

WMA Version9 Decoder on C64x+

User Guide

Literature Number: SPRUE1A
February 2007

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

About This Manual

This document describes how to install and work with Texas Instruments' (TI) WMA Version9 Decoder implementation on the C64x+ platform. It also provides a detailed Application Programming Interface (API) reference and information on the sample application that accompanies this component.

TI's codec implementations are based on the eXpressDSP Digital Media (XDM) standard. XDM is an extension of the eXpressDSP Algorithm Interface Standard (XDAIS).

Intended Audience

This document is intended for system engineers who want to integrate TI's codecs with other software to build a multimedia system based on the C64x+ platform.

This document assumes that you are fluent in the C language, have a good working knowledge of Digital Signal Processing (DSP), digital signal processors, and DSP applications. Good knowledge of eXpressDSP Algorithm Interface Standard (XDAIS) and eXpressDSP Digital Media (XDM) standard will be helpful.

How to Use This Manual

This document includes the following chapters:

- ❑ **Chapter 1 - Introduction**, provides a brief introduction to the XDAIS and XDM standards. It also provides an overview of the codec and lists its supported features.
- ❑ **Chapter 2 - Installation Overview**, describes how to install, build, and run the codec.
- ❑ **Chapter 3 - Sample Usage**, describes the sample usage of the codec.
- ❑ **Chapter 4 - API Reference**, describes the data structures and interface functions used in the codec.

Related Documentation From Texas Instruments

The following documents describe TI's DSP algorithm standards such as, XDAIS and XDM. To obtain a copy of any of these TI documents, visit the Texas Instruments website at www.ti.com.

- ❑ *TMS320 DSP Algorithm Standard Rules and Guidelines* (literature number SPRU352) defines a set of requirements for DSP algorithms that, if followed, allow system integrators to quickly assemble production-quality systems from one or more such algorithms.
- ❑ *TMS320 DSP Algorithm Standard API Reference* (literature number SPRU360) describes all the APIs that are defined by the TMS320 DSP Algorithm Interface Standard (also known as XDAIS) specification.
- ❑ *Technical Overview of eXpressDSP - Compliant Algorithms for DSP Software Producers* (literature number SPRA579) describes how to make algorithms compliant with the TMS320 DSP Algorithm Standard which is part of TI's eXpressDSP technology initiative.
- ❑ *Using the TMS320 DSP Algorithm Standard in a Static DSP System* (literature number SPRA577) describes how an eXpressDSP-compliant algorithm may be used effectively in a static system with limited memory.
- ❑ *DMA Guide for eXpressDSP-Compliant Algorithm Producers and Consumers* (literature number SPRA445) describes the DMA architecture specified by the TMS320 DSP Algorithm Standard (XDAIS). It also describes two sets of APIs used for accessing DMA resources: the IDMA2 abstract interface and the ACPY2 library.
- ❑ *eXpressDSP Digital Media (XDM) Standard API Reference* (literature number SPRUEC8)

The following documents describe TMS320 devices and related support tools:

- ❑ *Design and Implementation of an eXpressDSP-Compliant DMA Manager for C6X1X* (literature number SPRA789) describes a C6x1x-optimized (C6211, C6711) ACPY2 library implementation and DMA Resource Manager.
- ❑ *TMS320C64x+ Megamodule* (literature number SPRAA68) describes the enhancements made to the internal memory and describes the new features which have been added to support the internal memory architecture's performance and protection.
- ❑ *TMS320C64x+ DSP Megamodule Reference Guide* (literature number SPRU871) describes the C64x+ megamodule peripherals.
- ❑ *TMS320C64x to TMS320C64x+ CPU Migration Guide* (literature number SPRAA84) describes migration from the Texas Instruments TMS320C64x™ digital signal processor (DSP) to the TMS320C64x+™ DSP.
- ❑ *TMS320C6000 Optimizing Compiler v 6.0 Beta User's Guide* (literature number SPRU187N) explains how to use compiler tools

such as compiler, assembly optimizer, standalone simulator, library-build utility, and C++ name demangler.

- ❑ *TMS320C64x/C64x+ DSP CPU and Instruction Set Reference Guide* (literature number SPRU732) describes the CPU architecture, pipeline, instruction set, and interrupts of the C64x and C64x+ DSPs.

Introduction

This chapter provides a brief introduction to XDAIS and XDM. It also provides an overview of TI's implementation of the WMA Version9 Decoder on the C64x+ platform and its supported features.

Topic	Page
1.1 Overview of XDAIS and XDM	1-2
1.2 Overview of WMA Version9 Decoder	1-3
1.3 Supported Services and Features	1-4

1.1 Overview of XDAIS and XDM

TI's multimedia codec implementations are based on the eXpressDSP Digital Media (XDM) standard. XDM is an extension of the eXpressDSP Algorithm Interface Standard (XDAIS).

1.1.1 XDAIS Overview

An eXpressDSP-compliant algorithm is a module that implements the abstract interface IALG. The IALG API takes the memory management function away from the algorithm and places it in the hosting framework. Thus, an interaction occurs between the algorithm and the framework. This interaction allows the client application to allocate memory for the algorithm and also share memory between algorithms. It also allows the memory to be moved around while an algorithm is operating in the system. In order to facilitate these functionalities, the IALG interface defines the following APIs:

- ❑ `algAlloc()`
- ❑ `algInit()`
- ❑ `algActivate()`
- ❑ `algDeactivate()`
- ❑ `algFree()`

The `algAlloc()` API allows the algorithm to communicate its memory requirements to the client application. The `algInit()` API allows the algorithm to initialize the memory allocated by the client application. The `algFree()` API allows the algorithm to communicate the memory to be freed when an instance is no longer required.

Once an algorithm instance object is created, it can be used to process data in real-time. The `algActivate()` API provides a notification to the algorithm instance that one or more algorithm processing methods is about to be run zero or more times in succession. After the processing methods have been run, the client application calls the `algDeactivate()` API prior to reusing any of the instance's scratch memory.

The IALG interface also defines three more optional APIs `algControl()`, `algNumAlloc()`, and `algMoved()`. For more details on these APIs, see *TMS320 DSP Algorithm Standard API Reference* (literature number SPRU360).

1.1.2 XDM Overview

In the multimedia application space, you have the choice of integrating any codec into your multimedia system. For example, if you are building a video decoder system, you can use any of the available video decoders (such as MPEG4, H.263, or H.264) in your system. To enable easy integration with the client application, it is important that all codecs with similar functionality use similar APIs. XDM was primarily defined as an extension to XDAIS to ensure uniformity across different classes of codecs

(for example audio, video, image, and speech). The XDM standard defines the following two APIs:

- ❑ `control()`
- ❑ `process()`

The `control()` API provides a standard way to control an algorithm instance and receive status information from the algorithm in real-time. The `control()` API replaces the `algControl()` API defined as part of the IALG interface. The `process()` API does the basic processing (encode/decode) of data.

Apart from defining standardized APIs for multimedia codecs, XDM also standardizes the generic parameters that the client application must pass to these APIs. The client application can define additional implementation specific parameters using extended data structures.

The following figure depicts the XDM interface to the client application.

As depicted in the figure, XDM is an extension to XDAIS and forms an interface between the client application and the codec component. XDM insulates the client application from component-level changes. Since TI's multimedia algorithms are XDM-compliant, it provides you with the flexibility to use any TI algorithm without changing the client application code. For example, if you have developed a client application using an XDM-compliant MPEG4 video decoder, then you can easily replace MPEG4 with another XDM-compliant video decoder, say H.263, with minimal changes to the client application.

For more details, see *eXpressDSP Digital Media (XDM) Standard API Reference* (literature number SPRUEC8).

1.2 Overview of WMA Version9 Decoder

WMA Version9 Decoder is a WMA standard decoder that decodes Windows Media Audio files in Raw Compressed Audio format (RCA).

From this point onwards, all references to WMA Decoder means WMA Version9 Decoder only.

1.3 Supported Services and Features

This user guide accompanies TI's implementation of WMA Decoder on the C64x+ platform.

This version of the codec has the following supported features of the standard:

- ❑ Supports all versions, namely V2, V7, V8, V9, V9 beta odd, and V9 NC
- ❑ Supports Class 4 implementation of WMA decoder
- ❑ Supports low, medium, and high bit rates
- ❑ Supports Variable Bit Rate (VBR) mode
- ❑ Supports 8-48 kHz output sampling rates and 5-384 kbps input bit rates
- ❑ Supports mono and stereo output channel
- ❑ Compliant with Microsoft Acceptance Test criteria
- ❑ Supports Raw Compressed Audio (RCA) streams
- ❑ Outputs 16-bit PCM samples
- ❑ Does not support Digital Rights Management (DRM)
- ❑ eXpressDSP compliant
- ❑ eXpressDSP Digital Media (XDM) compliant

Installation Overview

This chapter provides a brief description on the system requirements and instructions for installing the codec component. It also provides information on building and running the sample test application.

Topic	Page
2.1 System Requirements	2-2
2.2 Installing the Component	2-2
2.3 Before Building the Sample Test Application	2-4
2.4 Building and Running the Sample Test Application	2-4
2.5 Configuration Files	2-5
2.6 Standards Conformance and User-Defined Inputs	2-6
2.7 Uninstalling the Component	2-6

2.1 System Requirements

This section describes the hardware and software requirements for the normal functioning of the codec component.

2.1.1 Hardware

This codec has been built and tested on the DM644x EVM with XDS560 USB.

2.1.2 Software

The following are the software requirements for the normal functioning of the codec:

- ❑ **Development Environment:** This project is developed using Code Composer Studio version 3.2.37.12.
- ❑ **Code Generation Tools:** This project is compiled, assembled, archived, and linked using the code generation tools version 6.0.8.

2.2 Installing the Component

The codec component is released as a compressed archive. To install the codec, extract the contents of the zip file onto your local hard disk. The zip file extraction creates a top-level directory called 100_A_WMA_D_1_10_00, under which another directory named DM644x_RCA is created.

Figure 2-1 shows the sub-directories created in DM644x_RCA directory.

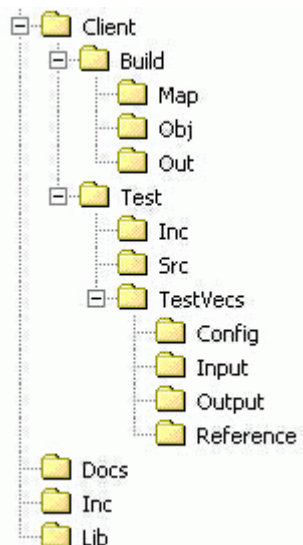

Figure 2-1. Component Directory Structure

Table 2-1 provides a description of the sub-directories created in the DM644x_RCAdirectory.

Table 2-1. Component Directories

Sub-Directory	Description
\Inc	Contains XDM related header files which allow interface to the codec library
\Lib	Contains the codec library files
\Docs	Contains user guide, datasheet, and release notes
\Client\Build	Contains the sample test application project (.pj1) file
\Client\Build\Map	Contains the memory map generated on compilation of the code
\Client\Build\Obj	Contains the intermediate .asm and/or .obj file generated on compilation of the code
\Client\Build\Out	Contains the final application executable (.out) file generated by the sample test application
\Client\Test\Src	Contains application C files
\Client\Test\Inc	Contains header files needed for the application code
\Client\Test\TestVecs\Input	Contains input test vectors
\Client\Test\TestVecs\Output	Contains output generated by the codec
\Client\Test\TestVecs\Reference	Contains read-only reference output to be used for verifying against codec output
\Client\Test\TestVecs\Config	Contains configuration parameter files

2.3 Before Building the Sample Test Application

This codec is accompanied by a sample test application. To run the sample test application, you need DSP/BIOS.

This version of the codec has been validated with DSP/BIOS version 5.21.

2.3.1 Installing DSP/BIOS

You can download DSP/BIOS from the TI external website:

https://www-a.ti.com/downloads/sds_support/targetcontent/bios/index.html

Install DSP/BIOS at the same location where you have installed Code Composer Studio. For example:

<install directory>\CCStudio_v3.2

The sample test application uses the following DSP/BIOS files:

- ❑ Header file, bcache.h available in the <install directory>\CCStudio_v3.2<bios_directory>\packages\ti\bios\include directory.
- ❑ Library file, biosDM420.a64P available in the <install directory>\CCStudio_v3.2<bios_directory>\packages\ti\bios\lib directory.

2.4 Building and Running the Sample Test Application

The sample test application that accompanies this codec component will run in TI's Code Composer Studio development environment. To build and run the sample test application in Code Composer Studio, follow these steps:

- 1) Verify that you have an installation of TI's Code Composer Studio version 3.2.37.12 and code generation tools version 6.0.8.
- 2) Verify that the codec object library wmadec_tii_rca.l64P exists in the \Lib sub-directory and the ASF parsing library asf_parser.lib exists in the \Client\Test\Src sub-directory.
- 3) Open the test application project file, TestAppDecoder.pjt in Code Composer Studio. This file is available in the \Client\Build sub-directory.
- 4) Select **Project > Build** to build the sample test application. This creates an executable file, TestAppDecoder.out in the \Client\Build\Out sub-directory.
- 5) Select **File > Load**, browse to the \Client\Build\Out sub-directory, select the codec executable created in step 4, and load it into Code Composer Studio in preparation for execution.
- 6) Select **Debug > Run** to execute the sample test application.

The sample test application takes the input files stored in the \Client\Test\TestVecs\Input sub-directory, runs the codec, and uses the reference files stored in the \Client\Test\TestVecs\Reference sub-directory to verify that the codec is functioning as expected.

- 7) On successful completion, the application displays one of the following messages for each frame:
 - “Decoder compliance test passed/failed” (for compliance check mode)
 - “Decoder output dump completed” (for output dump mode)

2.5 Configuration Files

This codec is shipped along with:

- A generic configuration file (Testvecs.cfg) – specifies input and reference files for the sample test application.

2.5.1 Generic Configuration File

The sample test application shipped along with the codec uses the configuration file, Testvecs.cfg for determining the input and reference files for running the codec and checking for compliance. The Testvecs.cfg file is available in the \Client\Test\TestVecs\Config sub-directory.

The format of the Testvecs.cfg file is:

```
x
Input
Output/Reference
```

where:

- x may be set as:
 - 1 - for compliance checking, no output file is created
 - 0 - for writing the output to the output file
- Input is the input file name (use complete path).
- Output/Reference is the output file name (if x is 0) or reference file name (if x is 1).

A sample Testvecs.cfg file is as shown:

```
0
..\..\Test\TestVecs\Input\test1_WMA_v8_5kbps_8kHz_1.wma
..\..\Test\TestVecs\Reference\test1_WMA_v8_5kbps_8kHz_1.wav
```

2.6 Standards Conformance and User-Defined Inputs

To check the conformance of the codec for the default input file shipped along with the codec, follow the steps as described in Section 2.4.

To check the conformance of the codec for other input files of your choice, follow these steps:

- Copy the input files to the \Client\Test\TestVecs\Inputs sub-directory.
- Copy the reference files to the \Client\Test\TestVecs\Reference sub-directory.
- Edit the configuration file, Testvecs.cfg available in the \Client\Test\TestVecs\Config sub-directory. For details on the format of the Testvecs.cfg file, see Section 2.5.1.
- Execute the sample test application. On successful completion, the application displays one of the following messages for each frame:
 - “Decoder compliance test passed/failed” (if x is 1)
 - “Decoder output dump completed” (if x is 0)

If you have chosen the option to write to an output file (x is 0), you can use any standard file comparison utility to compare the codec output with the reference output and check for conformance.

2.7 Uninstalling the Component

To uninstall the component, delete the codec directory from your hard disk.

Sample Usage

This chapter provides a detailed description of the sample test application that accompanies this codec component.

3.1 Overview of the Test Application

The test application exercises the IAUDDEC base class of the WMA Decoder library. The main test application files are TestAppDecoder.c and TestAppDecoder.h. These files are available in the \Client\Test\Src and \Client\Test\Inc sub-directories respectively.

Figure 3-1 depicts the sequence of APIs exercised in the sample test application.

Figure 3-1. Test Application Sample Implementation

Note:

Audio codecs do not use `algActivate()` and `algDeactivate()` APIs.

The test application is divided into four logical blocks:

- ❑ Parameter setup
- ❑ Algorithm instance creation and initialization
- ❑ Process call
- ❑ Algorithm instance deletion

3.1.1 *Parameter Setup*

Each codec component requires various codec configuration parameters to be set at initialization. For example, a video codec requires parameters such as video height, video width, etc. The test application obtains the required parameters from the Decoder configuration files.

In this logical block, the test application does the following:

- 1) Opens the generic configuration file, `Testvecs.cfg` and reads the compliance checking parameter, input file name, and output/reference file name.
- 2) Reads the input bit stream into the application input buffer

After successful completion of the above steps, the test application does the algorithm instance creation and initialization.

3.1.2 *Algorithm Instance Creation and Initialization*

In this logical block, the test application accepts the various initialization parameters and returns an algorithm instance pointer. The following APIs are called in sequence:

- 1) `algNumAlloc()` - To query the algorithm about the number of memory records it requires.
- 2) `algAlloc()` - To query the algorithm about the memory requirement to be filled in the memory records.
- 3) `algInit()` - To initialize the algorithm with the memory structures provided by the application.

A sample implementation of the create function that calls `algNumAlloc()`, `algAlloc()`, and `algInit()` in sequence is provided in the `ALG_create()` function implemented in the `alg_create.c` file.

3.1.3 *Process Call*

After algorithm instance creation and initialization, the test application does the following:

- 1) Sets the dynamic parameters (if they change during run time) by calling the `control()` function with the `XDM_SETPARAMS` command.
- 2) Sets the input and output buffer descriptors required for the `process()` function call. The input and output buffer descriptors are

obtained by calling the `control()` function with the `XDM_GETBUFINFO` command.

- 3) Calls the `process()` function to encode/decode a single frame of data. The behavior of the algorithm can be controlled using various dynamic parameters (see Section 4.2.1.5). The inputs to the process function are input and output buffer descriptors, pointer to the `IAUDDDEC_InArgs` and `IAUDDDEC_OutArgs` structures.

There could be any ordering of `control()` and `process()` functions. The following APIs are called in sequence:

- 1) `control()` (optional) - To query the algorithm on status or setting of dynamic parameters etc., using the six available control commands.
- 2) `process()` - To call the Decoder with appropriate input/output buffer and arguments information.
- 3) `control()` (optional) - To query the algorithm on status or setting of dynamic parameters etc., using the six available control commands.

The do-while loop encapsulates frame level `process()` call and updates the input buffer pointer every time before the next call. The do-while loop breaks off either when an error condition occurs or when the input buffer exhausts. It also protects the `process()` call from file operations by placing appropriate calls for cache operations as well. The test application does a cache invalidate for the valid input buffers before `process()` and a cache write back invalidate for output buffers after `process()`.

In the sample test application, after calling `process()`, the output data is either dumped to a file or compared with a reference file.

3.1.4 Algorithm Instance Deletion

Once encoding/decoding is complete, the test application must delete the current algorithm instance. The following APIs are called in sequence:

- 1) `algNumAlloc()` - To query the algorithm about the number of memory records it used.
- 2) `algFree()` - To query the algorithm to get the memory record information.

A sample implementation of the delete function that calls `algNumAlloc()` and `algFree()` in sequence is provided in the `ALG_delete()` function implemented in the `alg_create.c` file.

API Reference

This chapter provides a detailed description of the data structures and interfaces functions used in the codec component.

Topic	Page
4.1 Symbolic Constants and Enumerated Data Types	4-2
4.2 Data Structures	4-6
4.3 Interface Functions	4-15

4.1 Symbolic Constants and Enumerated Data Types

This section summarizes all the symbolic constants specified as either #define macros and/or enumerated C data types. Described alongside the macro or enumeration is the semantics or interpretation of the same in terms of what value it stands for and what it means.

Table 4-1. List of Enumerated Data Types

Group or Enumeration Class	Symbolic Constant Name	Description or Evaluation
IAUDIO_ChannelId	IAUDIO_MONO	Single channel
	IAUDIO_STEREO	Two channel
	IAUDIO_THREE_ZERO	Three channel. Not supported in this version of WMA Decoder.
	IAUDIO_FIVE_ZERO	Five channel. Not supported in this version of WMA Decoder.
	IAUDIO_FIVE_ONE	5.1 channel. Not supported in this version of WMA Decoder.
	IAUDIO_SEVEN_ONE	7.1 channel. Not supported in this version of WMA Decoder.
IAUDIO_PcmFormat	IAUDIO_BLOCK	Left channel data followed by right channel data. Note: For single channel (mono), only one channel data is available.
	IAUDIO_INTERLEAVED	Left and right channel data interleaved. Note: For single channel (mono), only one channel data is available.
XDM_DataFormat	XDM_BYTE	Big endian stream
	XDM_LE_16	16-bit little endian stream
	XDM_LE_32	32-bit little endian stream
XDM_CmdId	XDM_GETSTATUS	Query algorithm instance to fill <code>Status</code> structure.
	XDM_SETPARAMS	Set run time dynamic parameters via the <code>DynamicParams</code> structure.
	XDM_RESET	Reset the algorithm.

Group or Enumeration Class	Symbolic Constant Name	Description or Evaluation
	XDM_SETDEFAULT	Initialize all fields in <code>Params</code> structure to default values specified in the library
	XDM_FLUSH	Handle end of stream conditions. This command forces algorithm instance to output data without additional input.
	XDM_GETBUFINFO	Query algorithm instance regarding the properties of input and output buffers.
XDM_ErrorBit		The bit fields in the 32-bit error code are interpreted as shown.
	XDM_APPLIEDCONCEALMENT	Bit 9 <input type="checkbox"/> 1 - Applied concealment <input type="checkbox"/> 0 - Ignore
	XDM_INSUFFICIENTDATA	Bit 10 <input type="checkbox"/> 1 - Insufficient input data <input type="checkbox"/> 0 - Ignore
	XDM_CORRUPTEDDATA	Bit 11 <input type="checkbox"/> 1 - Invalid data <input type="checkbox"/> 0 - Ignore
	XDM_CORRUPTEDHEADER	Bit 12 <input type="checkbox"/> 1 - Corrupted frame header <input type="checkbox"/> 0 - Ignore
	XDM_UNSUPPORTEDINPUT	Bit 13 <input type="checkbox"/> 1 - Unsupported feature/parameter in input <input type="checkbox"/> 0 - Ignore
	XDM_UNSUPPORTEDPARAM	Bit 14 <input type="checkbox"/> 1 - Unsupported input parameter or configuration <input type="checkbox"/> 0 - Ignore
	XDM_FATALERROR	Bit 15 <input type="checkbox"/> 1 - Fatal error (stop decoding) <input type="checkbox"/> 0 - Recoverable error

Note:

The remaining bits that are not mentioned in `XDM_ErrorBit` are interpreted as:

- Bit 16-32: Reserved
- Bit 8: Reserved
- Bit 0-7: Codec and implementation specific (see Table 4-2)

The algorithm can set multiple bits to 1 depending on the error condition.

XDM_FLUSH is not applicable for WMA Decoder. Just returns IALG_EOK.

The WMA Decoder specific error status messages are listed in Table 4-2. The value column indicates the decimal value of the last 8-bits reserved for codec specific error statuses.

Table 4-2. WMA Decoder Error Status

Group or Enumeration Class	Symbolic Constant Name	Value	Description or Evaluation
tWMAFileStatus	cWMA_NoErr	0	Successful decoding
	cWMA_Failed,	1	Decoding failed
	cWMA_BadArgument	2	Decoder handle passed in the function call is NULL
	cWMA_BadAsfHeader	3	ASF parser encountered an error in the ASF header
	cWMA_BadPacketHeader	4	ASF parser encountered an error in the ASF packet header
	cWMA_BrokenFrame	5	Encountered an error during frame decoding
	cWMA_NoMoreFrames	6	Input data has been decoded
	cWMA_BadSamplingRate	7	Sampling rate of the encoded file is not supported by this decoder
	cWMA_BadNumberOfChannels	8	Channel number of the encoded file is not supported
	cWMA_BadVersionNumber	9	Version number of the encoded file is not supported
	cWMA_BadWeightingMode	10	The mode (a parameter of the encoded file) is not supported
	cWMA_BadPacketization	11	This version of WMA Decoder does not return this error
	cWMA_BadDRMType	12	This version of WMA Decoder does not support DRM and hence does not return this error.
	cWMA_DRMFailed	13	DRM processing failed. This version of WMA Decoder does not return this error.
	cWMA_DRMUnsupported	14	This version of WMA Decoder does not support DRM and hence does not return this error.

Group or Enumeration Class	Symbolic Constant Name	Value	Description or Evaluation
	<code>cWMA_DemoExpired</code>	15	Number of samples for the demo is greater than the limit defined. This version of WMA Decoder does not return this error.
	<code>cWMA_BadState</code>	16	This version of WMA Decoder does not return this error
	<code>cWMA_Internal</code>	17	Decoder encountered an error in the bit stream and further decoding is not possible.
	<code>cWMA_NoMoreDataThisTime</code>	18	This version of WMA Decoder does not return this error
	<code>cWMA_HandleNotCreated</code>	19	This version of WMA Decoder does not return this error

4.2 Data Structures

This section describes the XDM defined data structures that are common across codec classes. These XDM data structures can be extended to define any implementation specific parameters for a codec component.

4.2.1 Common XDM Data Structures

This section includes the following common XDM data structures:

- ❑ XDM_BufDesc
- ❑ XDM_AlgBufInfo
- ❑ IAUDDEC_Fxns
- ❑ IAUDDEC_Params
- ❑ IAUDDEC_DynamicParams
- ❑ IAUDDEC_InArgs
- ❑ IAUDDEC_Status
- ❑ IAUDDEC_OutArgs

4.2.1.1 XDM_BufDesc

|| Description

This structure defines the buffer descriptor for input and output buffers.

|| Fields

Field	Datatype	Input/ Output	Description
**bufs	XDAS_Int8	Input	Pointer to the vector containing buffer addresses
numBufs	XDAS_Int32	Input	Number of buffers
*bufSizes	XDAS_Int32	Input	Size of each buffer in bytes

4.2.1.2 XDM_AlgBufInfo

|| Description

This structure defines the buffer information descriptor for input and output buffers. This structure is filled when you invoke the `control()` function with the `XDM_GETBUFINFO` command.

|| Fields

Field	Datatype	Input/ Output	Description
minNumInBufs	XDAS_Int32	Output	Number of input buffers
minNumOutBufs	XDAS_Int32	Output	Number of output buffers
minInBufSize[XDM_MAX_IO_BUFFERS]	XDAS_Int32	Output	Size in bytes required for each input buffer
minOutBufSize[XDM_MAX_IO_BUFFERS]	XDAS_Int32	Output	Size in bytes required for each output buffer

Note:

For WMA Decoder, the buffer details are:

- Number of input buffer required is 1.
- Number of output buffer required is 1.
- The input buffer size should be greater than the encoded ASF data packet size. The maximum encoded ASF data packet size can be upto 25K-bytes.

- ❑ The output buffer size is 16348 bytes (4096 samples * 2 channels * 2 bytes/sample).

These are the maximum buffer sizes but you can reconfigure depending on the format of the bit stream.

4.2.1.3 IAUDDEC_Fxns

|| Description

This structure contains pointers to all the XDAIS and XDM interface functions.

|| Fields

Field	Datatype	Input/ Output	Description
ialg	IALG_Fxns	Input	Structure containing pointers to all the XDAIS interface functions. For more details, see <i>TMS320 DSP Algorithm Standard API Reference</i> (literature number SPRU360).
*process	XDAS_Int32	Input	Pointer to the <code>process()</code> function
*control	XDAS_Int32	Input	Pointer to the <code>control()</code> function

4.2.1.4 IAUDDEC_Params

|| Description

This structure defines the creation parameters for an algorithm instance object. Set this data structure to `NULL`, if you are unsure of the values to specify for these parameters.

|| Fields

Field	Datatype	Input/ Output	Description
size	XDAS_Int32	Input	Size of the basic or extended (if being used) data structure in bytes.
maxSampleRate	XDAS_Int32	Input	Maximum sampling frequency to be supported in Hertz (Hz). For example, if maximum sampling frequency is 44.1 kHz, set this field to 44100.
maxBitrate	XDAS_Int32	Input	Maximum bit rate to be supported in bits per second. For example, if maximum bit rate is 128 kbps, set this field to 128000.

Field	Datatype	Input/ Output	Description
maxNoOfCh	XDAS_Int32	Input	Maximum channels to be supported. See IAUDIO_ChannelId enumeration for details
dataEndianness	XDAS_Int32	Input	Endianness of input data. See XDM_DataFormat enumeration for details.

Note:

- ❑ The current WMA Decoder implementation supports XDM_BYTE format. Input data is big endian as per standard and output is little endian.
- ❑ The supported maxBitrate is 384 kbps and maxSampleRate is 48 kHz.
- ❑ Maximum number of channels supported is 2.
- ❑ The maxBitrate, maxSampleRate, and maxNoOfCh are only used during initialization for checking the capability of the decoder by the application. During actual decoding, the WMA9 Decoder decodes all the sampling frequencies, bit rates, and channels mentioned in this document.

4.2.1.5 IAUDDEC_DynamicParams**|| Description**

This structure defines the run time parameters for an algorithm instance object. Set this data structure to NULL, if you are unsure of the values to be specified for these parameters.

|| Fields

Field	Datatype	Input/ Output	Description
size	XDAS_Int32	Input	Size of the basic or extended (if being used) data structure in bytes.
outputFormat	XDAS_Int32	Input	To set interleaved/block format for output. See IAUDIO_PcmFormat enumeration for details.

Note:

- ❑ Both interleaved and block output formats are supported. The default outputFormat is interleaved.

4.2.1.6 IAUDDEC_InArgs**|| Description**

This structure defines the run time input arguments for an algorithm instance object.

|| Fields

Field	Datatype	Input/Output	Description
size	XDAS_Int32	Input	Size of the basic or extended (if being used) data structure in bytes.
numBytes	XDAS_Int32	Input	Number of valid input data (in bytes) in input buffer. For example, if number of valid input data in input buffer is 128 bytes, set this field to 128.

4.2.1.7 IAUDDEC_Status**|| Description**

This structure defines parameters that describe the status of the algorithm instance object.

|| Fields

Field	Datatype	Input/Output	Description
size	XDAS_Int32	Input	Size of the basic or extended (if being used) data structure in bytes.
extendedError	XDAS_Int32	Output	Extended error enumeration for XDM compliant encoders and decoders. See <code>XDM_ErrorBit</code> enumeration for details.
bitRate	XDAS_Int32	Output	Bit rate in bits per second. For example, if the value of this field is 128000, it indicates that bit rate is 128 kbps.
sampleRate	XDAS_Int32	Output	Sampling frequency in Hertz (Hz). For example, if the value of this field is 44100, it indicates that the sample rate is 44.1kHz.
numChannels	XDAS_Int32	Output	Number of channels. See <code>IAUDIO_ChannelId</code> enumeration for details.
numLFEChannels	XDAS_Int32	Output	Number of Low Frequency Effects (LFE) channels in the stream

Field	Datatype	Input/Output	Description
outputFormat	XDAS_Int32	Output	The output PCM format. See <code>IAUDIO_PcmFormat</code> enumeration for details.
autoPosition	XDAS_Int32	Output	Flag to indicate support for random position decoding, which means that a stream can be decoded from any point: <ul style="list-style-type: none"> <input type="checkbox"/> 1 - Supports random position decoding <input type="checkbox"/> 0 - Does not support random position decoding
fastFwdLen	XDAS_Int32	Output	Recommended Fast Forward length in bytes in case of random position decoding.
frameLen	XDAS_Int32	Output	Number of samples decoded per decode call
outputBitsPerSample	XDAS_Int32	Output	Number of output bits per output sample. For example, if the value of the field is 16, it indicates 16 output bits per PCM sample.
bufInfo	XDM_AlgbufInfo	Output	Input and output buffer information. See <code>XDM_AlgbufInfo</code> data structure for details.

Note:

- `numLFEChannels` and `fastFwdLen` is not applicable for WMA Decoder.

4.2.1.8 IAUDDEC_OutArgs**|| Description**

This structure defines the run time output arguments for the algorithm instance object.

|| Fields

Field	Datatype	Input/Output	Description
size	XDAS_Int32	Input	Size of the basic or extended (if being used) data structure in bytes.
extendedError	XDAS_Int32	Output	Extended error enumeration for XDM compliant encoders and decoders. See <code>XDM_ErrorBit</code> data structure for details.
bytesConsumed	XDAS_Int32	Output	Bytes consumed during the process call

4.2.2 WMA Decoder Data Structures

This section includes the following WMA Decoder specific extended data structures:

- ❑ IWMA_Params
- ❑ IWMA_DynamicParams
- ❑ IWMA_InArgs
- ❑ IWMA_Status
- ❑ IWMA_OutArgs
- ❑ tWMAFileHeader
- ❑ RestorationStruct

4.2.2.1 *IWMA_Params*

|| Description

This structure defines the creation parameters and any other implementation specific parameters for the WMA Decoder instance object. The creation parameters are defined in the XDM data structure, `IAUDDDEC_Params`.

|| Fields

Field	Datatype	Input/ Output	Description
<code>auddec_params</code>	<code>IAUDDDEC_Params</code>	Input	See <code>IAUDDDEC_Params</code> data structure for details.

4.2.2.2 *IWMA_DynamicParams*

|| Description

This structure defines the run time parameters and any other implementation specific parameters for the WMA Decoder instance object. The run time parameters are defined in the XDM data structure, `IAUDDDEC_DynamicParams`.

|| Fields

Field	Datatype	Input/ Output	Description
<code>auddec_dynamicparams</code>	<code>IAUDDDEC_DynamicParams</code>	Input	See <code>IAUDDDEC_DynamicParams</code> data structure for details.
<code>monoToStereo</code>	<code>XDAS_UInt8</code>	Input	If this flag is set the decoder always outputs 2 channels. Even for mono streams, the mono stream is output in both the channels.
<code>stereoToMono</code>	<code>XDAS_UInt8</code>	Input	If this flag is set, the decoder always outputs mono channel output. For stereo streams, the decoder automatically downsamples the stereo PCM samples into mono stream and outputs it to the application.

4.2.2.3 *IWMA_InArgs*

|| Description

This structure defines the run time input arguments for the WMA Decoder instance object.

|| Fields

Field	Datatype	Input/ Output	Description
auddec_inArgs	IAUDDDEC_InArgs	Input	See IAUDDDEC_InArgs data structure for details.
syncSearchEnteredFlag	XDAS_UInt16	Input	This value is set to 1 if data has been extracted from the pad data of the input bit stream
rs	RestorationStruct	Input	See RestorationStruct (Section 4.2.2.7) data structure for details.

4.2.2.4 *IWMA_Status*

|| Description

This structure defines parameters that describe the status of the WMA Decoder and any other implementation specific parameters. The status parameters are defined in the XDM data structure, IAUDDDEC_Status.

|| Fields

Field	Datatype	Input/ Output	Description
auddec_status	IAUDDDEC_Status	Output	See IAUDDDEC_Status data structure for details.
hdr	tWMAFileHeader	Output	ASF header information. See (Section 4.2.2.6) for details. Note: This field should be ignored for RCA library.

4.2.2.5 *IWMA_OutArgs*

|| Description

This structure defines the run time output arguments for the WMA Decoder instance object.

|| Fields

Field	Datatype	Input/ Output	Description
auddec_outArgs	IAUDDEC_OutArgs	Output	See IAUDDEC_OutArgs data structure for details.
OutputSamplesReady	XDAS_Int32	Output	Number of samples decoded per channel.

4.2.2.6 *tWMAFileHeader*

|| Description

This structure defines the WMA Decoder file header information.

|| Fields

Field	Datatype	Input/ Output	Description
version	XDAS_UInt16	Output	Version of the WMA bit stream
sample_rate	XDAS_UInt32	Output	Sampling rate
num_channels	XDAS_UInt16	Output	Number of audio channels
duration	XDAS_UInt32	Output	Duration of the file in milliseconds
packet_size	XDAS_UInt32	Output	Size of an ASF packet
first_packet_offset	XDAS_UInt32	Output	Byte offset to the first ASF packet
last_packet_offset	XDAS_UInt32	Output	Byte offset to the last ASF packet
has_DRM	XDAS_UInt32	Output	Set to 1 if stream is DRM encrypted
LicenseLength	XDAS_UInt32	Output	License length in the header
bitrate	XDAS_UInt32	Output	Bit rate of the WMA bit stream
pcm_format_tag	XDAS_UInt16	Output	wFormatTag in PCM header
bits_per_sample	XDAS_UInt16	Output	Number of bits per sample of mono data (container size, always multiple of 8)

Field	Datatype	Input/ Output	Description
valid_bits_per_sample	XDAS_UInt16	Output	Actual valid bits per sample of mono data (less than or equal to bits_per_sample)
subformat_data1	XDAS_UInt16	Output	GUID information
subformat_data2	XDAS_UInt16	Output	GUID information
subformat_data3	XDAS_UInt16	Output	GUID information
subformat_data4 [8]	XDAS_UInt8	Output	GUID information
channel_mask	XDAS_UInt32	Output	Data extracted from the ASF header. Required by core audio decoder for initialization.

4.2.2.7 RestorationStruct

|| Description

This structure defines the WMA Decoder file content information. Used when extracting the initialization parameters from the ASF pad data

|| Fields

Field	Datatype	Input/ Output	Description
cbPacketSize	XDAS_UInt32	Input	Size of an ASF packet
wFormatTag	XDAS_UInt16	Input	Format tag
nChannels	XDAS_UInt16	Input	Number of channels in the source material
nSamplesPerSec	XDAS_UInt32	Input	Sample rate of the source material
nAvgBytesPerSec	XDAS_UInt32	Input	Average compressed stream rate in number of bytes per second
nBlockAlign	XDAS_UInt32	Input	Refer "Advanced Systems Format (ASF) Specification", Revision 0.1.20.03, Microsoft Corporation, December 2004.
wBitsPerSample	XDAS_UInt16	Input	Valid bits per sample
nSamplesPerBlock	XDAS_UInt32	Input	Samples per block
nEncodeOpt	XDAS_UInt16	Input	Refer "Advanced Systems Format (ASF) Specification", Revision 0.1.20.03, Microsoft Corporation, December 2004.
wAudioStreamId	XDAS_UInt16	Input	Audio stream ID

4.3 Interface Functions

This section describes the Application Programming Interfaces (APIs) used in the WMA Decoder. The APIs are logically grouped into the following categories:

- ❑ **Creation** – `algNumAlloc()`, `algAlloc()`
- ❑ **Initialization** – `algInit()`
- ❑ **Control** – `control()`
- ❑ **Data processing** – `algActivate()`, `process()`, `algDeactivate()`
- ❑ **Termination** – `algFree()`

You must call these APIs in the following sequence:

- 1) `algNumAlloc()`
- 2) `algAlloc()`
- 3) `algInit()`
- 4) `algActivate()`
- 5) `process()`
- 6) `algDeactivate()`
- 7) `algFree()`

`control()` can be called any time after calling the `algInit()` API.

`algNumAlloc()`, `algAlloc()`, `algInit()`, `algActivate()`, `algDeactivate()`, and `algFree()` are standard XDAIS APIs. This document includes only a brief description for the standard XDAIS APIs. For more details, see *TMS320 DSP Algorithm Standard API Reference* (literature number SPRU360).

Note:

Audio codecs do not use `algActivate()` and `algDeactivate()` APIs.

4.3.1 Creation APIs

Creation APIs are used to create an instance of the component. The term creation could mean allocating system resources, typically memory.

|| Name

`algNumAlloc()` – determine the number of buffers that an algorithm requires

|| Synopsis

```
XDAS_Int32 algNumAlloc(Void);
```

|| Arguments

Void

|| Return Value

```
XDAS_Int32; /* number of buffers required */
```

|| Description

`algNumAlloc()` returns the number of buffers that the `algAlloc()` method requires. This operation allows you to allocate sufficient space to call the `algAlloc()` method.

`algNumAlloc()` may be called at any time and can be called repeatedly without any side effects. It always returns the same result. The `algNumAlloc()` API is optional.

For more details, see *TMS320 DSP Algorithm Standard API Reference* (literature number SPRU360).

|| See Also

`algAlloc()`

|| Name

`algAlloc()` – determine the attributes of all buffers that an algorithm requires

|| Synopsis

```
XDAS_Int32 algAlloc(const IALG_Params *params, IALG_Fxns
**parentFxns, IALG_MemRec memTab[]);
```

|| Arguments

```
IALG_Params *params; /* algorithm specific attributes */
```

```
IALG_Fxns **parentFxns; /* output parent algorithm
functions */
```

```
IALG_MemRec memTab[]; /* output array of memory records */
```

|| Return Value

```
XDAS_Int32 /* number of buffers required */
```

|| Description

`algAlloc()` returns a table of memory records that describe the size, alignment, type, and memory space of all buffers required by an algorithm. If successful, this function returns a positive non-zero value indicating the number of records initialized.

The first argument to `algAlloc()` is a pointer to a structure that defines the creation parameters. This pointer may be `NULL`; however, in this case, `algAlloc()` must assume default creation parameters and must not fail.

The second argument to `algAlloc()` is an output parameter. `algAlloc()` may return a pointer to its parent's IALG functions. If an algorithm does not require a parent object to be created, this pointer must be set to `NULL`.

The third argument is a pointer to a memory space of size `nbufs * sizeof(IALG_MemRec)` where, `nbufs` is the number of buffers returned by `algNumAlloc()` and `IALG_MemRec` is the buffer-descriptor structure defined in `ialg.h`.

After calling this function, `memTab[]` is filled up with the memory requirements of an algorithm.

For more details, see *TMS320 DSP Algorithm Standard API Reference* (literature number SPRU360).

|| See Also

```
algNumAlloc(), algFree()
```

4.3.2 Initialization API

Initialization API is used to initialize an instance of the algorithm. The initialization parameters are defined in the `Params` structure (see data structures section for details).

|| Name

algInit() – initialize an algorithm instance

|| Synopsis

```
XDAS_Int32 algInit(IALG_Handle handle, IALG_MemRec  
memTab[], IALG_Handle parent, IALG_Params *params);
```

|| Arguments

```
IALG_Handle handle; /* algorithm instance handle*/  
IALG_memRec memTab[]; /* array of allocated buffers */  
IALG_Handle parent; /* handle to the parent instance */  
IALG_Params *params; /* algorithm initialization  
parameters */
```

|| Return Value

```
IALG_EOK; /* status indicating success */
```

```
IALG_EFAIL; /* status indicating failure */
```

|| Description

algInit() performs all initialization necessary to complete the run time creation of an algorithm instance object. After a successful return from algInit(), the instance object is ready to be used to process data.

The first argument to algInit() is a handle to an algorithm instance. This value is initialized to the base field of memTab[0].

The second argument is a table of memory records that describe the base address, size, alignment, type, and memory space of all buffers allocated for an algorithm instance. The number of initialized records is identical to the number returned by a prior call to algAlloc().

The third argument is a handle to the parent instance object. If there is no parent object, this parameter must be set to NULL.

The last argument is a pointer to a structure that defines the algorithm initialization parameters.

For more details, see *TMS320 DSP Algorithm Standard API Reference* (literature number SPRU360).

|| See Also

algAlloc(), algMoved()

4.3.3 Control API

Control API is used for controlling the functioning of the algorithm instance during run time. This is done by changing the status of the controllable parameters of the algorithm during run time. These controllable parameters are defined in the Status data structure (see data structures section for details).

|| Name

`control()` – change run time parameters and query the status

|| Synopsis

```
XDAS_Int32 (*control) (IAUDDDEC_Handle handle, IAUDDDEC_Cmd
id, IAUDDDEC_DynamicParams *params, IAUDDDEC_Status
*status);
```

|| Arguments

```
IAUDDDEC_Handle handle; /* algorithm instance handle */
IAUDDDEC_Cmd id; /* algorithm specific control commands*/
IAUDDDEC_DynamicParams *params /* algorithm run time
parameters */
IAUDDDEC_Status *status /* algorithm instance status
parameters */
```

|| Return Value

```
IALG_EOK; /* status indicating success */
IALG_EFAIL; /* status indicating failure */
```

|| Description

This function changes the run time parameters of an algorithm instance and queries the algorithm's status. `control()` must only be called after a successful call to `algInit()` and must never be called after a call to `algFree()`.

The first argument to `control()` is a handle to an algorithm instance.

The second argument is an algorithm specific control command. See `XDM_CmdId` enumeration for details.

The third and fourth arguments are pointers to the `IAUDDDEC_DynamicParams` and `IAUDDDEC_Status` data structures respectively.

Note:

If you are using extended data structures, the third and fourth arguments must be pointers to the extended `DynamicParams` and `Status` data structures respectively. Also, ensure that the `size` field is set to the size of the extended data structure. Depending on the value set for the `size` field, the algorithm uses either basic or extended parameters.

|| Preconditions

The following conditions must be true prior to calling this function; otherwise, its operation is undefined.

- ❑ `control()` can only be called after a successful return from `algInit()` and `algActivate()`.
- ❑ If algorithm uses DMA resources, `control()` can only be called after a successful return from `DMAN3_init()`.
- ❑ `handle` must be a valid handle for the algorithm's instance object.

|| Postconditions

The following conditions are true immediately after returning from this function.

- ❑ If the control operation is successful, the return value from this operation is equal to `IALG_EOK`; otherwise it is equal to either `IALG_EFAIL` or an algorithm specific return value.
- ❑ If the control command is not recognized, the return value from this operation is not equal to `IALG_EOK`.

|| Example

See test application file, `TestAppDecoder.c` available in the `\Client\Test\Src` sub-directory.

|| See Also

`algInit()`, `algActivate()`, `process()`

Note:

Audio codecs do not use `algActivate()`, `algDeactivate()`, and `DMAN3_init()` APIs.

4.3.4 Data Processing API

Data processing API is used for processing the input data.

|| Name

`process()` – basic encoding/decoding call

|| Synopsis

```
XDAS_Int32 (*process)(IAUDDDEC_Handle handle, XDM_BufDesc
*inBufs, XDM_BufDesc *outBufs, IAUDDDEC_InArgs *inargs,
IAUDDDEC_OutArgs *outargs);
```

|| Arguments

```
IAUDDDEC_Handle handle; /* algorithm instance handle */
```

```
XDM_BufDesc *inBufs; /* algorithm input buffer descriptor
*/
```

```
XDM_BufDesc *outBufs; /* algorithm output buffer descriptor
*/
```

```
IAUDDDEC_InArgs *inargs /* algorithm runtime input
arguments */
```

```
IAUDDDEC_OutArgs *outargs /* algorithm runtime output
arguments */
```

|| Return Value

```
IALG_EOK; /* status indicating success */
```

```
IALG_EFAIL; /* status indicating failure */
```

|| Description

This function does the basic encoding/decoding. The first argument to `process()` is a handle to an algorithm instance.

The second and third arguments are pointers to the input and output buffer descriptor data structures respectively (see `XDM_BufDesc` data structure for details).

The fourth argument is a pointer to the `IAUDDDEC_InArgs` data structure that defines the run time input arguments for an algorithm instance object.

The last argument is a pointer to the `IAUDDDEC_OutArgs` data structure that defines the run time output arguments for an algorithm instance object.

Note:

If you are using extended data structures, the fourth and fifth arguments must be pointers to the extended `InArgs` and `OutArgs` data structures respectively. Also, ensure that the `size` field is set to the size of the extended data structure. Depending on the value set for the `size` field, the algorithm uses either basic or extended parameters.

|| Preconditions

The following conditions must be true prior to calling this function; otherwise, its operation is undefined.

- ❑ `process()` can only be called after a successful return from `algInit()` and `algActivate()`.

- ❑ If algorithm uses DMA resources, `process()` can only be called after a successful return from `DMAN3_init()`.
- ❑ `handle` must be a valid handle for the algorithm's instance object.
- ❑ Buffer descriptor for input and output buffers must be valid.
- ❑ Input buffers must have valid input data.

|| Postconditions

The following conditions are true immediately after returning from this function.

- ❑ If the process operation is successful, the return value from this operation is equal to `IALG_EOK`; otherwise it is equal to either `IALG_EFAIL` or an algorithm specific return value.
- ❑ After successful return from `process()` function, `algDeactivate()` can be called.

|| Example

See test application file, `TestAppDecoder.c` available in the `\Client\Test\Src` sub-directory.

|| See Also

`algInit()`, `algDeactivate()`, `control()`

Note:

- ❑ Audio codecs do not use `algActivate()`, `algDeactivate()`, and `DMAN3_init()` APIs.

4.3.5 Termination API

Termination API is used to terminate the algorithm instance and free up the memory space that it uses.

|| Name

`algFree()` – determine the addresses of all memory buffers used by the algorithm

|| Synopsis

```
XDAS_Int32 algFree(IALG_Handle handle, IALG_MemRec  
memTab[]);
```

|| Arguments

```
IALG_Handle handle; /* handle to the algorithm instance */  
IALG_MemRec memTab[]; /* output array of memory records */
```

|| Return Value

```
XDAS_Int32; /* Number of buffers used by the algorithm */
```

|| Description

`algFree()` determines the addresses of all memory buffers used by the algorithm. The primary aim of doing so is to free up these memory regions after closing an instance of the algorithm.

The first argument to `algFree()` is a handle to the algorithm instance.

The second argument is a table of memory records that describe the base address, size, alignment, type, and memory space of all buffers previously allocated for the algorithm instance.

For more details, see *TMS320 DSP Algorithm Standard API Reference* (literature number SPRU360).
