

TMUX720x 具有 1.8V 逻辑电平和闩锁效应抑制特性的 44V、8:1 单通道和 4:1 双通道精密多路复用器

1 特性

- 闩锁效应抑制
- 双电源电压范围：±4.5V 至 ±22V
- 单电源电压范围：4.5V 至 44V
- 低导通电阻：4 Ω
- 低电荷注入：3pC
- 大电流支持：400mA (最大值) (WQFN)
- 大电流支持：300mA (最大值) (TSSOP)
- -40°C 至 +125°C 工作温度
- 1.8V 逻辑兼容输入
- 逻辑引脚上的集成下拉电阻
- 失效防护逻辑
- 轨到轨运行
- 双向信号路径
- 先断后合开关

2 应用

- 工厂自动化和控制
- 可编程逻辑控制器 (PLC)
- 模拟输入模块
- 半导体测试设备
- 电池测试设备
- 超声波扫描仪
- 患者监护和诊断
- 光纤网络
- 光学测试设备
- 有线网络
- 数据采集系统 (DAQ)

3 说明

TMUX7208 是一款 8:1 单通道精密多路复用器；TMUX7209 是一款 4:1 双通道多路复用器，具有低导通电阻和电荷注入。此器件在单电源 (4.5V 至 44V)、双电源 (±4.5V 至 ±22V) 或非对称电源 (例如 $V_{DD} = 12V$, $V_{SS} = -5V$) 供电时均能正常运行。TMUX720x 可支持源极 (Sx) 和漏极 (D) 引脚上 V_{SS} 到 V_{DD} 范围的双向模拟和数字信号。

TMUX720x 是精密开关和多路复用器系列器件，具有非常低的导通和关断漏电流，因此可用于高精度测量应用。TMUX720x 系列具有闩锁效应抑制，可防止器件内寄生结构之间通常由过压事件引起的大电流不良事件。闩锁状态通常会一直持续到电源轨关闭为止，并可能导致器件失效。闩锁效应抑制使得 TMUX720x 系列开关和多路复用器能够在恶劣的环境中使用。

表 3-1. 器件信息

| 器件型号 ⁽¹⁾ | 配置 | 封装 ⁽²⁾ |
|---------------------|-------------------|-------------------|
| TMUX7208 | 1 通道 8:1 多路复用器 | PW (TSSOP, 16) |
| TMUX7209 | 2 通道 4:1 多路复用器 | RUM (WQFN, 16) |

(1) 请参阅器件比较。

(2) 有关更多信息，请参阅节 12。

图 5-2. TMUX7208 : RUM Package 16-Pin WQFN Top View

表 5-1. TMUX7208 Pin Functions

| PIN | | | TYPE ⁽¹⁾ | DESCRIPTION ⁽²⁾ |
|-------------|----|-----|---------------------|---|
| NAME | PW | RUM | | |
| A0 | 1 | 15 | I | Logic control input, has internal 4M Ω pull-down resistor. Controls the switch configuration as shown in 节 8.5. |
| A1 | 16 | 14 | I | Logic control input, has internal 4M Ω pull-down resistor. Controls the switch configuration as shown in 节 8.5. |
| A2 | 15 | 13 | I | Logic control input, has internal 4M Ω pull-down resistor. Controls the switch configuration as shown in 节 8.5. |
| D | 8 | 6 | I/O | Drain pin. Can be an input or output. |
| EN | 2 | 16 | I | Active high logic enable, has internal 4M Ω pull-down resistor. When this pin is low, all switches are turned off. When this pin is high, the Ax logic input determines which switch is turned on. |
| GND | 14 | 12 | P | Ground (0V) reference. |
| S1 | 4 | 2 | I/O | Source pin 1. Can be an input or output. |
| S2 | 5 | 3 | I/O | Source pin 2. Can be an input or output. |
| S3 | 6 | 4 | I/O | Source pin 3. Can be an input or output. |
| S4 | 7 | 5 | I/O | Source pin 4. Can be an input or output. |
| S5 | 12 | 10 | I/O | Source pin 5. Can be an input or output. |
| S6 | 11 | 9 | I/O | Source pin 6. Can be an input or output. |
| S7 | 10 | 8 | I/O | Source pin 7. Can be an input or output. |
| S8 | 9 | 7 | I/O | Source pin 8. Can be an input or output. |
| VDD | 13 | 11 | P | Positive power supply. This pin is the most positive power-supply potential. For reliable operation, connect a decoupling capacitor ranging from 0.1 μ F to 10 μ F between V _{DD} and GND. |
| VSS | 3 | 1 | P | Negative power supply. This pin is the most negative power-supply potential. In single-supply applications, this pin can be connected to ground. For reliable operation, connect a decoupling capacitor ranging from 0.1 μ F to 10 μ F between V _{SS} and GND. |
| Thermal Pad | | | — | The thermal pad is not connected internally. It is recommended that the pad be tied to GND or VSS for best performance. |

(1) I = input, O = output, I/O = input and output, P = power.

(2) Refer to 节 8.4 for what to do with unused pins.

图 5-3. TMUX7209 : PW Package 16-Pin TSSOP Top View

图 5-4. TMUX7209 : RUM Package 16-Pin WQFN Top View

表 5-2. TMUX7209 Pin Functions

| NAME | PIN | | TYPE ⁽¹⁾ | DESCRIPTION ⁽²⁾ |
|-------------|-----|-----|---------------------|---|
| | PW | RUM | | |
| A0 | 1 | 15 | I | Logic control input, has internal pull-down resistor. Controls the switch configuration as shown in 节 8.5. |
| A1 | 16 | 14 | I | Logic control input, has internal pull-down resistor. Controls the switch configuration as shown in 节 8.5. |
| DA | 8 | 6 | I/O | Drain Terminal A. Can be an input or an output. |
| DB | 9 | 7 | I/O | Drain Terminal B. Can be an input or an output. |
| EN | 2 | 16 | I | Active high logic enable, has internal pull-up resistor. When this pin is low, all switches are turned off. When this pin is high, the Ax logic input determines which switch is turned on. |
| GND | 15 | 13 | P | Ground (0V) reference. |
| S1A | 4 | 2 | I/O | Source pin 1A. Can be an input or output. |
| S1B | 13 | 11 | I/O | Source pin 1B. Can be an input or output. |
| S2A | 5 | 3 | I/O | Source pin 2A. Can be an input or output. |
| S2B | 12 | 10 | I/O | Source pin 2B. Can be an input or output. |
| S3A | 6 | 4 | I/O | Source pin 3A. Can be an input or output. |
| S3B | 11 | 9 | I/O | Source pin 3B. Can be an input or output. |
| S4A | 7 | 5 | I/O | Source pin 4A. Can be an input or output. |
| S4B | 10 | 8 | I/O | Source pin 4B. Can be an input or output. |
| VDD | 14 | 12 | P | Positive power supply. This pin is the most positive power-supply potential. For reliable operation, connect a decoupling capacitor ranging from 0.1 μ F to 10 μ F between V _{DD} and GND. |
| VSS | 3 | 1 | P | Negative power supply. This pin is the most negative power-supply potential. In single-supply applications, this pin can be connected to ground. For reliable operation, connect a decoupling capacitor ranging from 0.1 μ F to 10 μ F between V _{SS} and GND. |
| Thermal Pad | | | — | The thermal pad is not connected internally. It is recommended that the pad be tied to GND or VSS for best performance. |

- (1) I = input, O = output, I/O = input and output, P = power.
 (2) Refer to 节 8.4 for what to do with unused pins.

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)^{(1) (2)}

| | | MIN | MAX | UNIT |
|---------------------------|--|----------------|--------------------------------|------|
| $V_{DD} - V_{SS}$ | Supply voltage | | 48 | V |
| V_{DD} | | - 0.5 | 48 | V |
| V_{SS} | | - 48 | 0.5 | V |
| $V_{ADDRESS}$ or V_{EN} | Logic control input pin voltage (EN, A0, A1, A2) | - 0.5 | 48 | V |
| $I_{ADDRESS}$ or I_{EN} | Logic control input pin current (EN, A0, A1, A2) | - 30 | 30 | mA |
| V_S or V_D | Source or drain voltage (Sx, D) | $V_{SS} - 0.5$ | $V_{DD} + 0.5$ | V |
| I_{IK} | Diode clamp current ⁽³⁾ | - 30 | 30 | mA |
| I_S or $I_D (CONT)$ | Source or drain continuous current (Sx, D) | | $I_{DC} + 10\%$ ⁽⁴⁾ | mA |
| T_A | Ambient temperature | - 55 | 150 | °C |
| T_{stg} | Storage temperature | - 65 | 150 | °C |
| T_J | Junction temperature | | 150 | °C |
| P_{tot} | Total power dissipation (QFN package) ⁽⁵⁾ | | 1650 | mW |
| | Total power dissipation (TSSOP package) ⁽⁵⁾ | | 700 | mW |

- (1) Stresses beyond those listed under *Absolute Maximum Rating* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Condition*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltages are with respect to ground, unless otherwise specified.
- (3) Pins are diode-clamped to the power-supply rails. Over voltage signals must be voltage and current limited to maximum ratings.
- (4) Refer to *Source or Drain Continuous Current* table for I_{DC} specifications.
- (5) For QFN package: P_{tot} derates linearly above $T_A = 70^\circ\text{C}$ by $24.4\text{mW}/^\circ\text{C}$.
For TSSOP package: P_{tot} derates linearly above $T_A = 70^\circ\text{C}$ by $10.8\text{mW}/^\circ\text{C}$.

6.2 ESD Ratings

| | | | VALUE | UNIT |
|---|-------------------------|--|-------|------|
| TMUX7208 in PW package | | | | |
| $V_{(ESD)}$ | Electrostatic discharge | Human body model (HBM), per ANSI/ESDA/ JEDEC JS-001, all pins ⁽¹⁾ | ±2000 | V |
| | | Charged device model (CDM), per JEDEC specification JESD22-C101, all pins ⁽²⁾ | ±500 | |
| TMUX7209 in PW package | | | | |
| $V_{(ESD)}$ | Electrostatic discharge | Human body model (HBM), per ANSI/ESDA/ JEDEC JS-001, all pins ⁽¹⁾ | ±2000 | V |
| | | Charged device model (CDM), per JEDEC specification JESD22-C101, all pins ⁽²⁾ | ±500 | |
| TMUX7208 and TMUX7209 in RUM package | | | | |
| $V_{(ESD)}$ | Electrostatic discharge | Human body model (HBM), per ANSI/ESDA/ JEDEC JS-001, all pins ⁽¹⁾ | ±2000 | V |
| | | Charged device model (CDM), per JEDEC specification JESD22-C101, all pins ⁽²⁾ | ±500 | |

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Thermal Information

| THERMAL METRIC ⁽¹⁾ | | TMUX720x | | UNIT |
|-------------------------------|--|------------|------------|------|
| | | PW (TSSOP) | RUM (WQFN) | |
| | | 16 PINS | 16 PINS | |
| $R_{\theta JA}$ | Junction-to-ambient thermal resistance | 93.5 | 41.2 | °C/W |
| $R_{\theta JC(top)}$ | Junction-to-case (top) thermal resistance | 24.9 | 24.5 | °C/W |
| $R_{\theta JB}$ | Junction-to-board thermal resistance | 40.0 | 16.1 | °C/W |
| Ψ_{JT} | Junction-to-top characterization parameter | 1.0 | 0.2 | °C/W |
| Ψ_{JB} | Junction-to-board characterization parameter | 39.4 | 16.1 | °C/W |
| $R_{\theta JC(bot)}$ | Junction-to-case (bottom) thermal resistance | N/A | 2.8 | °C/W |

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

6.4 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

| | | MIN | NOM | MAX | UNIT |
|----------------------------------|--|----------|-----|-------------------------|------|
| $V_{DD} - V_{SS}$ ⁽¹⁾ | Power supply voltage differential | 4.5 | | 44 | V |
| V_{DD} | Positive power supply voltage | 4.5 | | 44 | V |
| V_S or V_D | Signal path input/output voltage (source or drain pin) (Sx, D) | V_{SS} | | V_{DD} | V |
| $V_{ADDRESS}$ or V_{EN} | Address or enable pin voltage | 0 | | 44 | V |
| I_S or I_D (CONT) | Source or drain continuous current (Sx, D) | | | I_{DC} ⁽²⁾ | mA |
| T_A | Ambient temperature | -40 | | 125 | °C |

(1) V_{DD} and V_{SS} can be any value as long as $4.5\text{ V} \leq (V_{DD} - V_{SS}) \leq 44\text{ V}$, and the minimum V_{DD} is met.

(2) Refer to *Source or Drain Continuous Current* table for I_{DC} specifications.

6.5 Source or Drain Continuous Current

at supply voltage of $V_{DD} \pm 10\%$, $V_{SS} \pm 10\%$ (unless otherwise noted)

| CONTINUOUS CURRENT PER CHANNEL (I_{DC}) | | $T_A = 25^\circ\text{C}$ | $T_A = 85^\circ\text{C}$ | $T_A = 125^\circ\text{C}$ | UNIT |
|---|------------------------------------|--------------------------|--------------------------|---------------------------|------|
| PACKAGE | TEST CONDITIONS | | | | |
| PW (TSSOP) | +44 V Dual Supply ⁽¹⁾ | 300 | 190 | 110 | mA |
| | $\pm 15\text{ V}$ Dual Supply | 300 | 190 | 110 | mA |
| | +12 V Single Supply | 220 | 150 | 90 | mA |
| | $\pm 5\text{ V}$ Dual Supply | 210 | 140 | 90 | mA |
| | +5 V Single Supply | 170 | 110 | 70 | mA |
| RUM (WQFN) | +44 V Single Supply ⁽¹⁾ | 400 | 230 | 120 | mA |
| | $\pm 15\text{ V}$ Dual Supply | 400 | 230 | 120 | mA |
| | +12 V Single Supply | 310 | 190 | 100 | mA |
| | $\pm 5\text{ V}$ Dual Supply | 300 | 190 | 100 | mA |
| | +5 V Single Supply | 230 | 150 | 90 | mA |

(1) Specified for nominal supply voltage only.

6.6 ±15 V Dual Supply: Electrical Characteristics

V_{DD} = +15 V ± 10%, V_{SS} = - 15 V ± 10%, GND = 0 V (unless otherwise noted)

Typical at V_{DD} = +15 V, V_{SS} = - 15 V, T_A = 25°C (unless otherwise noted)

| PARAMETER | | TEST CONDITIONS | T _A | MIN | TYP | MAX | UNIT | |
|--|---|--|------------------|-------|---------|-----|------|----|
| ANALOG SWITCH | | | | | | | | |
| R _{ON} | On-resistance | V _S = - 10 V to +10 V I _D = - 10 mA Refer to On-Resistance | 25°C | | 4 | 5.9 | Ω | |

7 Parameter Measurement Information

7.1 On-Resistance

The on-resistance of a device is the ohmic resistance between the source (Sx) and drain (D) pins of the device. The on-resistance varies with input voltage and supply voltage. The symbol R_{ON} is used to denote on-resistance. 图 7-1 shows the measurement setup used to measure R_{ON} . Voltage (V) and current (I_{SD}) are measured using this setup, and R_{ON} is computed with $R_{ON} = V / I_{SD}$.

图 7-1. On-Resistance Measurement Setup

7.2 Off-Leakage Current

There are two types of leakage currents associated with a switch during the off state:

- Source off-leakage current
- Drain off-leakage current

Source leakage current is defined as the leakage current flowing into or out of the source pin when the switch is off. This current is denoted by the symbol $I_{S(OFF)}$.

Drain leakage current is defined as the leakage current flowing into or out of the drain pin when the switch is off. This current is denoted by the symbol $I_{D(OFF)}$.

图 7-2 shows the setup used to measure both off-leakage currents.

图 7-2. Off-Leakage Measurement Setup

7.3 On-Leakage Current

Source on-leakage current is defined as the leakage current flowing into or out of the source pin when the switch is on. This current is denoted by the symbol $I_{S(ON)}$.

Drain on-leakage current is defined as the leakage current flowing into or out of the drain pin when the switch is on. This current is denoted by the symbol $I_{D(ON)}$.

Either the source pin or drain pin is left floating during the measurement. 图 7-3 shows the circuit used for measuring the on-leakage current, denoted by $I_{S(ON)}$ or $I_{D(ON)}$.

图 7-3. On-Leakage Measurement Setup

7.4 Transition Time

Transition time is defined as the time taken by the output of the device to rise or fall 90% after the address signal has risen or fallen past the logic threshold. The 90% transition measurement is utilized to provide the timing of the device. System level timing can then account for the time constant added from the load resistance and load capacitance. 图 7-4 shows the setup used to measure transition time, denoted by the symbol $t_{TRANSITION}$.

图 7-4. Transition-Time Measurement Setup

7.5 $t_{ON(EN)}$ and $t_{OFF(EN)}$

Turn-on time is defined as the time taken by the output of the device to rise to 90% after the enable has risen past the logic threshold. The 90% measurement is utilized to provide the timing of the device. System level timing can then account for the time constant added from the load resistance and load capacitance. 图 7-5 shows the setup used to measure turn-on time, denoted by the symbol $t_{ON(EN)}$.

Turn-off time is defined as the time taken by the output of the device to fall to 10% after the enable has fallen past the logic threshold. The 10% measurement is utilized to provide the timing of the device. System level timing can then account for the time constant added from the load resistance and load capacitance. 图 7-5 shows the setup used to measure turn-off time, denoted by the symbol $t_{OFF(EN)}$.

图 7-5. Turn-On and Turn-Off Time Measurement Setup

7.6 Break-Before-Make

Break-before-make delay is a safety feature that prevents two inputs from connecting when the device is switching. The output first breaks from the on-state switch before making the connection with the next on-state switch. The time delay between the *break* and the *make* is known as break-before-make delay. 图 7-6 shows the setup used to measure break-before-make delay, denoted by the symbol $t_{OPEN(BBM)}$.

图 7-6. Break-Before-Make Delay Measurement Setup

7.7 $t_{ON}(V_{DD})$ Time

The $t_{ON}(V_{DD})$ time is defined as the time taken by the output of the device to rise to 90% after the supply has risen past the supply threshold. The 90% measurement is used to provide the timing of the device turning on in the system. 图 7-7 shows the setup used to measure turn on time, denoted by the symbol $t_{ON}(V_{DD})$.

图 7-7. $t_{ON}(V_{DD})$ Time Measurement Setup

7.8 Propagation Delay

Propagation delay is defined as the time taken by the output of the device to rise or fall 50% after the input signal has risen or fallen past the 50% threshold. 图 7-8 shows the setup used to measure propagation delay, denoted by the symbol t_{PD} .

图 7-8. Propagation Delay Measurement Setup

7.9 Charge Injection

The TMUX7208 has a transmission-gate topology. Any mismatch in capacitance between the NMOS and PMOS transistors results in a charge injected into the drain or source during the falling or rising edge of the gate signal. The amount of charge injected into the source or drain of the device is known as charge injection, and is denoted by the symbol Q_{INJ} . 图 7-9 shows the setup used to measure charge injection from source (Sx) to drain (D).

The TMUX7208 and have a transmission-gate topology. Any mismatch in capacitance between the NMOS and PMOS transistors results in a charge injected into the drain or source during the falling or rising edge of the gate signal. The amount of charge injected into the source or drain of the device is known as charge injection, and is denoted by the symbol Q_{INJ} . 图 7-9 shows the setup used to measure charge injection from source (Sx) to drain (D).

图 7-9. Charge-Injection Measurement Setup

7.10 Off Isolation

Off isolation is defined as the ratio of the signal at the drain pin (D) of the device when a signal is applied to the source pin (Sx) of an off-channel. 图 7-10 shows the setup used to measure, and the equation used to calculate off isolation.

$$Off\ Isolation = 20 \times \text{Log} \frac{V_{OUT}}{V_S}$$

图 7-10. Off Isolation Measurement Setup

7.11 Crosstalk

Crosstalk is defined as the ratio of the signal at the drain pin (D) of a different channel, when a signal is applied at the source pin (Sx) of an on-channel. 图 7-11 shows the setup used to measure and the equation used to calculate crosstalk.

图 7-11. Crosstalk Measurement Setup

7.12 Bandwidth

Bandwidth is defined as the range of frequencies that are attenuated by less than 3 dB when the input is applied to the source pin (Sx) of an on-channel, and the output is measured at the drain pin (D) of the device. 图 7-12 shows the setup used to measure bandwidth.

图 7-12. Bandwidth Measurement Setup

7.13 THD + Noise

The total harmonic distortion (THD) of a signal is a measurement of the harmonic distortion, and is defined as the ratio of the sum of the powers of all harmonic components to the power of the fundamental frequency at the mux output. The on-resistance of the device varies with the amplitude of the input signal and results in distortion when the drain pin is connected to a low-impedance load. Total harmonic distortion plus noise is denoted as THD.

图 7-13. THD Measurement Setup

7.14 Power Supply Rejection Ratio (PSRR)

PSRR measures the ability of a device to prevent noise and spurious signals that appear on the supply voltage pin from coupling to the output of the switch. The DC voltage on the device supply is modulated by a sine wave of 620mVPP. The ratio of the amplitude of signal on the output to the amplitude of the modulated signal is the ACPSRR. A high ratio represents a high degree of tolerance to supply rail variation.

The below shows how the decoupling capacitors reduce high frequency noise on the supply pins. This helps stabilize the supply and immediately filter as much of the supply noise as possible.

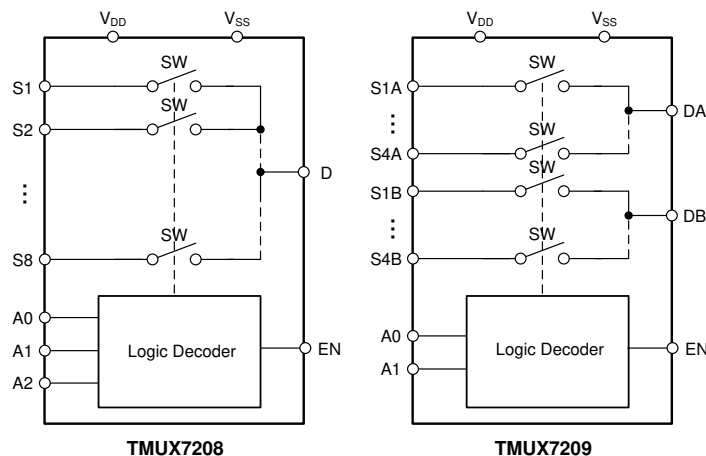

图 7-14. ACPSRR Measurement Setup

8 Detailed Description

8.1 Overview

The TMUX7208 is an 8:1, 1-channel multiplexer and the TMUX7209 is a 4:1, 2 channel multiplexer. Each channel is turned on or turned off based on the state of the address lines and enable pin.

8.2 Functional Block Diagram

8.3 Feature Description

8.3.1 Bidirectional Operation

The TMUX7208 and TMUX7209 conduct equally well from source (S_x) to drain (D) or from drain (D) to source (S_x). Each channel has similar characteristics in both directions and supports both analog and digital signals.

8.3.2 Rail-to-Rail Operation

The valid signal path input or output voltage for TMUX7208 and TMUX7209 ranges from V_{SS} to V_{DD} .

8.3.3 1.8V Logic Compatible Inputs

TMUX7208 and TMUX7209 have 1.8-V logic compatible control for all logic control inputs. 1.8-V logic level inputs allows the to interface with processors that have lower logic I/O rails and eliminates the need for an external translator, which saves both space and BOM cost. For more information on 1.8V logic implementations refer to [Simplifying Design with 1.8V logic Muxes and Switches](#).

8.3.4 Integrated Pull-Down Resistor on Logic Pins

The TMUX720x has internal weak pull-down resistors to GND to ensure the logic pins are not left floating. The value of this pull-down resistor is approximately $4M\Omega$, but is clamped to about $1\mu A$ at higher voltages. This feature integrates up to four external components and reduces system size and cost.

8.3.5 Fail-Safe Logic

TMUX7208 and TMUX7209 support Fail-Safe Logic on the control input pins (EN and A_x) allowing it to operate up to 44V, regardless of the state of the supply pins. This feature allows voltages on the control pins to be applied before the supply pin, protecting the device from potential damage. Fail-Safe Logic minimizes system complexity by removing the need for power supply sequencing on the logic control pins. For example, the Fail-Safe Logic feature allows the TMUX7208 and TMUX7209 logic input pins to ramp up to +44V while V_{DD} and $V_{SS} = 0V$. The logic control inputs are protected against positive faults of up to +44V in powered-off condition, but do not offer protection against negative overvoltage conditions.

8.3.6 Latch-Up Immune

Latch-Up is a condition where a low impedance path is created between a supply pin and ground. This condition is caused by a trigger (current injection or overvoltage), but once activated, the low impedance path remains even after the trigger is no longer present. This low impedance path may cause system upset or catastrophic damage due to excessive current levels. The Latch-Up condition typically requires a power cycle to eliminate the low impedance path.

The TMUX720x family of devices are constructed on Silicon on Insulator (SOI) based process where an oxide layer is added between the PMOS and NMOS transistor of each CMOS switch to prevent parasitic structures from forming. The oxide layer is also known as an insulating trench and prevents triggering of latch up events due to overvoltage or current injections. The latch-up immunity feature allows the TMUX720x family of switches and multiplexers to be used in harsh environments. For more information on latch-up immunity refer to [Using Latch Up Immune Multiplexers to Help Improve System Reliability](#).

8.3.7 Ultra-Low Charge Injection

The TMUX7208 and TMUX7209 have a transmission gate topology, as shown in [图 8-1](#). Any mismatch in the stray capacitance associated with the NMOS and PMOS causes an output level change whenever the switch is opened or closed.

图 8-1. Transmission Gate Topology

The TMUX720x contains specialized architecture to reduce charge injection on the Drain (D). To further reduce charge injection in a sensitive application, a compensation capacitor (C_p) can be added on the Source (S_x). This will ensure that excess charge from the switch transition will be pushed into the compensation capacitor on the Source (S_x) instead of the Drain (D). As a general rule of thumb, C_p should be 20x larger than the equivalent load capacitance on the Drain (D). [图 8-2](#) shows charge injection variation with different compensation capacitors on the Source side. This plot was captured on the TMUX7219 as part of the TMUX720x family with a 100pF load capacitance.

图 8-2. Charge Injection Compensation

8.4 Device Functional Modes

When the EN pin of the TMUX7208 is pulled high, one of the switches is closed based on the state of the Ax pin. Similarly, when the EN pin of the TMUX7209 is pulled high, two of the switches are closed based on the state of the address lines. When the EN pin is pulled low, all of the switches are in an open state regardless of the state of the Ax pin. The control pins can be as high as 44V.

The TMUX7208 and TMUX7209 can be operated without any external components except for the supply decoupling capacitors. The EN and Ax pins have internal pull-down resistors of 4M Ω . If unused, Ax and EN pins must be tied to GND in order to ensure the device does not consume additional current as highlighted in [Implications of Slow or Floating CMOS Inputs](#). Unused signal path inputs (Sx or D) should be connected to GND.

8.5 Truth Tables

表 8-1 shows the truth tables for the TMUX7208.

表 8-1. TMUX7208 Truth Table

| EN | A2 | A1 | A0 | Selected Source Connected To Drain (D) Pin |

9 Application and Implementation

备注

以下应用部分中的信息不属于 TI 器件规格的范围，TI 不担保其准确性和完整性。TI 的客户应负责确定器件是否适用于其应用。客户应验证并测试其设计，以确保系统功能。

9.1 Application Information

The TMUX7208 and TMUX7209 are part of the precision switches and multiplexers family of devices. These devices operate with dual supplies ($\pm 4.5V$ to $\pm 22V$), a single supply (4.5V to 44V), or asymmetric supplies (such as $V_{DD} = 12V$, $V_{SS} = -5V$), and offer true rail-to-rail input and output. The TMUX7208 and TMUX7209 offer low R_{ON} , low on and off leakage currents and ultra-low charge injection performance. These features makes the TMUX720x a family of precision, robust, high-performance analog multiplexers for high-voltage, industrial applications.

9.2 Typical Application

One example to take advantage of performance is the implementation of multiplexed data acquisition front end for multiple input sensors. Applications such as analog input modules for programmable logic controllers (PLCs), data acquisition (DAQ), and semiconductor test systems commonly need to monitor multiple signals into a single ADC channel. The multiple inputs can come from different system voltages being monitored, or environmental sensors such as temperature or humidity. 图 9-1 shows a simplified example of monitoring multiple inputs into a single ADC using a multiplexer.

图 9-1. Multiplexed Data Acquisition Front End

9.2.1 Design Requirements

表 9-1. Design Parameters

| PARAMETER | VALUE |
|-----------------------------|----------------------------|
| Positive supply (VDD) | +15V |
| Negative supply (VSS) | -15V |
| Input / output signal range | -12V to 12V (limit of ADC) |
| Control logic thresholds | 1.8V compatible |
| Temperature range | -40°C to +125°C |

9.2.2 Detailed Design Procedure

The application shown in 图 9-2 demonstrates how a multiplexer can be used to simplify the signal chain and monitor multiple input signals to a single ADC channel. In this example the ADC (ADS8661) has software programmable input ranges up to $\pm 12.288V$. The ADC also has overvoltage protection up to $\pm 20V$ which allows for the multiplexer to be powered with wider supply voltages than the input signal range to maximize on resistance performance of the multiplexer, while still maintaining system level overvoltage protection beyond the useable signal range. Both the multiplexer and the ADC are capable of operation in extended industrial temperature range of $-40^{\circ}C$ to $+125^{\circ}C$ allowing for use in a wider array of industrial systems.

Many SAR ADCs have an analog input structure that consists of a sampling switch and a sampling capacitor. Many signal chains will have a driver amplifier to help charge the input of the ADC to meet a fast system acquisition time. However a driver amplifier is not always needed to drive SAR ADCs. 图 9-2 shows a typical diagram of a sensor driving the SAR ADC input directly after being passed through the multiplexer. A filter capacitor (C_{FLT}) is connected to the input of the ADC to reduce the sampling charge injection and provides a charge bucket to quickly charge the internal sample-and-hold capacitor of the ADC.

The sensor block simplifies the device into a Thevenin equivalent voltage source (V_{TH}) and resistance (R_{TH}) which can be extracted from the device datasheets. Similarly the multiplexer can be thought of as a series resistance ($R_{ON(MUX)}$) and capacitance ($C_{ON(MUX)}$). To ensure maximum precision of the signal chain the system should be able to settle within 1/2 of an LSB within the acquisition time of the ADC. The time constant can be calculated as shown in 图 9-2. This equation highlights the importance of selecting a multiplexer with low on-resistance to further reduce the system time constant. Additionally low charge injection performance of the multiplexer is helpful to reduce conversion errors and improve accuracy of the measurements.

$$t_{ACQ} > k \times \tau_{FLT}$$

- $\tau_{FLT} = (R_{TH} + R_{ON(MUX)}) \times (C_{FLT} + C_{ON(MUX)})$
- k is single pole time constant for N bit ADC

图 9-2. Driving SAR ADC

9.2.3 Application Curve

The low on and off leakage currents of TMUX7208 and ultra-low charge injection performance make this device ideal for implementing high precision industrial systems. The TMUX7208 contains specialized architecture to reduce charge injection on the drain side (D) (see 节 8.3.7 for more details). 图 9-3 shows the plot for the charge injection versus source voltage for the TMUX7208.

图 9-3. Charge Injection vs Drain Voltage

9.3 Power Supply Recommendations

The TMUX7208 and the TMUX7209 operate across a wide supply range of $\pm 4.5V$ to $\pm 22V$ (4.5V to 44V in single-supply mode). The device also perform well with asymmetrical supplies such as $V_{DD} = 12V$ and $V_{SS} = -5V$.

Power-supply bypassing improves noise margin and prevents switching noise propagation from the supply rails to other components. Good power-supply decoupling is important to achieve optimum performance. For improved supply noise immunity, use a supply decoupling capacitor ranging from $0.1 \mu F$ to $10 \mu F$ at the V_{DD} and V_{SS} pins to ground. Place the bypass capacitors as close to the power supply pins of the device as possible using low-impedance connections. TI recommends using multi-layer ceramic chip capacitors (MLCCs) that offer low equivalent series resistance (ESR) and inductance (ESL) characteristics for power-supply decoupling purposes. For very sensitive systems, or for systems in harsh noise environments, avoiding the use of vias for connecting the capacitors to the device pins may offer superior noise immunity. The use of multiple vias in parallel lowers the overall inductance and is beneficial for connections to ground and power planes. Always ensure the ground (GND) connection is established before supplies are ramped.

9.4 Layout

9.4.1 Layout Guidelines

A reflection can occur when a PCB trace turns a corner at a 90° angle. A reflection occurs primarily because of the change of width of the trace. The trace width increases to 1.414 times the width at the apex of the turn. This increase upsets the transmission-line characteristics, especially the distributed capacitance and self-inductance of the trace which results in the reflection. Not all PCB traces can be straight and therefore some traces must turn corners. 图 9-4 shows progressively better techniques of rounding corners. Only the last example (BEST) maintains constant trace width and minimizes reflections.

图 9-4. Trace Example

Route high-speed signals using a minimum of vias and corners which reduces signal reflections and impedance changes. When a via must be used, increase the clearance size around it to minimize its capacitance. Each via introduces discontinuities in the signal's transmission line and increases the chance of picking up interference from the other layers of the board. Be careful when designing test points, through-hole pins are not recommended at high frequencies.

图 9-5 和 图 9-6 illustrate an example of a PCB layout with the TMUX7208. Some key considerations are:

- Decouple the supply pins with a 0.1 μF and 1 μF capacitor, placed lowest value capacitor as close to the pin as possible. Make sure that the capacitor voltage rating is sufficient for the supply voltage.
- Keep the input lines as short as possible.
- Use a solid ground plane to help reduce electromagnetic interference (EMI) noise pickup.
- Do not run sensitive analog traces in parallel with digital traces. Avoid crossing digital and analog traces if possible, and only make perpendicular crossings when necessary.
- Using multiple vias in parallel will lower the overall inductance and is beneficial for connection to ground planes.

| TMUX7209RUMR | ACTIVE | WQFN | RUM | 16 | 3000 | RoHS & Green | NIPDAU | Level-1-260C-UNLIM | -40 to 125 | TMUX X209 | Samples |

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided.
