, factory/warehouse automation, agriculture, ...

Let's look at Model Composer!

Build your own model with Edge AI Studio!

<https://www.ti.com/edgeai>

- Pick a problem to solve with vision AI and build proof of concept
 - Recognize a dog is on the couch
 - Birds on a tree/bush/garden
 - Your boss is near your desk
- Take 20-30 pictures and load into Model Composer
 - Use a classification model
- Train and compile a model
- Run live inference to see how it performs

Next steps:

- Get an EVM for an Am6xA Edge AI SoC
- Go beyond proof of concept
