

TPL0401x-10-Q1 具有 I²C 接口的 128 抽头单通道数字电位计

1 特性

- 单通道 128 位置分辨率
- 10kΩ 端到端电阻选项
- 低温度系数: 22ppm/°C
- I²C 串行接口
- 2.7V 至 5.5V 单电源运行
- ±20% 电阻容差
- A 和 B 版本具有不同的 I²C 地址
- L 端子内部连接至 GND
- 工作温度: -40°C 至 +125°C
- 采用行业标准 SC70 封装
- 根据 JESD 22 测试得出的静电放电 (ESD) 性能
 - 2000V 人体放电模型 (A114-B, II 类)

2 应用

- 机械电位计的替代产品
- 可调电源
- 可调增益放大器和偏移修剪
- 设定点阈值精密校准
- 传感器微调和校准

3 说明

TPL0401x-10-Q1 器件是一款具有 128 个抽头位置的单通道线性抽头数字电位计。TPL0401x-10-Q1 的低电平端子内部连接至 GND。可使用 I²C 接口来调节抽头位置。TPL0401x-10-Q1 采用 6 引脚 SC70 封装, 额定温度范围为 -40°C 至 +125°C。此部件有一个 10kΩ 端到端电阻, 工作电源电压范围为 2.7V 至 5.5V。这类产品广泛用于为低功耗 DDR3 存储器设定电压基准。

TPL0401x-10-Q1 的低电平端子内部连接至 GND。

7 Specifications

7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted) ⁽¹⁾

		MIN	MAX	UNIT
V _{DD}	Supply voltage	-0.3	7	V
I _H , I _L , I _W	Continuous current		±5	mA
V _I	Digital input pins (SDA, SCL)	-0.3	V _{DD} + 0.3	V
	Potentiometer pins (H, W)	-0.3	V _{DD} + 0.3	
T _{J(MAX)}	Maximum junction temperature		130	°C
T _{stg}	Storage temperature	-65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

7.2 ESD Ratings

		VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human-body model (HBM), per AEC Q100-002 ⁽¹⁾	±2500
		Charged-device model (CDM), per AEC Q100-011	±1000

- (1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	MAX	UNIT
V _{DD}	Supply voltage	2.7	5.5	V
V _W , V _H , SDA, SCL	Terminal voltage	0	V _{DD}	V
V _{IH}	Voltage input high (SCL, SDA)	0.7 × V _{DD}	V _{DD}	V
V _{IL}	Voltage input low (SCL, SDA)	0	0.3 × V _{DD}	V
I _W	Wiper current	-2	2	mA
T _A	Ambient operating temperature	-40	125	°C

7.4 Thermal Information

THERMAL METRIC ⁽¹⁾		TPL0401x-10-Q1	UNIT
		DCK (SC70)	
		6 PINS	
R _{θJA}	Junction-to-ambient thermal resistance	234	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance	110.5	°C/W
R _{θJB}	Junction-to-board thermal resistance	79	°C/W
ψ _{JT}	Junction-to-top characterization parameter	7.2	°C/W
ψ _{JB}	Junction-to-board characterization parameter	77	°C/W
R _{θJC(bot)}	Junction-to-case (bottom) thermal resistance	N/A	°C/W

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

7.5 Electrical Characteristics

Typical values are specified at 25°C and V_{DD} = 3.3 V (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
R _{TOTAL}	End-to-end resistance	8	10	12	kΩ
R _H	Terminal resistance		100	200	Ω
R _W	Wiper resistance		35	100	Ω

Electrical Characteristics (continued)

Typical values are specified at 25°C and $V_{DD} = 3.3\text{ V}$ (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
C_H	Terminal capacitance			10		pF
C_W	Wiper capacitance			11		pF
TC_R	Resistance temperature coefficient			22		ppm/°C
$I_{DD(STBY)}$	V_{DD} standby current	–40°C to +105°C			0.5	μA
		–40°C to +125°C			1.5

Parameter Measurement Information (continued)

- A. Code change is from 0x40 to 0x00
- B. All inputs are supplied by generators having the following characteristics: $PRR \leq 10 \text{ MHz}$, $Z_O = 50 \Omega$, $t_r/t_f \leq 30 \text{ ns}$.

Figure 10. Switch Time Waveform (t_{SW})

9 Detailed Description

9.1 Overview

The TPL0401x-10-Q1 has a single linear-taper digital potentiometer with 128 wiper positions and an end-to-end resistance of 10 k Ω . The potentiometer can be used as a three-terminal potentiometer. The main operation of TPL0401x-10-Q1 is in voltage divider mode.

The low (L) terminal of the TPL0401x-10-Q1 is tied directly to GND. The high (H) and low (GND) terminals of TPL0401-10-Q1 are equivalent to the fixed terminals of a mechanical potentiometer. The H terminal must have a higher voltage than the low terminal (GND). The position of the wiper (W) terminal is controlled by the value in the Wiper Resistance (WR) 8-bit register. When the WR register contains all zeroes (zero-scale), the wiper terminal is closest to its L terminal. As the value of the WR register increases from all zeroes to all ones (full-scale), the wiper moves from the position closest to the GND terminal to the position closest to the H terminal. At the same time, the resistance between W and GND increases, whereas the resistance between W and H decreases.

9.2 Functional Block Diagram

9.3 Feature Description

The TPL0401x-10-Q1 device is a single-channel, linear taper digital potentiometer with 128 wiper positions. Default power up state for the TPL0401x-10-Q1 is mid code (0x40). The TPL0401x-10-Q1 has the low terminal connected to GND internally. The position of the wiper can be adjusted using an I²C interface. The TPL0401x-10-Q1 is available in a 6-pin SOT package with a specified temperature range of –40°C to +125°C. The part has a 10-k Ω end-to-end resistance and can operate with a supply voltage range of 2.7 V to 5.5 V. This kind of product is widely used in setting the voltage reference for low power DDR3 memory. The TPL0401x-10-Q1 has the low terminal internal and connected to GND.

9.4 Device Functional Modes

9.4.1 Voltage Divider Mode

The digital potentiometer generates a voltage divider when all three terminals are used. The voltage divider at wiper-to-H and wiper-to-GND is proportional to the input voltage at H to L (see [Figure 11](#)).

Device Functional Modes (continued)

Figure 11. Equivalent Circuit for Voltage Divider Mode

For example, connecting terminal H to 5 V, the output voltage at terminal W can range from 0 V to 5 V. [Equation 1](#) is the general equation defining the output voltage at terminal W for any valid input voltage applied to terminal H and terminal L (GND).

$$V_W = V_{WL} = (V_H - V_L) \times \frac{D}{128} \quad (1)$$

The voltage difference between terminal H and terminal W can also be calculated in [Equation 2](#).

$$V_{HW} = (V_H - V_L) \times \left(1 - \left(\frac{D}{128} \right) \right)$$

where

- D is the decimal value of the wiper code (2)

[Table 1](#) shows the ideal values for DPOT with end-to end resistance of 10 kΩ. The absolute values of resistance can vary significantly but the Ratio (R_{WL}/R_{TOT}) is extremely accurate.

The linearity values are *relative* linearity values (that is, linearity after zero-scale and full-scale offset errors are removed). Consider this when expecting a certain absolute accuracy because some error is introduced when the device gets close in magnitude to the offset errors.

Note that the MSB is always discarded during a write to the wiper position register. For example, if 0×80 is written to the wiper position register, a read returns 0×00. Another similar example is if 0×FF is written, then 0×7F is read.

Table 1. Resistance Values Table

STEP	HEX	R_{WL} (KΩ)	R_{HW} (KΩ)	R_{WL}/R_{TOT}

9.5 Programming

9.5.1 I²C General Operation and Overview

9.5.1.1 START and STOP Conditions

I²C communication with this device is initiated by the master sending a START condition and terminated by the master sending a STOP condition. A high-to-low transition on the SDA line while the SCL is high defines a START condition. A low-to-high transition on the SDA line while the SCL is high defines a STOP condition. See [Figure 12](#).

Figure 12. Definition of START and STOP Conditions

Programming (continued)

9.5.1.2 Data Validity and Byte Formation

One data bit is transferred during each clock pulse of the SCL. One byte is comprised of eight bits on the SDA line. See [Figure 13](#). A byte may either be a device address, register address, or data written to or read from a slave.

Data is transferred Most Significant Bit (MSB) first. Any number of data bytes can be transferred from the master to slave between the START and STOP conditions. Data on the SDA line must remain stable during the high phase of the clock period, as changes in the data line when the SCL is high are interpreted as control commands (START or STOP).

Figure 13. Definition of Byte Formation

9.5.1.3 Acknowledge (ACK) and Not Acknowledge (NACK)

Each byte is followed by one ACK bit from the receiver. The ACK bit allows the receiver to communicate to the transmitter that the byte was successfully received and another byte may be sent.

The transmitter must release the SDA line before the receiver can send the ACK bit. To send an ACK bit, the receiver shall pull down the SDA line during the low phase of the ACK/NACK-related clock period (period 9), so that the SDA line is stable low during the high phase of the ACK/NACK-related clock period. Consider setup and hold times. [Figure 14](#) shows an example use of ACK.

Programming (continued)

Figure 14. Example Use of ACK

When the SDA line remains high during the ACK/NACK-related clock period, this is a NACK signal. There are several conditions that lead to the generation of a NACK:

- The receiver is unable to receive or transmit because it is performing some real-time function and is not ready to start communication with the master.
- During the transfer, the receiver gets data or commands that it does not understand.
- During the transfer, the receiver cannot receive any more data bytes.
- A master-receiver is done reading data and indicates this to the slave through a NACK.

Figure 15 shows an example use of NACK.

Figure 15. Example Use of NACK

9.5.1.4 Repeated Start

A repeated START condition may be used in place of a complete STOP condition followed by another START condition when performing a read function. The advantage of this is that the I²C bus does not become available after the stop and therefore prevents other devices from grabbing the bus between transfers.

Programming (continued)

9.5.2 Programing With I²C

9.5.2.1 Write Operation

To write on the I²C bus, the master sends a START condition on the bus with the address of the slave, as well as the last bit (the R/W bit) set to 0, which signifies a write. After the slave responds with an acknowledge, the master then sends the register address of the register to which it wishes to write. The slave acknowledges again, letting the master know that it is ready. After this, the master starts sending the register data to the slave until the master has sent all the data necessary (which is sometimes only a single byte), and the master terminates the transmission with a STOP condition. See [Figure 16](#).

-  Master controls SDA line
-  Slave controls SDA line

Write to one register in a device

Figure 16. Write Operation

9.5.2.2 Read Operation

Reading from a slave is very similar to writing, but requires some additional steps. In order to read from a slave, the master must first instruct the slave which register it wishes to read from. This is done by the master starting off the transmission in a similar fashion as the write, by sending the address with the R/W bit equal to 0 (signifying a write), followed by the register address it wishes to read from. When the slave acknowledges this register address, the master sends a START condition again, followed by the slave address with the R/W bit set to 1 (signifying a read). This time, the slave acknowledges the read request, and the master releases the SDA bus but continues supplying the clock to the slave. During this part of the transaction, the master becomes the master-receiver, and the slave becomes the slave-transmission.

The master continues to send out the clock pulses, for each byte of data that it wishes to receive. At the end of every byte of data, the master sends an ACK to the slave, letting the slave know that it is ready for more data. When the master has received the number of bytes it was expecting (or needs to stop communication), it sends a NACK, signaling to the slave to halt communications and release the bus. The master follows this up with a STOP condition. [Figure 17](#) shows the read operation from one register.

Programming (continued)

Read from one register in a device

Read from one register in a device (Repeated Start)

Figure 17. Read Operation from One Register

Read from one register in a device with single register

Figure 18. Short Read Operation

The TPL0401x-10-Q1 has 1 register, and it is not a requirement that the register address be sent before a read. A shorter read allows the user to simply send a read request to the device address as shown in [Figure 18](#).

9.6 Register Maps

9.6.1 Slave Address

[Table 2](#) and [Table 3](#) show the TPL0401A-10-Q1 and TPL0401B-10-Q1 bit address respectively.

Table 2. TPL0401A-10-Q1 Bit Address

BIT 7 (MSB)	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0 (LSB)
0	1	0	1	1	1	0	R/W

Table 3. TPL0401B-10-Q1 Bit Address

BIT 7 (MSB)	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0 (LSB)
0	1	1	1	1	1	0	R/W

9.6.2 Register Address

Following the successful acknowledgment of the address byte, the bus master sends a command byte as shown in [Figure 19](#), which is stored in the Control Register in the TPL0401x-10-Q1. The TPL0401x-10-Q1 has only 1 register, but requires the command byte be sent during communication.

Figure 19. Register Address Byte

[Table 4](#) shows the TPL0401x-10-Q1 register address byte.

Table 4. Register Address Byte

REGISTER ADDRESS BITS								REGISTER ADDRESS (HEX)	REGISTER	PROTOCOL	POWER-UP DEFAULT
B7	B6	B5	B4	B3	B2	B1	B0				
0	0	0	0	0	0	0	0	0x00	Wiper Position	Read/Write byte	0100 0000 (0x40)

See [Table 1](#) for more information on the wiper position register values. Note that the MSB is always discarded during a write to the wiper position register. For example, if 0x80 is written to the wiper position register, a read returns 0x00. Another similar example is if 0xFF is written, then 0x7F is read.

10 Application and Implementation

10.1 Application Information

There are many applications in which voltage division is needed through the use of a digital potentiometer such as the TPL0401x-10-Q1; this is one example of the many. In conjunction with many amplifiers, the TPL0401x-10-Q1 can effectively be used in voltage divider mode to create a buffer to adjust the reference voltage for DDR3 DIMM1 Memory.

10.2 Typical Application

Figure 20. DDR3 Voltage Reference Adjustment

10.2.1 Design Requirements

Table 5 lists the design parameters for this example.

Table 5. Design Parameters

PARAMETER	EXAMPLE VALUE
Input voltage	1.5 V
V_{REF}	0 V to 0.75 V

10.2.2 Detailed Design Procedure

The TPL0401x-10-Q1 can be used in voltage divider mode with a unity-gain op amp buffer to provide a clean voltage reference for DDR3 DIMM1 Memory. The analog output voltage, V_{REF1} is determined by the wiper setting programmed through the I²C bus.

The op amp is required to buffer the high-impedance output of the TPL0401x-10-Q1 or else loading placed on the output of the voltage divider affects the output voltage.

10.2.3 Application Curve

The voltage, 1.5 V, applied to terminal H of TPL0401x-10-Q1 determines the voltage that is buffered by the unity-gain op amp and divided as the DDR3 DIMM1 voltage reference. By using the TPL0401x-10-Q1, and dividing the 1.5 V, a maximum of 0.75 V is applied to the buffer and passed to the voltage divider. The output voltage then ranges from 0 V to 0.75 V.

Figure 21. TPL0401-10-Q1 Digital Input vs Reference Voltage for DDR3 DIMM Memory

11 Power Supply Recommendations

11.1 Power Sequence

Protection diodes limit the voltage compliance at SDA, SCL, terminal H, and terminal W, making it important to power up V_{DD} first before applying any voltage to SDA, SCL, terminal H, and terminal W. The diodes are forward-biasing, meaning V_{DD} can be powered unintentionally if V_{DD} is not powered first. The ideal power-up sequence is V_{DD} , digital inputs, and V_W and V_H . The order of powering digital inputs, V_H and V_W does not matter as long as they are powered after V_{DD} .

11.2 Power-On Reset Requirements

In the event of a glitch or data corruption, the TPL0401-10-Q1 can be reset to its default conditions by using the power-on reset feature. Power-on reset requires that the device go through a power cycle to be completely reset. This reset also happens when the device is powered on for the first time in an application.

Figure 22. V_{DD} is Lowered to 0 V and then Ramped Up to V_{DD}

Table 6 specifies the performance of the power-on reset feature for TCA6408A for both types of power-on reset.

Table 6. Recommended Supply Sequencing and Ramp Rates at $T_A = 25^\circ\text{C}$ ⁽¹⁾

PARAMETER			MIN	MAX	UNIT
t_{FT}	Fall rate	See Figure 22	0.0001	1000	ms
t_{RT}	Rise rate	See Figure 22	0.0001	1000	ms
t_{RR_GND}	Time to re-ramp (when V_{DD} drops to GND)	See Figure 22	1		μs

(1) Not tested. Specified by design.

11.3 I²C Communication After Power Up

In order to ensure a complete device reset after a power up condition, the user must wait 120 μs after power up before initiating communication with the TPL0401x-10-Q1. See Figure 23 for an example waveform.

Figure 23. Recommended Start Up Sequence

11.4 Wiper Position While Unpowered and After Power Up

When DPOT is powered off, the impedance of the device is undefined and not known.

Upon power-up, the device returns to 0×40h code because this device does not contain non-volatile memory.

12 Layout

12.1 Layout Guidelines

To ensure reliability of the device, follow common printed-circuit board (PCB) layout guidelines:

- Leads to the input must be as direct as possible with a minimum conductor length.
- The ground path must have low resistance and low inductance.
- Use short trace-lengths to avoid excessive loading.
- It is common to have a dedicated ground plane on an inner layer of the board.
- Terminals that are connected to ground must have a low-impedance path to the ground plane in the form of wide polygon pours and multiple vias.
- Use bypass capacitors on power supplies and placed them as close as possible to the V_{DD} pin.
- Apply low equivalent series resistance (0.1- μ F to 10- μ F tantalum or electrolytic capacitors) at the supplies to minimize transient disturbances and to filter low-frequency ripple.
- To reduce the total I^2C bus capacitance added by PCB parasitics, data lines (SCL and SDA) must be as short as possible and the widths of the traces must also be minimized (for example, 5 to 10 mils depending on copper weight).

12.2 Layout Example

13.6 静电放电警告

ESD 可能会损坏该集成电路。德州仪器 (TI) 建议通过适当的预防措施处理所有集成电路。如果不遵守正确的处理措施和安装程序，可能会损坏集成电路。

ESD 的损坏小至导致微小的性能降级，大至整个器件故障。精密的集成电路可能更容易受到损坏，这是因为非常细微的参数更改都可能会导致器件与其发布的规格不相符。

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "-" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
